John Kell M. D.
B.

Riviere, or Riverius, Lazarus,
an eminent physician, was born at
Montpellier, in 1589. — He became
professor of medicine at his native
place in 1622, which situation he
occupied till his death, in 1655.

He published "Institutiones
Medicinae;" "Praxis Medica;" &
"Observationes Medicae et
Curationes insignes." —

LAZARUS RIVERIUS
Physitian to the now King of
France

Ng C.H. CULPEPER
Physitian & Astrologer

ABDIAH COLE
D^r of Physick

John Fernelius, sometime Physician to the
King of France.

THE
Practice of Physick,
IN
Seventeen several Books,

Wherein is plainly set forth,
The *Nature, Cause, Differences*, and Several sorts of
Signs; Together with the *Cure* of all Diseases in the Body.

By { *Nicholas Culpeper*, Physitian and Astrologer.
 Abdiab Cole, Doctor of Physick. And
 William Rowland, Physitian.

Being chiefly a Translation of
THE WORKS
OF THAT
Learned and Renowned Doctor,
LAZARUS RIVERIUS,
Sometimes
Councillor and Physitian to the KING of France.

To which are added
Four BOOKS containing Five hundred and thirteen
Observations of Famous Cures. By the same Author.

And a Fifth Book of Select Medicinal Counsels. By *John Fernelius*.

With a TABLE of the Principal Matters Treated of therein. As also a
Physical Dictionary, Explaining the hard Words used in these Books.

LONDON,
Printed for George Sawbridge, at the Bible on Ludgate-
Hill. MDCLXXVIII.

LAZARUS

The Printer to the Reader.

READER,

THY Cheerful Acceptance of my former Endeavours in this Kind for the good of my Native Country, hath encouraged me, though with great Care, Labour and Cost, to present thee with the Learned, Judicious, and Worthily Renowned Riverius his Practice of Physick. He was an Author lately living, and sufficiently known: And his Works will speak for themselves, and praise him in the Gates.

And if thou shalt shew a Friendly Countenance to this Worthy Stranger, who now speaks English, I shall be thereby encouraged by all other Means to study to promote thy good, by bringing thee more acquainted with this, and other Excellent Authors.

And whereas some, either out of Envy, or Mis-understanding do condemn Works of this Nature published in our Mother Tongue, alledging chiefly, That such Books encrease the number of Empericks; are a hinderance to Learned and Noble Physitians; also occasion some to hurt themselves by rashly practising on their own Bodies. I shall answer to these Objections in Order.

First, As for Empericks; These Books, and such as these published in English, are so far from making more Empericks, that they will spoyle those that are, and make that we shall have fewer of them. For an Emperick being one that gives Physick (Hab Nab, as we use to say) relying only on Experience, and what he hath seen done before him, not being able to give any reason touching the Disease, its Cause or Cure; These Books will teach such persons how to go upon good grounds, and to be able to give a solid Reason for what they do; and of Empericks make them Rational Physitians, if they be Men of good Natural Parts, though they be ignorant of all Tongues but their Mothers.

As for the hurt which is hereby pretended to be done to Learned Physitians, it is a meer imagination, and no Learned Physitian that bethinks himself well, will so judge. For the use of these Books respects chiefly the Poor of this Nation, together with Seafarers, and Souldiers. But for the Rich that have Money to spare, and bide at home, no otherwise (in point of Practice) than for an honest Curiosity and delightful Speculation. What Rich Man is there so mad, who reading a Chapter in these Books, and seeing what a world of Considerations and Cautions belong to the knowledg and orderly Cure of every Disease, but will be more fearful than ever he was before to commit himself to the Cure of any but a Learned Physitian. Now it is not by the Poor, but by the Rich, that the Learned Physitian maintains himself; The Poor are but a trouble to him, onely before such Books as these were extant in the English Tongue, Conscience (sometime) forced the Learned Physitian to take Care of the Poor, because the Unlearned were wholly unable: Whereas now there may be found Industrious Men that know no more Languages than their Native one, who may in a rational way contribute to the Necessities of the Poor. Nay, these kind of Books are profitable to the Learned Physitians; for many of the Gentry, especially of the Ladies and Gentlewomen, viewing the state of their own Bodies in such Books as these (as in Looking-Glasses), will perceive certain Diseases in themselves, either now in being, or likely, e're long, to seize upon them, which otherwise they would never have so much as dream'd of; and thereupon crave the Advice and Assistance of the Learned Physitian.

The Printer to the Reader.

Also the Ladies and Gentlewomen being well read in such Books as these, will better know how to demean themselves towards their Husbands, Children, or other Relations and Friends in their respective Sicknes in point of ordering them, and will be more apprehensive of the Physitians Directions, and so better able to practise them; also more capable of his Reasons, and Prognosticks, and so more confident and cheerfully obedient. All which will very much advance the Cure, and consequently the Honour and Gain of the Learned Physitian: for, as Hippocrates notes in his first Aphorisme, It is not enough towards the Cure that the Physitian do what is fitting; but the By-standers and Friends of the Sick must play their part, or all will not be well.

And in the third place, whereas it is objected, That People reading these Books will practise upon themselves, and hurt themselves.

I Answer, If they do, they have none to blame but their own folly; for it is not the intent of the publishers of these Books, that every one that can read English, should dare to take of their own heads such Medicines as are described in the said Books. But our intent is, That where in the Country there is no Learned Physitian at hand; at Sea, in the Kings and Merchants Ships, where the Chirurgion is compelled to act both his own, and the Physitian's part; In Armies and Leaguers, &c. An ingenious and diligent Chirurgion, Apothecary, or any other that hath from his Youth been exercised in these kind of Studies, and conversant about the Sick, may attain such a competent knowledge in the Causes and Methodical Cure of Diseases, as they may with honour to themselves, and profit to the Sick (by Gods blessing) supply the place of a more Learned Physitian. For the use of such persons these Books are intended, and for diligent Midwives; and not that every Fool should turn Physitian, or that every Reader should tamper with him or her self.

Also divers Honourable Ladies and Gentlewomen, that out of a truly Christian and Charitable Disposition have not disdained, but counted it a great honour to be helpful to the Poor in the time of their Sicknes, may by perusal of these Books, and the like, confirm and encrease their Knowledge, and become honourable Instruments in the hand of God, of much Relief and Comfort to many poor distressed Creatures in their respective Countries and places of Habitation. For the worthy sakes of which Honourable Ladies and Gentlewomen in the first and chiefest place, and for the ease of all others unacquainted with the Greek and Latin Tongues, and consequently unable to understand divers Terms of Art, and other words drawn from the said Tongues (which it is necessary to retain for brevity sake, and to avoid tedious Circumlocutions) I have caused a Physical Dictionary to be added at the end of these Books, explaining all such Terms of Art aforesaid as are used therein.

When the Reader meets in these Books, with the Names of Simple or Compound Medicaments, and desires a more full Knowledge of them, let him have recourse to the London Dispensatory in English, where he may be satisfied; for it had been an endless and vain work, to repeat what hath been said. If there occur accidentally the name of any Disease which the Reader would better understand, let him look into the Table of the Contents of the Chapters of these Seventeen Books, and he shall find the said Disease described and explained.

Also the Reader may please to take notice, That many hard Phrases in these Seventeen Books are explained in the Context, by more easie words following, which signifie the same with the foregoing hard word.

As for Example, MASTICATORIES, or Chewing Medicines, giving the Reader to understand, That Masticatories, is as much as to say, Medicines that are only chewed in the Mouth to bring away Rheum by spitting.

The Printer to the Reader.

So GARGARISMS, *that is*, Medicines to Gargle in the Throat: A PLETHORICK, *or* Full Body; EMPYEMA, *or* Corrupt matter gathered between the Chest and Lungs; HYPOCHONDRIA, *or* Parts under the short Ribs; A VESICATORY, *or* Plaister to draw Blisters. *Many such passages there are throughout these Books, where the later Clause is an Exposition of the former.*

And that thou mayst know to whose great Industry and Pains thou art obliged for the Englishing this most Excellent Piece of Art, know, That it hath been three times Translated by Nicholas Culpepper, Physitian and Astrologer; Abdiah Cole, Doctor in Physick, who hath practised Physick Twenty nine Years in the Service of Three of the Greatest Princes in Europe: And William Rowland, a Knowing Physitian; And also by an Eminently Learned and Pious Physitian, who desires not to be named, being (as he sayes) content with the Applause of his own Conscience: A Work that tends to profit many Millions, not only of this Generation, but of all that shall follow, till the World become one great Bone-fire, or this Nation and Language perish together. And it hath been (he sayes) a long time his Opinion, That it is more Rational, Manly, Generous and Christian, whilst God shall please to afford him Food and Rayment, to imploy his Time and Pains in Actions largely conducing to the good of Mankind, though little advancing his own Fortunes, than in matters of petty and poor Concernment, that bring great Gain with them; In which Generous Resolution, God (the Author of it) will, he hopes, preserve him to his dying day; at which time the fruit and profit of his Labours will comfort him, but all the Gain in the World will do him no good at all.

Use our Labours with Diligence, Care, Ingenuity, Compassion towards the Sick, and in the fear of God. Attribute the Success and Honour of all thy Endeavours to him; Bless him for the light he discovers to this Generation, denied to so many Millions of our Ancestors. Bless him for the Piety and Noble Generosity of our Gracious Sovereign, that gives us leave to Be as Good as we Will, and to Do all the Good we Can (though seeming to cross private Interest) Oh! What a Royal and Free Priviledge is this, and how are we obliged to bless God and the King for it!

Finally, Pray for those that have taken pains in the Work; and as thou enjoyest the Benefit thereof, so let them participate of thy best Thanks and Well-Wishes.

1915

A

THE Author to the Reader.

Five and twenty Years ago [*Reader*] to Satisfie the Desires of my Auditors, I undertook to Explain unto them the Methodical Cure of all inward Diseases of the Body; which that I might accomplish the sooner, I medled not at all, in a manner, with the Theory, knowing full well, that any Student might with ease enough fetch the same from divers Authors: which notwithstanding they could not so easily do in point of Practice, because of the almost infinite Company and Variety of Medicaments, wherewith the Books of those that have delivered the Practical part of Physick do swarm, with which Young Beginners are so confounded, that they remain amazed, not knowing which to choose. I conceived it would be most profitable for them, if out of such a multitude of Medicaments, I should select the most choice, and which were most frequently used, and dispose them into the same order which we are wont to observe in our Practice, when we attend the Cure of our Sick Patients.

This Method of teaching, gave such Content to our Students of Physick, that as many as came flocking to this University to Study, after that I had finished the same, did all earnestly desire to have written Copies thereof; and many of them did frequently exhort me, and earnestly Beg, that I would suffer it to be Printed, and so for the future free all Men from the tedious Labour of writing it out. But I, who never had the thought (being very free from Self-Love) that my Writings were of so much worth, as to be published in Print, especially this Method of Practice, which was slipt from me as a thing only begun with rude Notes, hastily huddled up to perform my daily Task of Reading, and half maimed for want of the Theorick part; I thought it better to believe my own Conscience, than their too favourable Opinion. I pondered likewise in my Mind, that it was a very hazardous thing, to subject my Reputation to the Judgment of the whole World, and (as it commonly falls out) to the biting Teeth of envious Detractors, especially in this Polished Age, abounding with neat and passing fine Wits, who are hardly pleased with such Works as have been wrought with the greatest Industry possible, and who are wont to peep curiously to spy spots in the shining Sun. Nevertheless this unperfect Birth of mine, which I desired to keep close and hidden, was sent into the wide World by one of my Scholars, who without my knowledge, and against my will, gave that imperfect, homely and unpolished Work to a Printer of *Paris* to print. And this Child of mine which I did account abortive, was more pleasing, and found greater favour in the Eyes of Strangers than in its Fathers; for all the Books of this First Edition were suddenly sold off. A Second Edition, and a little after a Third, was procured
by

The Author to the Reader.

by the same Printer, by which all *Europe* was filled with Copies. Nevertheless, some years after there came out Three other Editions within two years time, one at *Lions*, and two other in *Holland*, viz. at *Tergow* and the *Hague*. In the mean while, I received very many Letters out of the chief Cities of *France*, *Germany*, *Holland*, and *Italy*, from Doctors of Physick whom I was acquainted with, when they studied Physick in this University; seriously expostulating that this Work was lame because it wanted the Theory of the Diseases, and withal advising me, that it would be worth my pains to spend some part of my Studies that way. Conceiving at length that it was fitting to consent unto their Just Requests, I laboured with all my might, as far as my Employments and Health would give me leave, to finish and publish this Theoretick Part; in-somuch, that at last (Blessed and Praised be God) I brought the same to a Conclusion. Accept it (Friendly Reader) with a Chearful Mind, being joyned to the foresaid Practick Part, so that in one continued Discourse thou mayest behold the *Nature, Differences, Causes, Diagnosticks, and Prognostick Signs*, together with the *Cure of all Diseases*.

I suppose this Child of mine will merit highly thy Favour, being now adorned in all parts, and advanced to a far greater degree of Perfection; and seeing that thou wert pleased with it in its Cradle and Swadling Clouts; now that it is greater, and hath attained its perfect Sature of Body, it will not, I hope, displease thee. Enjoy it with Gods Blessing, and whatever thou shalt learn therefrom, let Christian Charity cause thee to employ it for the good of thy Neighbour. Also I desire thee to take notice, that many faults were crept into the former Editions through the negligence of Printers, all which are carefully Corrected in this Edition. And furthermore, there are added many and those very Choice Medicaments to the Cures formerly Printed, which will not a little conduce to the happy Cure of Difficult Diseases. Farewell.

The

The CONTENTS of all the Seventeen BOOKS.

The First Book of the Practice of Physick.

Of the Diseases of the Head.

The PREFACE.

CHAP. 1. Of the Cold Distemper of the Brain,	Page 8
Chap. 2. Of Drowsie Diseases called Coma, Letargie, Carus, and Apoplexy.	9
Chap. 3. Of Waking Coma.	16
Chap. 4. Of the Sleeping Diseases called Cataplexy, and Catalepsis or Congelation,	16
Chap. 5. Of the Palsie, or Paralysis,	18
Chap. 6. Of a Convulsion,	24
Chap. 7. Of the Epilepsie, or Falling-Sickness,	28
Chap. 8. Of the Falling-Sickness in Children,	33
Chap. 9. Of Giddiness called Vertigo.	35
Chap. 10. Of Tremor, or Trembling.	37
Chap. 11. Of Phrenitis, or Phrenzie.	38
Chap. 12. Of the Inposthume, and Sphacelus, or Mortification of the Brain.	44
Chap. 13. Of Mania, or Madness.	45
Chap. 14. Of Melancholy.	48
Chap. 15. Of a Catarrh, or Defluxion.	50
Chap. 16. Of the Head-ach.	56

The Second Book of the Practice of Physick.

Of the Diseases of the Eyes.

The Preface.

CHAP. 1. Gutta Serena, or Amaurosis.	62
Chap. 2. Of the Diseases of the Vitreous or Glassy Humour.	66
Chap. 3. Of the Diseases in the Crystalline Humour.	66
Chap. 4. Of the Diseases of the Watry Humour, and especially of a Suffusion.	68
Chap. 5. Of the Enlarging, or Dilatation of the Pupilla.	74

Chap. 6. Of the Strainness or Contraction of the Pupilla.	74
Chap. 7. Of Albugo, or the White Spot called Pin and Web, and of other Colours of the Cornea changed.	76
Chap. 8. Of Ophthalmia, or Inflammation of the Eyes.	78
Chap. 9. Of Hypopio, or Matter under the Cornea.	85
Chap. 10. Phlyctænæ, or Blisters in the Eyes.	86
Chap. 11. Of the Ulcers in the Cornea and Adnata.	ibid.
Chap. 12. Of a Cancer in the Cornea.	87
Chap. 13. Of the Rupture of the Cornea.	88
Chap. 14. Of the coming forth of the Uvea.	89
Chap. 15. Of Ectropion, and Fistula Lacrymalis.	ibid.
Chap. 16. Of Rhays and Encanth's.	90
Chap. 17. Of Epiphora.	91
Chap. 18. Of Pterygium, or Haw in the Eyes, called Unguis.	93

The Third Book of the Practice of Physick.

Of the Diseases of the Ears.

The Preface.

CHAP. 1. Of Deafness, and thick or dull Hearing.	95
Chap. 2. Of Noise in the Ears.	99
Chap. 3. Of Pain in the Ears.	101
Chap. 4. Of those things which come forth of the Cavities of the Ear preternaturally.	106

The Fourth Book of the Practice of Physick.

Of the Diseases of the Nostrils.

The Preface.

CHAP. 1. Of the Ulcer of the Nostrils, and Oæna.	108
Chap. 2.	

The Contents of all the Seventeen Books.

Chap. 2. Of Sarcoma and Polypus.	110
Chap. 3. Of the loss of Smelling.	111
Chap. 4. Of the stink of the Nostrils.	112
Chap. 5. Of Coryza, or Pose.	ibid.
Chap. 6. Of Sternutation, or Neezing.	113
Chap. 7. Of Bleeding at the Nose, called Hæmorrhagia.	114

The Fifth Book of the Practice of Physick.

Of the Diseases of the Tongue.

The Preface.

Chap. 1. Of the Inflammation of the Tongue, and other Tumors of the same.	123
Chap. 2. Of the Tumor called Ranula, under the Tongue.	125
Chap. 3. Of the Taste being hurt.	126
Chap. 4. Of the Palsie of the Tongue, and the Hurt Motion thereof.	127

The Sixth Book of the Practice of Physick.

Of the Diseases of the Teeth, Gums, Faws, Palate, and Wind-Pipe, or Larynx.

The Preface.

Chap. 1. Of the Tooth-ach.	129
Chap. 2. Of the Blackness and Rottenness of the Teeth.	134
Chap. 3. Of the Erosion or eating away, and of the Exulceration of the Gums.	ibid.
Chap. 4. Of Bleeding at the Gums.	135
Chap. 5. Of the Ulcer of the Mouth and Jawes.	136
Chap. 6. Of the Relaxation of the Uvula, or Falling down of the Palate.	137
Chap. 7. Of Angina, or Quinzie or Squinzie.	138

The Seventh Book of the Practice of Physick.

Of the Diseases of the Breast.

The Preface.

Chap. 1. Of Asthma, or Difficulty of Breathing.	146
Chap. 2. Of Pleuritis, or a Pleurisie.	152

Chap. 3. Of Peripneumonia, or Inflammation of the Lungs.	158
Chap. 4. Of Empyemy, or Water in the hollow of the Thorax.	160
Chap. 5. Of the Dropsie in the Breast.	163
Chap. 6. Of Hæmoptysis, or Spitting of Blood.	164
Chap. 7. Of Phthisis, or Consumption.	169

The Eighth Book of the Practice of Physick.

Of the Diseases of the Heart.

The Preface.

Chap. 1. Of Syncope, or Swooning.	178
Chap. 2. Of the Palpitation or Breathing of the Heart.	182
Chap. 3. Of Weakness.	244

The Ninth Book of the Practice of Physick.

Of the Diseases of the Stomach.

The Preface.

Chap. 1. Of want of Appetite, or loathing of Meat.	249
Chap. 2. Of Dogs Appetite, called Fames Canina.	254
Chap. 3. Of Pica and Malacia.	256
Chap. 4. Of the Thirsty Diseases called Sitis Morbosa.	258
Chap. 5. Of the Hurt Concoction of the Stomach.	259
Chap. 6. Of Singultus, or Hiccough.	262
Chap. 7. Of Nausea, and Vomiting.	265
Chap. 8. Of Vomiting Blood.	269
Chap. 9. Of the Disease called Cholera.	272
Chap. 10. Of Pain in the Stomach, called Dolor Ventriculi.	274
Chap. 11. Of the Inflammation, Ulcer, and Impostume in the Stomach.	277

The Tenth Book of the Practice of Physick.

Of the Diseases of the Intestines, or Guts.

The Preface.

Chap. 1. Of the Cholick.	280
Chap. 2. Of the Iliack Passion.	283
Chap.	

The Contents of all the Seventeen Books.

Chap. 3. Of Aſtriction, or binding of the Belly	288
Chap. 4. Of Lientery, and Cæliack Paſſion.	289
Chap. 5. Of Diarrhoea.	291
Chap. 6. Of Dyſenteria, or Dyſentery.	295
Chap. 7. Of Tenafmus.	303
Chap. 8. Of Fluxus Hepaticus, or Flux of the Liver.	305
Chap. 9. Of the Worms.	307
Chap. 10. Of the Immoderate Flux of the Hemorrhoids.	313
Chap. 11. Of the Pain of the Hemorrhoids.	316

The Eleventh Book of the Practice of Phyſick.

Of the Diſeaſes of the Liver.

The Preface.

CHAP. 1. Of the Hot Diſtemper of the Liver,	320
Chap. 2. Of the Inflammation, Impoſtume and Ulcer of the Liver.	323
Chap. 3. Of the Stoppage, or Obſtruction of the Liver,	327
Chap. 4. Of the Jaundice.	333
Chap. 5. Of the Schirrhus of the Liver.	335
Chap. 6. Of the Dropſie.	336

The Twelfth Book of the Practice of Phyſick.

Of the Diſeaſes of the Spleen.

The Preface.

CHAP. 1. Of the Inflammation of the Spleen.	347
Chap. 2. Of the Pain of the Spleen.	348
Chap. 3. Of Obſtruction, Tumor, or Puſſing up of the Spleen.	348
Chap. 4. Of the Schirrhus or Hard Swelling of the Spleen.	349
Chap. 5. Of Hypochondriack Melancholy.	350
Chap. 6. Of the Scurvy.	357

The Thirteenth Book of the Practice of Phyſick.

Of the Diſeaſes of the Meſentery, Sweet- bread, and Caul.

The Preface.

CHAP. 1. Of the Obſtruction of the Meſentery,	362
Chap. 2. Of the Inflammation of the Meſentery,	363

Chap. 3. Of the Impoſtume, Ulcer and Schirrhus of the Meſentery.	364
Chap. 4. Of the Diſeaſes of the Pancreas, or Sweet-bread.	365
Chap. 5. Of the Diſeaſe of the Caul, or Omentum.	466

The Fourteenth Book of the Practice of Phyſick.

Of the Diſeaſes of the Reins and Bladder.

The Preface.

CHAP. 1. Of the Stone in the Kidneys, and Pain in the Reins, called Dolor Nephriticus.	367
Chap. 2. Of the Stone in the Bladder.	378
Chap. 3. Of the Inflammation of the Reins and Bladder.	382
Chap. 4. Of Piſſing of Blood.	385
Chap. 5. Of the Ulcer of the Reins & Bladder.	387
Chap. 6. Of Diabetes, or extraordinary Piſſing.	390
Chap. 7. Of Piſſing the Bed, of Involuntary Piſſing, or not containing of Urine.	393
Chap. 8. Of Stoppage of the Urine and Strangury.	394
Chap. 9. Of Dysuria, or Scalding of Urine.	397

The Fifteenth Book of the Practice of Phyſick.

Of Womens Diſeaſes.

The Preface.

CHAP. 1. Of the Green-Sickneſs, called Chloroſis.	400
Chap. 2. Of the Stoppage of the Terms.	403
Chap. 3. Of the Immoderate Flux of the Courſes,	409
Chap. 4. Of the Whites.	413
Chap. 5. Of Madneſs from the Womb.	417
Chap. 6. Of the Mother-fiſs, or Womb-sickneſs,	420
Chap. 7. Of Inflammation of the Womb.	431
Chap. 8. Of an Ulcer in the Womb.	434
Chap. 9. Of a Schirrhus, or a Painleſs hard Swelling of the Womb.	490
Chap. 10. Of a Cancer of the Womb.	491
Chap. 11. Of Mortification, or Gangrenation and Sphacelation, or Blaſting of the Womb.	493
Chap. 12. Of the Womb's Wind and Water Swelling, or Dropſie.	494
Chap. 13. Of the falling down of the Womb.	498
Chap. 14. Of the Womb ſhut up, or Imperforated.	501
Chap. 15. Of Barrenneſs.	502
Chap. 16. Of Acute and Chronical Diſeaſes of Women with Child.	509
Chap. 17. Of Abortion or Miſcarriage.	512
Chap. 18.	

The Contents of all the Seventeen Books.

Chap. 18. Of hard Child-birth.	517
Chap. 19. Of a dead Child.	520
Chap. 20. Of the After-birth retained.	521
Chap. 21. Of Immoderate Flux of the Loches, or Child-bed Purgations.	523
Chap. 22. Of Suppression of Child-bed Purgations	524
Chap. 23. Of Gripping after Child-bearing.	525
Chap. 24. Of Acute Diseases of Women in Child-bed.	527

The Sixteenth Book of the Practice of Physick.

Of Diseases of the Joynts, and Rheumatick Pain of the whole Body.

The Preface.

Chap. 1. Of Pain in the Joynts, called Arthritides, or the Gout.	531
Chap. 2. Of the Hip-Gout, or Sciatica.	544
Chap. 3. Of Rheumatick Pains of the whole Body	547

The Seventeenth Book of the Practice of Physick.

The Preface.

SECT. I.

Of Feavers.

SECT. II.

Of Simple Feavers.

The Preface.

Chap. 1. Of the Feaver-Ephemera.	553
Chap. 2. Of the Feaver Synochus Simplex.	554
Chap. 3. Of an Heſtick Feaver.	555

SECT. III.

Of Putrid Feavers.

The Preface.

Chap. 1. Of continual Putrid Feavers.	560
Chap. 2. Of the Symptomes which accompany Putrid Feavers.	575
Chap. 3. Of a Tertian Ague.	580
Chap. 4. Of a Quotidian Feaver.	585
Chap. 5. Of a Quartan Ague.	586
Chap. 6. Of Compoundd or Complicated Feavers, and particularly of a Semi-Tertian.	593

SECT. IV.

Of Pestilential Feavers.

The Preface.

Chap. 1. Of a Pestilential Feaver.	611
Chap. 2. Of the Measles, and Small Pox.	637

Books lately Imprinted.

1. **T**HE English Physician Enlarged, being an Astrologo-Physical Discourse of the vulgar Herbs of this Nation; wherein is shewed how to cure a Man's self of most Diseases incident to his Body, with such Things as grow in England.

2. A Translation of the *New Dispensatory* made by the Colledge of Physitians of London.

3. A Directory for Midwives, or, A Guide for Women, in Two Parts, newly Enlarged, and Illustrated with divers Plates. All being Works of Nich. Culpeper.

4. *Oriatrike, or Physick Refined*; The common Errors therein refuted, and the whole Art reformed, and rectified. Written by the Acute Philosopher, and Profound Physitian, John Baptista Van Helmont.

5. *Riolanus's Anatomy.*

6. *Veslingus Anatomy of the Body of Man.*

7. *Bartholinus's Anatomy.*

8. *Riverius's Practice of Physick, and Observations.*

9. *The Hidden Treasures of the Art of Physick*; fully discovered in Four Books. A Work whereby the diligent Reader may attain to the knowledge of the Art above named: The Fourth Edition, with Additions. By John Tanner, Student in Physick and Astrology.

10. *Mathematical Collections and Translations*, from the Original Copies of *Galileus*, and other Famous Modern Authors: By Thomas Salisbury, Esq; To be Sold by George Sawbridge.

THE
FIRST BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Head.

The Preface

IN this our Treatise of Head Diseases, we speak first only of those which are in the Substance of the Brain, and the Films which contain it. For although the Eyes, Ears, Tongue, Teeth, Gums, Fauces, and Palate go to the making up the Head; yet we think it fit to speak of their Disease in several Books for better Method sake; And to call the Diseases of the Brain and its Meninges or Films, by the name of Head-Diseases, most properly so, from the Excellency of the parts wherein they are, These come from the hinderance of the Action of the Brain, either in respect of Sense, Motion, or Nutrition.

The sense is divided into Internal, and External; The Internal hath the cheif Actions, as Imagination, Reasoning, Memory; as also Sleep and Waking; the Diseases of which are Frenzie, Maaness, Melancholy, Catoche, Coma waking sleep, and Coma long sleep, Lethargy, Carus, Apoplexy.

The External Sences are five, namely, Sight, Hearing, Smelling, Taste, and Feeling.

D

But

But because the first four have their peculiar Organs or parts, which have divers Diseases which we shall treat of in several Books: We will in this Book lay down and declare those which belong to the Sense of Feeling, because they come immediately from the Brain and its membranes or Films disturbed, and are either termed Palsies, which come from Sense destroyed or diminished; or Head-Aches which come from sense depraved.

When the actions of the Brain are hindered in respect of motion, there ariseth Convulsion, Falling-Sickness, Palsie, Apoplexy, Giddiness, or swimming of the Head, called Vertigo, and Trembling. Finally, when the acting or working of the Brain is hurt or hindered in its Nutrition, or Nourishment, the Disease is either in distemperature, or disorder of the excrement of the Brain, of which cometh a Catarrh, Defluxion or Distillation.

We shall bring all these Diseases under their proper Heads and Chapters in that order which is most usual for the way of Cure. Therefore we shall first declare the Cold Distemperature of the Brain, and then all Diseases that come from thence, because the ground of their Cure is in the Cure of that. Afterwards we shall lay down the Diseases that come from a Hot Distemper, and hot Humors; which will all more clearly appear in their several Chapters.

CHAP. I.

Of the Cold Distemper of the Brain.

ALL Distempers are usually divided into Simple, and Compound; Material, and Immaterial. Simple or single distempers are seldom seen; as also immaterial distempers, for they come from Primary Causes, and either vanish of their own accord, or with very small Remedies or Medicines: But Material Distempers produce all the diseases of the Head; therefore we will fall close to discourse of them; which few Authors have done in handling them severally, because in the laying down of the Diseases which are produced of those distempers, they are sufficiently explained. We therefore will transfer the handling of the hot distempers of the Brain, and also the moist and dry distempers, to the Chapters which contain those diseases which are produced from them. But because the greatest number of Diseases of the Head come from a cold and moist distemper of the Brain, we thought fit to discourse of that by it self in the beginning of this Treatise; that the cure of that may be as the Foundation of the Cure of all Diseases coming from thence, and that the Medicines may be found in this Chapter which appertain to the Cure of their cause: Therefore we will avoid the vain repetition of those diseases; which is the Custom of almost all Writers of practical Physick, who by that means enlarge their Volumes, and make the Art more difficult and tedious to young Beginners.

The cold distemper of the Brain which is compound and Material, or joyned with Matter, is for the most part waterish and moist; because the Brain is that mother of moisture or Flegm, and Coldness long abiding draws moisture to it self. For albeit sometimes it is joyned with a melancholy humor, yet that humor is seldom begot in the Brain as Flegm is, but it is for the most part lodged in the *Hypochondria*, or parts beneath the Ribs, and sent from thence to the Brain, whereby most greivous Symptoms are produced.

CAUSES. The Causes of a cold and Flegmatick distemper of the Brain are these:

1. Cold and moist meats which easily turn into Flegm; and also in the time of their Concoction, by cooling the Stomach and the Liver too much, produce abundance of Flegm, which after is sent up to the Brain.
2. Too great a quantity, not only of Meats which are too cold, but also of good and wholesome, which destroyeth the Natural heat, and begetteth Crudities.
3. Eating presently after or before meat, and before the former meat is concocted; whence come many Crudities, which send Flegm to the Head.

4. The

4. The ceasing of a Natural custom of vomiting, or purging Flegm; or the omitting the custom of taking Purges, Sweats, Diureticks, or Provokers of Urine, or omitting of accustomed Exercise.
5. To be born of Parents troubled with a cold distemper of the Brain.
6. Old Age, which by reason of the decay of Natural heat, produceth much Flegm; as also youth by reason of Gluttony and disorderly Diet.
7. A cold and moist dwelling near standing Pools, Marshes, Fens, and great Rivers, open to the North Winds, Snow and Rain.
8. Long and deep sleep, especially presently after meat.
9. A sedentary idle life, without or with too much Care, Study, or Sorrow, because by dispersing the Natural heat, especially in the Brain, they make it cold.
10. To these may be added a hot and moist Liver, which sends many Vapors to the Brain, which there condense or grow thick, and turn into Flegm.

SIGNS. The Signs of a cold distemper of the Brain, are taken either from the Causes above mention'd, by the presence of which we may easily conjecture of the condition of the distemper; or they are taken from the effects of the distemper; which that they may be particularly examined and tried, we shall fetch from their original, namely, from Actions, Passions, Excrements, and habit of Body.

1. The Animal Actions which declare a cold distemper of the brain are these; A heavy and dull Mind, a slow blockish wit, an unfortunate Memory, a great inclination to sleep, and long and deep continuance therein, except a Catarrh or Defluxion, pain of the head, or Passions of the mind do hinder it: Dreames of Coldness, of waters, as Rain, Snow, Floods, Pools, Seas, and of white things: A slowness and dulness of all the Senses; Slowness of motion, yet continuance therein: because great Spirits are more difficult to be diffused or dissolved.

2. The Passions, which declare a cold distemper of the Brain, are cold Diseases, as Palſies, Legarthy Catarrh, or Defluxion, and many others, with which if the sick party have been formerly troubled, may well conjecture that he is subject to this distemper of a cold Brain. This will further appear, if the sick man be better in clear, hot and dry weather, than in cold, moist winter, and rainy weather. Moreover, an often and plentiful sending forth of snot and flegm from the mouth and nostrils, is a clear demonstration of abundance of cold flegm and moisture in the Brain.

3. From the Habit of the Body we may have signs both general and particular of this Distemper: The general Signs are taken from the whole Habit or Constitution; for if the whole Constitution be cold and moist, then without question the Brain, which is most cold and moist of all other parts, is the same. Therefore a skin which is cold, soft, smooth, and white; a body soft and slow, not fleshy, with small veins, declare a cold constitution or temper. The particular signs of a cold Brain are in the head; as paleness of Face, no veins to be seen in the Eyes, soft hair, smooth and thin, growing slowly, red, and not curling, continuing the whole life without baldness; and when the head is quickly offended with outward Cold, and refreshed with Heat.

PROGNOSTICK. As to the prognosis, or Prognostical part concerning this Distemper; It is hard to be cured, and often produceth grievous diseases: That which hath been long breeding is most hard to be cured; that which is Natural, Hereditary, and from the Birth, is never to be cured: as also that which is in old Folks, if it hath been of long Continuance. Winter is not a fit time for the Cure of this Distemper, but Summer.

CURE. The cure is wrought from two Indications or Intentions; namely, by evacuating or discharging the flegm abounding, and correcting or qualifying the distemper of the humor by its contraries, which must be done by Diet, Chirurgery and Physick.

DIET. The Diet must be hot and dry; and first make choice of a pure Air, somewhat hot and dry, but not too hot, for that would dissolve and pour forth the humors in the Head too soon, and so produce a distillation, and other diseases which happen to those who stay long in the Sun, or inflame their heads with too neer approach to the fire. The Air cannot be too dry, so it be temperate in its active qualities, but it had better be too hot than too cold.

Let not the Chamber of the sick party be too little, too low, nor too moist or filthy, but open to dry winds which may pass through. In moist, cloudy, cold times, the Chamber air may be altered with hot and sweet Herbs strewed upon the Floor, as Sage, Marjerom, Lavender, Rosemary, tyme; or by burning the same, or other dry woods, and especially Juniper: Let the fire be clear, and such as will dry the Air in the Chamber, Fumigations if they be not too strong, do well to consume moisture; but they must be carefully used, they must be very gentle and moderate, otherwise they do hurt by melting and pouring forth the cold Humors too speedily, which cause Defluxions; and also you must consider the Patients Constitution in the use of them, for some men are presently brought to the Head-ach by any strong scent, having their heads presently filled with the vapor: A temperate and proper Fumigation is made of the purest Amber, putting little pieces thereof upon the Coals; it's

no way offensive, dries well, and strengthens the Brain, especially the Indian Amber, called *Gum Animi*: Or you may prescribe this following, which is thus compounded;

Take Wood-Aloes and Benjamin, of each two drams; of Storax, called Styra Calamita, one dram and a half; Frankincense and Sanderach, of each two scruples; Gum Animi and Cloves, of each half a dram. Make a gross Powder of them to be thrown upon the Embers.

Southerly winds, and those that cause Rain are to be avoided, night-air, and especially Moon-shine, which much offend the Brain: very cold and north Winds are to be beware of, especially when they suddenly are changed from the South; for such a wind doth squeeze a Brain full of moist excrements, and sends them down into the Body, even as a mans hand squeezeth a wet sponge.

Secondly, A special care is to be had of Diet, for as *Hypocrates* saith in his Book of *Humane Nature*, Diseases are partly from Diet, and partly from the Air wherein we breathe. Therefore let the Diet be of good juyce, easie concoction, neither cold, nor over nourishing: Therefore Mutton, Kid, Veal, are to be used, and which are better, young Pidgeons, Chickens, Capons, Hens, Partridges, Black-birds, Thrushes, and all kind of mountain Fowl, and yelks of new laid Eggs; roast meats are better than boyled. Take heed of hard flesh, and of hard concoction, as Beef, Pork, Venison, Hares, Geese, Ducks, and Sea-Fowl: as also of the heads, entrails, and appurtenances of Beasts. Eat Fish but seldom, and make choice of those that have solid Flesh, coming out of swift Rivers, and stony places; boil them in Wine, adding Vinegar, Butter and Spice, which Sawce is to be allowed with other meat, unless the Liver be hot; of which principally use Nutmeg, Cloves, Cinnamon: never or seldom eat cold and moist Herbs, as Lettuce, Purslain, Spinage: but in Summer time we can allow a moderate use of Herbs which are gently cooling and drying, for the strengthening of the Body, and fixing the Blood, that it may not evaporate, as Endive, Succory, Sorrel, but they must be taken boyled, not raw. Roots of Parsly, Carrots, Parships, Mints, Hyfop. Water-creffes are very good. But you must avoid all things that easily disturb the head, and fill it with vapors; and they are of two sorts: Either they are such as discuss and melt the humors with their sharpness, as Onions, Garlick, Mustard, Rocket, Rhadishes: or such as fill the Head with gross vapors, as milk, and all milk-meats: all manner of Pulse, as Beans, Pease, &c. of which the red Pease are the least hurtfull, by reason of their opening and absterfiv nature; therefore the broth of them is allowed. You must avoid all green raw Fruit, which are not lasting especially, and those which are very moist: dried Fruits may be used at second or last courses, as Raisins, Almonds, Pine-nuts, Dates, and the like; but you must use them sparingly, for they are for the most part hard of concoction. Pears boyled and Sugared, Citron Rinds Candied, Limmon and Orange Pils Candied, may be eaten at the last course: but it is much better to take one spoonfull of digestive Powder after meat, whose Aromatical sweet vapour ascending with the vapor of what is eaten doth strengthen and dry the Brain. It is made of Coriander Fruit, Annis seeds, Cinamon, Nutmeg, with a double quantity of Sugar of roses. Let your Bread be of the best Wheat well baked and leavened, and made with Salt and Annis seeds: In a great distemper Bisket is best. Let your drink be thin wine of small strength which will not fill the Head with many vapors, well mixed with water; and also it is Profitable one hour before meat to mix wine and water that the vapors may be allayed, and to boyl a little Coriander seed in the water, that it may better strengthen both Stomach and Brain: In stronger Diseases use Hydromel, or water and Honey. This is a good Rule in all Diet, to eat moderately, and to let the supper be less and lighter than the Dinner. Sobriety as in all diseases, so especially in head-diseases is of great concernment; for the Head by much food is filled with humors and vapors: and contrarily, by little and slender Diet is emptied of them.

Thirdly, You must use moderate Exercise, and every day continue it, for too much rest weakens the Natural heat, and makes it so dull that it cannot well concoct, and fills the body full of Excrements. On the other side, Motion and Exercise stir up the Natural heat, help concoction, expel Excrements, and cheer the Spirits, and purifie them; but you must exercise before meat, and after meat rest for an hour or two, or at least move very easily.

Fourthly, Use a mean in sleep and waking; for as with moderate sleep the strength is repaired, so with too long the body is made cold, burdened with excrements, especially the brain: but too much watching makes the body thin, spends the Spirits, and feeds upon the sound parts of the Body. Let not therefore sleep be too long, but according to custom commonly seven hours are allowed, but more or less may be taken according as age and custom shall require; if you offend in either extreme, it is better to offend in too much waking than in too much sleep. You must not sleep straight after meat, but two hours after at least, having taken a gentle walk. You must sleep with your head high, and upon one side: lying on the back is not allowed.

Fifthly, All the Excrements of the body are to be evacuated in their season, of the Brain especially; therefore every morning hawk from the Palate, blow the Nose, comb and rub the head with a course-cloth or sponge, which will fetch the superfluities of the Brain through the futures or seams of the Skull.

Skull. The Belly must be kept open; and if it will not otherwise, use a Suppository, or a Clyster, or some gentle Lenitive at the mouth. For the Excrements are not only taken away by so doing, but also by degrees something is fetcht from the Brain, or at least something is retained and driven thereby from the head, which was or would have been sent thither as to the weakest part.

Lastly, You must have special care of the passions of the mind, from which Bodies are many times wonderfully altered and disturbed, especially of Anger and Sorrow: Sorrow diminisheth the Natural heat, wounds the Spirits, whence comes small concoction, and many excrements. Anger makes a great boiling of the Blood, and motion of the Spirits, by which the humors are diffused and dissolved, and then if there be any Excrements in the Brain, presently they are sent to the weak and infirm parts, from whence arise many dangerous Diseases.

The other two Means for cure, namely, Chirurgery and Physick, may be used as followeth.

In almost all Diseases which come of the humors, we use to make a general Evacuation by Blood-letting and Purging.

Blood letting is not agreeable with Flegmatick Diseases; but if in other parts of the Body blood do abound, the Liver be inflamed, and the age of the patient be flourishing, and consistent with it, we may then let blood: for so will the ascension of vapors into the head be hindered, and superfluous Nourishment taken away, that Nature afterwards may more easily concoct what is raw and waterish in the blood; and then Purging Medicines may be given more safe.

But if *Plethora*, or too great repletion do not Constrain, it is better before blood-letting to give a purge for Flegm by way of Potion, Bolus, Pills, or Powder. The forms whereof are as followeth:

Take of *Senna* half an ounce; *Annis seeds* and *Cloves*, of each half a dram; *Leaves of Mints* and *Betony*, of each half a handful; of the tops of *Time*, half a pugil. Boyl them to a quarter of a pint in *Spring Water*, strain it, and infuse in it two scruples of the best *Agarick Trochiscated*; of *Cinamon* half a scruple; strain it again, and dissolve in it three drams of *Diaphœnicon*, and one ounce of *Syrup of Roses*. Let this be the Potion to be given with safe Government. Or,

Take *Diacatholicon*, *Diaphœnicon*, of each half an ounce; make it into a Bolus with a little *Sugar*. You may add two drams of *Diacarthamum*, and take away as much of the *Diaphœnicon*: Or you may make it of equal parts of *Diacarthamum* and *Diaphœnicon*, without the *Diacatholicon*. Or,

Take *Pill. Cochie* the lesse two scruples; with the water of *Betony*, make them into five or six Pills gilded; which let him take early in the morning, having eaten but a light supper over-night.

The Pills of *Agarick*, and of *Cochie* the greater, are very fit for this purpose. For a Powder,

Take *Senna*, *Turbith*, *Hermadaets*, of each a scruple; *Diagridium* half a scruple, one *Clove*. Give this Powder in Broth fasting.

After Blood-letting, if it be necessary, we come to the preparation and purging of the Humors, which may be done with the following Apozeme, or opening Drink.

Take the Roots of *Cyprus*, *Flowerdeluce*, *Angelica*, *Zedoary*, and of *Elecampane*, of each one ounce; the Leaves of *Betony*, *Marjerom*, *Balm*, *Pennyroyal*, *Organ*, *Calamint*, of each a handful; of the tops of *Time* and *Sage*, of each half a handful; *Annis-seeds*, *Seselis* or broad *Cummin*, *Fennel-seeds*, of each three drams; *Liquoris* scraped, and *Raisins stoned*, of each one ounce; the Leaves of *Senna* sprinkled with *Aqua-vitæ*, two ounces; *Carthamus seeds* bruised, and fresh *Polypody* of the Oak, of each one ounce; *Agarick trochiscated*, *Turbith*, *Hermadaets*, of each three drams; *Ginger* and *Cloves*, of each one dram; *Stœchas*, *Rosemary*, *Sage*, and *Lavender flowers*, of each one pugil or small handful: Boyl them in fair water to two pints; strain it and add four ounces of white *Sugar*. Clarifie it, and aromatize it, that is, make it sweet with two drams of *Cinamon*. Let this be for four mornings draughts.

In the first and last draught dissolve *Diacarthamum* or *Diaphœnicon* three drams; and let him drink it with Physical Regiment.

Or if you add no Electuary to the last dose, the day following you may give the purging Pills above mentioned.

After Purging that the Brain may be altered and strengthened, and the Medicines purging not leave any offence, the Patient may take this Bolus following.

Take of old *Treacle* one dram; *Conserve of Rosemary* and *Roses*, of each two scruples; with *Sugar* make a Bolus, which let him take in the morning two hours before meat, and drink after a small draught of small Wine.

But because this is a stubborn Disease, and will not alwayes yield to gentle Medicines, we must fly to stronger. And then after purging, we must use a sweating Diet, which dryes and warms the Brain and the whole Body, concocts crude and raw humors, and makes the thick humors thin, cuts those which are slimy and clammy, cleanseth those that are foul and dull, and sends forth whatsoever is over moist

moist by Urine, Sweat, or insensible transpiration. For the effects of all which it is very good to use a slender Diet at the time of taking it.

This Diet-drink may be made either of a Decoction of Guajacum, or Lignum vitæ only, or by putting to it some Saxafras, or Roots of Sarsaparilla, or those things which are most proper for the Head, as the Prudent Physician shall think fit that will consider the divers tempers and constitutions of Bodies; in respect of which we will prescribe a longer or shorter continuance of his Diet to fifteen, twenty or thirty dayes.

Now the Sweating Drink is made as followeth:

Take of Chips Guajacum, and Roots of Sarsaparilla, of each two ounces, infuse them twenty four hours in four pints of Water upon warm embers; then boyl them gently without smoak to the consumption of half; strain it through a Hippocras bag, and keep it in a glass bottle: and give halfe a pint warm in the morning, covering him warm, and provoking sweate.

Take of Sarsaparilla two ounces, infuse them twelve hours in twelve pints of Spring water; then boyl them as before to the consumption of the fourth part; strain it as before, adding Coriander seeds, Liguors, Sugar or Cinnamon, as much as will make it pleasant. Use this for ordinary Table Drink at the time of the Diet eating Bisket made with Annis-seeds, roast meat, not boyled, Almonds roasted, Raisins, Pine-nuts, Prunes boyled with Sugar, and the like.

This is alwayes to be observed in the use of Sudorifick or Sweating Medicines: you must give a Purge once a week, and that day omit Sweating, by reason that Sweating expels only the thinner matter, leaving the thick, which must be sent forth by stool. Moreover, because by the use of Sweating Medicines the Body is often bound, you must give a Clyster every third or fourth day.

If the Disease be not yet cured, you may use these bags for the head in the time of Sweat.

Take of Annis-seeds, Fennel-seeds, Bayberries powdered, of each three ounces; of Milium, or Millet seed, or Hyrle, one pound; of common salt half a pound. Fry them in a pan, pouring by degrees a little strong Wine upon them. With these fill two bags, apply them hot one after another to the mold of the head being shaven; do this presently after he hath taken the sweating potion. Then wipe off the sweat, and clap this strengthening Plaister to the Head.

Take of cleer Amber, Frankincense, Mastick, of each one dram and an half; Galbanus, Opopanax, of each one scruple; of Misselto of the Oake two drams; male Peony seeds half a dram, Oyl of Nutmegs as much as is sufficient: make a plaister of them in an oval form. Or you may use the Head strengthening Plaister in the Apothecaries Shops at Montpelior, not in the Dispensatory, whose description followeth;

Take of Storax, Benjamin, Laudanum, of each four ounces; Peony roots, Flowerdeluce roots, Misselto of the Oak, Mastick, of each one ounce; Liquid Styra: as much as is sufficient to make a Plaister: of which one ounce upon Leather in an oval form may be applied to the Coronal Suture.

If you desire a more drawing dissolving Plaister, which is commonly called *Epispastick*, thus you must make it;

Take of Emplaister de Mucilagibus two ounces; Flowerdeluce roots, Hermodacts, Pellitory of Spain, Staphesagre, Cubebs, Pidgeons dung, Mustard-seed, of each one ounce; Nutmeg, Cloves, Cinamon, long Pepper, and black Pepper, of each halfe a scruple; Liquid Styra: as much as is sufficient. Make a body of Plaister, and spread a little upon Leather in an oval form for the mold of the head.

After general Evacuations, you may come to particulars; which are made by Errhines or Jucye for the nostrils, sneefing powders, Apoplegmatisms, or Medicines chewed in the mouth.

Take Leaves of Marjerom, Sage, and Betony, of each one handfull; beat them in a Marble stone Morter, sprinkling by degrees Betony water and white Wine, of each 2 ounces, press out the Jucye and make an Errhine, which you may make sharper if you add half an ounce of Flowerdeluce roots.

It is a custom now adaies to rub the dry leaves of Tobacco between the fingers, and to snuff up the powder: this fetcheth much humor from the brain, and is at hand.

But the best Sternutories are made thus;

Take the Leaves of Marjerom, Sage, Rosemary, all dried, of each half a dram; Pellitory of Spain and white Hellebore, of each one scruple; Musk three grains, which with a quill may be blown into the Nostrils. Or,

Take Ginger, and Flowerdeluce Roots, or Orris, of each one scruple; Castor half a scruple; Euphorbium six grains: Make them into a Powder.

But the chiefeft sneefing Powder is made of black Hellebore, with an equal weight of Sugar Candy fine powdered, which also is excellent for curing a Defluxion.

Apophlegmatismi, or medicines drawing Flegm out of the Head, are either called *Masticatories*, that is, chewing Medicines; or *Gargarismi*, that is, Medicines to gargle in the Throat. A Masticatory is thus prepared;

Take Pellitory of Spain two drams; Mustard seed and Stavifagre, of each one dram: Make them

them up with white wax into little Balls; of which let one be chewed every morning, holding down the head.

Flower-deluce root is usual for the same purpose, which will do good in small infirmities. Mastich alone chewed is the mildest Masticatory, and attracts and draws humors to the mouth without heat and inflammation, which others do not.

A Gargarism is thus made;

Take of Stavisagre half an ounce, Mustard-seed three drams; Pellitory of Spain one dram; Boyl them in Water and Honey to three ounces, in which dissolve Vinegar or Squils two ounces.

In the use of these Medicines we must observe, that the Evacuation which is made by the Palate, is more beneficial than that which is made from other parts, because it is ordained by Nature for the only way by which the head is to be purged and cleansed. But the Nose is made for smelling and breathing through, and Nature doth oppress and abuse it, when she sends forth her superfluous Excrements by it. Moreover, the way of Evacuation by the Palate is more safe, neither is the Brain so much shaken by it as by sneezing. But Errhine, or Medicines that purge the Head by the Nose, do draw forth the matter more violently, because not only the quality or vapor of the Medicine stir up the Brain as in Gargarisms, but also the very substance it self.

We must also observe, That the use of Errhines or neezings is dangerous when the Eyes are sore or the Nostrils are ulcerated or sore, and when the Patient is inclined to bleeding at the Nose, or to a giddiness of the head, which neezing will suddenly bring by shaking the Brain too violently,

Liquid and moist Errhines are snuff into the Nose from the palm of the hand, or by lying down are poured in; but the mouth must first be filled with Water or Wine, lest the Medicine come by the Palate into the mouth, although that which passeth through brings the humors more forcible out of the mouth.

They must take heed of Gargarisms that are subject to Defluxions or Consumptions.

Moreover, For particular Evacuations we may use *Vesicatories*, or plaisters that draw blisters, to the Nape of the Neck. In the Dispensatory of Montpelier is this Receipt; though it be not in any other.

Take of Galbanum and Ammoniacum, of each five ounces; of the powder of Cantharides, or Spanish Flies, one pound and half; Mustard, Pepper, of each half a pound; Verdigrise and Pellitory of Spain, of each two ounces and an half; Euphorbium one ounce and an half: Wax one pound and an half: Pitch, Rozin and Turpentine, of each one pound: Oyl a small quantity. One ounce or two of this Plaister spread upon Leather, may be applied to the Nape of the Neck.

The Brain is also strengthened by outward application of Powder, Rheum-Caps, by which it is comforted and made warm, and the Remainder of the humor dispersed.

Take Powder of Orris half a pound; Storax and Benjamin, of each two ounces: powder the head with them every night, and comb it off in the morning.

This Powder is very refreshing by its scent, strengtheneth the head, dryeth the hair: If you will make it stronger, put Cloves, Nutmegs and Cinnamon thereto.

Take of Stechas, Rosemary Flowers, and red Rose Leaves, of each half a small handful, dried Betony two scruples; Coriander seed, Lignum Rhodii, Frankincense, Orris, Nutmeg, Mastich, of each one scruple: Benjamin, Vernix, Mace, and Cloves, of each half a scruple: Powder them, and wrap them in the thrids of Scarlet, or sweet Cotton, and with a piece of red Taffery make a Rheum-Cap for the head, to be sewed in another Cap, or to be worn by it self.

The following Fumigation doth dry the Head:

Take of Lignum Aloes, Frankincense, Mastich, cleer, Amber, yellow Sanders, red Rose Leaves, Betony dried, of each one dram: Cinnamon, Mace, Cloves, Syrax Calamita, of each one scruple: make them all into gross Powder, which you must sprinkle upon coals of fire, and let the Patient take the fume or smoak of it fasting, covering his head with a large Linnen cloth to preserve the fume, and opening his mouth. Let him do this twice or thrice in a week.

But if by Fumes he find pain in his head, you may only perfume his night-caps every evening: for which use this following is easily prepared:

Take of Frankincense, Mastich, Syrax Calamita, Benzoin, and Sandarach, of each half an ounce: Mace and Cloves, of each two drams: Make gross powder of them.

But because this is a stubborn disease, and useth to produce new Flegm after both general and particular Evacuations, we shall prescribe those usual Medicines by which the humor may sometimes be drawn away, and the Brain preserved longer in that state, into which by Physick it is restored. To this end you may make a Magistral Syrup of those Drugs which are in the Apozeme, or opening drink above written, taking three times as much of the purging things as before, which he may use twice or thrice in a moneth, the quantity of two or three ounces in a Decoction of Betony and Marjerom.

Or in stead of Syrups he may use to take these Pills.

Take

Take of the best Aloes half an ounce; Turbith that is Gummy, Hermodacts, and Agarick new made up, of each two drams; Diagridium one dram; Ginger and Cloves, of each half a scruple; Saffron and Sagem, of each seven grains. Powder them all, and sprinkle them with the water of Marjerom: then dry them in the shade, and make them into a Mass or Body with Oxymel of Squils; of which let him take half a dram or two scruples once a week two hours before Dinner.

The day after his Syrup or Pills, also as twice or thrice in a week, let him take a quantity of this Opiate, or Electuary;

Take of Conserve of Acorus Roots, or of Ginger, and Citron Barks candied, of each one ounce; the Conserve of Sage and Rosemary flowers, of each six drams; Nutmegs candied half an ounce; one candied Myrabolan; old Treacle, and confection of Alkermes, of each three drams; of the Powder Diambra, and Diamoschu dulcis, of each one dram; with the syrup of Citron Barks make it up: And let him take every morning two hours before meat, the quantity of a Chesnut; drink after it a little Wine and Water.

This following Balsom doth more strongly corroborate the Brain, of which he may take now, and then three or four drops in Wine or Broth.

Take of the Chymical Oyl of Nutmegs 3 drams; Oyl of Marjerom, Rosemary, and Amber, of each half a dram; Musk and Amber-greece, of each one scruple: with a little Oyl of a mans skul, mix them together. You may make the Oyl of a mans Skull thus; Take the shavings or raspings of a skull that was never buried, put them in a Retort or Still so called, in as much white Wine as will suffice. Let them stand in Balneo Mariæ, that is a Kettle of warm water for some time; then distil it in Sand till it's dry, and you shall find the Oyl swimming upon the water which is drawn off.

Anoint your Nostrills within with this Balsom every night, and it will strengthen the Brain wonderfully.

There is another cheaper for to anoint the Nostrills with; which is,

Take the Oyl of Orange Flowers two drams; White Wax one dram; melt them gently, and put thereto Oyl of Amber half a dram; of the Chymical Oyls of Sage and Rosemary, of each fifteen drops; Oyl of Spike five drops; mix them together.

It is also very good for the drawing away of the matter which breeds continually in the Brain, by an issue in the hinder part of the Neck.

Lastly, The Baths which come out of Brimstone, Nitre, Bitumen, as those called Belliucana, are very good for the drying and strengthening of the Brain, if it be washed therewith for some days, after general evacuations are made. Daily experience teacheth us, that most greivous Head-diseases coming of cold distempers are thereby cured. It is profitable also to drink those Waters for the strengthening of the Stomach which alwaies doth sympathize with the head. Therefore I set down this digestive Powder;

Take of Coriander seed prepared one ounce; Annis seeds, and sweet Fennel seeds, of each three drams; Cinnamon and Nutmeg, of each two drams; Coral, Ivory, and Pearl prepared, of each one scruple; Sugar of Roses as much as all the rest, or for Rich folk twice as much, of which let him take a spoonfull after every meal, not drinking or eating for three hours after.

CHAP. II.

Of Drouſie Diſeaſes called Coma, Lethargie,
Carus, and Apoplexy.

THere are four kinds of Preternatural Sleep, namely *Coma*, *Apoplexy*, *Carus*, and *Lethargie*. We will ſpeak of them together in this Chapter, becauſe they proceed from the ſame Cauſes, and are cured all the ſame way.

DIFFERENCES. Theſe four Diſeaſes differ one from another after this manner :

In the Diſeaſe called *Coma*, *Cataphora*, or *Subeth*, according to *Avicen*, is a deep ſleep ; but ſuch an one as from which the Patient is raiſed, openeth his eyes, and answereth, but preſently he is again in a deep ſleep.

In a *Lethargie*, the ſleep is like that of *Coma*, but it is joyned with a Feaver and Phrenſie, or Dotage.

In *Carus* there is no Feaver as in *Lethargie*, but in *Carus* the ſleep is more deep and profound, ſo that when the ſick Party is rouzed up, he ſcarce opens his eyes, and answers not, as in the former, but yet being pinched he is ſenſible, and his Breath comes freely.

In *Apoplexy* the ſleep is moſt deep, and a total privation of ſenſe and motion, except breathing : and ſo therefore the Sick doth neither open his Eyes, answer, nor feel when he is hurt ; as alſo he breatheth very difficultly.

CAUSES. There are many Cauſes of theſe Diſeaſes.

The firſt and chief Cauſe is Flegm and wateriſh humor contained in the Brain ; of which (when there is but a ſmall quantity, that moiſtneſh and cooleth the ſubſtance of the Brain, ſtopping up its Pores and paſſages) cometh *Coma*.

But if the ſame quantity of Humor ſo gathered together become putriſied and corrupt, or grow into a Tumor or Swelling, or be diſperſed throughout the Brain, it procureth a *Lethargie*.

When it is gathered in a great quantity without corruption, and that the Humor is ſucked up into the ſubſtance of the Brain, it cauſeth a *Carus*.

And laſtly, When the Humor is ſo great in quantity that it doth not onely fill the Brain, but alſo the Ventricle thereof, ſtopping and ſtraightning them, & alſo when it doth offend the Original of the Nerves which come from the Brain, and is placed in the baſis or bottom of the Skull, and when it hindereth the paſſage of the Animal Spirit, it begets an *Apoplexy*.

Secondly, Sleepy Diſeaſes ſpring alſo from abundance of blood in the Brain, for if the ſtore of blood contained be more raw, wateriſh and cold, it thickens the Animal Spirits, and makes them unfit to move ; as alſo the abundance of Humor charging the Brain, hindreth the free paſſage of the Spirits, and according as the Humor is more or leſs in quantity, more or leſs in coldneſs, it produceth a greater or a leſſer Diſeaſe : So that both *Coma*, *Carus*, and *Apoplexy* may be cauſed thereby.

But drouſie Diſeaſes, eſpecially the *Apoplexy*, are uſually cauſed by blood out of its Veſſels, ſtopping and compreſſing the Ventricle of the Brain, and that falleth out either from a Vein broken in the Brain, or from an overfulneſs of the Veſſels, or from ſome great Bruiſe or Contuſion of the Head, or from ſome Cut or punctured Wound, by which the Veins of the Brain are divided, and ſo ſend forth much blood. And the Fracture onely of the Skull compreſſing of the Brain may produce a dulneſs, drouſineſs or ſleeping Diſeaſe.

Thirdly, it is without doubt that a Tumor in the Brain, burdening it with its Weight, may produce a ſleepy Diſeaſe. This is reported by *Platerus* to be found in a certain Baron, who for a long time was ſottiſh and ſleepy, did nothing rationally, nor deſired Meat, neither did eat any thing but what was forced into him, went not to Bed but by compulſion, but would ſit all day at the Table leaning on his Arms with his Eyes ſhut, neither did he answer at any time without much asking and importunity, and then very little to the purpoſe. And after his death his Skull was opened, and there was found in his Brain a great Kernel, hard, and of a callous body ; the cauſe whereof might be ſome ſtroke upon the Head, which he had received long before the beginning of his Diſeaſe.

E

Fourthly,

Fourthly, Many vapors flying into the Brain may be the cause of a sleepy Disease : for if the vapors be many and gross, that they burden the Animal Spirits, and darken them as with a mist, even as the Clouds in the greater World darken and obscure the Beams of the Sun. But if they be over-moist they do so wet the Brain, that it becomes weak and faint in its functions and performances. Therefore Drunkards sleep profoundly from the Vapor of the wine, and the abundance of Crudities sent up into the Brain. So Children that are troubled with the worms, are often taken with sleepy Diseases from the abundance of gross and thick Vapors which arise from crude and waterish Humors. So in intermitting Fevers or Agues, sometimes in the beginning of the Disease there is irresistible sleep, by reason of the crude and stinking Humors which are contained in the Veins, especially in the Mesenterick Veins, which Humors being made thin by the heat of the fit of the Ague, send many Vapors to the Head; and produce such sleep as ends with his cold Fit sometimes, and at other times continues to the end of the Fit, according as the Vapors are more gross or thin; or as they are more or less in quantity, and so are longer and sooner dissolved and dispersed.

Fifthly, Many times so great a sleeping Disease is begot by the too frequent use of Medicines called *Narcoticks*, that do produce sleep, that many unawares by the unskillfull use of Opium have slept their last. There is also the same stupifying force in some living Creatures, as in the *Tarpedo*, or *Crawfish*. So *Plutarch* reports in the death of *Cleopatra*, That the Sting of a Viper causeth deadly sleep. But in Mans Body this stupid sleeping condition comes from the putrefaction of Humors, which is seen in malignant and pestilential Fevers; hence it is, that in those Diseases they are very sleepy oftentimes, which is a certain sign of Venosity and malignity, and sometimes of death.

DIAGNOSTICKS. The Diagnosticks or Signs which shew the differences of these sleeping Diseases were set down in the beginning of this Chapter : But the signs of the Causes that produce these Diseases are these.

When sleepy Diseases come from Watery Humors putrifying in the Brain, these are the signs; A Flegmatick Constitution, old Age, Infancy, a cold and moist Dwelling and Season, a stopping of an accustomed spitting, and blowing of Nose, and when the Sick man before the coming of the Disease was troubled with heaviness of the Head, dimness of the Sight, and dulness of the whole Body; and when in the Disease there is a defluxion of Rheum from the Nose or Mouth; or when the sick Party feelth it trickle down his Throat.

That sleeping Diseases are bred of blood, appears by a plethorick or full Body, red Face, pain of the Head, going before the Disease.

A Tumor or swelling in the Brain is scarce by any signs to be known, but is onely manifest after death by opening of the Skull, as was before mentioned.

That the Disease comes from Vapors flying into the Brain, appears from those signs which shew the particular Diseases of those parts from whence the Vapors are sent up to the Brain. A Surfet going before, with crude and sharp belchings and other signs of crude Humors in the Stomach and other parts of the lower Belly, shews that the Disease comes from Vapors which are sent from the Stomach : But if the Vapors come from worms, you shall know that in the Chapter of them.

PROGNOSTICK. As for the Prognosis or fore-knowledge of things in these Diseases; Every sleeping Disease is dangerous, but by how much deeper the sleep is, and the sick-man harder to be awaked, by so much greater is the danger; and therefore a *Carus*, is more dangerous than a *Coma* or a *Lethargie*; but an *Apoplexy* is worse than a *Carus*, for if it be violent, it is altogether incurable, as *Hippocrates* observeth in his 42. Aphorism of the Second Section, which is thus: Its impossible to cure a strong Apoplexy, and not very easie to cure a weak one; a strong Apoplexy is when the breathing is uneven and disorderly and sometime intermitting, and if such a breathing is very violent, the Disease is stronger, if the breath be stopt it is most strong, but when there is some order in the breathing, the Disease is weaker, which is declared by *Galen* in his Comment upon the said Aphorisms.

A sleeping Disease is very dangerous which comes upon an acute Disease, for it either signifies the extinction of the Natural heat, or a poysonous malignant quality which hath seized on the Brain.

That Disease which comes by consent of the lower parts, and from Vapors which arise from them, is less dangerous.

Men sick of a Lethargie die within seven dayes, if they live longer, they recover. *Hippocrates* in his Book of Diseases.

Sleeping Diseases in old men are for the most part deadly; for in regard of their want of Natural heat, they having a weak Concoction and weak Expulsion, it comes to pass that they cannot overcome and expel that Humor which causeth the Disease, much less can they expel that Humor which aboundeth in the Brain, for since the Brain is the coldest part of the body, it must needs in old people have its heat diminished and extinguished sooner than any other parts.

In a Lethargie, if a Tumor happen under the Ears, or if matter or filth come forth of the Ears, and the symptoms abate, it is a sign of health, for it sheweth the strength Nature hath got over the Cause of the Disease, which it expels before perfect Confection out of the Emunctories under the Ears, or

or purgeth it out being turned into Matter by the Natural Passages.

They who are preserved and cured of the Lethargie do use after to spit Matter and Blood, *Hippocrates* in *Coac.* and Third Book of *Diseases*. This Opinion, say some, agrees not with Experience, for few have seen a true *Empyema*, or corrupt Matter between the Breast and the Lungs, follow a Lethargie. But the Interpretation of *Mercurialis* upon the Aphorism is very right, for he said, That *Hippocrates* meaneth by *Empyema* and *Empyicus*, not the Disease of the Breast, but when filth is discharged by the Ears and Nostrils. And *Galen* hath taught us in his Commentary upon Aphorism 8. Sect. 5. and Aphorism 44. Sect. 7. That *Hippocrates* by *Empyema* understands there, not onely that Suppuration and breeding of Matter which is in the Breast, but also that which is in all other parts.

It is a good sign when a Phrensie followeth a sleepey Disease coming of a cold Cause, because by that violent heat which causeth a Phrensie, the watery matter which begets a sleepey Disease is concocted.

Men in Apoplexies die in seven days, except a Feaver take them, *Hippocrates* 2. of *Diseases* and Aphor. 51. Sect. 6. but that Feaver must be a violent one, and essentially spring from the Inflammation of the Humors and Spirits, otherwise it will not disperse the matter which causeth the Apoplexy: for if it be gentle, and onely symptomatical, or hapning to the Disease as an Accident, as in an Apoplexy, coming from the burning disposition of the Head through too much blood contained in the Veins thereof, then the Feaver doth not diminish the Disease, but rather cause some symptoms of Madnes, which weaken the Animal Faculties: and in this case a Phrensie coming upon a sleepey Disease is not good, as we said in the Prognostick before mentioned. Moreover, a Feaver that must dissolve a sleepey Disease, must have another condition, namely, That it come in the beginning of the Disease, whilst Nature is in some strength to put forth strong endeavors. For that Feaver which comes after the Disease hath long continued, is not healthful, as *Hippocrates* in *Coacis* saith, Apoplexies being like to be dissolved, if a Feaver come upon them after, they have long continued, are deadly.

A faint sweat in an Apoplexy is evil, for it shews great oppression of Nature.

CURERE. For the Cure of these Diseases, as of all other, three necessary means are required.

First, Order of Diet.

Secondly, Manual Operations, or Chyrurgery.

Thirdly, Medicines, or Physick.

The Diet in the beginning of these Diseases must be very slender, because they are very acute, or violent and sharp: therefore the Patient must be fed onely with thin Broaths now and then: But in the time of the declination of these Diseases, we may use the same Diet which is prescribed in the Chapter before-going, treating of the cold Distempers of the Brain.

The other two means are to be used by this following Method.

And because sleepey Diseases are sudden and full of danger, they require the Physicians cheif diligence, and quick application of Medicines.

First therefore, When the Physician is called to one taken with a sleepey disease, he shall endeavor to raise the Patient from his deep sleep by offering violence to all his Senses, and laying his Eyes towards the Sun-beams, and clearest light; he must make a great noise in his Ears, and he must be called aloud by his own Name: He must put sharp things to his Nostrils, as Rue, Castor, Vinegar, and sharp things into his Mouth also.

He must stir up his Feeling with pinching, pulling of Hair, by ligature or binding, bending of the Fingers, and the like.

Make first a Clyster of the common Decoction which is most ready, after this manner:

Take of common Decoction for Clysters one pint and an half, Hiera Picra and Diaphoenicon, of each one ounce, Oyl of Rue and of Lillies, of each one ounce and an half, Honey of Roses two Ounces, Saltrone Dram: Make a Clyster, give it presently.

While these things are doing, the Physician ought seriously to consider whether blood-letting be fit or not; for in these Diseases, as *Celsus* said, Blood-letting either kills or cures; and blood-letting is good, if blood be the principal Cause, or the assisting Cause, or if it be *sine qua non*, that is, a Cause without which the Disease would not be, if strenght permit. But his strenght is not to be looked upon as he is in his Fit: when his Animal Actions are hindred, but as it was before the Disease came: For if the Patient was formerly strong, he will endure blood-letting, except the Apoplexy be very strong; and if his strenght be not taken away by resolution of the Parts, but by oppression of them, then is blood-letting good. But if blood offend no way, or if the strenght be quite gone, or the Patient very old, you may omit blood-letting, but otherwise presently.

The first thing to be done either by Night or Day to one in any of these Diseases, is bloodletting nay, before the Clyster, if it be not already administred: But his Arm must first be well rubbed and chafed.

And this is to be observed, That it is more profitable and safe, not to let out so much blood at once as you require, but by degrees in some hours distance; for by the repearing of Blood-letting the matter is more easily moved, and the strength more preserved. Look in the Sick-mans Face after his first loss of blood, and feel his Pulse; for if his Face be better coloured and more lively, and his Breath more free, and his Pulse good, there is much hope, and you may let blood the second time with more confidence. Make the Orifice large, otherwise he will not bleed, his blood is so thick: The more plenty of blood he hath, the more he may lose; but if Flegm abound you must bleed sparingly, lest the Vital heat be lost, which is so absolute necessary for dissolving and dissolving this Disease.

A singular Example of large and often bleeding in an apoplexy, is laid down by *Zacutus Lusitanus*, in his First of *The chief Physicians*, and his 33 History, in these words: *A certain Noble young Maid, fell first into a general forgetfulness of all things, and then into a true Apoplexy, with the flowing of her Courses; unto whom when they had applied many Medicines both above and beneath, as Ligatures, sharp Clysters, Cupping with Scarrification: the Indication which comes from the flowing of the Terms being neglected, and danger coming on through continuance; I perceiving her strength to be sufficient for it, having first rubbed her Thighs very well, and placed Cupping-glasses thereon; in the space of eight hours opened the Head vein four times; and then she began to speak and so recovered.*

Some of our late Practitioners, are so bold as to open the Jugular Veins in Apoplexies, and say they cure also: and in so doing they take this course: First, They bind the Neck gently with a Linnen cloth, after the Vein is opened they presently lose it, and the Blood flows well without a Ligature, which might attract it to the Head; after they heal up the wound with a stinking Plaster without binding, and so they affirm the blood will easily stop: which *Zacutus Lusitanus* confirmeth (though he useth Ligatures) in his 79th Observation, in his First Book of *The Admiral Practice of Physick*, where he relates a Story of a most sharp Squinancy; in which, by the advice of most skilful Physicians, the Jugular Veins were opened, from whence followed (as he says) a most dangerous Flux of Blood not to be stopt, which brought the Patient very weak: *Zacutus* being sent for applies *Galen's* Plaster, which he in his Fifth Book of *Method*, and fourth Chapter, useth with good success for stopping blood in Arteries and Jugulars, and bending the Patients Neck gently he comes to his strength, and is cured. This Plaster is made of Frankincense, Aloes, the Hairs of a Hare mixt with the White of an Egg, having twice as much Frankincense as Aloes, as *Galen* teacheth in the place mentioned, sometimes an equal part of each, when the Bodies are harder. And *Galen* commends the Operation before-written, when he saith, *This Plaster stops the flux of the Jugular Veins without a Ligature or binding*. But this I would take notice of, That the blood doth not flow forth so violently in one that hath an Apoplexy, as in one that hath a Quinzy, because the blood is congealed; as *Hypocrates* shews in his Second Book *Of Diseases*, in the former, from whence the Veins and Arteries called *Caiodites* or *Jugulars*, are stopped: but in the later the blood is hot and thin, because they who have the Quinzy, have always an acute Feaver whital.

A few hours after bleeding you must purge without respect of time. Neither let the Physician be too curious or fearful in purging, since the Disease doth much require it, and the time of the Disease is not usually long. And that purge ought to be very strong because the Humor is stubborn, and the Senses so drowned that they cannot be rouzed or stirred up without strong Medicines. And that Medicine is usually one ounce of the Electuary *Diacarthamum*, dissolved in Betony-water with half a Scruple of Castor; Or,

Take Turbith four Scruples, Agarick two drams, Ginger two Scruples, Fennel-seeds one Scruple, Castor six Grains: Infuse them in a sufficient quantity of Betony-water, and in three Ounces of it strained, dissolve the Electuary, *Diacarthamum* three Drams, Syrup of Roses one Ounce; let him drink it.

Take of Cochie Pills the less, one Dram, Castor three Grains; with Betony-water make seven Pills, and if the Party cannot swallow them, dissolve them in Sage, Lavender, or Betony water. Or,

Take of Cochie Pills the greater, and Pills of Agarick; of each half a Dram, the Troches of *Alhandal*, *Diagridium* and Castor, of each three Grains; with Honey of Rosemary make Pills, or dissolve it in Sage-water. Or this Potion.

Take of Senna half an Ounce, of white Agarick one Dram and an half, of Turbith one Dram, of Ginger and Galanga half a Dram; boyl them in Sage and Rosemary-water. In two Ounces and an half of the strained Liquor put two Drams of *Diacarthamum* the Electuary, and of Castor half a Scruple, of simple Oxymel half an Ounce.

In a Lethargie, the purging Medicines must be milder from the beginning by reason of its continual Feaver accompanying; made of Agarick; with Rhubarb of Scammony, or of Pills of Hiera with Agarick, because Choler is that which carrieth the Humors to the Head, yet in the progress of the Disease, when the Matter is flown to the Head, and sticks there, we may use the purges above written.

Trallianus

Trallianus gives one Scruple of Scammony with two Scruples of Castor in Oxymel, by which he hath cured many desperate Lethargies. And *Oribasius* saith, That there is no better Medicine for a Lethargie to purge away that Flegm which Choler brought to the Head, than Scammony and Castor.

It often happens, that the Faculties are so oppressed that Physick will not work, which is an evil signe, and such seldom recover. But because *Celsus* saith, When things so fall out, we must use such Medicines as are at hand, if they be proper for the Disease, which is so desperate that we may use desperate Medicines. For as *Serenus* saith, The Physicians think such Medicines better in desperate cases, than for the Patient without tryal to die an easie Death. And *Celsus* saith, Many things may be done in time of danger and necessity, which may well be omitted at another time. Therefore when we have used those Medicines without any success, we may well rise higher, namely, To those Medicines which are made of Antimony; especially to those which are less vehement and furious; as *Aqua Benedicta*, of Dr. *Ruland*, made of the Infusion of *Crocus Metallorum*, which purging both upwards and downwards, bringeth such a quantity of flegm not only from the Stomach, but the Brain also, as sometimes the Patient is cured only with this Evacuation. And I can witness upon my own Experience, That I saw a Noble-man thrice in two years cured of the Apoplexy, with this only Medicine. Although some learned men do forbid the use of Vomits in these Diseases, yet we must yeild to Experience, which daily teacheth us, that Children affected with sleeping Diseases are more readily and safely cured by the vomiting Salt of Vitriol, than by another Medicine,

The Tincture of Tobacco drawn with *Aqua vita*, and taken in the quantity of two Drams, with Honey poured down the throat, excellently.

After you have given a purging Medicine, before it begins to work, and also while it worketh, you must think of all those things which cause revulsion of Humors, and bring them into practice, not only Frictions or Rubbings, and Ligatures or Bindings, mentioned before, but also Cupping-glasses to the Back, Shoulders, Arms and Thighs, without Scarrification if he was formerly blooded, and with Scarrification if blood-letting was omitted.

In an Apoplexy you must not apply Cupping-glasses to the Breast or Hypochondria or parts under the Ribs, lest the Muscles of the Breast and Belly being contracted, the Breath be hindred.

The cheif and onely Remedy in an Apoplexy especially is to apply Cupping glasses to the Head: Which kind of Cure the famous Physician *Fracastorius* being taken with an Apoplexy, did direct for himself by his Nods and signs, but for want of their understanding of them, he died.

Zacutus Lusitanus in his 33. History, and first Book of the *Principal Physician*, reports, That he cured a desperate Apoplexy, by setting a Cupping-glass twice upon the hinder part of the Head with deep Scarrification.

A Veficatory, or Plaister to draw Blisters to the Neck behind, and to the Shoulders.

Let two or three sharp Clysters be given every day.

Take of Pellitory of the wall, Hyssop, Calamint, Organ, Sage, Rue, and the lesser Centuary, of each one handfull, Carthamus-seeds half an ounce, of Fennel and Cummin-seeds, of each three Drams, of white Agarick tied in a linnen-clout, two drams, of Coloquintida tied with it, one Dram, and an half: Boyl them to one pint, strain them, and add them to the Liquor of Hiera Picra, half an Ounce, of Diaphenicon one Ounce, of Oyl of Rue two ounces: Make a Clyster.

The Chymical Physicians do usually add two Ounces of *Aqua Benedicta* of Dr. *Ruland*, made of the Infusion of *Crocus Metallorum*, and then it will work strongly.

You may give four or six ounces of the same Infusion at a time, and also you may take it out of the Glas wherein the Infusion was made, shaking it before, that it may have some of the Feces or residents of the powder in the bottom to make it more strong. Therefore for the most part we do prescribe Clysters of *Aqua Benedicta* or *Vino Emetico*, that is the Infusion of *Crocus Metallorum* because in many Diseases, especially Cholicks, it doth wonders.

Take of Emollient Decoction for Clysters one pint, of Diaphenicon one Ounce, of Infusion of *Crocus Metallorum* shaken together, four Ounces: Make a Clyster.

If the Clyster come not away in the due time, give this Suppository.

Take of the powder of Hiera Picra of Galens prescription, two Drams, of Coloquintida and Agarick the best, of each half a Dram, of Diagridium one Scruple. Sal gem two Drams, Honey boyled to a sufficient consistance or thickness, as much as is sufficient: Make Suppositories.

It often falls out that the Muscle of the Arse called *Sphincter*, is so weak, that a Clyster is given in vain because it cannot be contained, which is a desperate condition.

Apply Castor and Vinegar to the Nose, which are said to have a special quality against sleep.

It is also vety good to sprinkle sharp Vinegar upon a red hot Iron, that the Patient may receive the Vapor in his nostrils. And it will be better to put Nigella, or Pepperwort-seeds, Rue-seeds or Castoreum to the Vinegar. But Vinegar it self warmed and applied to the Nose, if it be sharp, stirs up the Patient powerfully, and more powerfully if you put to it Pepper and Castoreum. The Fume of Brimstone doth also raise from sleep.

The

The hairs of a Goat burnt, or the Horn of a Deer or Goat burnt, held to the Nose, are most strong for raising up of him that is in a deep sleep.

The fume or smoke of white Amber is excellent for the awaking of men in sleepy Diseases; as also the Oyl of it often applied to the Temples and Nostrils.

Rub also the Soles of the feet with Salt and Vinegar, anoint the hands with Oyl of Rue, and of Castoreum; touch the Tongue and Palate with old Treacle dissolved in *Aqua Cælestis*, or *Apoplectica*. But take heed that your Treacle be not new, for then Opium will cause more sleep. The Medicine called *Aura Alexandria*, or *Confectio Anacardina*. You may also boyl Mustard-seed in Vinegar or strong Wine, and wash the Palate therewith Roots of Pellitory of Spain boyled in Oxymel that is, Honey and Vinegar do the same thing. But with all these Medicines you may safely use Castoreum.

When you have purged the Body generally in all parts, you must then purge the Head either sensibly or insensibly.

Sensibly the Nostrils and Palate, by Errhines or Neefings, which are prescribed in the Cure of a cold Distemper of the Brain, and by touching of the Palate as before. To all these you may add Rue, Castoreum and Vinegar.

Concerning Neefing, It is to be observed, That if the Disease remain and encrease; and if the Patient be hard to be raised, it is very profitable: but we must not use them too long, lest they clog the Brain and move the Humors too much. But in the beginning of the Disease we must abstain from unreasonable Neefing, because it disperseth the Humor which will fix in other parts; from whence come stubborn Diseases, or a small sleeping Disease turns into a strong Apoplexy.

Last of all, you must use those things which resolve the Humor insensibly, which are compounded in this manner:

Take Bayberries, and Juniper-berries, of each one Ounce and half, Roots of Angelica, Zedoary, and Master-wort, called Imperatoria, or Pellitory of Spain, of each one ounce, Leaves of Betony, Sage, Rosemary, of each one handfull, Rue, Savory, Marjerom, Lavender-flowers, of each half a handfull, boyl them in Vinegar. Dip a Sponge or linen cloth in this Liquor, and apply it warm to the Head. It is a wonderful thing to see what good this doth in sleeping Diseases: But you must rub the Arms and Hands, and the Legs and Feet with the same.

Take of Castor half an Ounce, of Mans Hair burnt three Drams, of the juyce of Rue, of Vinegar and common Oyl, of each two Ounces; boyl them to an Ointment, and then anoint the Head therewith after the Fomentation.

Take of Oyl of Pepperwort, called Oleum Costinum, of the Oyl of Castor, and Euphorbium, of each one Ounce, of the Powder of Mustard-seed, and Ephorbium of each one Dram, of Vinegar one Spoonful; of Wax as much as will serve to make an Ointment.

If the Disease doth not decrease after all these are used, then you must apply a great Cupping-glass to the Crown of the Head, and to the hinder part of the Head.

But a Vesicatory is best if Euphorbium be in it, for that will draw the humor outwardly which lieth deep.

Some are so bold in the height of the Disease to burn the hinder part of the Head, between the first and second Vertebra, or Back-bone with an actual Cautery.

Zacutus Lusitanus applied many in his time with good success, as he witnesseth in his First Book of *Wonderfull Practice*, and the fourteenth Observation, in these words: *I being called to visit a sick man, who was for the space of thirty dayes taken with drowsiness and irresistible sleep, with a small Fever, not able to hold open his eyes; he had used many evacuating and diverting or repelling Medicines, but they perfected nothing; therefore I applied the Cautery with much benefit; for with a red hot Iron I scorched the crown of his head till it was hard and crusty, as also the hinder part and almost every where about his head, by which means he awaked, and the places burned beginning to matter, he arose and came to him self. By this means I remember I cured two Sleepers, contrary to expectation, after all other means had been used in vain: and these were cured by the heat of the fire melting, dissolving the Humor which came forth at their Mouths and Nostrils many dayes after.*

Others have an ancient Custom, to hold a red hot Frying-pan so near the Head that it may burn the Hair, and not the Skin.

It is good in the Diseases to give the Patient a little *Aqua Cælestis*, or Apoplectick-water, or other Strong-water, which by its piercing quality doth very much good, and hath freed many from Apoplexies present and approaching, if blood be not predominant or chief in the Body, which will be hurt by the use of Strong-waters.

Now there are many sorts of Apoplectick-waters, in *Languis*, *Wickernis*, *Quercetanus*, *Crollius* and others; but we shall here only lay down one Water invented by my self, and made of the most proper Ingredients.

Take

Take of Peony Roots, and Miſſto of the Oak, of each two Ounces, Calimus Aromaticus, Galangal, and Cyprus, of each one ounce: Betony, Sage, Marjerom, of each one handfull, Peony, Annis, Fennel, and Carway-ſeeds, of each three Drams, Lavender, Stæchas, and Roſemary-flowers, of each a pugil; Nutmeg, Mace, Cloves, Cubebs, Grains of Paradife, Cardamum, of each half an Ounce, Cinnamon two ounces, Saffron one Dram and an half, the Species of Diambra and Diāmolchu of each two Drams: Cut and beat them according to Art, put them in a glaſs-Still, and then pour in as much of the beſt Spirit of Wine as is ſufficient. Let it ſtand in Balneo Maria, or a Kettle of warm-water, with Hay in it for the ſpace of eight days, afterwards draw it off, and keep the Water in a cloſe ſtopt Glaſs-bottle.

Now if the Diſeaſe decline, and his ſleep begin to ceaſe, you muſt omit all other Medicines and follow thoſe things onely which ſtrengthen the Brain; which may be very well done by the uſe of that Opiate or Electuary which I preſcribed in the Treatiſe of the cold Diſtemper of the Brain. But if you will uſe ſtronger than that, take the *Aqua Apoplectica* above mentioned.

Continue the uſe of Caſtor above all things, if the Diſeaſe continue, giving every Morning three or four Grains of it in the of Oxymel Squills, or ſimple Oxymel. *Trallianus* affirmed, That many overcome with this Diſeaſe, have been recovered onely with this Remedy.

Outwardly you may uſe ſome Chymical Balſoms againſt Apoplexies, of which there are divers: We will onely diſcover one of the beſt unto you.

Take of the Oyl of Nutmegs by Expreſſion, half an Ounce, Ambergreece, Muſk, and Civit, of each one Scruple, the Diſtilled Oyls of Spike, Amber, Cinnamon, Roſemary, Cloves, of each half a Scruple. With this Balſom touch the Palate every Morning, and drop ſome into the Ears, and ſnuff ſome into the Noſtrils. For this purpoſe the diſtilled Oyls of Nutmegs uſed in the ſame manner are much commended.

Laſtly, We muſt obſerve, That in the Cure of theſe Diſeaſes, we muſt uſe leſs hot things, and loſe more blood, when the Diſeaſe is cauſed of blood; and alſo we muſt mix Medicines that purge Choler with thoſe that purge Flegm.

They which have been troubled with any of theſe Diſeaſes, and are cured, do uſe many times to relapſe and fall into the ſame again; which that you may prevent, you muſt correct the cold Diſtemper of the Brain, as before is taught; by which Method you may prevent either Apoplexy, Carus, Lethargie, or Coma. And if the Brain be very cold after Generall Evacuations, you may often uſe *Aqua Apoplectica*; or theſe Tablets or Lozenges following:

Take of Ambergreece half a Scruple, the diſtilled Oyl of Annis-ſeeds, Cinnamon, and Nutmeg, of each three drops, Oyl of Cloves, one drop, Sugar diſſolved in Orange-flower-water, four Ounces: Make theſe into Lozenges, and let him take a dram or two every Morning.

Pills to ſtrengthen the Head are thus made:

Take of Cubebs, Maſtick, Nutmegs, Cloves of each one Dram, Ambergreece half a Dram, of Muſk ſix Grains: With juyce of Marjerom make pills, and let him take one Scruple at a time twice in a week at his going to Bed.

This Powder is in much uſe, and is much commended:

Take of White-Amber half an Ounce of the powder, of the Electuary called Diarrhodon Abbatis, two Drams, of Peony Roots one dram and an half: Make a Powder of them, and take a Dram at a time in any water for that purpoſe before every New Moon.

It is good to hold Nutmeg in the mouth, and chew it very often.

Sweet Perfumes are to be uſed to the Noſe, eſpecially the Apoplectick Balſom.

Uſe Spices with Meat, after Meat a digeſtive Powder mentioned in the Cure of the cold Diſtemper of the Head.

If you fear a ſleepy Diſeaſe will come from too much blood, you muſt firſt take ſome away by the Arm, and uſe all means to make the Pills or Hemorrhoid-veins to bleed, which is very good; for which you muſt purge with Senna and Rhubarb, and with cooling things.

If you fear an Apoplexy from Malancholy, you muſt purge Malancholy, and provoke the Hemorrhoids, and give the Medicines preſcribed for the ſtrengthening of the Brain, eſpecially that powder which is made of White-Amber, Diarrhodon, and Peony Roots.

CHAP. III.

Of Waking Coma.

THE Disease is called *Waking Coma*, or *Coma vigil*, is put among sleeping Diseases, yet because it is another condition different from the rest, we will treat of it in this Chapter by it self.

This *Coma Vigil* is a Disease in which the Patient lieth with his Eyes shut as if he were asleep, when he is awaked and distracted; and if you touch him, he presently openeth his Eyes and looks strangely, and falls asleep again, which is hindred by divers strange imaginations and fancies. This Disease Galen placeth as a mean between a Phrensie and *Lethargie*, and calleth it *Typhomania*.

CURE.] The usual Cause of this Disease, is Choler mixed with Flegm, by which Humors the Brain is made too moist, or it is swelled or inflamed; from whence either the Tumor called *Erysipelas œdematosum*, or *œdema Erysipelatosum* do arise. But because those Humors are diversly mixed sometimes a greater proportion of the one than of another, it comes to pass that the Diseases from them are divers: for if Choler be chief, then it is a *Delirium* or dotage, and the sick man sleepeth but little though his Eyes be shut; but if Flegm prevail, the Patient doth sleep more, and is less dotting, and being raised makes less noise, and is not so foolish.

This *Coma Vigil* comes by sympathy from Cholerick Vapors mixed with Flegmatick that fly into the head, which happens in Feavers that come from mixed Humors, especially in half Tertians, which are made of a Tertian and a Quotidian. We may safely affirm that this Disease cometh from Vapors simply hot and moist in strong Feavers, because sleep comes from moisture, and waking comes from heat.

DIAGNOSTICK.] The Diagnosis or knowledge of this Disease is plain enough by what hath been said, that they which have it, lie with their Eyes shut, and seem to sleep, yet they cannot sleep, but toss and tumble, lift themselves up suddenly, strive to get out of their bed, and then fall again asleep. The divers Causes are easily known from what hath been said.

This Disease is accounted dangerous if the Brain have a swelling or Inflammation, or if it be overcome with the Humors above mentioned, namely Choler and Flegm: or if it come of Vapors which arise from the malignant humor of a Pestilent Feaver.

If the Dotage of *Delirium* be strong, it produceth a Convulsion, for it comes of a Humor or Vapor which is very sharp, which falling upon the Nervous parts causeth a Convulsion.

CURE.] A true *Coma Vigil* is cured as a Phrensie and *Lethargie*, and if it inclineth most to a Phrensie, then the Medicines proper for that are most to be used; if to a *Lethargie*, then the Medicines proper for that. But a *Coma* that cometh by Sympathy, is cured by curing the malignant Feaver from whence it cometh; but the more peculiar Remedies must also be used, which draw and keep humors from the Brain in the beginning of the Disease, as bleeding in the Arm and Foot, Vinegar of Roses applied to the Forehead, Clysters, Cupping-glasses to the Shoulders, Back, Buttocks, Thighs, opening the Head vein, applying Leeches to the Temples, and behind the Ears, and laying living Creatures to the Head to dissolve the Humor.

CHAP. IV.

Of the Sleeping Diseases called *Catoche*, and *Catalepsis* or Congelation.

THERE is some Confusion among Authors about this *Catoche*, for some take it for *Coma Vigil*, Waking Coma, others for *Catalepsis*: Paulus gave them the cause of their difference in his Third Book, and the Eighth Chapter, he treats of a twofold *Catoche*; and first under that Name he speaks of a *Coma vigil*: In the end, under the same Name he speaks of *Catalepsis*. Custom hath brought it to pass, that *Catoche*, and *Catalepsis* are taken for one and the same Disease in all Authors; the Latines call it commonly *Congelation*, or stiffness of the Body.

It is a Disease seldom seen, and to be admired, and those Authors which have seen the Disease do think it so much worth the Observation, as to describe the whole passage and History of it. First of all

all, *Galen* in his First Comment, *Prorret. Sect. 2. Part 55.* mentioneth a Story of a School-fellow of his, who when he had wearied himself with long study, fell into a *Catalapsis*, or Congelation; He lay (saith he) like a Log all along, not to be bent, stiff and stretched out, and seemed to behold us with his eyes, but spake not a word: and he said, that he heard us what we said, at that time, although not evidently and plainly, and told us some things that he remembred, and said, all that stood by him were seen of him, and could remember and declare some of their gestures at that time, but could not then speak or move one part of his body. But *Fernelius* in his Third Book of the Parts of Diseases Chap. 2. relates two Stories, which are these: One while he being very studious and writing, was so suddenly struck with this Disease, that sitting and holding his Pen with his eyes open, and looking upon his Book, you would have thought he had been hard at study till he was by calling and jogging found to want all sense and motion. Another I saw like a dead man, lying along with neither seeing, hearing, nor feeling when he was pinched; but he breathed freely, and whatsoever was put into his mouth, he presently swallowed; If he were taken out of his Bed he did stand aloft, but being thrust he would fall down, and which way soever his Arm, Hand or Leg was set, there it stood fixed and firm; you would have taken him for a Ghost, or some rare Statue.

You may read the like Stories in *Schenkius*, *Marcellus*, *Donatus*, *Rondeletius*, *Jacotens*, and others: from whom you may gather, That in this Disease there is found a destruction or hindrance of the internal and external Senses with a stiffness of all the Members: and sometimes the Senses are not so much hindered but the sick-party heareth those that speak unto him: sometimes the members are not so stiff but they may be bent and bowed by them that stand by, and put into divers postures.

CAUSES. The Causes of this Disease are divers: *Galen* in his Comments, Aphorism 3. Sect. 2. says, That a *Catalapsis* comes from a cold Distemper of the Brain, which Distemper chiefly seizeth upon the hinder part of the Head, makes it stiff and thick, from whence the Nerves proceeding are also made stiff, and such a Distemper may seize upon all the Nerves, whether it come of an external or internal Cause: but some question this Cause, supposing that no living body can be so cold as to have such a Congelation: But *Galen* answereth this in his 5. Chap. of his Book of the Difference of Diseases, by a reason taken from Experience in these words: "For those who in a Jour-ney are taken with cold which is unto death, are thus stiff, whom the Greeks call *Emprostos*, or Bowers forward: *Opisthotos*, or Bowers backward: *Tetanos* extend streight: and others that are killed with cold are taken with this Catalepsy or Congelation. Therefore *Galen* teacheth us, That a *Catalepsy* may be got by external cold, and Reason may easily persuade us to it, for they which are killed upon the way with great cold do first grow stiff, they have a stiffness of Congelation before they die, therefore cold may bring a less stiffness than that which bringeth death. So we see that Congelation of the Nerves or *Catalepsy*, may come of a cold Distemper, and the sooner it is be mixt with a dry Distemper.

But this disease is most often gotten by a cold and dry distemper joyned with matter, that is an Humor or melancholy Vapor, from whence cometh a Constipation or Congealing of the hinder part of the brain, an Extension of the Nerves, and also a stiffness of the same: from this Humor it cometh (I say) not onely in respect of the quality, which is cold and dry, but also in respect of its quantity, which by Repletion makes a Distention, or stretching forth of the Nerves.

Etius in his Sixth book and fourth Chapter, saith, That a Congelation may be caused of blood unto which thing *Rondeletius* consents, saying, That it comes to pass when the Veins and Arteries of the brain are so full, that the body groweth stiff, and distended or stretched out like those bodies that are congealed with cold Weather: he confirms his Opinion by History of a Noble-woman taken with a continual Feaver called *Synochus*, who had in the nineteenth day a Congelation, which was cured by a large Flux of blood from her Nose.

Sennertus hath found out a new Cause, which he saith is a congealing Spirit by which the Animal Spirits are fixed, and made immoveable: he denies that the force of Congealing and Fixing depends upon a cold and dry distemper, but riseth from some hidden quality. Such Congealing Spirits are found in the greater World, as in Thunder, when men are thereby made stiff, and as it were congealed: As *Cardanus* reports of eight Mowers, which supping under an Oak, were struck with Thunder so as they kept the same shape of body, the one seeming to eat, the other to lay hold of the Pot, another to drink, when they were all dead. It is usually reported, that Wine will be congealed in the Vessel by the Spirit of Thunder: In Earthquakes many times such Spirits break forth suddenly out of the Earth, as make Men and other living Creatures to be stiff and stark. Moreover, *Sennertus* addeth, that there is a great congealing force in Nitre and other Minerals: he brings no Examples, we shall onely bring one Instance taken from Lead, whose Vapor doth so fix and congeal Mercury, or Quick-silver, that it becomes thereby malleable, or to be beaten with the Hammer.

This Opinion of *Sennertus* were not wholly to be rejected, if he had not made this the only cause of the Disease, and cast off all the rest: which when they are allowed and confirmed by *Galen*, and

the best of Authors are not easily to be cast off and denied. Nor is it needful that we fall to hidden Causes when there are enough visible and manifest able to produce such effects as is before declared. And when *Sennertus* says, That this his congealing Spirit is caused of a melancholy Humor, he seemeth to differ from the common Opinion, which is, That a Congelation cometh of a Cold or dry melancholy Vapor.

DIAGNOSTICK. The knowledge of this Disease, or Diagnosis, is manifest from the Stories of *Galen* and *Fernelius* already mentioned; for the evil befalls a man quickly, and leaves him in that posture in which it found him, and keeps him unmoved as if he were congealed: The diversity of Symptoms which we propounded before, is seen plainly. We foretel this Disease by the same signs as we do other sleeping Diseases; as the Symptoms are greater or less, so is the Disease more or less dangerous.

CURE. The way of Cure is twofold, either in the time of the Fit, or out of the Fit: In the Fit you may use those Medicines which are set down for sleeping Diseases; out of the Fit you must labour to cure Melancholy (the Disease so called) if the Congelation come from a melancholy Humor or vapor, which is the most common cause of it; but if a cold Distemper either inward or outward give this Disease a beginning, the Remedies which cure it are to be taken out of the first Chapter of this Book. And lastly, If plenty of blood have begot this Disease, or doth maintain and nourish it, it is proper to diminish it by opening a Vein.

You must advise the patient to a hot and moist Diet, as in all Diseases that come from a melancholy Humor.

CHAP. V. Of the Palsey, or Paralysis.

A Palsey is the loss of Sense and Motion in some parts of the Body, by reason of the stopping of the passages of the Animal Spirits.

There are many kinds of Palseys; for either it is in all the parts of the Body below the Head, and then it is called *παραπληγία*; or else it possesseth onely one side of the body and then it is called *ήμιπληγία*; or it possesseth but one part of the body, and then it is called a *Particular Palsey*; although some Authors use all these terms, as *Paralysis*, *Hemiplegia*, *Paraplegia*, *Paresis*, and *Resolutio*, promiscuously for one and the same Disease, which is a loss of Sense and motion in any other part of the body.

There is therefore a double Palsey one called *Perfect* in which Sense and Motion is quite gone, another *Imperfect* in which Sense and motion are decayed and diminished, and if it be a small diminution, it is not a Palsey, but a numbness or dulness called *Torpor* or *Stupor*, which is the way to a true and perfect Palsey, and the fore-runner thereof.

There is another kind Palsey, which is, When the Motion is hurt, and the Sense not: or when the Sense is hindered and the Motion not.

CAUSES. The Causes of a Palsey are generally all those which hinder the passages of the Animal Spirits into the Nerves and Muscles.

The chief of all is a watery Humor, which by stopping, compressing, condensing, or making thick, refrigerating or making cold, hinder the passage of the Animal Spirits.

This watery Humor comes from the Brain, and falls upon the Nerves and Marrow of the Back: So a light Apoplexy turns into a Palsey, when the Humor that caused it falls from the Head upon the Marrow and beginning of the Nerves, and so gets into the substance of them, and shuts up those insensible passages through which the Spirits come to the parts; or descending by the hollow of the Back-bone, and by the Marrow of the Back, and running upon the Nerves, it compresseth and streightneth them, whereby the Animal Spirits are hindered in their Motion.

Moreover, the same Humor may so thicken the substance of a Nerve by its coldness, that it cannot be passed through by the Animal Spirits.

And lastly, The passage of the Animal Spirits to the parts of the body may be so hindered by a simple Distemper in cold and moistness, that the Native temper of a Nerve, and the heat in it may be destroyed, and the Animal Spirit not perform his office; for the heat of the Animal Spirits must be joyned with the Natural heat of the part for the performance of its Office.

There is a Controversie whether other Humors may be the cause of a Palsey, which we will not omit, though they are very seldom mentioned by others.

Trallianus in his First Book, Chap 6. Reports of a certain man that fell into a Palsey through sadness and grief, and after taking *Hiera* he became immovable without motion, and had died if he had not used all moistning things for his Meat and Drink, and other things to bring him to a temperate condition,

condition, especially many Baths and oyntments of *Hydredanum*, that is, of water and oyl beate together.

Paulus in his Third Book, Chap. 28. and 43. talks of a Palsey which came of a Cholerick Cholick, which is cured by cooling means: and in our time the Cholick of the People of *Poitiers* in *France* is very remarkable, for it turns for the most part into a Palsey; and all men of understanding acknowledg it to proceed of a Cholerick matter, of which I shall speak more at large in my Treatise of the Cholick. An Example is given by *Forests* in his 97. Observation, and his Tenth Book, of a young man who had an extenuation for want of nourishment in his Limbs; and when he grew worse by hot and dry Medicines which Physicians prescribed for him, was at last restored only by the taking and applying of moistning Medicines.

And Reason doth clearly shew this; for Choler, Melancholy, or any other humor falling upon the Nerves: if they fall upon them inwardly, they may stop the insensible passages of the Nerves, or if they fall upon them outwardly, they may so press upon them that they may bring a Palsey. Nor do the Reasons which *Rondeliius* gives to the contrary any way convince, when he saith, That Choler and Melancholy do rather dry than soften and mollifie the Nerves; and Choler is more likely to produce a Convulsion by his sharpness and griping, than a Palsey: For although commonly a Palsey be called a resolution and softning of the Nerves, which is always in a Palsey, that cometh of flegm, yet it is not requisite that a resolution of the Nerves should be in every Palsey, because it comes more properly and essentially from a stopping and hindering of the passage of the Animal Spirits, which when it may be caused by a compression or straitning of the Nerves, and the like, it doth not always proceed of softning and mollifying. But the opinion of a Palsey coming from a relaxing and softning of the Nerves came from hence; namely, Because the parts which have the Palsey being not able to be stretched forth, seem as it were to be relaxed and softned: for the motion of parts is by the extension or stretching forth of the Muscles, and by contraction or drawing together of the same to their Original; which extension when the parts do want, they are said to be relaxed, although they have neither been extraordinarily moistned nor softned.

Moreover, Since there are divers sorts and degrees of Choler, it is not necessary that every sort should have such acrimony and sharpness as is able to beget a Convulsion.

Furthermore, There is a various mixture of Humors and Flegm, or Water may be mixed with that Choler which produceth the Palsey, and so temperate or mitigate his sharpness. Such a mixture doth often happen in Bastard Tertian Fevers, which are probable to be those which *Fernelius* saith, turn into Palseys.

Finally, This is very manifest from the Scorbutick Palsey, or that which is joyned with the Scurvy, which hath often a Convulsion accompanying it (as *Galen* in many places, and *Sennertus* in his Book of the Scurvy, the fifth Chapter:) And albeit a true Scorbute or Scurvy is seldom seen in our Country, yet we often see certain Scorbutick Infirmities, in which some symptoms of the true Scorbute do evidently appear. And therefore in our 74. Observation, and the first Century, and in our 98. Observation, and in the second Century, were given two Examples of Scorbutick Palseys accompanied with Convulsions.

There may be divers other Causes of a Palsey which are little observed.

As first, A cold and moist distemper simple and without Matter, may by congealing of the Spirits, not only hinder their passages and influence upon the parts, but also by destroying the temper of the Nerves, make them incapable of receiving the Animal Spirits, whereby they have Sense and Motion: and this cold and moist distemper from over-coldness of the Air, or from the touching of a cold thing, as *Galen* teacheth 4. de Loc. Aff. Chap. 4. Of a certain man who (when in a cold season and a great storm, he had wrapt his wet Cloak a long time about his Neck) fell into a Palsey in his hand, the Nerves which come from the Neck and Marrow of the back-bone, being thereby made too cold and moist.

Some of our late Writers have reported, That a Palsey may be procured by a stupifying or numbing quality, which is inherent in some Medicines and Poysons, sometimes in the Humors themselves. And hence they say comes that Palsey which is caught by touching the Torpedo or Cramp-fish: but it is not so much to be termed a Palsey which cometh by that way, as a Stupor, or stupifaction and numbness; such like as that which Goldsmiths and Gilders have often by the touching and much using of Quick-silver, and Looking-glass-makers also, which is often seen in *Venice*. And *Platerus* supposeth, that Wine by a narcotick or stupifying quality begets Palseys and Numbness: although others differ from his Judgment, yet *Fernelius* seems to favor his opinion, affirming in the place above-cited, that he once saw a man whose skin by gluttony and drunkenness was all over stupified and insensible. And *Petrus Fabius* in his Notes upon *Altimar*, Chap. 14. relates a Story of a certain Barbar, who after he had been strongly tipling of Wine awaked at Mid-night, and fell suddenly into an universal Palsey of all the parts of his body beneath his face, so deprived of Sense and Motion, that he felt not when he was cut and scarrified with a knife, nor when he was pricked deeply

with Needles: But his Surfeit and drunkenness being past, he was cured in the space of three days, only by Revulsions, and resolving ointments applied to the back: Notwithstanding this Author doth not impute this Palsey to the narcotick or stupifying quality of the Wine; but to those gross Vapors which arose from his Surfeit, and stopped the Nerves, and this cause may be accounted among others that produce this Disease.

We have shewed in our Treatise of sleeping diseases, that there is a stupifying quality in corrupt and malignant humors, which being carried to the Nerves, may hinder their actions: and since the humors which produce the Scorbute have a venemous and malignant quality, they may also have a stupifying force which may cause also a Palsey with the Scorbute, or a Scorbutick Palsey, although (as we said before) an obstruction or stopping or pressing of the Nerves, may be sufficient to cause a Palsey alone.

Moreover, Tumors growing by the Back-bone and its Nerves, may without doubt cause a Palsey by pressing upon the Nerves.

So the cutting and pricking of a Nerve may produce the same effect.

The dislocation, luxation, or making loose of any of the Back-bones, or other Joynts, may cause the same by pressing upon the Nerves.

And lastly, The Condensation or thickning of the Nerves, may hinder the influence and passage of the Spirits, which comes either by too much exsiccation or drying, or of a gross earthly humor, which is taken into the substance of them.

So in those that have the Leprosie called *Elephantiasis*, the sense and feeling of many parts is lost by reason of their growing too thick and hard, by an earthy and gross nourishment which they receive.

The causes of different Palseys are these: In a perfect Palsey, which supposeth a perfect privation of both Sense and Motion, there is more plenty of the matter, which causeth it by a general obstruction, or stopping and binding of the Nerves. But in an imperfect Palsey there is less matter to stop and bind the Nerves, whereby it comes to pass that the passage of the Animal Spirits is not altogether so closed up, but it will suffer some portion of them to have their recourse.

Sometimes the motion is hindered, and the sense not; because there is more vertue to cause motion, than to cause sense or feeling, in regard feeling is a kind of passion; but motion consists altogether in action. Sometimes the sense is hindered, and not the motion, for in some parts of the body those Nerves and their branches which serve for sense, do not serve for motion: as those Nerves which are in the skin, if they only be hurt, the sense only is hurt, which is seen in a particular Palsey which is in one part only of the body: But if the chief Nerves which are carried to the Muscles be hurt, the sense cannot only be hindered, but the motion also.

DIAGNOSTICK. The Diagnosis or knowledge of this Disease is directed to three things; namely, the kind or sort of the Disease to the part affected, and to the cause that produceth it.

We may easily know what kind of Palsey it is, because the want of motion and the privation of sense are to be discovered by the eye.

It is harder to know the part affected, but it is found out by the knowledge of Anatomy, which declared the Original and joyning of the Nerves.

For if the right or left side of the face hath the Palsey, and no other part be hurt, the Brain is only hurt in that part from whence the Nerves are brought that come to those sides of the face: But if the parts under the Head be hurt, together with the face, then it is a sign that the Back-bone is hurt as well as the Brain; and if the parts beneath the Head are hurt, and not the face, the fault is only in the Back-bone: If half the body have the Palsey, only one half of the Back-bone is affected; but if the whole body suffer, then is the Original of the Back-bone hurt. When the Palsey is in the Legs, the part affected is about the bottom of the Marrow of the Back, and the *Vertebrae* or turning bones of the *Os Sacrum*, and so we must search out for the place whence the Nerves spring, which are brought to that part which is troubled with the Palsey.

Sometimes also the searching into the outward Cause doth much avail for the knowledge of the part affected: Two Examples whereof are brought by *Galen*, one whereof we mentioned before out of his Fourth Book, *de loc. affect.* cap. 4. Concerning a man in a cold stormy time wrapt his wet Cloak so long about his Neck till he fell into a Palsey in his hand. Another is in the First Book, *de loc. affect.* chap. 5. of *Pausanias Syrus*, who lost the sense of three fingers; and when *Galen* understood that he fell from his Chariot upon his Back, he concluded that some part was hurt in the Original of that Nerve which comes from the seventh *vertebra*, or *Spondil*; therefore (after he had in vain applied Medicines to the fingers) he used means to the Back, and so wrought a brave Cure.

The Diagnosis or knowledge of the Causes of this Disease is fetcht from the primary Causes, the Diseases foregoing, and the temperament and constitution of the sick party: and therefore when external cold Causes and moist went before, when the Patient is old, when he is flegmatick of constitution, the weather cold, diet cold and moist, and an Apoplexy hath formerly been, it signifies that

that a Disease is approaching from a cold Distemper and Flegmatick Humor.

SIGNS. But when a Palsy is caused of a Cholerick Humor or Melancholy, these signs declare, Feavers did go before, or are present, a cholerick temper and constitution, or else a Melancholy one; the coming of the Disease in hot weather, Summer or Autumn; the use of Spices, Salt and other hot Meats; heavy and long passions of mind, a voiding cholerick and melancholy humors, sharp and sour; many sharp defluxions falling upon divers parts, and putting them to pain: And lastly, When pain and a Convulsion accompany the diminishing sense and motion, and the Patient is the worse when he takes hot and dry things, but the better by the use of cold and moist.

When Tumors, Luxations, or Dislocation, or Wounds cause a Palsy, they are evident of themselves.

PROGNOSTICK. As for the Prognostick part in the Treatise of this Disease, you may fore-tell Events as followeth:

1. A Palsy coming of Flegm fixed to the substance of the Nerves is hardly cured, because it will not be easie to discuss or divide the flegm from the Nerves by reason of their coldness and their weakness in expulsion or sending forth of that which offendeth, which must co-operate or work together with the Medicine, and in regard of a deep situation of the Spina and Nerves, so as the whole force of the Medicine cannot reach them, and because the Patient must of necessity continue long in the use of Medicines, which for the most part people cannot endure, and therefore will not be cured.
2. A Palsy coming after an Apoplexy is seldom cured, and often returns into an Apoplexy, by a new flowing of the same matter into the Brain, which is made weak by the former Disease.
3. A trembling coming upon or after a Palsy is healthful, for it signifieth that the passages of Nerves are somewhat open, by which some of the Animal Spirit beginneth to pass, for to move the Muscles.
4. If the part affected hath an actual heat in it, there is hope of health, but if it be always actually cold, it is difficult to be cured.
5. An Atrophy, or want of Nourishment in the Paralytick part, with great paleness, takes away all hope of Cure; for it doth not only signifie a decay of the Animal Spirit, but shews a near extinction of the natural heat.
6. If the Eye on that side on which the Palsy happeneth be hurt thereby, there is little hope, for it argues a great want of Spirits in that part.
7. A Palsy in the Legs and Feet is easier cured than in the upper parts, because those Nerves are harder and stronger.
8. In old men the Palsy is incurable, by reason of their natural want of heat.
9. In Winter a Palsy cannot be cured, but in the Spring and Summer it may, if other things agree.
10. A strong Feaver coming upon a Palsy is good, for it may consume the matter which causeth it.
11. A *Diarrhoea*, or looseness coming upon a new and weak Palsy is good, for *Rhasis* saith,

1. *Cont.* That he hath seen many Paralyticks cured by a *Diarrhoea*.

CURE. The Cure of this Disease is to be altered according to the variety of the Causes: And since for the most part it cometh of Flegm and a cold Distemper, we must labour chiefly to take away that Cause, which we must begin to do by a general cleansing and emptying of the whole body.

As for bleeding it can scarce do any good, because the fault is not in the blood, but flegm, and this Disease comes for the most part to old men, such as are flegmatick and cold by nature. But if plenty of crude blood unconcocted seems to produce flegm, and to feed it, we may open a Vein in his Arm on the sound side of his body, but take little blood lest his weak natural heat should be extinguished.

After we have omitted Blood-letting, or taken very little away, we must go on to take away the Antecedent Cause, which is a cold distemper of the Brain, which must be done as before was shewed by Apozems or opening Drinks, by Pills, Sweating Diet, Bags for the Head, Emplasters, Errhines for the Nose, Neezings, Masticatories, Gargarisms that draw flegm, Vescicatories, or Blisters, or Cupping head-powders, Caps, Fums, Magistral Syrups, ordinary Pills, a strengthening Opiate or Electuary, by Caustick or burning, by digestive Powder and Baths.

A Diet-drink in this Disease ought to be made of Guajacum alone and his Bark, and after he hath taken a draught, he must have hot Bricks applied to the diseased parts; but first they must be quenched in a Decoction of this, good for the head made with White-wine and Vinegar, and be wrapped in a Linnen-cloth, for the stirring up of the weak heat which is in the parts, and every fourth or fifth day you must purge; but it is better to give a Purging-drink fifteen days before you give the Sweating, that all the load of crude humors may be better cast out, and afterwards the reliicks and remainder may be discussed by the habit of the body; which may be thus made:

Take of the Chips of Guajacum three ounces, of the Bark of the same one ounce; of Spring-water four Pints: Infuse them twenty four hours: then let them boyl to the consumption of half, adding

ding in the conclusion one ounce of Senha, Turbith and Hermodacts, of each two drams. Let him take half a Pint of this strained every Morning for fifteen days, not sweating.

Apply a Caustick to the hinder part of the Head, or the sound Arm if the other be affected. If the Legs be affected, apply a Caustick to them both.

After his Diet, let him use for his ordinary Drink a Decoction of Guajacum, or water and Honey, wherein hath a little Rosemary been boyled. Let him abstain from Wine, which is very hurtful for this Disease; but if he desire to drink Wine, let Betony and Sage be boyled therein. And it is far better if in the Vintage-time those Herbs are put into a full Vessel of new Wine.

If the Disease be perverse and stubborn, omitting the usual Pills and Magistral Syrup; after his Diet use stronger Medicines made thus:

Take of Pill Fœtida the greatest, and Pill Cochy the less, of each half a dram; of Troches of Albandal four grains: Let him take them once every week.

But because the humor must be prepared before every Purge, therefore for two or three days before he takes the Pills, let him take three or four ounces of this following water every Morning two hours before meat.

Take of the Chips of Guajacum four ounces, of the Bark of the same one ounce; of Sarsaparilla one ounce and an half: of China-root one ounce: of Saxaphras six drams: of Lignum Aloes, Galangal, of each one dram and an half: of the Roots of Angelica, Peony, and Fennel, of each three drams and an half: of Peony-seeds two drams: Infuse them for twenty four hours in six Pints of Water, and four pints of White-wine: After add the Leaves of Betony, and Ivy, and Sage, of each one handful; of the Flowers of Linden, Primroses, Stæchas, or French-Lavender, and Rosemary, of each two Pugils: of Lavender one Pugil: of old Treacle half an ounce: of Citron-seeds and Barks, of each two drams and an half: of Polipody half an ounce: of Cinnamon six drams: Distil them in Balneo Mariæ according to Art: and to every two pints and half of the Liquor, put of Manus Christi prepared with the Oyl of Cinnamon, four ounces. Or instead of this water you may use the Opiate prescribed in the Chapter of the cold distemper of the Brain for the strengthening of the Head: but you had better use the Opiate of Montagnanus described in the Cure of the Epilepsis.

When other Purges do little good, it will not be amiss to come to the use of Chymical Vomits, if the Patient be strong: and they are mentioned in the Chapter of sleepy Diseases, for they draw the stubborn humors from the Root, and cure Diseases which cannot be rooted out with ordinary Medicines.

In the days wherein he takes no other Medicine, let him take the Cephalick Opiate mentioned in Chap. 1. or the Apoplectick Water, or Tabellers, or Lozenges, for sleepy Diseases formerly mentioned.

After Universal Medicines, we must proceed to Topical or Particular Medicines for the part, for the stirring up of heat, and recalling the Spirits, and for drying and discussing in the Spinal Marrow, where for the most part the Cause of the Disease lieth.

Therefore let the part affected be daily rubbed with warm Cloaths, but gently, lest that the Natural heat and Spirits drawn thither should be again dispersed.

Also let Cupping-glasses be applied to the heads of the Muscles of the part affected, and let them be narrow-mouthed, and applied very hot; but let them not stand on very long, lest they disperse too much. After apply a Plaister of Pitch, and the Rozin of the Pine-tree, that what is drawn thither may be preserved. Or rub gently the part benumbed with green Nettles, or lay on Sinapisms, or Medicines of Mustard, while the part begin to grow red; but you must not let them lie while they make Blisters, for so the Spirits and Blood would be dispersed, but only till the part made red will not grow white by the impression of the finger, but remain red still.

Afterwards anoint the part, and the Spinal Marrow with Oyls, Oyntments and Balsoms, of which there are many forms in Authors. The Balsom of Guido which is prepared by the Apothecaries, is excellent for this purpose. This we use alone, or mixed with other Medicines.

It is made after this manner:

Take of Oyl of Foxes, Earth-worms, and Castor, of each one ounce: of Guido's Balsom three ounces: of Aqua-vitæ half an ounce: of Oyl of Rosemary distilled, one dram and an half. Mix them for a Liniment. With which anoint all the Spinal Marrow very hot, and the part also resolved, covering them with warm Cloaths.

This following oyntment of Variola in his Observations, is much commended.

Take of Sage, Marjerom, Betony, Bays, Rosemary, and Primrose-leaves, of each one handful: of the Roots of Time, Acorus, or great Galangal, and Flowerdeluce newly gathered, of each three ounces: of the Oyl of Foxes, or Indian Nuts, and Rue, of each one pound: of Oyl of Turpentine half a pound: of the strongest Wine one pound: of Aqua-vitæ half a pound. Boyl them till the Wine be consumed, then strain them, and add of Serapinum, or Sagapennum, Opopanax, and Bdellium,

Bdellium, of each two Drams : *Castor* half an Ounce : *Mace*, *Nutmegs*, *Styrax Calamita*, *Benjamin*, of each three Drams : long *Pepper* and *Pellitory*, of each one Dram : the Grease of an old *Cat*, of a *Serpent*, and a *Goose*, of each one ounce : the *Murrow* of an *Oxe-bone* two Ounces : the *Juyce* of *Dwarf-Elder*, *Sage* and *Balm*, of each four Ounces : of the best *Wax*, or *Bee-glew* which the *Bees* make at the entering into their *Hive* to keep out the cold, two Ounces : Mix them and with a sufficient quantity of *Wax* melted into the foresaid Oyls, make them into the consistence of a thin Ointment, with which anoint all the *Back-bone* warm, laying soft *Wooll* or *Linnen-cloth* warm thereon.

But an Ointment of greater effect, and less trouble, is made in this manner.

Take of the *Juyce* of *Squils* or *Sea-Onions*, four Ounces : the *Juyce* of *Cucumber* and *Rue*, of each one Ounce : *Euphorbium*, *Castor*, *Sagapenum*, *Ammoniacum*, and *Bdellium* dissolved in *Vinegar*, of each one Dram and an half : *Myrrh*, *Frankincense*, *Pellitory* and *Nitre*, of each one Dram : the Oyls of *Elder*, *Turpentine*, and *Euphorbium*, of each half an Ounce : *Wax* as much as is sufficient : Make an Ointment.

You must chiefly use the Ointments in the time of his Diet, after the sweating is wiped off, and after the time of bathing, for then the Pores and passages of the Skin being open, do more easily receive the Ointment.

Let the Linnen-cloaths that are used after anointing be warmed with this Fumigation :

Take of *Amber*, *Mastic*, and *Myrrh*, of each one Dram : *Frankincense* two Scruples : *Cloves*, *Nutmegs*, *Cinnamon*, and *Mace*, of each half a Dram : *Wood of Aloes* half a Scruple : Powder them, and sprinkle them with the Spirit of *Wine*, dry them, and do so five times, and then make a Powder to be thrown upon Embers.

If the Disease do not yield to these, Cerats and Emplaisters must be laid to the Back.

Take of the Emplaister of *Betony*, *Melilot*, and *Bay-berries*, of each one Ounce : *Frankincense* half an Ounce : *Castor* and *Euphorbium*, of each one Dram : the Seeds of *Nigella* or *Gith*, the Seeds of *Water-cresses* and *Mustard*, the Roots of *Pellitory*, and of *Sal Nitre*, of each half an Ounce : with the Oyl of *Bricks* : Make them into the form of an Emplaister, which apply upon Leather.

But this following is better.

Take of *Pitch*, *Galbanum*, *Sagapenum*, and *Ammoniacum*, of each one Ounce : *Pellitory*, and *Mustard-seed*, of each half an Ounce : *Euphorbium* two Drams, yellow *Wax* three Drams : With as much Oyl of *Turpentine* as is sufficient, make a Plaister.

You may also provoke Sweat in the part, by the fume of the Decoction of Herbs and Roots proper for the Head boyled in *White-wine*, which you must do by putting it into such a Vessel as the Patient being fasting may sit so covered over it, that the Water may not touch him but the Vapor only. Or you may sweat him with a dry Bath, commonly called *Stuphes*. Let the Vapor of the former Decoction be received from red hot *Flints*, upon which it hath been sprinkled.

A Decoction of *Burdock* and other Dock-roots is much commended for provoking Sweat : But our Women use the Decoction of *Danewort*, called *Ebulus*, for this and Diseases of the Joynts, by which they provoke Sweat violently.

When the Patient hath sweat enough, get him to bed, and give him one Dram of Treacle with any proper Water distilled : He must bathe thus twice or thrice in a Week. In Autumn he must hold his Limbs in the hot Grapes, or Wine-press an hour or two, and afterwards anoint them with a proper Ointment before mentioned : this is to be done all the time of the Vintage.

Lastly, *Sulphur* or *Brimstone*, bathes of *Niter* and *Bitumen* before mentioned, are very agreeable, and many times go beyond all other Medicines : if the Patient use them some dayes for drink, bathing and washing the Head, after that anoint it with one of the Liniments prescribed.

The Chymists have many Remedies for the Cure of this Disease ; among which, the best are *Elixar Proprietatis*, Spirit of *Tartar*, and Balsom of *Galbanum*.

All the time of the Disease, let the parts affected be wrapt in the Skins of *Foxes*, *Hares*, or *Lambs*.

A Palsey which comes from *Choler* or *Melancholy*, requires the same Cure which is prescribed in the Cure of *Hypochondriack Melancholy* ; but when the Disease is more *Cholerick*, you must make choice of those Medicines which are more cold.

CHAP. VI.

Of a Convulsion.

Spasms, Cramp or Convulsion is an involuntary and continued retraction of the Nerves and Muscles to their Original.

D I F F E R E N C E S. Convulsion is twofold; The one Proper, to which the Definition mentioned agreeth: The other Improper, which is called a Convulsive Motion; and they are thus distinguished: In a true Convulsion, the Retraction of the Muscles is always, but in a Convulsive Motion, the Retraction is every time new. Moreover, in a true Convulsion the Limb is immoveable, in a Convulsive Motion it is moved divers ways, as in the Falling-sickness, which is the chief Convulsive Motion.

C A U S E S. They differ also in respect of their Causes; for a true Convulsion is either from Fulness or Emptiness; but a Convulsive Motion is from Irritation or Provocation. Lastly, they are distinguished, in that the true Convulsion comes from the Disease onely; the Convulsive Motion from the Faculty alone: Which, that Novices may rightly understand, they must know that *Galen* in his Second Book, *de symp. caus.* Chap. 1. hath thus distinguished the Symptoms of a depraved Motion: Some (saith he) are onely the work of Nature, which is constrained to move from some violent Cause; Others accompany Diseases, Nature not assisting their production; Others are by the agreement and concurrence of Nature and the Disease. Now *Galen* by the name of Nature, understands Faculty: the Operations of the Faculty are Neesing, Coughing, Yawning, Reaching, and Hiccoughs: but the Operations of the Disease onely, is Palpitation and Convulsion: but the Operation of both the Disease and Faculty, is Trembling and imperfect Palsey, or Resolution.

From *Galen's* words above-mentioned, there ariseth a great difficulty, when he mentions the Hiccoughs in the operation of the Faculty; for it continueth by Irritation or Provocation, and is a Convulsive Motion: but *Galen* recites a Convulsion among those Operations which come onely from the Disease; Yet *Hippocrates* in his Aphorism 39. and Sect. 6. affirmeth, *That the Hiccough and Convulsion come of Fulness and Emptiness, and Repletion and Inanition, or Fulness and Emptiness make onely a true Convulsion.* For the resolving of which Difficulty, we say, that the word Repletion or Fulness, in its large sense comprehends Provocation, according to many Authors, because the provoking Causes are material, and therefore do in some sort fill the parts in which they are contained; but thus Repletion is not the immediate Cause of Hiccoughs, but the mediate; because it doth provoke the part in which it is, to Expulsion by its quantity or quality.

Lastly, We must know and observe, *Hippocrates* and *Galen* do declare a Convulsive Motion by the general name of a Convulsion, so that they cannot be distinguished but by the Differences mentioned.

Again, A true Convulsion is divided into a total one, by which almost the whole body is contracted, and a partial one, which is onely in some one Member.

An universal or total Convulsion is caused either from the Brain, when the Muscles of the Face are plucked together as well as the whole Body: Or from the Spinal Marrow, when the Muscles that move the Head, and Spine, or Back, either before or behind, or both, are plucked and drawn together. Whence arise three kinds of Convulsions: The first called *Emprostotonos*, when the Body with the Neck and Head is violently contracted and drawn forward, so that the Chin is joyned to the breast, and the body looks like the Keel of a Ship; nay, it is sometimes like a Bow and sometimes round, and the Head of the Patient is joyned to his Knees, and then the two Muscles which bend the Head forward are chiefly affected. The second is called *Opisthotonos*, when the body is drawn backward, and in that either the twelve Muscles which extend the Head, or some of them are drawn together. The third is called *Tetanos*, when the Muscles both before and behind are equally contracted, and the Parts drawn by the opposite Muscles being ballanced remain stiff and straight, and that is called *Mortuus Tonicus*, which is a most violent Convulsion springing from the contention of all the Muscles.

A particular Convulsion is made from the Contraction of the Muscle of some part coming from the hurt of the Nerve which is ordained for his motion, and sometimes it hath a peculiar Name from the Effect or Symptom: So the Convulsion of those Muscles which move the Eyes, is called *Strabismus*: or the Jaws and Temples, is called *τρεῖς*. The Convulsion of the Mouth by Contraction of the broad Muscle on the one side is called *Spasmus Cynicus*, a Dog-Convulsion, and a wresting of the mouth; but if the Contraction be on both sides, it is called *Risus Sardonius*, or a grinning. But the wrining of the Mouth may be without a Convulsion, namely, from the Resolution of one Muscle, which being resolved, the Muscle on the other side draws it to the sound part, and there is a distorti-

on or wryness, which is improperly called a Convulsion. The Convulsion of the Muscles of the Yard is called *Satyriasis* or *Priapismus*. Other Convulsions want proper names.

But the immediate causes of a Convulsion according to the Opinion of *Hippocrates* and *Galen*, are Repletion and Inanition, or fulness and emptiness above mentioned. And this Opinion is confirmed by the example of a Lute or Harp strings, which use to be stretched; which instance *Galen* doth bring most elegantly in his Book of Palpitation, of trembling and shaking, *Chap. 8.* and this third Book of Parts affected, *Chap. 6.* and his Second Book of the Causes of Symptoms, *Chap. 2.* and his Comment upon *Aphor. 39. Sect. 6.* For saith he, while the strings are moist and filled with humor, as it falls out when the wind is Southernly, they are stretched and so broken; and when they are over-dry, as it happens in Northern weather, they are contracted, and also broken. So the Reins of a Bridle drying too near the fire, are contracted when they were before extended with too much moisture: the same befalls the Nerves, which being either too full of moisture or too dry, are stretched and contracted: and the Muscles into which they are united, are so drawn back to their principal or original, from whence all the body hath a Convulsion.

The Mediate Causes of a Convulsion, which make Repletion or Emptiness are divers. And first the Causes of Repletion are recited by *Galen* in his Book *Of Trembling, Chap. last*, to the increase of flegm and Inflammation, a waterish humor flowing to the Nerves is supposed to stretch them in their breadth, which must needs make them shorter.

But here is a very great difficulty which is propounded by divers Authors, but is resolved perfectly and plainly by none: namely, what difference there is between the cause of a Palsy, and of a Convulsion, when both come from a water flowing upon the Nerves: why that matter which makes a Palsy (which so fills the Nerves that it stops all their passages or pores, whereby the Animal Spirits are hindered in their motion) doth not also stretch the Nerves in breadth, and cause also a Convulsion; and why the matter causing a Convulsion, filling the Nerves, doth not also stop the passages, and cause a Palsy, when contrarily in a Convulsion the feeling remaineth, and the part affected for the most part is very much pained? For the resolving of this doubt, Authors are much divided; and the most ingenious of them all, confess that it is beyond their capacity. Most witty *Averroes* considering of this point, breaks forth in this expression; *I would I knew the reason* (saith he) *why the Nerves are extended in their breadth, and not in their length.* And presently after he saith; *Know ye that the words of all Physicians that write of this Symptom, are more proper to Fiddlers and Singers, than to Demonstrators, or such as should make things plain.* And ingenious *Argenterius* in his Comment upon the 26. *Aphor. Sect. 2.* speaks thus; *It is not easie to render a reason of all things, and especially why water which is said to be the cause of the Palsy, or resolution of Nerves, and of the Convulsion, should sometimes bring one, and sometimes another, when it is the same matter, and the same parts are affected, namely, the Nerves; why should not the same Disease be always produced?* Thus *Argenterius*. The great difficulty of this matter hath distracted all Writers into divers Opinions, so that some have left the Doctrine of *Hippocrates* and *Galen*, among whom are *Averroes*, *Erastus*, *Platerus*, *Cesalpinus*, *Sennertus* and others, whose divers Opinions, and long Disputations we cannot attend to repeat, for we desire to be very short, and lay aside all Controversies, only adhering to those things which are most necessary to Cure. The Opinion of the soundest Writers, which are unwilling to dissent from *Galen*, comes to this, That a Convulsion is caused of a thick matter, which extendeth the Nerves in their breadth, and contracteth them in their length; and that a Palsy comes of a thin humor which runs through the substance of the Nerve, and softneth it, but doth not open the pores and passages. But this doth not satisfy a Soul that is greedy of truth: For if a thick humor by filling the Nerve doth stretch it broader, why doth it not also fill its pores, and stop the insensible passages, and hinder the coming of the Animal Spirit, and so bring a Palsy? and why doth not a Convulsion follow a Palsy in process of time, when a thin humor long sticking upon a part, must needs grow thick, even as the serous matter which makes the *Arthritis*, or Joynt Gout by long continuance upon the part, causeth the matter which makes the stone. Others say, That in a Convulsion, only the external part of the Nerve which is membranous and tender, is possessed with the humor; but in a Palsy, the internal; But this giveth less satisfaction: For when the Nerves are for the most part slender, it is not easie to conceive how the humor should only possess the external part, and not the internal; or the internal, and not the external: Or leastwise (if this could be so) a Convulsion would follow a Palsy, and a Palsy a Convulsion, by the increase of the matter; and that which at first did only possess the outward or the inward part, in process of time would seize upon the whole Nerve.

Therefore we, although we cannot satisfy our selves in this great difficulty while better Arguments are propounded, suppose that those Objections may be taken off thus; A Convulsion and a Palsy differ in this; A Palsy is made of a pure watery humor without mixture, which doth not extend the parts, but softneth them, as we may see in the Tumor called *Oedema*; but a Convulsion is caused of the same humor, but not pure and simple, but mixed with much wind, by which wind the

Nerves are stretched, and the Muscles also which are contracted to their Original: For no cause can be thought upon more fit to make so great a contraction, than wind, which *Galen* acknowledgeth in his Second Book *de sympt. caus. chap. 2.* and experience teacheth us; that the greatest distensions are made especially by wind, as we may see in the Dropsy called *Tympanites* and the Cholick. And in Convulsions those are the greatest which are caused of wind, which stretcheth and distendeth the parts. By this Argument, all the aforesaid Objections are answered: For if it be demanded, Why the Flegm or water which maketh a Convulsion, doth not bring a Palsy by hindring the passage of the Spirits? We may answer, That it is in so small quantity, that it cannot stop the insensible passages of the Nerves, and that it is so extenuated and made thin by much wind, that it cannot produce a stoppage or Obstruction. Or we may say that wind is the chief cause of Convulsions, which *Galen* acknowledgeth in the place mentioned. And in his 6 Book, *de loc. affect. cap. ult.* he makes the only cause of a *Priapism* (which is the Convulsion of the Yard) to be wind.

The other cause of a Convulsion coming from Repletion, which *Galen* mentions in the place cited, is the Inflammation of the Nervous parts, especially in the Original of the Nerves, or near to its original, by which they are stretched; and that Inflammation is either from a cause only internal, namely, from a flux of blood upon the part; or of an outward cause, as of a wound, contusion or bruise, or a puncture of a Nerve.

The Causes of a Convulsion by Emptiness or Inanition, are all extraordinary or immoderate Evacuations, by bleeding at the Nose, or any outward part, by vomit, flux of the belly, or sweat as also all great Consumptions of the Radical moisture which happen in strong Feavers, immoderate exercise, watchings, cares, immoderate Lechery, hunger and thirst, and the daily use of Food and Medicines which heat and dry.

This kind of Convulsion from Emptiness is rejected by many; who suppose that so great a drought cannot be brought into a living body, as may contract the Nerves; but that is usual in a Hectick Fever, or a *Marasmus*: These men are thus answered: Every emptiness or dryness cannot make a Convulsion, but that which is made suddenly and unequally; by which means there is a sudden Evacuation or Emptying of the Radical moisture, which makes the parts cling and close together for the avoiding of a *Vacuum* or emptiness which Nature abhorreth; but if the moisture be equally drawn from all parts, and by degrees, there is no contraction, because the parts made empty are filled with Air.

A Convulsive Motion, is of a sharp pricking matter which provokes the Nerves; and it is for the most part, a humor or vapor full of acrimony or malignancy; this comes often in a malignant Fever: These Convulsive Motions are caused for the most part from the Brain and Nerves, suffering by sympathy or consent, and then it is called *Convulsio Sympathica*. And this Sympathy is either by their plain suffering together in respect of their likeness in substance and office, and their vicinity or nearness; or from an evil quality, or poisonous air sent to the original of the Nerves. And it is often caused by consent from the mouth of the stomach through an æruginous or rust-like Cholera, through worms, poison or other sharp matter which gripeth; and also from consent with the womb, as it happeneth in Hysterical passions, or the Mother.

DIAGNOSTICK. The Diagnosis or knowledge of a Convulsion is easily learned from those things which we propounded in the beginning of this Chapter: For in a true Convulsion the part is contracted, stiff and unmoveable, that it cannot be bent at the pleasure of the Patient; but in a Convulsive motion the part is shaken and tossed hither and thither.

PROGNOSTICK. As to the Prognostick; A Convulsion which is in many parts, especially those near the Brain is dangerous; as also that which is in the Muscles of the Breast, which giveth us to fear a suffocation, by reason of the shortness of the Patients breathing.

A Convulsion coming of too much bleeding or purging, is deadly, as *Hippocrates* saith in his *Aphorisms*: for as *Galen* sheweth in his *Comment*, that such a Convulsion comes of emptiness; but it may so fall out as it may come of irritation or provoking by the motion of sharp and cholerick humors to the Nervous parts, or of the malign quality of a venomous Medicine, as it happens after the taking of Hellebore.

A Convulsion from a Frenzy is deadly. *Asius* affirmeth, That he never heard of, nor saw any so taken, that recovered.

It is better that a Fever follow a Convulsion, than a Convulsion a Fever, *Aphor. 37. Sect. 2.* for a Fever coming upon a Convulsion, takes away its cause; but a Convulsion coming upon a Fever, shews a malignant matter which threatneth death.

Whosoever are taken with the *Tetanus* or Cramp so called, die within four days; but if they continue longer they are cured, *Aph. 6. Sect. 5.* for that the great stretching of all the Muscles hinders breathing, so that they are suffocated. And we must observe, that a Convulsion is not the cause of death in respect of what is done to the Nerves; for a Palsy coming of the like cause continues many years; but in respect of the suffocation it brings by the Convulsion of the Muscles ordained for breathing.

The

CURE. The Cure of this Disease is divers, as the Cause is divers.

That which comes of Emptiness is seldom, and incurable, therefore we shall not insist upon the Cure of it. Authors do prescribe all kind of moistening Medicines, and opening ointments. That which comes of provoking or irritation, is from other Diseases, and is comprehended under the Cure of them. It remains therefore that we treat of the Cure of a Convulsion by Repletion, which when it comes of Flegm and Wind, must be cured by removing of them. This is done first by blood-letting if it abound, and the party be strong; but it is better to take too little than too much; for blood is an Enemy to that principal Cause, which is Flegm.

After blood-letting, or being omitted if need do not require, you must purge with Pills which are strong (but have an eye to the Patients strength) according to those forms in the first Chapter, you must add to them three grains of Castor.

If the Patient will not take Pills, he may take Potions, Powders, and other Medicines prescribed in the first Chapter.

After purging, if you have not let blood before, apply Cupping-glasses with Scarrification, otherwise without: first to the remote parts; then to the parts near the part affected. But if the Thighs or Legs have a Convulsion, apply them to the Buttocks and Loyns: if the Arms, to the Neck and Shoulders, labouring always to bring the humor back to its original.

You may also with profit apply a Veficatory to the parts opposite to that which is affected.

After the first purging, the matter is to be prepared with an Apozeme, prescribed in the Cure of the cold distemper. Make it purging, if strength and other things will permit; otherwise leave out the Purgatives.

The Apozeme done, give him Pills again, putting Castorium to them, and to all his Purges.

If you use only an altering Apozeme, which changeth the humors, you must in that time give several sharp Clysters, such as are prescribed in the Chapter of sleeping Diseases.

Also anoint the part with this Liniment.

Take of Ointment of Marsh-mallows six ounces; Oyl of Turpentine and Camomel, of each one ounce; Oyl of Spike three drams; and of Foxes half an ounce; Liquid Storax two ounces: Anoint the part and Back-bone often therewith.

Take of Oyl of Dill, and Chamomel, of each one ounce; Unguentum Martiatum half an ounce; Oleum Petroleum and Spike, of each one dram; Spirit of Wine three drams.

Ducks or Goose-Grease prepared as followeth is much commended.

Take a Goose or Duck that is fat, pluck it and draw it; then fill it with these things following:

Take of Sage, Marjerom, and French Lavender, of each one handful; Gum Ammoniacum and Bdellium, of each one ounce; Calamus Aromaticus, Nutmeg, Mace, and Cloves, of each half an ounce; Beat them in a Mortar, and moisten them with the Oyl of Earthworms; after, put them into the Belly of the Goose sewed well together, and roast it upon a Spit. Receive the Dripping into a Vessel half full of Vinegar, and anoint with it.

But it is stronger thus:

Take of the Dripping aforesaid six ounces; the Chymical Oyls of Wax, Nutmeg, and Sage, of each two drams.

After you have anointed, you must cover the part affected with a hot Sheep-skin; and when it is cold, if you have not a fresh one, make it warm again with oyl of Dill, or the like hot oyl.

We apply succesfully to the part affected, the hot Lungs of a Sheep, as also young Pidgeons, Whelps and Chickens slit in the middle.

Put the part affected into an Oxe or Sheeps Belly, or other great Creatures newly killed, and let it remain there while it is warm.

Baths of Head-herbs are good, putting to them a third part of oyl, or anointing afterwards.

Some commend this Emplaster:

Take of Colophony two ounces; Rozin and Pitch, of each one ounce; Frankincense, Mastich, Ceruss, of each half an ounce; Sanguis Draconis, common Salt, Ammoniacum and Turpentine, of each two drams; new Wax two ounces, white Vitriol two drams, Mother of Pearl two ounces, Load-stone half an ounce, yellow Amber one dram and an half; Oyl of Eggs and Roses, of each two drams. Make a Plaister upon Leather.

Baths coming of Brimstone are excellent, especially in constant Convulsions. Also dry Baths of the fume of the Decoction of Sage, Rosemary, Stœchas, Chamepitys, or Ground-pine, Origan, and the like, in white Wine sprinkled upon the stones fire-hot, or Iron.

It is very good to foment the hinder part of the Head and the Neck with hot *Aqua vite*.

Penotus doth wonderfully extol the following Medicine for quite curing of a Convulsion.

Take Oyl of Turpentine half an ounce, Oyl of Cloves six drops, of the Mucilage or slime of Briony, so much as is sufficient to make a Liniment. Anoint the part affected, and the root of the Nerve which comes unto it.

Others say, they quickly cure a Member with the oyl of Turpentine, of Wax, Chamomel, and the like, mingled with the Spirit of Salt.

The following Liniment is very powerful:

Take old Butter, and Bacon, of each a quarter of a pound; Bdelium, and Ammoniacum, of each one ounce; Myrrh, and Castor, of each two drans; Stachas and Rosemary flowers, of each one pugil: Nutmeg and Cloves, of each one dram; a Kitten or young Cat, flead, bowelled, and cut in pieces. Stuff a Goose with these, and roast her; cast away the first dripping which is watery, the next which is fatty receive in a Vessel half full of Vinegar. Anoint the parts affected, and the Back-bone therewith.

Sometimes the pain is so intolerable that it must first be cured: For which this is good;

Take of Oyl of Violets, Lillies and Chamomel, of each an ounce and an half; Oyl of sweet Almonds, Mastich, and Roses, of each one ounce.

If you will have stronger, make this Bath;

Take of Marsh-mallow Roots, and Lillies, of each one pound and an half; of the Leaves of Origan, Violets, Mallows, Sage, and Wormwood, of each two handfuls; Linseeds, and Fenugreek, of each one pound: Boyl them for a Bath, in which let the party sit not long, but come out as soon as he finds ease: It is sufficient if the parts affected be only bathed therewith.

Others make Baths only of Oyl, and if the Patient be rich, then boyl a Fox or two in it.

While these are doing, purge the Head with neefing and chewing described in the first Chapter.

As also you must strengthen with the Cephalick or Capital Opiate, Apoplestick water, Treacle, and the like.

Rondeletius speaks thus of his water of Swallows; A water made of Swallows and Castor, presently cureth a Convulsion coming of Repletion: You may find the description of it in his Chapter of the Epilepsie.

CHAP. VIII.

Of the Epilepsie, or Falling-sickness.

THe Epilepsie is a Convulsion of the whole body, not continually but by Fits, with a hinderance both of the Mind and Senses.

The word Convulsion, is not here taken properly and strictly for a true Convulsion; but improperly, for a Convulsive Motion: For an Epilepsie is a Convulsive Motion, not a true Convulsion. But we keep the name of Convulsion in imitation of Galen, who calls an Epilepsie always a Convulsion.

DIFFERENCES. This Definition is taken out of Galen, 3. de loc. aff. cap. 7. and lib. de diff. sympr. cap. 3. and defines a perfect Epilepsie, in which all the body is contracted, and all the Senses both internal and external are abolished. Yet there are imperfect Epilepsies, in which only the Head, or Arm, Leg, and Thighs or half the body is only contracted. There is also an Epilepsie in which the mind remains sound, and the external Senses, and also the voluntary motion of some parts. I saw a Nun, which in her Epileptick Fits had divers contractions, sometimes of the Arms, then of the Legs, sometimes of the Head, afterwards of the whole body; yet she saw those that stood by and spake, nay, she also endeavoured a voluntary motion against the Convulsive, so as she did in a manner diminish the involuntary motion: sometimes she was in a small fit only, and walked about her Chamber, but with a disorderly motion, leaping and using strange antick postures, by which she caused the rest of the Nuns to be very merry, and she at that time laughed with them, and spake when she pleased.

CAUSES. Every Convulsive motion (as I said in the former Chapter) cometh of provocation, which proceedeth from the quantity or quality of the matter. The quantity of the matter which causeth the disease, burdening Nature, stirs her up to expel that which is troublesome to her. Whence the Opinion of Galen is confirmed, which is so disputed by late Physicians, that an Epilepsy comes of an imperfect obstruction of the Ventracles of the Brain; for if the humor obstructing or stopping is burdensom to Nature, the Brain will labour to expel it. In the quality there is no difference, for all agree in this, That the expulsive faculty is stirred up by sharpness and acrimony, and by any quality which is offensive to Nature.

The Causes stirring up or provoking are either contained in the Brain, and make a proper Epilepsy, or come from other parts, and so make an Epilepsy by consent or sympathy.

And that provoking or irritation makes an Epilepsy, when the Brain labouring to expel that which is offensive shakes it self, and by consequence all the Nerves which are adjoynd to it.

There

There is in *Galen*, and almost all Authors, a threefold Epilepsie. The first is that which hurts the Brain in which the Disease is: The second is that which hurts the Brain by consent from the Stomach. The third is when the Disease is sent from other parts of the Body to the Head. And these have their proper names: The first, as being chief, is called *Epilepsia*; the second *Analepsia*; the third *Catalepsia*. But (by *Galen's* leave) that division is superfluous, and in vain is that Epilepsie which comes from the Stomach separated from those which comes by sympathy from other parts; when all ought to be called *Sympathica*, or Epilepsies by consent. Neither is it sufficient to say, that an Epilepsie from the Stomach is distinct from others, because it is most frequent, since that which comes from the Stomach and Spleen, is as usual and as frequent, if not more.

Therefore we divide an Epilepsie into a proper one, and one by consent. Again, we subdivide that which is by consent according to the divers parts from whence these sharp and malignant vapors are sent to the Brain, for there is almost no part in the body from which a malignant vapor cannot be sent. Two Stories are related by *Galen* in the place quoted; the one of a Boy of thirteen years old, who at the first had the Epilepsie in his Leg, after that it ascended into his Thigh and Bowels, and by the sides into the Neck till it came to the Head, which at first touch made him not able to stand. Another is of a Youth, who in the beginning of his Fit perceived as it was a cold Air to ascend. But it is remarkable and well known, that an Epilepsie comes for the most part from the Guts, the matter that breeds Worms, from the Matrix and other parts, and it is confirmed by many Authors.

Therefore it is manifest from what hath been said, how *Galen's* Opinion may be defended, who affirms, That a proper Epilepsy comes of an imperfect obstruction of the ventricle of the Brain; which we cannot defend to be the constant cause, *Galen* seems to grant who lays down no other: but we are rather forced to confess, that it is less usual than the rest.

Nor do the Arguments brought against *Galen* any way convince, the chief whereof are these:

First, as *Fernelius* saith, If an Epilepsie comes from plenty of humors, it would come most in the sleep, at which time there is plenty of humors. I answer, That the humor of which sleep is begot, is in the substance, not the Ventricles of the Brain, and therefore doth not stir up the expulsive faculty which resideth most in the Ventricles.

Secondly, *Fernelius* saith, That because an Epilepsie is quickly dissolved, it should turn into a Palsey, as an Apoplexy doth when the humor is cast into the Nerves. I answer, That in an Apoplexy, by reason of the weakness of the expulsive faculty which is oppressed by many humors, they are cast into the parts adjoining: but expulsion being stronger, and more free in an Epilepsie, they are sent to those parts which are ordained by Nature for their discharge. And it is false which *Fernelius* saith, that an Epilepsie never ends in a Palsey; for we have seen a Palsey come after it. And sometimes Apoplexies at the first coming are turned into Convulsions before there be a perfect obstruction of the Ventricles of the Brain; and also many Epileptick men die by an Apoplexy, when a little obstruction turns into a total stopping.

Thirdly, Against *Galen* some argue thus: As a compleat obstruction of the Ventricles totally takes away the Functions of the Brain in an Apoplexy: So an incompleat obstruction would only diminish, not deprave the Functions, nor produce such convulsive motions as are sometimes more violent than sound Motions. I answer, That Nature being wholly oppressed by a total obstruction doth not labour for expulsion; but she hath strength enough in an half obstruction to move and stir up the Brain to expulsion. This is confirmed by the example of a defluxion falling upon the Lungs, which if it fill the whole Lungs, it makes great difficulty of breathing without a Cough, as cometh to pass in an Asthma, or shortness of breathing: But if small quantity only of humor do fall, the Lungs are stirred up to the expulsion, whence cometh a Cough.

SIGNS. The signs of an Epilepsie are of three sorts; Either they are such as signifie an approaching Epilepsie, or one that is present, or such as shew the difference of Epilepsies.

The signs of an Epilepsie approaching are twofold: Either they signifie the first coming of the Disease; or some fit to be at hand. The same signs serve for both, but most surely in those who are actually possessed therewith, do they shew the condition of it in its return; for in those who never had this disease formerly, these signs are doubtful for the most part, and may declare many Head-diseases; but all of them together may give some certainty.

Therefore all signs of an Eminent Epilepsie are to be propounded with this admonition, That all signs do not meet in all; but some in one, some in another, as the causes and constitutions do differ. But that they may orderly be laid down, we must search the Original of these signs, which flow from Animal, Vital, and Natural actions, from excrements, qualities changed, and proper accidents.

In respect of the Animal Functions, an unaccustomed disturbance of the mind and body, threatneth an Epilepsie, heaviness of the head, head-ach, vertigo, or giddiness, or much sleep, from whence the body hath no refreshment; troublesome dreams, dulness of mind, or perplexity, forgetfulness, sorrow, fear, dread, sloth, graveness of actions, snatching and trembling of the parts, dulness of the senses, a down look, clouds and other things flying before the eyes, noise in the ears, a stink in the nostrils

trills, a stiff Tongue, and its inordinate Motion, yawning, and neezing.

In respect of the Vital Function, these with others are the Signs: Anger, Beating or Palpitation of the Heart, straitness of the Breast, and alteration in Breathing.

In respect of Natural Functions, these are forerunners of an Epilepsy; disdain of Meat, or immoderate Appetite, Squeamishness, Heart-burning.

In respect of Excrements, these are Signs: Much spittle, thin and crude Urin, often Nocturnal Pollutions.

In regard of qualities and proper accidents changed; paleness of face, and swelling of the heart.

A present Epilepsy is easily known, if it be perfect; but it hath many differences which cause difficulty, as we shall shew.

In a compleat fit all the Senses both internal and external are hindered. The party suddenly falls, and the whole body, or at least some parts are diversly moved: Moreover, there is a staring and thrusting forth of the Eyes, gnashing of Teeth, a difficult breathing, as in those that are hanged; the seed, dung, and urin are sent forth involuntarily, and about the end of the fit, he foameth at the Mouth and Nose, which happeneth only in a vehement Epilepsy, and the fit being ended, he forgets all things he then acted.

Some of the Ancients make three kinds of Epilepsies: one which is like a deep sleep; another which doth shake the body after divers motions; a third which is made of both the former. The late Physicians deny the first kind, saying, That it is more like a Coma, or a Carus, than an Epilepsy; and these two Diseases cannot be otherwise distinguished, but that in a Coma is a deep sleep without a Convulsion, and a Convulsion is a certain Sign of an Epilepsy. But *Avicen* saith otherwise, namely, That an Epilepsy comes many times without an apparent Convulsion. And Experience teacheth us, That many men in Epilepsies have fits like Coma: and it's known to be an Epilepsy, not a Coma, or a Carus by this; The sleep in an Epilepsy cometh and goeth by fits, when in a Coma it comes all at once.

A true Epilepsy is distinguished from an Epilepsy by consent, thus: In the true there appears many Signs of the Brain affected; as heaviness of mind, and slowness, decay of memory, troublesome sleep with dreams, dulness of senses, slowness and idleness of body, pain of the head, and other things. Moreover, the Sick man doth not perceive the fit coming, but is suddenly taken there-with unawares, at the New Moon for the most part. The due proportion of the inferiour parts being without blemish do confirm this Sign.

But we may know whether it come from the right or left side of the head most: By this, either the sight of the one eye is more obscured, or the hearing more thick with the noise of the head on that side; or if the right or left side be more dull.

But we may know from what humor especially an Epilepsy cometh by those Signs which declare when Flegm, Choler, or Melancholy abound.

An Epilepsy by consent is thus known: There appear no Signs of a distempered Brain; the Patient perceives his Disease coming, and a Wind rising from the parts below; or some lower part is weakned, or else affected strongly in the time of the fit.

These things following do shew that the cause of an Epilepsy is in the Stomach: Disdain of meat, an inability to fast, loathing, vomiting, pain of the Stomach, gnawing, pricking, and distention; sometimes beating of the heart, which ariseth from the Stomach.

That the Disease comes from the Liver or Spleen, appears by often belching and breaking of wind, a swelling of the Belly with rumbling and noise, sour belchings, straitness of the Midriff, and pain at times, reaching of the Back, besides some distemper in inferiour parts.

An Hysterick fit, or the Mother, mixt with Convulsions, if a retaining of the Courses or Seed went before, shews that it comes from the Womb.

If the Epilepsy comes from an external part, some wind is perceived to rise from that part, and the matter causing the Disease, sometimes tickleth and beateh in the part, which is a Sign there is a fit at hand; and if that part be tyed hard, the Fit is hindred.

Lastly, The Signs of Worms shew that the disease come from them, as stinking sour Breath, itching of the Nose, pain of the Belly, earthy Excrements, grating of the Teeth, sleepiness, and the like, especially if sometimes Worms are voided.

But the extraordinary causes, as Imposthumation, foulness of the Bone, stopping of Urin, and the like, may be taken from their proper Signs.

PROGNOSTICK. As to the Prognostick, an Epilepsy is a Disease of long continuance, and very stubborn and deadly in Infants.

An Epilepsy coming hæreditary is incurable; but that which comes from external causes, and evil diet is curable.

An Epilepsy coming before fourteen years of age in Boys, and twelve in Girls, is curable: after twenty five years of age is incurable; out of *Hippocrates*, Aph. 7. Sect. 5. For in the time of ripeness

ness of Age, there is great store of Natural heat, which is powerful to discuss Diseases. Moreover, at that time women begin to have their terms, by which the uncleanness of the body is purged. Yet although *Hippocrates* supposed an Epilepsy to be incurable after twenty five years of age, yet this is not always true, for we find by experience that many have been cured after, although but seldom seen; therefore we may say that the *Aphorism* is true for the most part. A strong Epilepsy often killeth the Patient in the fit, or turns into an Apoplexy, or by reason of the strength of the symptoms, and the violent shaking of the Brain, the Fabrick of the body is overthrown. And some parts thereof are broken, and it happens sometimes that pieces of the bones called *Processus Mamillares* come out of the Nose.

An Epilepsy coming of Melancholy turns sometimes into Madness, when the humor is sent from the Ventricles of the Brain into the substance thereof.

The same humors when it is only in the Ventricles of the Brain, stopping them and paining them, causeth an Epilepsy: But when it offends the substance of the Brain, which is the seat of the chief Functions, by defiling its Natural temper, and corrupting the Animal Spirits, and darkening them, it makes a melancholy doting. Hence *Hippocrates*, (6 *epid. Sect. 8. text. 40.*) saith, that Melancholy men turn for the most part to Epileptick, and Epileptick to Melancholy. But these diseases thus change in a twofold respect; either by the change of the matter causing the Disease from its proper seat: and so when one comes, another goes, or by the Propagation of the matter, and then both remain.

An Epilepsy coming of Flegm turns either into an Apoplexy, or a Palsey.

A Quartane Ague coming upon an Epilepsy, and continuing long cureth it, by reason the matter of the Disease is by degrees consumed by the heat of the Feaver if it be of flegm; but if it come of Melancholy, it is sent from the part affected, to the place where the ground of the disease lieth, that it may supply matter to the new fits.

The Cure of the Epilepsy is twofold; the one in the Fit, the other out of it.

Physicians are seldom called to the Cure of the Fit, except it continue over long: in which case those Remedies which we laid down in the Cure of sleepy diseases, especially the Apoplectick Water, the Cinnamon Water, *Aqua Vite* and other Spirits are very proper to discuss the Fit.

Out of your Fit you must vary your Cure as the Cause requires.

And first we shall lay down the Cure of a proper Epilepsy, which consists in Evacuation of humors throughout the body, in the discussing the matter of the Disease, and rectifying its evil qualities; as also in strengthening of the Brain. And since the matter offending in a true Epilepsy is for the most part Flegm, we will direct our general Cure in opposition to that; admonishing young beginners, that if Choler or Melancholy abound, they would prepare and purge them. But the specific Remedies are always the same, of what cause soever the disease doth come.

For a perfect Cure we must thus proceed:

First give him a Potion to purge Flegm, or some other Medicines to that purpose which the Patient can best take, mentioned in the first Chapter. First giving a Clyster, if his body be bound.

After if there be signs of Repletion, or if the party be Sanguine he must be let blood; otherwise not.

Afterwards the Universal Cure of the cold distemper of the brain is to be followed with this Caution, That to the Decoction, Apozemes, Diets, Sweats, Syrups, Chewing and head Powders, you add the Root and Seed of Peony, and Mistletoe of the Oak, which all ancient Authors hold to be most proper for the Cure of this disease.

For his Diet, Guajacum is the best Sweater. By the use of which *Jachinus* reports, that he cured many; but let it be continued thirty or forty days.

To every Dose of the Sudorifick Decoction, put some drops of the Spirit of Vitriol, which is thought very proper for the Epilepsy.

You must often use the common Purges, namely, the Pills, or Magistral Syrup, once or twice a week if the Patients strength will suffer them, and continue purging for divers moneths: and sometimes use stronger Purges, as *Messaria* ordains, who saith it comes from hence that Epilepsies are not, or seldom cured, because the Physicians always give weak Medicines.

For this cause, the Chymicks use Minerals, which draw the humors from the remotest parts, but not without much danger, especially if they be not well prepared. But if good success may be expected from these Chymical Medicines, it is to be found in Mercury or Quicksilver, either by its self, or with Gold calcined in a Furnace of Sand with a long continuance of fire, watching narrowly lest any crude portion of him remain, which would make the Medicine very violent; otherwise it will work gently, if given in the quantity of four or five grains in Cochie Pills, or any extract that purgeth flegm or all humors.

A new Epilepsy is sometimes cured with salt of Vitriol; as *Angelus Sala* saith, That he hath cured at thrice taking of it, an Epilepsy, giving it every fourth day. And after in his 77 *Curat. Cent. 2.* he boasts

boasts that he cured a Girl of eleven years of age of an Hereditary Epilepsie, with *Stibium* calcined given only thrice.

Quercetan's Syrup of Tobacco is very good for the Cure of the Epilepsy: But it is not to be used but by a wise Physician, it is so vehement.

Instead of the Opiate before mentioned, this may be used, which is more specificall:

Take of the Conserve of Rosemary flowers, Peony and Bugloss, of each half an ounce; Citron Bark candied two drams; of the Powder of Mistletoe of the Oak, Peony seeds and Elks Claw, of each half a dram; Mans Skull that was not buried calcined white, one dram and an half; Coral Pearl and Harts-horn prepared, of each four scruples: right Bezoar stone one scruple: Diamoschu dulce, Diatrion santalon, of each two scruples; old Treacle, and Confectio de Hyacintho, of each one dram: Spirit of Vitriol fifteen drops; with the Syrup of candied Citron Barks make an Opiate; of which take the quantity of an Acorn or Filbert, drinking a little Cinnamon water after it.

But this following is most powerful for the rooting out of the Disease after the Body is well purged:

Take of Conserve of Betony Flowers and Rosemary Flowers, of each two ounces and an half: Eringus Roots candied, and Mithridate of each one ounce: the Powder of Saxafras six drams: Castoreum three drams; Mans Skull not buried, and Elks hoof of each two drams: of the roots and seeds of Peony and Gith seeds, wild Rue and Pellitory, of each one dram; Oxytel as much as is sufficient to make an Opiate, of which take two or three drams.

The Opiate of *Montagnus* goes beyond all, by which many have been cured: It is made thus:

Take of the Roots of small Peony, Stachas and Pepper-wort, of each ten drams: Agarick five drams: Pellitory, Caraway seeds, Dill, Asafoetida and Aristolochia or round Birthwort two drams and an half: of the Juice of Squills and Honey, of each one pound and two ounces: Boyl the Squills and Honey gently to a good consistence; then add the Powders, and make an Electuary: of which take two, three or four drams, as age requires, continuing it twenty or thirty days.

After the use of the Epilpastick Plaster, you must apply a Velicatory to the fore-parts of the head, and a Cautery to the Neck.

But a Seton or Skein of Silk drawn through the Neck draws the Humors more strongly out of the Brain. And *Fabricius Hildanus* reports that he cured a Youth that had the Falling-Sickness every day, and had used all means he could get, in vain; and a Girl of eighteen years of age, born so, only by the continuance of a Seton.

If you conjecture that the vapors rising from the parts below and flying into the Brain, produce this disease and nourish it; it is good to apply a Caustick to the forepart of the head, avoiding the Sutures; for *Carolus Fiso* reports that he cured two by so doing. Also if the Disease come from the inferior parts, the waters of Germany called *Aque Acidule* do work wonders, and sometimes root out the Disease, if first Evacuations have been sufficiently made, and the Veins inferior have been opened.

But an Epilepsie coming from the Matrix requires a special Cure.

The Powder of Elder Berries described by *Quercetanus*, given three days together, the quantity of a dram with some Hysterical Water, is good.

If all means fail, the last Remedy is, to open the part of the Skull with a Trepan, at distance from the Sutures, that the evil air may breath out. By this means many times desperate Epilepsies have been cured, and it may be safely done if the Chirurgeon be skilful.

Let the Patient drink ordinary Hydromel, or a small Decoction of Guajacum with Peony Roots.

Let him carry a Bag about his Neck made thus:

Take Peony Roots and Mistletoe of the Oak, of each one ounce; Elks hoof two drams; Nutmegs, Cloves, and Mace, of each two drams: Rue and Hyssop, of each one dram and an half: Powder them and put them into red Sarsnet to be hung about his Neck that he may often smell to it.

After Universal Evacuations, among other Medicines you must use Specificall Medicines, which you may find in many Authors. We shall set down some of the best (besides those Opiates prescribed) which are of no small Consideration in the Cure of this Disease.

Rondeletius commendeth much the Water of Swallows, which *Quercetanus* borrowed of him in his Dispensatory. Treacle Water is of no less value, and *Aqua Cephalica*, and *Syrupus Antiepilepticus*, mentioned by *Quercetanus*.

This Root of wild Valerian is much commended by *Fabius Columna*, that (once or twice taken) it cures the Epilepsy: And he reports he gave it to many of his Friends, who affirmed, That (under God) they were cured by it. The Dose is half a spoonful in Wine, Water, Milk, or any other proper

proper Liquor; but it is given to Children in a less quantity in Milk.

The Chymists commend the Spiritual mixture, than which no better Medicine can be required (as they say) The Composition whereof is as followeth:

Take of the Spirit of Vitriol one part, Spirit of Tartar three parts: Treacle Water with Camphire four parts: Mix them, and let them stand in a glass well stopped three or four weeks.

The Dose is one dram in any proper Liquor, or Vehiculum to swallow it down with.

Rulandus used much the *Oleum ligni Heraclei* (which the Chymists affirm to be of Corolyne, or the Oyl of the Hazel-nut, or Filbert-tree.) And in his Centuries he relates some passages of them, which by the use of the Medicine were cured. The Dose is three or four drops in any proper Liquor for five days together.

The Oyl of white Amber is inferior to none, if not the best, being drawn by a good Artificer, and smelliug of no fire, but sending forth a most fragrant scent. The Dose is from half a scruple to one scruple.

The Oyl of Box-tree taken by four drops at a time, in four ounces of the water of the Tile-tree flowers with four drops of the Spirit of Sulphur for some certain days together is very powerful, and is thought by many to be the true Oyl of *Lignum Heraclei*.

Crato calls the Natural Cinnaber the Load-stone of the Epilepsie, and makes this Powder of it;

Take of Natural Cinnaber or Vermillion, which is clear, and finely powdered, half an ounce; red Coral and Pearl prepared, of each two scruples; Saffron one scruple, the Leaves of Gold five; Grind them all very finely upon a stone. The Dose is from six grains to a scruple in the time of the fit, in some proper Liquor.

The Cinnaber or Vermilion, or Antimony, which is taken after the extraction of *Mercurius Vita*, is thought by Chymists to be of no less vertue than the former: for if it be mixed with an equal weight of the Magistery of Pearl, Coral and Powder of a dead mans Skull, it is a Specificall Medicine in an Epilepsy though it be old. The Dose is from ten grains to fifteen in a proper Liquor.

The Cure of an Epilepsy by Consent is first to begin with the part affected, and that part is to be cleansed and strengthened by convenient Medicines taken out of those proper Chapters wherein they are mentioned; not omitting Specificall and Antepileptical Medicines, which are always to be used in every Medicine. But if the Epilepsy come from any external parts, besides the Universal Cure, we must have a special eye to that, and the malignant matter therein contained is to be evacuated by Cupping-glasses with Scarrification, Vesicatories and Cauteries. And if the disease continue after the Escar or Scab is fallen off, you must apply the Cupping-glasses again; and at last, when necessity urgeth, you must apply an actual Caution. If the Disease come from a foulness of the Skull, that is to be taken away with the Trepan and burning.

CHAP. VIII.

Of the Falling-sickness in Children.

BECAUSE this disease is common among Children, and useth to be very dangerous unto them, therefore we shall add a peculiar way for their Cure it self, because it is very much differing from that in elder People.

First therefore make the Belly soluble with a Suppository or Clyster.

After or about the same time, give a purging Medicine proportionable to the strength of the child. We need not fear to give of the Electuary or *Diacarthammum* two drams to a child of one year old, if the Disease come of corrupt Milk.

Take of Hiera Picra half a scruple; Pulvis de Gutteta half a scruple; Give it with a proper Liquor, or with Honey of Roses.

Apply Cupping-glasses to the Shoulders and Loyns, and with Scarrification, if the Child be one or two years old.

Apply a Vesicatory to the hinder part of the Neck.

If the Purgation have not done well, or little profited, you must vomit with the white Vitriol prepared, or with Salt of Vitriol, which may be given twice, thrice or four times if the disease increase. The Epileptick Powder commonly called *de Gutteta*, may be given often with Milk or Broth, from half a scruple to a scruple.

That Epileptick Powder is not found written in our Dispensatory, but in the Shops at Montpelier, It is usually compounded thus:

Take of Peony Roots and Seeds, white Distamnus, Mistle of the Oak, of each half an ounce;

H

Powder

Powder de Gutteta, the seed of Attriplex or Orange, two drams; the Powder of Mans Skull three drams; Red Coral prepared, Hyacinths prepared, of each one dram and an half: Elks hoof prepared half an ounce, Musk one scruple, Leaf of Gold one dram; Mix them into Powder.

Take it in a small spoonful of water against the Epilepsy; or instead thereof in Cinnamon water, or Imperial water, or with some drops of the Spiritual mixture with a proper Liquor.

Apply to the hinder part of the Head, a Plaster of *Ammoniacum*, the hair being shaven, for it hinders a Flux of humors that falls from the head upon the Back-bone outwardly.

Use this Powder to the fore-part of the Head.

Take of Nutmeg half a dram; Peony seeds one dram and an half; Lavender flowers one pugil, Amber two scruples; Make a Powder.

Or apply the strengthening Plaster prescribed in the Cure of the cold Distemper of the Brain.

Two or three drops of Oyl of Amber, with an equal quantity of Spirit of Vitriol given in Betony water, do presently free a Child from a fit of the Falling sickness. The same Oyl is good to anoint the Nostrils. Instead of Oyl of Amber, give the Oyl of Box; as also the water of Tile-tree-flowers and Betony water.

The smoak of Tobacco doth free Children from the Epilepsy, if you put in the small end of the Pipe into the Childs mouth, and blow in the smoak, or if you blow it from your mouth.

Let the Back-bone and the Members contracted be anointed with this Liniment:

Take of the Oyl of Rue, and of Earth-worms, of each two ounces: Oyl of Castor one dram: a little Aqua vitæ. Make a Liniment.

Take of old Treacle one dram: Confection of Alkermes and Hyacinths, of each one scruple: Betony, Sage, Marjerom and Cinnamon water, of each half an ounce. Mix them, and bath therewith the Nostrils, Temples and Ears. You may also give a spoonful to be drunk.

But it is better to anoint the Nostrils, Temples and Crown of the Head with the Apopleckick Balsom described for sleepey Diseases; as also the Mouth and Palate.

Skenkins in his 5 Century of Exotick Experiments, num. 85. hath this Receipt out of *George Rufner*; This is an approved Medicine in Childrens Epilepsies: Give a little fine Musk in thin Wine, twice or thrice in a day, and it will cure perfectly.

While these things are performing, you must give once or twice in a day, a Clyster thus made:

Take of the Roots of round Birthwort, of Polipody of the Oak, of Carthamus seeds, of each half an ounce: Peony and Cummin seeds, of each three drams: the flowers of Camomel and Rosemary, of each one pugil: boyl them to one pint: take half a pint of it strained: Hiera Picra three drams: Honey of Rosemary one ounce: Oyl of Rue and Lillies of each three drams.

Two special things are to be practised:

The one is the Root of wild Valerian before commended by *Columna*; which he saith he hath given powdered in Milk, and thereby cured very many.

Another is the Gall of a sucking Puppy, which is mentioned in *Vntzerus*, thus; Take a little black sucking Puppy (but for a Girl take a Bitch Whelp) choak it, open it, and take out the Gall, which hath not above three or four drops of pure Choler: give it all to the Child in the time of the fit with a little Tile-tree-flower water, and thou shalt see him cured as it were by a Miracle presently.

If the Child suck, look that the Nurfs Milk be good, let her have meat of good juyce, and light of digestion: let her drink no wine, but water, or water and Honey, and a small drink of *Sarsaparilla*.

Some Children are so subject to this disease, that it will return again after it is once cured. Nay, in some Families all the Children use to die of this Disease. Therefore you must use preventing Medicines, not only to those which are newly born, but to those also which have recovered.

First therefore to Children newly born, before they suck, give one scruple of the Powder de Gutteta mentioned before, in a little Milk, and give the same quantity thrice in two days.

It is good both for them which have been cured, and children when they are a few days old, to apply a Caustick to their Necks. But an actual Caustery is much better, which our Physicians will not use, because they abhor violent and terrible Medicines. *Rondeletius* affirms, That the actual Caustery is so used in Florence, that the women do use to apply it themselves. And this doth *Aquapendens* witness in his Chirurgical Operations, and teacheth the way of applying them in his proper Chapter of the burning of the hinder part of the head in Children.

Let the child be purged twice in a moneth with Manna, Syrup of Roses, or of Cichory with Rubarb.

Every New Moon give it a dose of the Epileptick Powder de Gutteta above mentioned.

Make a Bag to strengthen the head and a Fume for the head-cloaths; as in the cure of cold diseases of the head; and also powder its hair with the Powder before mentioned.

For the Cure of this Disease, this is a good Preservative ;

Take of Spirit of Wine four ounces ; Spirit of Castor one ounce ; Peony Roots three ounces. Let them be infused and strained. Wash the whole body of the Child with it warmed.

CHAP. IX.

Of Giddiness, called Vertigo.

A Vertigo is a false Imagination, in which all objects and the head it self seem to turn round, so as the Patient often falls to the ground, unless he lay hold on some stay at hand.

It may be objected, That in a Vertigo the Imagination is not hurt ; for if it were so, the Patients would think the objects truly turned round ; as men in Madnefs and Phrenzy do think what they imagine to be truly so. We answer, That in a Vertigo the Reason is not hurt, which perceiveth the error of the Imagination ; but in a Phrenzy, or Melancholy, the Reason is hurt as well as the Imagination.

DIFFERENCES. There are two sorts of Vertigo's ; the one simple, called in Greek *δίνος*, in which the Sight remains unhurt : the other is called *σκότωμα*, or *σκούρόδίνος*, a dark Vertigo, in which the Eyes are both darkned as it were with Smoak, or a Cloud.

In both kinds the Sight is somewhat hurt, because the Spirits which use to go directly to the Eyes, are moved out of order by the Vifive Nerve, by reason whereof the Eye doth not so fitly enjoy them. But in a dark Vertigo there is a more violent motion of the Spirits, so that they come less to the Eyes, from whence the Sight is darkned or hindred.

CAUSES. The immediate cause of a Vertigo, is the circumvolution of the Spirits coming of a vaporous matter or wind, which coming into the Ventracles of the Brain, *Plexus Choroides*, disturbs the Spirits, and makes them run round ; whence the species of the Objects brought by those Spirits are moved in like manner ; and so the objects themselves seem to be moved also the same way. But here we may doubt, since a Vertigo is the symptom of a hurt action, and every action hurt depends immediately upon a disease, how the Circumvolution of the Spirits can be the immediate cause of a Vertigo, when it can be referred to no kind of disease. To which we thus answer, A Circumvolution of the Spirits is a Disease in respect of Scituation ; for at that time the Spirits do not keep that place or position which naturally ought, but move preternaturally and amiss. And this answer hath a weighty instance : For a Disease is an affection of a true part, but Spirits are not true parts. We answer, That Axiom is not always, but sometimes true ; according to *Galen*, that which is principal and hinders the action of its self, is the true Disease : We say that the word [*Part*] ought to be taken in a larger sense, comprehending all those things which go to the making up of the body, and whatsoever hinders the action of any part, is called a Disease. So a yellow colour in the Eye hurts the sight immediately, and therefore it is called a Disease in number ; so a bitter savour in the tongue, and noise in the ears, are Diseases in number, in regard there is something in those parts besides which offendeth the actions. After the same manner is the Circumvolution of the Spirits, a Disease in Scituation or Position, for the Reason above-mentioned.

But those vapors are sent up from evil humors, not continually without intermission, but by the compass and going about, and at a distance, namely, as often as they are raised up by an external cause ; and the humors are such as use to produce vapors, namely, Blood, Choler, Flegm, and Melancholy, and the watery humor ; because both a cold as well as hot vapor may cause a Vertigo ; as *Galen*, 3. de loc. affect. Chap. 8. and Comment. Aphor. 23. Sect. 3.

These evil humors are either contained in the Brain, or in the inferior parts. Hence a twofold Vertigo ariseth, one proper, the other by consent.

Waterish and flegmy humors heaped up in the Brain send wind and vapors to its Ventracles, which stirring about there, do cause a Vertigo. And so a proper Vertigo comes to be a fore-runner of an Epilepsie or Apoplexy.

But humors contained in the inferior parts, especially the Stomach and the Spleen, do easily send up vapors to the head, which if they touch the Ventracles and the Arteries, cause a Vertigo.

The external causes are all such things as will quickly dissolve the humors, and turn them to vapors, or make an inordinate motion in those vapors. Among which are reckoned by *Hippocrates*, Aphor. 17. Sect. 3. a South-wind, and sudden change of Air. To these add the heat of the Sun, windy Meats, Garlick, Mustard, Radish, Pease and Beans, Drunkenness, Gluttony, immoderate Exercise, and unseasonable, the suppression of a wanted evacuation, anger, Baths, hunger, especially in those which are full of bitter Choler, often turning of the body round, long looking upon Wheels and things

things that run round, and of Waters that run swift, looking down from a high place, a Fall, a stroke upon the Head, a Fracture, or depression of the Skull, compressing and lying upon the Brain.

DIAGNOST. We shall lay down no Diagnosis, or general signs to know this Disease by, because it is of it self manifest. Yet in particular we shall declare those signs which shew the part affected that containeth the mine or matter of the disease; as also those which shew the humor offending.

Pain of the Head shews that a Vertigo cometh from a disease of the Brain, which is a true or proper Vertigo. Also heaviness, and the loss of some sense; as dimness of sight, noise in the ears, thicknes of hearing, decay of smelling and tasting; the beating of the Arteries of the head when other parts are free.

The signs that shew what the matter is that offendeth, are these; That abundance of Flegm offendeth, is signified by a dulness of the internal and external senses, heaviness of the head, slowness of motion, drouziness, much spitting, want of appetite, want of thirst, white Urin and crude with the other signs of abundance of flegm.

But watchings, wrath, nimbleness in actions, thirst, bitterness of mouth, quickness of pulse, a thin and yellow Urin, and the like, shew that a Cholerick matter offendeth.

The signs of a melancholy matter are, fear, sorrow, troublesome thoughts, much watching, fearful dreams, sour belchings, and the like.

The signs of blood abounding, are stretching of the Veins with fulness, redness of face, and heat, beating of the Temples, heaviness and distention in the head, long sleep, dreams of red things, weariness, retching, thick and red Urin, sometimes thin and transparent by the ascension of blood into the head.

A Vertigo by consent is known by the want of those Symptoms which come from the Head, when any disorder is found in the Brain, but rather some part beneath is sensibly hurt.

These things shew that a Vertigo comes from the Stomach, want of appetite, loathing, sour belchings, pain of the Stomach, or swelling with Wind.

That a Vertigo comes from the Liver, Spleen, or Matrix by consent, the same signs declare which were laid down in an Epilepsie by consent coming from the same parts in the Chapter foregoing.

PROGNOSTICK. The Prognostick or foreknowledge of this Disease, is thus:

A new Vertigo that comes but seldom, and which comes only from external causes, are more light and easier cured: On the contrary, that which is old and comes often, turneth for the most part into an Epilepsie or Apoplexy.

A Vertigo in an old man is most dangerous, because his Brain is colder and weaker, and Flegm doth more abound.

A Vertigo in which not only external things, but also the Head and whole body seem to be turned about, and which happens with hurt to the sight, is more dangerous, for it signifies greater force in the cause of it; and if the sick man falls to the ground, it foretels an Epilepsie or Apoplexy.

A Vertigo coming of hot humors, is sooner dissolved than that which comes of cold, because hot humors are sooner dispersed.

CURE. The cause of the Vertigo is much like that of the Epilepsie, because both Diseases come almost of the same causes: whence it comes that a Vertigo often turns into an Epilepsie. But because a Vertigo is a lighter Disease, it doth not need to many Medicines as an Epilepsie: but they will serve, which we will here lay down; and also we shall demonstrate in short what is that which this Disease most properly requireth for its Cure.

In the first place, Therefore if blood abound in the whole body, or in the head, you must open a Vein, and let the blood out by degrees, giving before a Clyster that is somewhat sharp.

After that, give the ordinary Purge which is prescribed in the Cure of the cold distemper of the Brain.

Afterwards we must come to the particular Evacuations of the Brain, by Errhines, Sternutatories, and Gargarisms, or Apophlegmatisms mentioned in the first Chapter.

Cupping glasses dry, and with Scarrification; Frictions of the extreame parts, and opening of the Hemorrhoids are to be used for to cause revulsion.

Apply Vescicatories and Cauteries for derivation, and at last use those things which strengthen the Brain, and disperse vapors and humors as well externally as internally, as Opiates, Powders, and Bags that are described in the first Chapter.

And you must not omit the digestive Powder, because the weakness of the Stomach often causeth this Disease.

And lastly, You must use those Medicines which are esteemed by special quality to cure the Vertigo; such are those which were prescribed for the Cure of the Epilepsie; namely, Antepileptick Waters, a Balsom to anoint the Nostrils, Temples, and Crown of the Head, Oyl of Amber, Powder of Cinnaber, and many other.

Moreover, *Quercetanus* in the twentieth Chapter of his Dispensatory, commends a Medicine made

made of Peacocks dung, whose preparation and manner of use may be seen in the Author.

If the Disease do obstinately resist the propounded Remedies, you must fall to a Diet of the Decoction of Guajacum.

A Caustery in the fore-part of the Head, is much commended by *Zacutus Lusitanus* in his First Book of Admirable Practice, Obs. 38. in these words; *A certain man was so troubled with a dark Vertigo, that his Brain did almost continually seem to run round: and when he had tryed many Medicines, and there was fear of an Apoplexy to follow; with no other means (besides general and particular Evacuations, and Fontanels or Issues in divers parts, and a Seton in the nape of the Neck) could be cured, but with a Caustery in the fore-part of the Head; by which only (beyond the expectation of Physicians) I have cured many of the Falling-sickness, letting them run a long time.*

CHAP. X.

Of Tremor, or Trembling.

T*remor* is called *τρόμος* in Greek; it is a voluntary motion depraved, by which the Member is sometimes elevated, sometimes depressed, through the mutual contention between the faculty, and the part affected.

It is called a depraved motion, from *Galen*, 2. *de sympt. caus.* chap. 1. and he says the same in his Book of the Difference of Symptoms, Chap. 3. but he seems to contradict himself, when in his Book of Trembling, Chap. 4. he reckons Trembling among the motions which are diminished. But that contradiction may be reconciled, by saying, that motion may be considered two ways, either in respect of it self, or in respect of the faculty: If it be considered in respect of it self, it is depraved, because it is not in that manner it ought to be; if it be considered in respect of the faculty, it is a diminished motion, because it comes from a faculty so weak that it cannot produce motion strong enough. But one may instance, That the action is always diminished when it comes from a weak faculty, but never depraved. I answer, That it is true, if all the actions depend upon the faculty; but Trembling comes partly from the faculty, partly from the heaviness of the part; therefore it is a depraved motion.

The moving faculty desireth to lift up the Member, and to keep it in that Position; but the weight of the member presseth it downwards, whence comes a trembling motion.

CAUSES. The mediate Cause of Trembling, is weakness of the motive faculty, or rather of its nearest Instruments, that is, the Animal Spirit, which is not able to exercise a voluntary motion perfectly.

The Spirits are made weak, either by a fault in themselves, or by a defect in the Nerves, which are the Conduit-Pipes by which they are carried, do act.

The fault is in the Spirits, either when they are but few at the first; or when they are afterwards dissipated.

They are few at the first, either by reason of the cold distemper of the Brain, as in old men, or through the want of vital Spirits, which are the matter of which the Animal are made.

The Spirits are dissipated from many external Causes, as immoderate Evacuations, much use of Venery and unseasonable, great pain, and constant fasting, sorrow, and long violent Diseases.

The Spirits are hurt by defect in the Nerves, and are weakened either when the Nerves are too cold, or are infected with a malignant quality, or obstruction, or compressed.

They grow too cold, either from cold Air, from use of cold meats, or much drinking of water, swimming often in cold water, and the like.

They are infected by the use of Opium, Henbane, Poppy, and the vapor of Quick-silver, as it is seen in Goldsmiths, and them which have the French-Pox, and have been cured with the fume of Cinnaber. So in malignant Feavers tremblings come also (which are rather to be accounted Convulsive motions) and also they come from the provocation or irritation of the nervous parts.

They are stopped not wholly, as in a Palsy, but much less, but by the same Cause, namely, a watery humor gently sprinkled upon the Nerves, which is produced of gluttony, drunkenness, and other Causes.

Lastly, Trembling may come from compression of the Nerves, when excrementitious humors abounding in the whole body do compress the Nerves, and hinder the free passage of the Animal Spirits.

Hercules Saxonia, besides the causes mentioned borrowed from *Galen*, acknowledgeth another Tremor coming of wind; and *Cardanus* another from pain in nervous parts. But they are deceived, because the motions produced from those Causes are to be referred to Palpitation, or Convulsive motion.

There

There is no need of Signs in this disease, because trembling appears of it self: But the Cause that produce it, are to be known by their proper Signs; as also we must search for those external Causes which went before.

PROGNOSTICK. As for the Prognostick. Trembling of it self is not dangerous; but if it be in old people, it continueth with them till they die. But it may be deadly by accident, in as much as it usually goes before a Palsie or an Apoplexy.

CURE. You must cure Trembling as you do cure the Palsie, and therefore we shall not make vain repetitions of Medicines.

C H A P. XI.

Of a Phrenitis, or Phrenzy.

A Phrenzy is an Inflammation of the Brain and its Membranes, with a continual raving, and a sharp constant Fever.

By the word *Inflammation*, we understand a true Tumor, which is commonly called a contracted Inflammation, coming of blood out of the Vessels falling upon the substance of the part; for the blood being hot and Cholerick, and in the Membranes or substance of the Brain, causeth a true *Erysipelas*, or an *Erysipelas Phlegmonodes*, or *Phlegmon Erysipelotodes*.

By *Delirium* or Doting, we understand the erring of Reason, for we suppose that fault cannot be in the Imagination alone, without a fault in the Reason, in a Phrenzy; whatsoever others think, we are led by the Authority of *Galen*, who in his Book of the Differences of Symptoms, chap. 3. gives an example of one *Theophilus* a Physician, who thought Fiddlers sate continually in a corner of his house playing, and believed that he saw them sometimes standing, sometimes sitting, and cryed continually that they should be cast out of doors. And *Galen* saith, That in him the Imagination was hurt without the Reason. First therefore we may say, that *Theophilus* had not a Phrenzy; for *Galen* doth not say that he had, but speaking of a *Delirium*, (which *Theophilus* had) therefore it was rather melancholy, because they sometimes are in one object, and discourse well concerning other: so saith *Galen* of *Theophilus*, that he had wisdom in other things, both to discourse, and to know his friends. But we say further of *Theophilus*, that not only his Imagination, but also his Reason was hurt, because he really thought the Fiddlers were there, and desired they should be put forth: For when the Imagination alone is hurt, the Reason being not hurt acknowledgeth the error of Imagination, as in a Vertigo, in which the Patient thinks all things run round; but Reason knoweth that it is not so indeed, but that Imagination doth err.

Nor is the Opinion of *Eustachius Rudius* to be received in this case, who saith, that it never comes to pass that the Imagination should be hurt, the Reason being sound, because Reason worketh upon Phantasms received from the Imagination, and therefore if foolish Phantasms are offered to the Reason, he thinks it necessary that the Understanding beholding those foolish fancies, should also be foolish. And hence *Eustachius* gathers, that the Imagination is not depraved; but there is a meer and simple deceit of the sight. We may say that the Understanding doth run from one thing to another, and is busied about those Species which are retained in the Memory; and though the Fancy presents absurdities to the Mind, yet the Species before received are still retained in the Memory, and are presented to the Reason, it can know and correct that mistake of the Fancy; namely, if it judg that those absurd fancies which are brought to it by a depraved Imagination do neither agree with time, place, or other circumstances which still remain in the Memory, and are known to be true. So in a Vertigo, Reason being in order judgeth that it is impossible that Roofs, Walls and Pavements, should turn round, and therefore they are falsely represented to the Imagination. So the Philosopher that was bit with a mad Dog, and his Imagination began to decay, going into a Bath, perceived the false Image of a Dog therein; but Reason being sound reproved the error of his Imagination, and made him speak thus; What hath a Dog to do in a Bath? and presently he cast himself into the Bath, by which means he was delivered from the danger of a Disease called *Hydrophobia*, or fear of Water.

DIFFERENCES. There are two kinds of Phrenzy; namely, a true Phrenzy, which is laid down in the Definition above-mentioned. Another which is called *Paraphrenitis*, or a Bastard-Phrenzy.

A true Phrenzy is sometimes in the Disposition, which is most usual, sometimes in the Habit, which is called *Hectical Phrenzy*, in which the cholerick humors are strongly fixed in the Brain, and possess many parts thereof, sticking thereto like a Tincture or Dye.

A *Paraphrenitis*, or a Bastard-Phrenzy is, when a hot distemper is communicated to the Brain, either from the whole body (as in burning Fevers) or from some part inflamed, as the Stomach, Liver,

Liver, Lungs, and especially the *Diaphragma* or Midriff, which by Inflammation doth produce a Disease very like a Phrenzy; namely, a continual Dotage called *Delirium*; which cometh to pass by the great consent which is between the Brain and the *Diaphragma* through the Nerves that come thither, and by the perpetual motion of the *Diaphragma* or Midriff, by reason whereof continual vapors are sent to the Brain.

CAUSES. The Cause of a true Phrenzy is Cholerick blood, to which there is joyned also excrementitious Choler, and this produceth a greater or less Phrenzy according to its divers degrees; namely in heat and adustion. So a pale Choler produceth the mildest Phrenzy, and an adust or burnt Choler stirs up a Bestial Phrenzy.

But when the Brain is inflamed, and the Membranes thereof, the Cholerick blood is out of its Vessels, and shed abroad into the substance of those parts; which is done two ways, either when the Brain is principally affected; or when it is affected by Sympathy.

The Brain is primarily affected when it doth immediately grow hot from an external cause, as from the Sun-beams, drinking of Wine, Wrath and the like; so that the blood which is contained in the Veins of the Brain is moved and carried out of its Vessels; and this may come from a wound or stroak, or contusion of the head: And a Phrenzy so coming may be called a primary or principal Phrenzy.

But a secondary Phrenzy is that which follows burning and malignant Feavers, when a part of that humor which causeth the disease, is carried to the head.

It followeth many times in these Feavers, That Nature being disturbed by the malignity of the Cause which maketh the Disease, sends some portion thereof to some flesh between the skin and the bone; whence we see Plurisies, shortness of Breathings, Quinseys, Hypatitides or Inflammations from the *Vena Porta* and other parts, to follow these Feavers: So if these humors are sent to the Brain, they make a true Phrenzy, and then the Fever goes before the *Delirium* or Doting. But in primary Phrenzies a *Delirium* appears with the Fever from the beginning.

SIGNS. The Signs which declare a Phrenzy to come are these, Watchings, troublesome sleep, much talk, and urine that is first thick, and after thin and perspicuous, heat of the head: for these declare that hot matter is carried to the head; the eyes are altered, because (the Brain being hurt) they want the animal Spirit. There is a pain about the hinder part of the head, because the jugular veins are carried to that part, and send forth the Cholerick blood.

These are the signs of a Phrenzy present; a continual doting, because the Brain is always affected; troublesom watchings coming from the hot distemper of the Brain; seldom and great violent breathing, because men in Phrenzies forget to breath: for when by forgetfulness, or great trouble of the mind by many fancies which are presented to a doting imagination, and withdraw the animal spirits, Respiration or breathing is very seldom, it is made up with the greatness of the blast.

Moreover in a Phrenzy there is no thirst, or very little; albeit there are strong causes of thirst present, because the mind is sick, and the animal spirits (by reason the Brain is hurt) do not send their beams to the mouth of the stomach whereunto thirst belongeth. The Pulse is weak because the heart suffers with the brain; hard, because the *Membrana* is inflamed; quick and often, by reason of the great urging; and sometimes moist, because the Brain is affected. Moreover, there is a continual Fever, because the Inflammation of the Brain must of necessity cause a Fever. The tongue is rough, black and yellow, by reason of the Cholerick vapors which dry up its moisture.

An Heetical, or Habitual Phrenzy is known from *Hippocrates*, 1. *Prorrh. text.* 33. by small doting, and little perceived; when the sick do not speak, but lie still and seem to sleep.

But a Phrenzy or *Phrenitis* is distinguished from a *Paraphrenitis* in this; The Disease which produceth that, is sooner known than a *Delirium* or Doting; and by the increase or diminution of that, the *Delirium* is increased or diminished: and sometimes it intermits and is not constant. But a *Paraphrenitis* springing from the Inflammation of the Midriff, in which there is a constant doting, is distinguished by other signs. Namely, because in a true Phrenzy there is great and seldom breathing: but in the other, little and often. Little, because the *Diaphragma* or Midriff being inflamed, cannot easily be extended and dilated. Often, for necessity, that the smallness might be made good by the frequency. Moreover, in a true Phrenzy the voice is high, and the Patient crys out loud: in the other the voice is low, because the instrument of breathing is hindered. And lastly, in the Inflammation of the Midriff, the *Hypochondria* are drawn up (according to *Hippocrates in Coacis*) and the reason is, because the Midriff is recovered beneath with a *Membrana* coming from the *Peritoneum*: and therefore when it is inflamed, it contracts the *Peritoneum*, and with it the *Hypochondria*.

Lastly, The Signs of the Causes may be known from the predominancy of the humor in the whole body, and from the manner of the *Delirium*: For a pale Choler makes a more gentle Phrenzy: a yellow Choler makes a more violent: an adust Choler makes the most violent: But a Cholerick blood causeth the most mild of all.

PROGNOSTICK. The Prognostick of this Disease is for the most part deadly; for few escape, in regard a noble part of the Body is affected with a great Disease.

The greatest hope of recovery is when there is a Dorage with laughter, and a decrease of Symptoms, continuance of strength; as also when after the height of the Disease there happeneth some beneficial evacuation, as sweat, blood or looseness.

But these shew the disease to be deadly; the tongue quavering, and Hand trembling, gnashing of Teeth, Convulsion, a great chilnel or cold in the beginning of the Disease; as also when the Patient picketh the wooll or Straws about his bed. You may farther collect Death to be at hand by a drop of black blood flowing from the Nostrils, by white stools, white and thin urine; For all these signify a great oppression of the Brain, or a flowing of Choler from the whole body to the part affected,

CURE. For the Cure of this disease, the blood that flows to the head must be let forth, and revealed, derived, repelled and intercepted; and that which was there before must be evacuated and discussed. The distemper of that part must be corrected; the strength of it and of the whole body is to be preserved.

All these things may be done with the following Medicines:

In the beginning of the Disease, at any time of the day you must be let blood out of the Head vein, because the disease is very violent, giving a Clyster before: or if blood do much abound, out of the Liver vein: or first, out of the middle vein: and a little after out of the Head vein.

If the disease come from stoppage of the Terms or Hemorrhoids, open the vein called *Saphena* in the foot. In the next place you must open the *Cephalick* or Head vein, that you may draw forth what is received into the Brain, or what is nigh into it.

For the most part once bleeding will not be sufficient in this disease, but twice or thrice, or oftner in the begining or increase of the disease; you may adventure upon it, according to the condition or plenty of the humor, the age, temper and strength of the Patient.

If a Phrenzy taketh one that hath a constant Feaver, (as is often in the increase of Feavers, or in the state of them, when nature is out of order and disturbed by the malignity of the matter which causeth the disease, sendeth Cholerick humors to the head) you must again let blood, though you have done it before in respect of the Feaver: but you must do it sparingly, because the strength is abated by the Feaver and former bleeding. Therefore at that time open the Head vein, or if the strength will not bear that, open the *Saphena* one foot, or both; which is approved in such Diseases: neither is it less beneficial to open the Hemorrhoid veins by Leeches.

But in all Bleedings which are made in the time of a *Delirium*, you must observe this, that the Orifice be not large, for then it will quickly heal, and you must bind it up carefully, lest the Patient being unruly, cause it to bleed again; as also 'tis very good for the sudden cure of it, to lay a Plaster of Aloes, white of an Egg, and the hair of a Hare.

After Bleeding provoke sleep. For if after bleeding there comes watchfulness, the humors will be again inflamed, and the Patient grow worse.

Sleep is caused by repelling Medicines laid to the fore-head which are cooling and narcotick or causing sleep, which we shall mention hereafter.

When you cannot conveniently let blood, apply Cupping glasses with deep Scarrifications; first, to the lower; then to the upper parts: and also to the Thighs and other parts, without Scarrification.

Use Frictions in the same parts, and use Ligatures to the Legs for revulsion.

Apply Vesicatories to the Shoulders and Arms.

Give every day a Clyster made of cold and moist things: For by these the Acrimony of the humors is qualified, and they are put downwards.

And they are thus made;

Take of Marsh-mallow Roots one ounce; the Leaves of Mallows, Violets, Lettuce, Pellitory, Beets, of each one handful; the flowers of Water-Lillies, and tops of Dill, of each one pugil; Prunes six: boyl them in Barley water; to one pint of the straining add of Cassia newly drawn, and Diaprunes simple, of each six drams; red Sugar one ounce; make a Clyster.

Use no Oyls in these kind of Clysters, because they will then inflame.

You must not purge in a primary Phrenzy, such a one as comes not from another disease, but it is good sometimes to purge when the Phrenzy comes upon a continual Feaver. For if there be an evil digestion or ill juyce in the body, and the Phrenzy begin: then the matter is wandring, and is taken for that which is called *Turgent* or abounding. And therefore by the Counsel of *Hippocrates*, *Aph. 22. Sect. 1.* is to be presently evacuated.

But the Purge must be made of cold things, with gentle, as Senna, Rhubarb, Cassia, Tamarinds, Catholicon and Syrup of Roses.

Presently

Presently after blood-letting you must use repelling Medicines, which hinder the ascent of humors, and cool the head, as Vinegar of Roses made of Oyl of Roses and Vinegar, in time past, but now we use distilled waters, and juyces of Herbs with it, and we repel and cool more or less, as there is a greater or less flux of humors and Inflammation, which we must diligently observe. Therefore we will lay down many forms that in particular cases we may chuse those which are most fit.

Take of Oyl of Roses three ounces; Vinegar of Roses one ounce; Rose and Plantane-water, of each two ounces. Lay them on the Forehead shaven, and with four-folded cloaths. Or,

Take of Rose-water four ounces, Oyl of Roses two ounces, Vinegar of Roses half an ounce; two whites of Eggs: mix them together. Or,

Take of Oyl of Violets and Water-lillies, of each half an ounce; Rose, Lettuce and Honsleek-water, of each two ounces; Vinegar half an ounce. Or,

Take of the Juyce of Lettuce, Purslane, Nightshade, Penny-grass, or Venus-navil, of each two ounces; Oyl of Roses three ounces; Vinegar of Roses one ounce. Or,

Take of Oyl-Olive in which Roses are infused, one ounce and an half; new Poplar Oyntment (for the old inflameth) one ounce; Vinegar of Roses half an ounce; one white of an Egg. Beat them together, and apply them with Flax.

The Milk of a Woman which hath brought forth a Girl, with the Juyce of Lettuce and Oyl of Roses, is very excellent.

Concerning these cooling Medicines, you must observe, that they be administred warily, and with judgment, because the Brain is of its own nature cold, and a principal Member, therefore it is to be feared lest the Patient by too much use thereof should fall into a contrary Disease, as a Coma, or the like, especially if he be weak or old; and although they are used sometimes more, sometimes less, yet the extent of the time of their usage ought not to be above three days.

Moreover, Those Medicines do stick to the Face and Eyes, therefore you must lay about them a Cloth, or a little Wooll: in the forepart of the Head you must apply them to the middle of the Forehead; in the sides of the Head above the Ears; in the hinder part about the Nape of the Neck, and towards the Crown of the head: and these are in Winter to be applied hot, in Summer cold, as Galen saith, 2. de comp. med. cap. 2. But it is best in old and weak people never to apply them actually cold.

If the Inflammation cometh to the Skin, as it sometimes doth, then we must avoid repelling Medicines, especially those that are strong, lest the matter driven to the Brain should augment the Disease.

You must apply Cloaths wet in Rose-water and Vinegar to the Neck, to hinder the humors from flying into the head.

Cauticks applyed to the Legs do very well for Revulsion, or drawing down of the humor to the inferior parts.

While these things are doing, you must use all those things which do cool the whole Body, especially the principal parts both internally and externally.

Inwardly you must use Juleps, Emulsions and Electuaries.

Take of the distilled Water of Lettuce, Purslane, Roses, and wild Poppies, of each three ounces; Syrup of Violets and Pomegranates, of each one ounce and an half; Sal Prunella three drams. Make a Julep for three Doses to be taken twice or thrice in a day. Or,

Take of Lettuce, Purslane and Plantane, of each two handfuls; water-Lillies and Violet-flowers, of each a Pngil. Boylthem in Barley-water to one Pint, and being strained dissolve in it Syrup of Violets three ounces; Sal Prunella three drams. Make a Julep for three Doses or Draughts.

It is very good to put to your Juleps (besides the Sal Prunellæ) the Spirit of Sulphur, or Vitriol, for those do much allay the heat of Choler.

Take of the four great cold Seeds six drams; white Poppy-seeds two drams; Barley-water half a Pint; Lettuce and Water-Lilly water, of each two ounces; Rose-water one ounce. Make an Emulsion according to Art, to two Doses, putting thereto Syrup of Violets two ounces.

Take of Conserve of Violets and Roses, of each one ounce; Conserve of Water-Lillies and Candied Lettuce-stalks, of each half an ounce; the Powder of Diamargariton Frigidum, half a dram: With the Syrup of Violets make an Electuary.

You may also make an Electuary of white Poppy-seed beaten in a Stone-mortar, and mixt with Sugar; this may be called *Diacodium album*: this temperates sharp and hot humors, and brings rest; it is made of one ounce of Poppy-seeds beaten with so much Rose-water; after put two ounces of Sugar to it: Or make it of equal parts of each.

Outwardly you must apply cold Epithems to the Heart and Liver.

Take of Rose-water three ounces; Borage, Bugloss and Sorrel-water, of each two ounces; White-wine Vinegar half an ounce; the Powder of the three Sanders one dram and an half; of burnt Ivory

Ivory half a dram; Wood of Aloes one scruple; Saffron eight grains; Camphire six grains. Make an Epitheme for the Heart.

Take of Lettuce and Rose-water, of each three ounces; Endive and Purslane-water, of each two ounces; Vinegar of Roses one ounce; white and red Sanders and burnt Ivory, of each one scruple; Camphire and Spicknard, of each six grains: the Powder of Diarrhodon one dram. Make an Epitheme for the Liver.

Let the Liver and the Loyns be anointed with this Oyntment:

Take of the Unguent of Roses one ounce and an half; the Cerate of Sanders one ounce; the juyce of Lettuce and Oyl of Roses, of each half an ounce. Make a Liniment.

Let the Breast be anointed with suppling oyls, as oyl of Violets, and the like.

Apply Cloaths wet in Water and Vinegar to the Stones or Cods, or (which is better) let them be with Rose-water and Vinegar.

It is good to wash the Feet with an actually hot Decoction made of cold things, for it will soften those parts by its hot moisture, and make the humors descend, and its potential coldness will be communicated to all the Body, and to the Brain, especially by the Nerves, whereby sleep will be provoked. It is made thus:

Take of Violets, Mallows, Willow-leaves, Vine-leaves, Water-Lillies, of each two handfuls; the Flowers of Roses and Water-Lillies, of each one handful; Poppy-heads ten; Make a Decoction for the use aforesaid.

Fair water may suffice to wash the feet, and if the feet of the sick man be put therein when it is a little warmed for three or four hours, it frees him from his Delirium, and makes him sleep.

The same effect is wrought by Housleek beaten into a Cataplasim, and laid to the Soles of the Feet; and also by Pumpions or Gourds beaten, and so applied.

Sweet Scents often applied to the Nose cool the Brain; they are prepared after this manner following:

Take of Violet-flowers and Water-Lillies, of each one Pugil; of Roses two Pugils; yellow Sanders one scruple: Tye them in a Clout, and dip it into Rose-water, and let the Patient smell to it often. Or,

Take of yellow Sanders, Roses and Water-Lillies, of each one dram; Camphire half a scruple; put them with Rose-water into a narrow-mouth'd Vessel. Let them boyl over the fire, and after let the Patient receive the Vapor at his Nose.

But because Watchings do chiefly trouble in this Disease, you must use all your skill from the beginning of the Disease to provoke sleep. For which the repelling Medicines before-mentioned are very good, especially if you anoint the Head with oyl of Violets cold, before you apply Rose-Vinegar, which is good against Watchings and Convulsions which come in this Disease. But the Medicines following will do it more powerfully;

Take of the heads of white Poppies with their seeds, in number six; the Flowers of Water-Lillies two Pugils; beat them together, and with Rose and Lettuce-water make them like a Pulstess, which apply to the Forehead between two Cloaths.

Note, That in Medicines to provoke sleep, you must use but little Vinegar, because it causeth Watching.

Take of Lettuce-flowers one handful and an half; Roses half a handful; white Poppy-seeds half an ounce: boyl them in Water till they grow soft; stamp them in Barley-meal and Womans Milk, of each half an ounce, and a little Oyl of Violets. Make a Frontal thereof.

Take of Oyl of Violets, Water-Lillies, and new Oyntment of Poplar, of each three drams; Opium and Oyl of Nutmegs, of each three Grains. Mix them into a Liniment to anoint the Forehead and Temples.

Great Housleek bruised with Womans Milk, and laid to the Forehead, appeaseth a Phrenzy, and provokes sleep. But as soon as the Patient begins to sleep, you must take it away, lest he fall into a Coma, or sleeping Disease.

Gourds or Pumpions do the same thing with less danger.

Penotus doth extol this Epitheme.

Take of Musk twelve grains; Camphire twenty grains; red Rose-water in which Sanders hath been infused twenty ounces: Mix them. Shave the head, and wet double Cloaths therein, and apply them warm to all the Sutures of the head. When they are dry, wet them again, and continue the Application twenty four hours, and so doing you shall provoke sleep, strengthen the Brain, and wonderfully recover the Patient, except the very substance of the Brain be corrupted.

Inwardly you may give one ounce of Syrup of Poppies sometimes in his Juleps and Emulsions.

Or you may give four or five grains of Laudanum, which also given in a Clyster doth provoke sufficiently to sleep, and with more safety.

The Physician must be wary in the use of Narcoticks, or Medicines that provoke sleep; for they must

must not be given if the Patient be very weak, lest the Spirits and Natural heat be thereby extinguished.

Having sufficiently used Evacuations, Revulsions, Derivations and Interceptions, we must come to the bringing forth of the matter: And first, we must open the Forehead-vein if it appear and may be taken, not tying a Ligature about the Neck as usually they do, for so the blood will be forced upwards.

But you may with most profit open the Veins in the Nostrils, and if the Disease be any ways curable, it will be cured thus: You may bleed plentifully and betimes in the beginning of the Disease, after you have made general Evacuations. And they are opened with Bristles put up into the Nose, and pricking often therewith.

Or you may draw blood from behind the Ears, from the Nostrils, Forehead, Hemorrhoids, with Horse leeches.

Apply to the Head things that resolve, with things that repel, in that proportion, that first you use a little of the Resolvers, and as the Disease declineth, increase the quantity, so that at length you use only Resolvers to discuss the relics of the Disease. For this end we use Oyl of Camomel and of Dill mixed with Oyl of Roses.

But among Resolving Medicines, the chiefest are Creatures newly killed and applied to the head, or pieces of them; as young Pigeons, Chickens, Puppies cut along the Back, and Sheeps-lights, for they fortifie the part with their natural heat, discuss the humor, and qualifie the sharpness thereof.

Which things if you have tried one or two days, and have found no benefit, *Mercatus* teacheth to apply a Cupping-glass to the Crown of the Head, that the humors may breath through the Sutures into the Skin; and if it appear red and be swelled under the Cupping-glass to scarrifie. This Counsel he saith (if followed) will do good when all things besides fail, especially if you bath presently after with sweet Water in which you have boiled some discussing Medicines: But he adviseth that this be not used in Phrenzies that come from other Feavers, but only in that which beginneth of its self.

This Remedy is confirmed by *Zacutus Lusitanus*, who says, that he cured a most desperate Phrenzy, by applying a Cupping-glass to the fore-part of the Head with Scarrification.

Some are so bold as to apply Vesicatories or Medicines to raise Blisters to the fore-part of the Head, which they say hath sometimes had success: But this requires extraordinary premeditation before it be used.

For his drink, let the Patient use Barley-water, or water made of Sorrel-roots, with Syrup of Pomegranates, Barberies or Lemons; or let him drink this following Infusion.

Take of Spring-water two pints; the leaves of Sorrel and wild Poppies, of each half a handful; the Flowers of Borage, Water-lillies and Violets, of each half a Pugil: the Spirit of Vitriol one dram: red Sanders rasped two Scruples. Let them be infused for some hours cold, then strain them with a Cap-paper, and as much Sugar as is sufficient to make it pleasant.

There is in this Disease for the most part a stoppage of Urin, because the Patient neglecteth to make it; from whence those parts that contain it are distended, and bring so great Inflammation, that it alone is able to bring death to the Patient. Therefore you must often call upon the Patient to make water, and you must foment the place where the Bladder lieth with warm water, and drive the Urin forth by the compression of the hand. But if the Symptoms do not yield to these light Medicines, you must proceed to stronger.

Take of the leaves of Pellitory of the Wall two handfuls: Parsley with its Roots one handful: Boil them, and after they are strained, add three ounces of the Oyl of Scorpions, and foment the hairy place of the Privities therewith.

Let the remainder of this Decoction after the straining, be fried in a Pan with the Oyl of Scorpions, and applied to the same part after the Fomentation.

If you desire a stronger Decoction, add the Seeds of Smallage, Parsley, Gromwel, Sefelis, or large and broad Cummin, of each two drams.

You may also profitably apply this following Oyntment after the Fomentation.

Take of the Fat of a Rabbet and Oyl of Scorpions, of each two ounces: Smallage-seeds, Parsley seeds, Asarabacca and Cummin-seeds finely powdred, of each half a dram. Make an Oyntment.

CHAP. XII.

Of the Imposthume, and Sphacelus, or Mortification of the Brain.

THE Imposthume and Mortification of the Brain is described by few Authors, although it was observed by *Hippocrates* in his 3. Book of Diseases, and happeneth sometimes in Practice, and deluding those Physicians who are not well grounded, making them conceive it to be another Disease.

Now a Sphacelus or Mortification of the Brain is a Suppuration or corruption, or matter of the substance of the Brain, which is called a Gangrene, Syderation, or blasting of the Brain.

CAUSES. The immediate Cause whereof is an Inflammation of the substance of the Brain, which is distinguished from a Phrenzy is this: In a Phrenzy the Membranes are chiefly inflamed, and they do communicate an Inflammation to the external part adjoining; but in this Disease the inward parts of the Brain are inflamed, and the whole substance thereof is putrified; for so great an Inflammation in a most tender place and moist, will quickly produce a Sphacelus or Mortification.

The Cause of this Inflammation is blood over-heated or over-cholerick, running into the body and inner parts of the Brain.

The Primary Causes are all such things as produce hot and much blood in the whole body which is sent to the Brain, as violent Exercise, the heat of the Sun, heat of the Head by Fire, Wrath, and the like: But great Wounds do more usually produce this Disease, as also Contusions. But a Sphacelus or Imposthume coming from a Wound or Contusion, is different from the former in this: An Imposthume made by a Fall or Contusion, doth not possess so many parts of the Brain, but for the most part adhereth to one. Hence the Symptoms are higher, especially in the beginning, and the Disease continueth longer.

SIGNS. The Signs of an Imposthume or Sphacelus which cometh without a wound or Contusion, are these:

In the beginning there is a great Head-ach, which is communicated by the hinder part of the head to the Neck and all the Back; after which comes a general decay of all the Senses both internal and external, as in an Apoplexy, from which it is distinguished by the Signs hereafter mentioned.

The Patient is tossed to and fro, and cannot remain in the same place; he layeth hold with his hands upon his head, and desires to tear and scratch his face, plucking his hair: but as the Disease increaseth, his body groweth faint, and he cannot use such violence.

A most sharp and strong Feaver always accompanieth this Disease, which comes from the great Inflammation of the Brain.

Lastly, In this Disease the Patient never takes Meat or Drink, neither can you take any course to give them any thing, and therefore their strength soon faileth.

An Imposthume by a Wound or Contusion is known by these signs following:

After the Wound or Contusion is received, there is a kind of numbness and sadness in the body, the Animal Spirits beginning to be weakened by the matter which is got out of its Vessel. When the Disease increaseth, there ariseth a kind of Feaver when the matter begins to putrify, thence comes Head-ach and drowsiness; after, when putrification is increased, all the Symptoms grow stronger, the Feaver sharper; the Patient rising from sleep suddenly roareth out, and then presently lieth down again, he often brings his hand to his head: Hence it is, that many before they die do send forth filthy green matter out of their Mouth and Nose.

PROGNOSTICK. As to the Prognostick part thus:

This Disease is most dangerous, and commonly deadly, even in three days space, as *Hippocrates* sheweth in his 51 Aphorism, Sect. 7. saying, *That they who have a mortified and putrified Brain, die in three days, but if they live longer, they recover.* Galen in his Comments teacheth, that we are not to understand here by a Sphacelus, a compleat corruption of the Brain, because that is incurable, but such as is at hand by reason of the great Inflammation.

In those which recover (who are very few) there is no remembrance of things past; they can neither remember their Disease, nor any thing concerning it.

CURE. We must make great hast for the Cure of this Disease, for if we do not apply Remedies in the beginning, there is no time for Cure.

Therefore in the first beginning of this Disease, we must let blood in great plenty, and very often twice or thrice, or four times in the same day, as strength will permit; for all the hope of the Cure lieth in this only Remedy: for when a great quantity of blood possesseth the substance of the Brain which is large, soft and moist, we cannot make so great a Revulsion from thence, except we draw

draw almost all the blood in the Veins : and here that common saying of *Celsus* is to be observed ; *Many things are done well in time of sudden danger, which at other times may be omitted.*

You must also give sharp Clysters every day, that the humors which tend upwards may be brought down.

At the same time apply those Medicines of Rose-vinegar prescribed in the Chapter of Phrenzy.

For the greater Revulsion and Derivation, apply Cupping-glasses to the Shoulders and Back, with deep scarrification ; use Frictions and Ligatures to the extreame parts : First, open the Ancle-veins, then the Forehead, and the Arteries in the Temples, apply Horse-leeches behind the Ears, and to the Hemorrhoids, Vesicatories to the Neck and Arms, and other Medicines which we prescribed in the Cure of the Phrenzy.

At last, If the Disease decline, you must apply to the Head things that gently resolve ; among which, the best is the hot Lungs of a Sheep newly slain.

CHAP. XIII.

Of Mania, Madness.

Mania is *Delirium*, or a loss of Wits without a Feaver, with raging and fury.

It is distinguished from a Phrenzy, in that there is in a Phrenzy an acute Feaver coming from the Inflammation of the Brain and its Membranes ; but a *Mania* hath no Feaver in respect of its being ; but a Feaver may be joyned with a *Mania*, coming from some other Cause, but not from that which produceth a *Mania*. And therefore in a Phrenzy a Feaver is symptomatical, but in a *Mania* it is essential and original, coming from some other cause : And so is *Galen* to be understood, Book 3. *de loc. affect.* Chap. 7. where he saith, *The Melancholy Juice which is made of Choler burnt begets bestial Madness, sometimes without, sometimes with a Feaver.*

It is distinguished from Melancholy by the Symptoms which declare the Disease ; for *Mania* is with fury and boldness, but Melancholy is with fear and sorrow.

CAUSES. The immediate Causes of a *Mania*, according to *Galen*, are a cold and dry distemper coming of the black Choler which is used with many difficulties.

For if there were such a distemper in the Brain, that it would disturb the Mind, it should produce a Feaver, when a less heat than will produce a Delirium, can produce a Feaver, as appears in those that are inflamed by the Sun.

To this doubt divers Authors answer diversly : The Answer of the most solid is, That the heat which produceth a Feaver must be smoaky, that the vapors sent to the heart may cause it, and this vaporeing heat ought to be in a moist matter, such as in putrid Feavers : but in a Madness the humors are adust and burnt, so that no vapors can arise from them. In one word they say, that the heat in a Madness or *Mania*, is as heat in a live Coal, but heat in a Feaver is as heat in the flame. And this Answer is urged with a strong Instance ; namely, in an Hectick Feaver there is more consumption of moisture than in a *Mania* : yet the Feaver continueth to the absolute consumption of all moisture, even Radical also, and the death of the Patient.

Platerus being perswaded by this and other Reasons, supposeth that besides the hot and dry distemper, there is a malignant and venomous quality, which is the chief cause of a Delirium. A great probability of this Opinion is, that a raging from the Mother comes from Seed corrupted and poisoned in that part. Because Hydrophobia or fear of water, which is a kind of *Mania* coming from the biting of a mad Dog, is caused in any constitution without the mixture of Melancholy : And the disease which comes from the bite of a Tarantula, is called a kind of madness. And lastly, certain poisons do cause madness, as is reported of the Bite of a Weevil and Nightshade. Therefore it is probable that some certain poison bred in the body may be the chief cause of madness : since malignant Feavers which are very mild, and so sometimes that the Pulse and Urin is like to those that are in health, use to produce Deliriums more than burning Feavers without malignity. And Experience teacheth us, that madness happens often not only in melancholy men, but also in all Natures and Ages, especially if it be hereditary, or come from Parents : and is often cured by hot Medicines which have special virtue against it. But we must confess that this Disease is oftneft in melancholy people, because that humor is more fit to receive such poison. And *Galen* seems to acknowledge that malignity to come upon melancholy, in his Comment upon Aphor. 56. Sect. 6. where he saith, *That the Cause of a Mania is a melancholy humor, not always, but when it is burnt above measure, or when it is putrified, and hath received a malignant sharpness.* There remains yet one difficulty, That mad-men can endure the coldest Weather naked without hurt, and to be hot externally, which shews an extraordinary heat. But we answer, that this is not proper to all mad folks, for some cannot

not endure cold, but go as warm as they can. And the other are not disturbed with the external Air by reason of Custom, because from Custom there is no Passion: so we see tender Women in Winter go with naked Breasts, which are hot to the touch, albeit according to *Hippocrates* Cold is a great Enemy to the Breast.

The matter producing this Disease is contained in his Veins and Arteries, either of the whole body, or those nearest to the Brain, or in the Vessels of the Brain, and in respect of the difference of the place containing, greater or lighter symptoms do arise. Sometimes the matter causing this Disease is in the Vessels of the Matrix, as Blood and Seed corrupted; hence cometh the raging called *Furor Uterinus*.

If the matter offending be in all the Veins, or those near the Brain, there is a continual madness; but if it be shut up only in one part, the Disease hath intermission, and comes by fits.

SIGNS. The Signs by which it is known, sometimes shews the Disease to be present, sometimes that it is growing.

For the knowledge of madness to come, first consider the Natural disposition of the Patient, which is cholerick or melancholy. So in *Hippocrates*, 2. *Epid.* 5. *He who hath a Vein beating in his Arm is like to be mad, and is subject to Wrath; but he that hath it moving by degrees, is slow and stupid.* Here *Hippocrates* calleth Arteries by the name of Veins. For he doth not mean a simple but a violent Pulsation, unto which he opposeth that which is by degrees: So that the meaning of his saying is this; They who have naturally a high strong Pulse, great and swift, are inclinable to anger and fury, but they who have a slow Pulse are dull and blockish.

Secondly, You must regard the Sex, for Men are more often mad than Women; which is to be understood of the Original Disease of madness, for Women are often mad by consent from the Matrix.

Thirdly, The Age is to be considered, for madness comes oftner to young men, than to Boys and old men.

Fourthly, Mark the time of the year, It comes often in Spring, oftner in Summer, most often at the Fall of the Leaf, according to *Hippocrates* and *Galen*, *Aphor.* 20, 21, and 22. *Sect.* 3. In the Spring, the humors bred at other times, and kept all Winter quiet, are moved and stirred, and produce proportionable Diseases: In the Summer much Choler, not only yellow, but black is increased in them that are inclined to it, which causeth madness at that time; or else increasing till Autumn, the Disease comes then.

These Signs are more remote, and shew only in general a disposition to this Disease; but these following shew it to be at hand: Constant pain in the head, watching, short and little sleep, troublesome dreams, cares and thoughtfulness, frights from small causes, a rash and often fury from none or the smallest occasion, eyes not enduring light, noise in the Ears, an unaccustomed desire of Venerie, Nocturnal pollutions often, laughter unaccustomed and without Reason, much talk not formerly used, and sometimes much silence. These shew that a *Mania* is begun.

But that the *Mania* is present, you may know by the signs mentioned in the definition; namely, a Delirium without a Fever with fury and boldness; divers are the kinds of Dotage or Delirium in divers sick men, and at divers times they come according as the Cause is more or less vehement; for some have a rash madness, and seize upon every man they meet, tear their own Cloaths, sometimes lay violent hands to destroy themselves: Others are milder and tamer, and hurt no body, but speak distractedly and ridiculously, sometimes they sing, sometimes they laugh, and have divers whimsies, and Symptoms much like those in melancholy men and fools.

And from the variety of those Symptoms you may gather the variety of the Cause: For immoderate laughter, mirth and singing signifie that the matter offending is dashed with much blood: but wrath, restlessness, howling, striking, pale and yellow colour in the face, shew that Choler is in fault; but a furious madness that lays hold on all it meets, and sometimes stayeth them, comes from Choler burnt, which is called black Choler; but if this black Choler comes not of yellow Choler, but melancholy adust, the Patient looks furiously, sometimes is long silent, and then breaks forth into earnest discourse, they are unruly and untoward, and sometimes cry and lament grievously.

PROGNOSTICK. The Prognostick of this Disease is:

A *Mania* is a strong Disease, and continueth not only Months but Years, even to death, especially if it be Hereditary. All Diseases of black Choler are hard to be cured, and this especially, because the Patients will not be ruled; and take their Medicines prescribed.

A *Mania* which comes with laughter and those light Symptoms is easier cured than that which comes with sadness and fury.

That the Disease will shortly be cured, appears by Natural Evacuations, by Sweat, Stool, bleeding at Nose, or Hemorrhoids or Varices, or crooked swelling Veins appears; whence *Hippocrates*, *Aphor.* 21. *Sect.* 6. If Varices or Hemorrhoids come to Mad-men, the Disease is cured.

Bloody-flux, Dropsie, Tertian Ague or Quartan happening to a Mad-man, takes away his disease, for

for there is a remove of the humors unto the lower parts from the head, in which they produce a new Diſeaſe.

CURE. For the Cure of this Diſeaſe, the matter offending is to be evacuated, revell'd, and repell'd, the hot Diſtemper is to be corrected, the Brain and other principal parts are to be ſtrengthen'd, which may be done by the means following:

Fiſt, Let blood out of the vein of the Arm which appears moſt, but give a Clyſter before; the day after bleed again in the other Arm; and do thus often. For *Platerus* affirms, that innumerable mad folks have been cured by Chyrurgions, and others who have ſtudied the Cure, and have let them blood twenty, or twenty fix times, not only in the Arms, but Feet, Forehead, Noſtrils, Hemorrhoids, if the Veins appear there, and alſo in the Hand, or *Salvatella*. This is to be done by degrees, intermitting Clyſters, and purging Medicines here preſcribed, Cupping-glaſſes to the ſhoulders and back with Scarrification, are to be applied after the other Veins are opened; as alſo Horſe-leeches to the Temples, and behind the Ears.

And you muſt intermix Preparations and Purges proper for the matter offending when you let blood ſo often, and they muſt be continued long: for which uſe are all thoſe which we have mentioned for preparing and purging of Choler, to which we may add theſe following, as being more excellent and choice.

Take of *Lapis Lazuli* one dram and an half; *Diagridium* half a dram; the beſt *Turbith* one dram, *Senna* half an ounce; *Epithimum*, and Cream of *Tartar*, of each two drams; *Cinnamon* and *Citron* Peels, of each one ſcruple; *Saffron* half a ſcruple. Make a Powder; the Doſe to be given at once is one dram or four ſcruples, with any proper *Liquor* or *Broth*.

Take of black *Hellebore* one ounce; infuſe it for three days ſpace in four ounces of *Rain-water*: boyl them with a gentle fire to three parts; add to the ſtraining of the beſt clarified *Honey* two ounces; and take one ſpoonful in fat *Broth*. Or,

Take of the Extract of black *Hellebore* half a ſcruple; *Syrup of Violets* one ounce. Mix them for one Doſe.

All Medicines made of *Hellebore*; as the *Wine*, *Syrup*, and *Oxymel* of it are very good againſt this Diſeaſe.

Hence it is reported, That *Melampus* the Son of *Amythaon* the Phyſician, cured the Daughters of *Prætus* King of *Greece* with *Hellebor'd Wine*, when by madneſs they ſuppoſed themſelves to be Cows.

Antimony in this Diſeaſe is not only commended by Chymiſts, but alſo by all *Galenists*, both in regard it doth diſcharge *Melancholy* from the whole body, and alſo becauſe the Patients will be eaſily perſwaded to take it. The doſe is divers according to the diverſity of the preparation of it.

Baths of hot water are to be often uſed, and after every Purge.

The order of Purging Medicines for this Diſeaſe is as followeth; Fiſt, Give altering *Apozems* that purge for three or four days together after you have let blood in both Arms. After give twice in a Week gentle Potions, Powders, or a Magiſtral *Syrup*; but give ſtrong Purges only twice in a Month, letting blood conſtantly before, as is before-mentioned.

In the time of Intermiſſion, uſe Baths, preparing *Juleps*, or altering *Broths*, as alſo ſtrengthening *Opiates*.

Befides the vulgar *Juleps*, this following made of Juices is very profitable;

Take of the Juice of *Borage*, *Buglofs*, and *Paremain*, of each three ounces; *Fumitory* and *Succory-water*, of each four ounces; white *Sugar* ſix drams. Boyl, clarify and aromatize them with yellow *Sanders*; and take ſix ounces thereof Morning and Evening.

You may make *Opiates* as followeth:

Take of *Conſerve of Roſes*, *Violets* and *Buglofs*, of each one ounce; *Conſerve of Tamarisk-flowers*, *Clove-Gilliflowers*, *Candied Lettuce-stalks*, *Citron-peels* Candied, of each half an ounce; one *Emblick Myrobolan* candied, *Confection of Alkermes* and *Hyacinths*, of each three drams; the Powder of the *Electuary* called *Diamargariton Frigidum*, and *Leticans Galeni*, of each one dram; *Coral* and *Pearl* prepared, of each half a dram; with the *Syrup of ſweet-smelling Apples* make an *Opiate*, of which let him take the quantity of a *Cheſnut*, drinking after it a little of his *Julep*, or of ſome other proper *Liquor*.

Tablets alſo may be made in this manner:

Take of *Confectio Alkermes* two drams; *Species de Gemmis*, and *Diamargariton Frigidum*, of each half a dram; *Sugar* diſſolved in the Juice of *Apples*, four ounces. Make Tablets of the weight of two drams, and give one for a Doſe.

Sometimes we may try Specificall Medicines and Amulets, or things to be hanged about the neck: of which ſort *Sennertus* hath many; but we will mention only one which in a Noble Family of *Montpelior*, is accounted as an Hereditary Secret, which is this:

Take of *Balm-flowers* one handful; chop them ſmall, and infuſe them in four Ounces of the Spirit of

of Wine; then add of prepared Pearl half a dram: mix them, and give two spoonfuls at a time; while you use these things, you must with all possible Art procure sleep by Medicines both internal and external, such as you have for the Cure of the Phrenzy.

And besides external sleeping-Medicines, you must apply such Remedies outwardly to the head, which may temper and allay the vehement heat and fury thereof. And these must not only be cooling, but also more moistning and (in the beginning of the Disease) repelling.

Therefore in the beginning, Oyl of Roses, Violets, Dill and Camomel are very good: After you must leave out the oyl of Roses; but when you will cool more, you must add the Oyl of the cold Seeds and Poppies. And lastly, that they may be brought into the form of a Liniment, you may add Butter, or the Mucilage of Linseed or Fenugreek.

An Epithem thus made is very good:

Take of the water of Water-Lillies one pint; Sal Prunella one ounce; Camphire one scruple: Mix them, and apply double cloaths dipped therein to the fore-part of the head.

An Epithem of Sal Saturni, or Salt of Lead with Rose-water, is very profitable.

As also that which is formerly mentioned, made of Rosewater, red Sanders being infused therein, with Musk and Camphire.

The Chymists prefer the Balsom of Lead, and anoint the head therewith as with a Liniment.

But in the height of the Disease, it is very necessary to apply some Creature newly killed, or some part of it, and especially a Sheeps Lungs, which must be warmed again in hot water after it is grown cold.

Some use stronger discutients in the declination of the Disease, and also in the vigor of it after sufficient Evacuation; this following Fomentation is of wonderful virtue:

Take of the Head Herbs with their Flowers, as many as you think fit, boyl them in Spring-water; then take of Bay-berries, and the Roots of black Hellebore, of each as much as will suffice: beat them grossly, and sew them into a long Bag, and then let it boyl in the Decoction before mentioned.

Afterwards for nine days together, take two Pints of the Decoction, and foment the head being shaved, with double Cloaths for the space of an hour; after apply the Bag to the *Coronal Suture*, binding it about with Linnen Cloaths. Let the Patient lye down, and rest if he can: then will he purge by all the Emunctuaries of the Brain, and also somewhat by Stool; so will the filth sticking to his Skull and Brain be wonderfully dissolved, which few other Medicines can perform.

Lastly, Apply a Cautery to the *Coronal Suture*, which is much approved by *Gordonius*, who confirms the benefit of it by the History of a certain Mad-man, who had a wound in his head, with a Fracture of the Skull, and was very well as long as it was open, but still when it was healed, grew mad again.

Although the Brain be principally affected in this Disease, yet other parts are to be altered, especially the Heart and Liver, with Epithems and Liniments prescribed in the Cure of the Phrenzy.

CHAP. XIV. Of Melancholy.

Melancholy is a Doting or *Delirium* without a Feaver with fear and sadness.

It is distinguished from a Phrensie by want of a Feaver? and from Madness, by Fear and Sadness, because that comes with Fury and Boldness.

We say this Disease hath no Feaver; namely, of its own nature of its self: but a Feaver may accidentally be joyned with it. For nothing hindreth, but a continual or intermitting Feaver may happen to one in this Disease, but this Feaver will not be essentially in it, as in a Phrensie, where a Feaver is essential to the Disease.

But we may doubt how fear and sadness may be said to be the Essence of Melancholy; when we perceive that in many melancholick people there is much laughter and appearance of joy. For some laugh, some sing, some think themselves to be very rich Kings and Monarchs. We answer, That there are divers degrees of Melancholy, and divers mixtures of melancholick Humors with others; from whence come varieties of Passions, so that they who have much blood or flegm mixed with melancholy, may have joy and cheerfulness: but that Disease is not at that time a true Melancholy, but is more like Foolishness.

Also great variety of Doting ariseth from the various disposition of the melancholick Humor: Hence it is, that some think themselves to be Kings, Princes, Prophets: Others, that they are made of Glasse, or Potters Clay; or that they are Barley Corns ready to be devoured by the Hens: Some think they are melting Wax, and dare not approach the Fire: Others, that they are Dogs, Cats,

Cats, Wolves, Cuckows, Nightingales, or Cocks, whose Voyces they imitate. Others fancy themselves dead, and will neither eat nor drink. Others dare not piss lest they should drown the World by a second Deluge. Some think they have lost their heads, or some other member, or that they carry the World upon their fingers-end, or that they have Sparrows in their heads, or Serpents, Frogs, Mice, and other Creatures in their Bellies.

CAUSES. The Immediate Cause of Melancholy (that I may use the words of *Galen*) is a dark spirit or vapor very black; for when the Animal Spirits ought in their own Natures to be pure thin and transparent for the cheerful performing of the Actions of the Brain, and to cause cheerfulness if they change their constitution, and become dark and obscure, they produce sorrow and fear. *Galen* in his 2. *de sympt. caus.* chap. 6. by an example borrowed from external darkness, doth explain the matter: *Of those things (saith he) which are without the Body, we see nothing that doth more terrify us than darkness; therefore when darkness doth encompass the rational part of Man, it is necessary that that man should exceedingly fear who doth always carry about with him another cause of fear besides that which is external.*

The Cause of this evil disposition of the Spirits is a melancholick Humor, which being possessed with thickness darkness and blackness, doth infect the Spirits, and makes them cloudy and dark.

And this melancholick Humor is cold and dry, and therefore proper for fixing and condensing of the Spirits, which fixing and condensing or thickning of the Spirits must needs cause sorrow and heaviness: For if the humor be thin and hot as is black Coler, (from which comes madness) it doth rather produce fury and boldness than fear and sorrow. Therefore the immediate cause of melancholy is thickness and darkness of the Spirits Animal; but the necessary condition, and without which it cannot be, is a cold and dry distemper. But if any shall instance of an Hypochondriack Melancholy from *Galen's* third Book, *de locis affectis*, chap. 7. That it is an Inflammation in the Hypochondria, and therefore the hot distemper doth prevail: We answer, That that inflammation or burning of the Hypochondria comes from the heat of blood long retained in the Spleen and Meseraick Veins by reason of Obstructions, from whence many vapors are sent up into the Brain, which though they be hot, yet are overcome by the coolness of the Brain, and are easily brought to a cold and dry temper which is proper to melancholy. But if the heat of those Vapors be such that they spoil the temper of the Brain, and make it hot and dry, then comes madness and not melancholy. So that in Madness or Mania and Melancholy, there is this difference: that in the first, namely, *Mania*, there is a hot and dry distemper: In the other, called Melancholy, a cold and dry distemper.

The former mentioned darkness of the Spirits confirmed by *Galen* is rejected of *Averroes* in this respect, Because darkness brought upon the Animal Spirits, and the black Choler of a melancholick humor cannot infect the Internal Senses: according to that vulgar Axiom, There is nothing in the Understanding which was not first in the Sense: therefore since that black Choler, or Internal darkness was not first represented to the eyes, it cannot be perceived by the Internal Senses. We answer, That the blackness of a melancholick humor, or the darkness of the spirits doth not affect the Internal Senses under the notion of colour: but as they are somewhat besides Nature in the Brain hindring its Actions. For the Animal Spirits for the perfect performance of the Actions of the Brain, ought to be pure, thin and clear. But if (on the other side) they be impure, thick and dark, they hinder the Actions of the Brain by infecting the Species which are sent thither, even as a coloured Glass doth represent the Species of the Object to the Eye with its own tincture.

A cold and dry distemper, which is propounded for a necessary condition to this disease of Melancholy, may be opposed by this Argument taken from *Avicen* in *Fen.* 1. *Lib.* 3. *Traet.* 4. *Chap.* 18. he saith, *That Stammerers are for the most part melancholick.* But these Stutterers are very moist in temper, according to *Galen*, *Comment.* *Aphor.* 32. *Set.* 6. where *Hippocrates* saith, *That Stammerers are most subject to looseness:* And *Galen* thereupon saith, *That Stammerers have the moistest temper, as appears in Children who are most subject to looseness.* We answer, That *Avicen's* Text is not to be understood of those which are true Stammerers, which cannot pronounce the letter R, of which *Hippocrates* and *Galen* spake in the *Aphorism* aforesaid, who are of a moister part: But of those which are called *Trauli* and Stutterers, which repeat the same syllable very often before they can pronounce a whole word, which comes from their head long fancy when they strive to speak very quickly, for then the tongue foldeth its self, and is constrained to stop and stay in the production of words; And these Stutterers are of a melancholick temper.

Lastly, It may be doubted, how darkness of the Spirits should be an immediate cause of a melancholy *Delirium*, when every hurt action depends immediately upon some disease; but this tenebrosity or darkness can be referred to no kind of Disease. We answer, That tenebrosity or darkness is a disease in number, by reason that the coming thereof doth increase the number of those things which are necessary in the Brain for the performance of Animal Functions: And the instance which may be brought against this Argument, namely, That a Disease is an affect of a true part, is answered in the *Treatise of Vertigo.*

SIGNS. The proper signs of Melancholy are propounded in the Definition, namely, Fear and Sorrow, without any manifest Cause, which are found in every kind of Melancholy. But the several sorts of Melancholy are known by their proper signs: So these following signs do shew that Melancholy doth only reside in the head, namely, an evil habit of the Brain, or hot diseases going before, by which the blood contained in its Veins is torried and burned, and at last brought into a Melancholick humor. Short and interrupted sleep, troublesome Dreams, giddiness, noise in the Ears, and no symptoms from other parts, and especially from the Belly.

That this Disease cometh from the whole body, appears by a Melancholy habit of the whole body either Natural, known by a black colour, roughness and leanness; or Acquisite, coming by Cares, Labors, Watchings, course diet and the like.

That it comes from the Hypochondria, these signs declare; Heart-burning with no thirst, often spitting, four belchings and windy, Eruptions upwards and downwards, rumbling of the Guts, pain and heaviness of the Midriff, perplexity, nauseousness, sometimes insatiable appetite, heart-beating, sometimes a swelling in the Hypochondria: And other signs which shall be shewn more at large in the Discourse of Hypochondriack Melancholy.

That this Disease comes from the Womb, may be known by those which are set down in their order for the declaring of Hysterical Diseases.

PROGNOSTICK. The Prognostick of this Disease is thus:

The Disease is dangerous if Chronical, of long continuance and very fixed: For a melancholy humor, especially that which comes by Aduision and inclineth to black Choler, contemns the force of Medicines if weak, and opposeth the strongest; whence a melancholick humor is said to be the scourge and disgrace of Physicians.

But a new sprung Melancholy coming of immediate Causes, is easily cured: For *Galen* reports in his third Book, *de loc. affect. chap. 7.* That he hath often cured a Melancholy in the beginning with onely Baths of sweet Waters.

The Hemorrhoids or Piles coming upon Melancholy men, sometimes they Cure, if the Humors be cast down thither critically by Nature; for sometimes they come symptomatically, and multiply the matter of the disease in many parts.

Sometimes it is cured by flux of the Hemorrhoids, by Scabs, Itch or other diseases breaking forth of the Skin.

CURE. As to the Cure of it, from wheresoever the Disease took its Original; we must observe always two things.

First, That the whole body be freed from a Melancholy humor, and the filth of other humors; for it seldom happens that one part alone is troubled with it.

Secondly, that the main Cure be directed to the Hypochondria, because that in the Spleen and Liver there is the first generation of Melancholy, and the gathering of it is in the parts thereabout; therefore the Cure of Hypochondriack Melancholy set down by us, will serve for the Cure of other Diseases of Melancholy; for you can scarce cure the Hypochondria from the abundance of any humor, and the generation of any new, but by consequence the whole body must be cured of the same. Therefore for all diseases of Melancholy, those Remedies will suffice which are propounded in the Cure of Hypochondriack Melancholy.

CHAP. XV. Of a Catarrh, or Defluxion.

A Catarrh is a preternatural Defluxion of an Excrementitious Humor, from the head into the inferior parts. It is therefore a Symptom of the third kind, namely, a fault in the Excrements.

The substance of the Brain being large needs much nourishment; of whence comes necessarily abundance of Excrements, especially by reason of the cold and Moist Distemper of the part, which Excrements if they have only their moderate and natural quantity are received into the fore-Ventricles of the Brain, and are sent by the *Choana*, as by a Funnel to the moist Glandels, and so are spit forth every day from the Palate; but if they grow more plentiful, and yet consist in their natural condition, they are dispersed about the Brain and *Meninges*, and so are sent forth, not only by the Palate, but also by the Nostrils.

But when the Brain is affected with distemper and weakness, or is constrained to receive too much and disproportionable nourishment, which it cannot sufficiently concoct, there is great increase of Excrements. Add further (as *Hippocrates* saith) That the Brain like Cupping-glasses applied to the body, never ceaseth to attract humors and vapors from the inferior parts; hence the excrements are increased,

creased, which by their quantity and quality provoking the expulsive, and overcoming the retentive faculty, run immoderately by unusual and improper ways which they find out, to the great disturbance of the body.

Since then a Fluxion is the motion of matter from one part to another, we must consider in that as in all motions, five things: The *terminus* or place from whence, the place to which it moves, the Mover, the Moved, and the ways by which it is moved. The place from whence, is the Brain; the place to which, is some part beneath the Brain; the Mover is the expulsive faculty stirred up, or the retentive weakened; the thing moved, is an excrementitious humour; the way by which, is the Palate, Nostrils, Eyes, Ears, and insensible passages, as also the Veins, Arteries, and Nerves.

CAUSES. In the place from which, or the part which sendeth forth, we may observe two kinds of Causes; One is that which begetteth much moisture in the body, the other is that which makes the humours flow: that is called the generating, this the expelling cause.

The generating causes consist in the hindring of Concoction, which comes either from the fault in the nourishment, or in the faculty.

The Concoction of the Brain is hindered chiefly from distemper either cold or hot.

A cold distemper causeth that the nourishment brought to the Brain is ill concocted and turned into flegm; as also that the Vapours brought from the inferiour parts are not sufficiently discussed, but are turned and condensed into water.

But a hot distemper doth attract more plentifully nourishment and vapours, so that Nature cannot sufficiently discuss them.

The Concoction of the Brain is hindered through the nourishment, either when there is too much, or when it hath evil qualities; so cold, gross, and slimy meats and drinks immoderately taken cannot be perfectly concocted, and make the Brain crude and moist. So sharp and windy nourishment send many vapours to the head.

To these you may adde external causes, which use to fill the head with superfluous humidity, as Southernly Air, long sleep, especially at Noon, idle life, and the like.

Although the Brain be called the chief sending part, yet is not always the chief cause of defluxion; but for the most part the matter is sent from other parts to the Brain: for after evil humours are collected either in the Veins, or any peculiar part, as the Liver, Spleen, Mesentery, Womb, not only many Vapours are sent from them to the Head, but also the humours themselves are carried to the Head, and descend again to the inferiour parts: and the fault lieth most in the inferiour parts in the breeding of a Defluxion, whose distemper is divers; and the Obstruction also divers.

For a hot distemper of the Bowels makes abundance of vapours, from which comes Defluxion, as in a Still or Alembick: but a cold distemper by weak decoction begets crude humours, which upon the least occasion fly to the brain.

But the Obstructions of the parts of the lower belly hinder the voiding of Excrements, whence it comes that they being increased by degrees, when they cannot find their free and ordinary course fly up to the Brain. And to this doth also concur the weakness of the Brain, fit to receive these Excrements, for (as we said) the stronger parts do disburden themselves upon the weaker, and it often happens that the Brain by reason of its soft and loose substance is weakest, and can less resist than solid and compact substances.

The impulsive Causes are too much heat of the Brain or coolness, or some concoction of humours; too much heat doth extenuate and diffuse the humours contained in the Brain, and opens the Pores by which they use to flow: such is the heat of the Head with the Sun or Fire, or too much covering, smelling of hot Spices, and other passions.

Coldness doth compress the Brain, and strains forth the humour therein contained, as a Sponge is squeezed in the hand. Such change is often in Winter, and especially in sudden alteration of Air: as when a Southern Wind hot and moist is turned into a North Wind cold and dry; or when one going out of a hot place comes speedily into a cold. To these causes you may add coldness of the Feet, which by sympathy is communicated to the Brain.

Many there are who deny the aforesaid compression of the Brain by cold, because cold doth in-crastrate and condense the humours, and makes them less apt to flow; neither doth the example of a Sponge prove any thing, which will not empty it self in the Air. But this Opinion delivered by Hippocrates in *lib. de loc. in homine*, seems to be true; Fluxions (saith he) come of cold, when the flesh and veins of the Head are extended; for those when the Head is cold and contracted, bound together and excluding, do strain forth moisture. And also the flesh doth assist them, and the hairs are on end, as being every where strongly pressed; and therefore whatsoever is strained from thence falls where it is occasioned. From whence it is manifest, that a contraction and compression of the parts may be made by cold, and from thence a humour may be expressed. Neither doth it hinder that densation or thickning of humours, which is made by cold, as we said; for it may be so when the whole body is equally cold. But when the external parts are offended by sudden cold, they are pre-

sently strained, and strain the humour contained. Of less force is that argument against the Sponge, that it is not expressed by the cold air; for there is another reason to be given of living parts, whose heat and spirits fly from the fence of cold, and cause the parts wherein they are to be contracted, which cannot be in a Sponge full of water. Yet we must confess, that this is not the onely way by which a Defluxion comes through cold; for cold of the feet will produce a Catarrh, by communicating a cold distemper to the brain by the chiefeft Nerves that come through the marrow of the back bone; and this coolness goes into the innermost parts of the brain, not the external, as cold air, which affects the head immediately: therefore we may rather think in this case, that the Retentive Faculty of the brain is weakned by cold of the head, so that it cannot contain the superfluous humours which are many, but lets them flow forth.

There is also another way very usual, by which a Catarrh of a cold cause cometh, namely the stoppage of the external Pores, especially in the time wherein the body requireth most sweat. Hence it comes, that men very much inflamed, running suddenly into the cold air, are troubled with Catarrhs. So Catarrhs come to be most frequent in Autumn, because the body being made thin, and the Pores opened in the Summer, casting forth many excrements by insensible transpiration, if they be presently stopped by contraction of the body with cold, do cause humours and vapours to fly into the head and centre of the brain. So about the beginning of Autumn there are not onely Catarrhs, but also abundance of watry humours are sent forth by most men in their Urine and by Stool, which cause Fluxes of the belly at that time. But if any ask why Defluxions do not last all the Winter, when by reason of cold the Pores are always stopped: We answer, That Nature doth in Winter discharge her self by other ways rather than by sweat, namely by Stool, Urine, and Spittle. How great that Evacuation is which is usually by insensible transpiration, is pleasantly taught by *Sanctorius*, in his book *de Statica Medicina*, where he saith, That it is larger than all the sensible Evacuations put together; so that if the meat and drink of one day be eight pound in weight, the insensible transpiration will be six pound: he is very curious in this matter. What light he hath left to the finding out of Causes, and curing Diseases, I leave to be judged by the Learned.

In the part receiving you must consider the imbecillity, or other disposition to receive and attract Defluxion. In regard of weakness it is an usual saying among Physicians, That the stronger part do always lay the superfluous burden upon the weaker; as in Commonwealths the great ones lay the chiefeft burden upon the poor Commons.

Now the weakness of the parts is either Natural or Adventitious. A natural weakness comes from the softness and looseness of the parts of the Glandules and Lungs, which do easily entertain Defluxions: but adventitious weakness is from a distemper, or from solution of continuity. A cold distemper by weakning the native heat causeth the part to have less power to resist the humour flowing unto it. And a solution of continuity or wound makes the part more fit to receive Defluxions by its weakness: hence arose the use of Cauterics or Issues, because the part being thereby weakned, the humours do flow from the other parts unto it. And so the Lungs being ulcerated, receive the humours from the head, and from all other parts.

Among other dispositions for the attracting of a Defluxion heat is chiefly to be reckoned; for we may observe, that parts inflamed do plentifully attract humours. So in a Consumption many humours are drawn from the Head to the Lungs, not onely by reason of the Ulcer, but also by reason of the Inflammation. Whence *Hippocrates* speaking of a *Phthisis* or Consumption in his first book of Diseases saith thus, *The Lungs being inflamed draw humours from the whole body, and especially from the head, and the head being made hot from the body, spits forth that thick matter.*

There are two ways by which the humours are carried from the head into the inferiour parts, either internal or external. The internal way is when the humour flows from the parts under the Skull, chiefly from the Ventricles of the brain, and makes divers diseases and symptoms according to the diversity of the parts receiving, of which some have peculiar names, according to the vulgar Verses in *Schola Salerni*:

*That Rheum is call'd Catarrhus which doth fall
Upon the Breast, upon the Jaws we call
It Branchus, Coryza through the Nose doth fall.*

When the humour flows upon the Breast, the disease keeps the general name of a Catarrh or Defluxion: when it falls upon the Jaws, and *Aspera Arteria* or rough Arteries, it is called *Branchus*, *Rauco*, or Hoarseness: when it flows into the Nostrils, it causeth not onely a *Coryza* or Murrh, but *Ozæna* or *Polypus*. But in other parts it produceth various effects: if it fall upon the Nerves, it produceth a *Torpor* or Numbness, a Palsie, Convulsion, Trembling; if in the Ears, Deafness, Swelling; if in the Eyes, Ophthalmie or Inflammation, Tears, Blindness; if upon the *Uvula* or Palate, Swelling, Looseness or Laxity, or Ulcer; if in the Throat, the *Quinzy*; if on the Lungs, the *Pleurisie*, Inflammation or Imposthumation, Cough, Shortness of breath, Spitting of blood, Consumption; if into the Stomach, Vomiting, Want of appetite; if into the Bowels, it causeth *Diarrhæa* and *Dysentery*;

sentery : therefore it is rightly conceived, that the greatest part of diseases that trouble Mans body have their original from the Head.

Moreover, sometimes the humour flows from the Brain with the blood into the Veins, whence comes the disease called *Febris Catarrhalis*, when Nature is strongly moved to expel the superfluous humour, and the Spirits being thereby much disturbed are inflamed, and cause a Quotidian Fever: hence it is that a Defluxion is reckoned among the Causes of a Quotidian Fever. And always before the coming of the Joynt Gout or Inflammation called Erysipelas such a Fever doth precede.

The external ways by which the humour flows from the Head, are those which are without the Skull under the Skin; and *Fernelius* supposed, that the humours were chiefly carried between the flesh and the skin, although by the continuity of the Muscles, Membranes, and Nerves, as also the Veins and Arteries, the humours use to flow into the Eyes, Teeth, Jaws, Neck, Shoulders, Joynts, and other external parts.

DIFFERENCES. Some Authors make difference of Catarrhs, which are these; some are called *Ferini* or wild, some suffocating, some epidemical or common.

A wild violent Catarrh is that which by its sharpness ulcerateth the Lungs, and brings a Consumption, and it comes of a sharp and salt humour rising from a hot Liver, and is sent into the brain, and from thence into the Lungs.

A suffocating Catarrh is when the humour flows violently into the hollow of the Lungs, and is still renewed to the danger of strangling.

Lastly, an epidemical Catarrh hath a malign quality, and is common among the people, and comes from the corruption of the Air.

DIAGNOSTICK. The knowledge of this disease is from three signs; of the Subject, of the Disease, and of the Cause.

The subject or body apt to fall into a Catarrh is known by the slender fabrick of it, easily pierced with either hot or cold air; as also by the too compact fabrick of it, which hindereth a free transpiration, as also a weak and cold brain, which cannot discuss the vapours which are sent unto it, or sufficiently concoct its own nourishment; as also a hot brain that attracts too many vapours: also the contrary actions of the Stomach and Liver, when one is hot and the other cold.

The Signs which shew the Disease either declare it to be coming or present.

The aforesaid Causes shew it to be coming, but especially heaviness in the head, dulness and numbness of the senses, long sleep, much snoring, a snotty Nose, and more spitting than usual, costiveness of body, and abundance of wind.

The signs of a Catarrh present are manifest, for either the humours flowing from the brain is plainly seen, or the swelling and pains which it produceth in divers parts.

The Signs of the Causes are also evident; for if a Catarrh come of a cold humour, there will be sense of cold, paleness of face, sweet spittle, sour belchings, slimy matter or watery, and a general flegmatick habit of body.

But that the humour distilling is hot, appears by redness of the face, thirst, saltness and sharpness in the mouth, inflammation, pain, and ulcers in the parts affected, and a cholerick habit of the whole body.

An external defluxion is known from an internal, in regard the pain is more external in the former, especially under the skin of the Crown of the Head, where sometimes you may perceive a soft tumour, often a painful combing back of the hair: and many times the humour is felt to fall down upon the outward parts with great pain, heat, or cold.

PROGNOSTICK. The Prognostick of this Disease is elegantly laid down by *Cornelius Celsus*, in these words: *If the Humor flow from the Head into the Nose, it is small; if into the Jaws, it is worse; but if upon the Lungs, it is worst of all.* But *Hippocrates* saith, That a Catarrh is very hard to be concocted in those that are very old.

Where there is a great plenty of Humors, either from Repletion or from evil Concoction, there is a dangerous Catarrh, for it is to be feared lest the Humor flow suddenly, and cause Suffocation, or some other grievous accident.

CURE. The Cure of this Disease is twofold, The one is of the Cold, the other of the hot Catarrh.

The whole Cure of a Catarrh consists in the preparing and evacuating of the Humor offending, and in the revelling of it, if it flow to the Breast or other part, and the stopping of its motion, and after let the Distemper of the Brain be amended.

First then, If the matter be much, and flow very violently, and we fear lest it flow also from other parts, especially if the Liver be hot, (for it is often seen that men subject to Catarrhs have a hot Liver and a cold Brain) we must breach a Vein; but if the matter be but little, and move gently, and the party be aged, and the temper of the Liver not hot, so that there is no suspicion for Humors to be sent to the Brain from any other parts, you may omit Phlebotomy.

The

The matter offending is first to be diminished with a Potion or Pills, or other purging Medicine, mentioned in the Chapter of the cold distemper of the Brain.

Afterwards the remainder of the humour is to be prepared with an Apozeme there also mentioned; or if you fear not to disturb the humour too much, you may give a purging Apozeme, and at last make a complete Evacuation with stronger Pills or other Purges.

If the Catarrh be very strong, you may give that which will powerfully root out the matter.

Colloquintida is very excellent to purge the Brain strongly, but it worketh very violently, and is offensive with its bitterness; both which faults are corrected by steeping it in Urine, for so it lays aside its bitterness, and becomes almost without taste, and also is so gentle, that it may be given to the quantity of a Dram safely: and it is a most gallant Remedy for all cold Diseases in the Head.

It sometimes happens that Excrementitious Humours sent from the parts beneath into the Brain, produce a Catarrh; and they find a preternatural course that way, by reason the natural course by which those humours use to be evacuated, is stopped, and then the Catarrh is best cured by opening those ways with gentle, mild, and constant purging, that the humours flowing upwards may be so sent downwards, and by degrees brought to their proper motion. And these gentle Purges may be made of Decoctions of Broths long continued; but in the mean while you must not neglect strengthening Medicines.

For Revulsion apply Cupping-glasses and Vescicatories, or things to cause Blisters to the Neck and Shoulders, and make Issues in the hinder part of the head and arms. *Zacutus Lusitanus in lib. 2. Praxis admiranda, observat. 160.* commends Issues behind the ears for the best remedy against all Distillations from the head: and we have seen good success by them, especially in Defluxions upon the eyes. You may use Errhines, Neeblings, Gargarisme, and Masticatories, but with this caution, that you use Errhines and Neeblings onely when the Catarrh falls upon the Jaws, Lungs, and Stomach; but when it falls into the Eyes or Nose, use Masticatories or Gargarisms.

The forms of all these Medicines were set down in the Chapter aforegoing; but observe in the use of them, that when the matter is somewhat thin you use not strong Discussients and Dissolvers, for by these you shall cause the humours to flow more violently upon the Breast, Lungs, or other parts; but you must mix some thickning things that may restrain the humour, as red Roses, Mastick, Coriander, Nutmeg, and other things which we shall declare more at large in the hot Catarrh. You may make an Errhine for this purpose as followeth.

Take Marjerom water four ounces, the juice of Betony one ounce, Nigella or Gith-seeds powdered half a dram, Nutmeg one scruple. For rich people you may adde two grains of Musk and Amber-greece. Or,

Take of Lignum vita one ounce; Spring-water one pint: Infuse it all night upon warm embers, then boil it to the consumption of half, adding in the conclusion sweet Marjerom, and red Rose-leaves, of each two pugils.

So when the matter is but thin, you may make a Masticatory either of Mastick alone, or after this manner.

Take of Nutmeg one dram, Mastick and Gum Arabick of each half a dram: Powder them, with Rose-water make Troches to chew.

The best Neebling is made of black Hellebore and Sugar, equal parts.

The Extract of Tobacco made in *Aqua vita*, and held under the Tongue in the bigness of a Pease, brings forth abundance of water; but if you take too much, or swallow it down, it will cause violent Vomiting. We have shewed that Cauteries to the Arms, hinder part of the Head, and behind the Ears, are very good, as also to the nape of the Neck and Shoulders, which are now adays in great request. But there is a new place found out by some, namely in the Neck near the Jugular Veins between the Muscles; and by this means two men have been cured of old Catarrhs which caused hoarseness.

Finally, after convenient Evacuation, things that strengthen the brain, and dry it, are to be used both internally and externally, as Opiates, Powders, Bags, Fumes, described in the Cure of the cold distemper of the Head. But you must remember to put unto them some Conserve of Roses, Nutmeg, or white Frankincense, when you cure a Catarrh.

The Decoction of Mastick wood used as a Sudorifick dries the brain, and stops defluxion: for which the following things are good.

Take of Coriander seed prepared half an ounce, Nutmeg and Frankincense of each three drams, Liqnoris and Mastick of each two drams, Cubebs one dram, Conserve of red Roses one ounce, white Sugar dissolved in Rose-water ten ounces: Make a Confection in little rolls weighing three drams. Let him take one morning and evening.

These following Troches are much commended by *Solenander, Conf. 10. sect. 4.* which he borrowed

which he borroweth from both the Antient Greeks and Arabians.

Take of the best Frankincense and juyce of Liquoris, of each one dram: Opium, Saffron and Mirrh, of each one scruple: With Syrup of Poppies make Troches, or Pills to be taken now and then, two scruples, or half a dram at a time.

These Tablets following are very good:

Take of Diambra and Diamoschu dulcis, of each one dram: white Amber one scruple: Oyl of Annis-seeds three drops: Sugar dissolved in Lavender water four ounces. Make Tablets of two drams in weight; take one Morning and Evening.

The Balsom for the head prescribed in the Chapter for the cold Distemper, after the Opiate, is excellent taken inwardly, and into the Nostrils.

Lac Sulphuris, and the flower of Brimstone are commended by Chymists for the Cure of a Catarrh, and the Galenists use it much in Tablets.

In a new Catarrh, Water of Nuts with Hydromel, given three Nights together doth much hinder it.

Shave the fore-part of the Head, and apply a Cataplasm of two ounces of Leven, and two drams of Amber: But if the Patient will not permit his Head to be shaved, let it be cut, and lay a Bag of Chamepytis or Ground-pine mixt with Amber.

Besides the afore-mentioned Fumes, one made of Tacamahaca is excellent, for it dries a Catarrh and hinders the motion; neither is the Scent too strong, but the Patient may shut it into his Chamber without offence.

It is profitable to dry the Head with Bags of Bran, Gromwel and Salt, Leaves of Sage, Betony, French Lavender, Annis-seeds, Fennel-seeds and the like.

Lastly, If the disease be stubborn, all those Medicines which are mentioned in the cold Distemper of the Head, are to be used.

A hot Catarrh is cured by Medicines which discharge the matter offending, and which doth thicken it and revel it; as also by correcting the distemper of the parts sending and receiving it.

For this end, first let blood, if nothing hinder, by which the humor flowing is revelled, and the sharpness abated.

Then carry away part of the humor by a gentle Purge which may no ways stir violently the humors as followeth:

Take of the best Rhubarb four scruples: Citrine Myrobalans rubbed with Oyl of sweet Almonds, half a dram: yellow Sanders half a scruple: Infuse them in Lettuce and Purslane-water, and strain it, adding of Manna and Syrup of Roses Solutive, of each one ounce. Make a Potion.

Or instead of the Waters afore-mentioned, you may make a Decoction of cold Herbs and Tamarinds, to which you may put your Purgatives.

Then you must alter and thicken the Humor with convenient Juleps.

Take of Lettuce, Purslane and Plantane, of each one handful: the four great Cold Seeds, white Poppy-seeds, of each two drams: Violets, Water lillies and red Poppies, of each one Pugil; boyl them to a pint: dissolve in the straining the Syrup of Violets, and dried Roses, of each one ounce and an half. Make a Julep for three draughts, to be taken twice in a day.

Or instead of this Decoction, use the distilled waters of those Herbs, or Emulsions of the four great Cold Seeds.

After use a little stronger Purge, putting to the former Senna, or Catholicon, or Diaprunes or the like.

A light sweet Medicine thickning and sweetning the Humor, is made of the Yelks of two new laid Eggs, dissolved in five or six ounces of Spring-water, with one ounce of Sugar, heat them well, and stir them upon the fire, and take it as hot as you can Morning and Evening for three days together.

And at last you must labour for a stronger restraining of the Flux, and thickning of the humor with this Syrup.

Take of Syrup of Violets and dried Roses, of each one ounce: Syrup of Poppies half an ounce. Give an ounce at a time in a Spoon at Bed-time.

The following Opiate is good for the same purpose:

Take of old Conserve of Roses six drams: the Species of Diatragacanth frigid two drams: Bole-armeniack washt in Rose-water, two scruples: With the Syrup of dried Roses make an Opiate. Take the quantity of a small-Nut at Night.

This Barley Cream is very profitable:

Take of cleansed Barley as much as is sufficient, steep it six hours, and then boyl it well and strain it; then take three ounces of blanched sweet Almonds; Pompion-seeds husked, one ounce and an half; Melon seeds one ounce; white Poppy and Lettuce, of each half an ounce. Beat them together

gether, and with Barley-water take out the Milk, which with two pound of the Pulp of Barley boyl a little and mix it with Sugar. Let him drink ten ounces at a time some Mornings in his Bed, and sleep after it, and sometimes in the Evening: And hold frequently the following Troches in the Mouth.

Take of Gum Tragacanth and Agarick, of each two drams: Bole-armeniack and Terra Sigillata washed in Rose-water, of each one dram: white Poppy-seeds and Juyc of Liquoris, of each half a dram: Sugar-Penids one ounce. With the Mucilage of Quince-seeds extracted with Rose-water, make little Cakes to be held in the mouth day and night.

The Spirit of Sulphur and Vitriol, three or four drops given Morning and Evening in convenient Liquor, hath great force against all Catarrhs, especially against those which come from Inflammation of the Bowels: It may be given in drink in a smaller quantity, for it goes with the Drink through all the Veins, and hinders the motion of humors.

The Crystall Mineral is for the same use given with Juleps and other Medicines.

When these do not avail, we must be constrained to use Narcoticks or Stupefactives: Among which *Landanum* is the best, given to four or five grains at bed-time; or one ounce, or half an ounce of Syrup of Poppies: These do wonders being used in the beginning of the disease. New Treacle given at night from a scruple to half a dram, hath the same force.

Benedictus Faventius useth the following Pills in a salt Catarrh with good success.

Take of the Juyc of Liquoris two drams: wash Aloes one dram: Pilulæ de Cynoglossa half a dram: With Syrup of Violets make a Mass, of which take a scruple at bed time.

The Troches of Solenander before-mentioned are excellent.

Diacodium album prescribed in the Cure of the Phrensie is good for this.

In the mean while the Matter flowing must be revelled by Clysters, Cupping-Glasses, Frictions and binding of the external parts, and chiefly by Vesicatories in the Neck, and finally with Issues in the hinder-part of the Head and Arms, if the Catarrh be old.

But for the strengthening of the Head, and stopping of the Fluxion, and consuming the remainder; Powders, Bags and Emplasters are good.

Take of white Amber, Sandarach, Mastich, Benjamin, Nutmeg, of each one ounce: Frankincense, Grains of Kermes and red Roses, of each half an ounce: all the Sanders, Mirtles and Pomegranate-flowers, of each two drams; make a Powder. Use it to the Head at night, and comb it off in the Morning.

Take of the Gum of Juniper two scruples: red Roses two Pugils: Mirtles one dram: Mace and Nutmeg of each one scruple: Frankincense and Peony-seeds, and Poppy-heads, of each two scruples: Cyprus-Nuts half a scruple, Powder them, and take them up with red Wooll, and with a red cloth make a lining for a Cap to wear constantly.

Take of Mastich and Frankincense, of each half a dram: Sandarach, red Coral, red Roses, Mirtles, Pomegranate-flowers and Peels, of each one dram: Labdanum two drams: Wax and Oyl of Roses, as much as is sufficient. Make an Emplaster for the Coronal Suture.

But because this Catarrh for the most part comes from a hot distemper of the Liver, therefore you must use Medicines to that.

Finally, This is most remarkable, which is also mentioned in the Cure of a cold Catarrh; That Excrements use to cause Catarrhs by flowing to the head when their usual natural passages are stopped: And then a Catarrh is best cured by opening those passages with a gentle and constant Purg-ing in Broths or the like.

CHAP. XVI. Of the Headach.

THe word *Cephalalgia* is used generally for every pain of the head: but more especially it signifieth a new Head-ach; but the word *Cephalea* signifieth an old Head-ach; and *Hemicrania* signifieth that pain which onely is in one side of the Head.

There are other differences of Head-aches; they are divided into Internal and External Parts by consent and propriety; and of these, one is called a pricking pain, another a stretching or extending pain; another a heavy, another a beating or shooting pain.

The Internal pain of the head is in the *Meninges* or Membranes, that is very deep and reacheth to the Roots of the eyes: But an external pain is in the *Pericranium* or Membrane without the Skull, and will not indure the Roots of the Hairs to be combed back, and is made greater by the least compression of the Head. This is the Doctrine of *Galen*, which he teacheth 3. *de loc. aff. cap. 1.* and *lib. 2. de comp. med. secundum loc. cap. 3.* saying very solidly, That the Internal Head-ach is distinguished from the external by this peculiar sign, That in the Internal the pain comes to the Roots of the

the eyes, not in an external; and he gives this reason, Because the Coats of the eyes come from the *meninges* of the Brain; whence it comes that the grief is conveyed into the eyes. But *Fernelius* contradicts this Doctrine, *lib. 5. Pathologia cap. 1.* and affirmeth, that external pains do reach to the roots of the eyes, because the *pericranium*, or skin of the Skull wherein those pains are, doth reach to the cavity of the eyes. To whom *Rondeletius* answers, *lib. 1. Meth. Med. cap. 5.* That the cavity of the eye doth not suffer with the *pericranium*, although it reach to it, by reason that the pain of the *pericranium* comes for the most part of external cold, for a cold part will easily suffer from the like quality: but that cold cannot reach to the hollow of the eye, because it is preserved by the heat, blood, and spirits of the eyes. But if at any time a Headach cometh of external heat, or the like, the skin of the head is onely affected, not the *pericranium* which lieth deep. But this Doctrine of *Rondeletius* doth not altogether take away all difficulty; for although all things which he alledgeth should be granted, yet if a pain arise from a Tumor gathered upon the *pericranium*, or of some other cause that dissolveth continuity and divideth, there is no reason why the grief should not reach to the hollow of the eye. We can say this in defence of *Galen*, That this sign was given by him for two reasons: First, because the Membrane which reacheth to the hollow of the eye from the *pericranium* is not so sensible, and therefore cannot suffer but absolutely: but the Coats of the eyes which come from the *meninges* are very sensible, and therefore have great pain. Moreover, that Membrane which cometh from the *pericranium* doth not touch the eye so inwardly and deeply towards the Optick Nerves, as the Coats which come from the *meninges*; whence it is that the external pain cannot extend it self to the roots of the eyes, as *Galen* saith.

A pain by propriety is constant and permanent, nor doth it follow the Disease of other parts: but a pain by consent or sympathy depends upon the infirmity of another part, so that as that increaseth or diminisheth, the Headach increaseth or diminisheth. Now this pain by sympathy is either by consent from the whole body, as in Fevers; or from some peculiar part, as the Stomach, Liver, Spleen, or Mother.

But we may know what part is affected when a pain is communicated to the head by its proper signs.

A pricking pain comes from a sharp cholerick humour or vapour which toucheth the Membranes of the Brain. A heavy pain comes from much thick and cold matter, namely Flegm or Melancholy compressing the sensible parts. An extending pain comes from wind or mild humours, which work themselves into the Membranes, and distend them. A beating or pulsative pain comes of thin cholerick blood or spirits abounding, by which the Arteries being stretched and swoln, do beat more vehemently and shake the Membranes, and so striking the adjacent parts, cause in them a fence of Pulsation, as *Galen* teacheth more at large, 2. *de loc. aff. c. 3.*

CAUSES. From what is said, the chief Causes of a Headach are sufficiently declared, which in general are referred to the Solution of Continuity, as to the immediate cause: for whatsoever doth bring a manifest or hidden Solution of Continuity, is like to bring a Headach.

SIGNS. The Signs of the kinds of Headach, and of the causes that produce them, may be learned from what is said, and therefore we come to the Prognosticks.

PROG. An external Headach is always less dangerous and easier cured than the internal.

A Headach in a sharp Fever with thin and white Urine is dangerous, for it signifies the cholerick matter is sent into the Brain, whence there is fear of a Phrensie.

A strong pain of the Head suddenly seising without Evacuation following, or mitigation of the Disease, is deadly; for it signifies the destruction of the Animal Faculty, which no more feeleth that object which caused the grief.

In a great Headach it is evil to have the outward parts cold, for by the vehemency of the pain there is a strong attraction of heat to the part affected, which will cause Inflammation.

They that recover of a Disease in the inferiour parts, and have after a vehement Headach, if a manifest Evacuation went not before, will have an Imposthume in their Brain, for it signifies a translation of the matter which caused the Disease into the Brain.

They who vomit green in an Headach, and are deaf being awake, are suddenly very mad, 1 *Prorrh.* for it signifieth a collection of Choler into the Brain, which maketh the Stomach consent therewith, and suffer.

Headach and noise in the ears without a Fever, or giddiness, or deafness, or numbness of the hands, signifieth an Apoplexy or Epilepsy to be at hand, *Hyp. in Coatis.* For those Symptoms come from abundance of thick flegm in the Brain.

To Women with child, sleepy and heavy Headaches are evil, 1 *Prorrh.* for they signify the flux of humours to the Head, which when they are many in Women with child, by reason they have not their Courses, do threaten danger.

A Headach which was not from the beginning of the Disease, but rose from the disturbance of the body, shews that there will be a *crisis* by bleeding at the Nose, or by Vomit.

CURE. Since then the pain of the head cometh either of a cold or hot cause, we must direct the Cure for the taking away of both.

For the cure of a cold Head-ach the flegmy matter is first to be evacuated, being prepared as is shewed in the Chapter afore going. Then we must correct the cold distemper of the Brain, and the reliques of the humor are to be discolled with Bags mention'd in the former Chapter, or in the Chapter of the Cold Distempers of the Brain: with which being warmed, let the Head being shaven be rubbed for an hour and an half every morning, till the cause of the pain be spent and exhausted.

After the Head is well rubbed, sprinkle upon it this following Powder, having put upon it Cotton or Wooll.

Take of Nutmegs, Cloves, Pepper, Pellitory, of each half an ounce; the leaves of Sage, Bayberries, of each two drams; Mustard-seed and Watercress-seed bruised, of each six drams. Make a powder of these, sprinkle it upon the Head as aforesaid, and comb it in the morning before the use of the little Bags, that the powder laid on the day before may be taken off.

Errhines are also profitable, Neelings and Apophlegmatisms, or things to chew, which were described formerly.

A Magistral Syrup also made as followeth is very profitable.

Take of Guajacum wood and roots of China sliced, of each one ounce and an half; infuse them twelve hours in four pints of Spring water; boil them till half be consumed, adding in the end the leaves of Vervain one handful, the flowers of French Lavender and Marjerom, of each a small handful; dissolve in it being strained half a pound of white Sugar; boil it up to a Syrup: but before it be perfectly boiled, cast in two ounces of Senna tied in a Clout, the best Agarick two ounces, Rhubarb three ounces: let him take two or three ounces once a week.

These Pills also following are very good, which in times past were of great esteem in Italy in the days of Eustachius Rudius, chief Professor in the University of Padua, who was reported to be the Inventor of them, and accounted them a great Secret, and therefore gave them to one Apothecary onely to be made by him, lest others should know the Receipt, which indeed he borrowed out of Wickerm, who propoundeth it from Andernacus, and it is thus.

Take of Coloquintida six drams; Agarick trochiscated, Diagridium, black Hellebore, and Turbith, of each half an ounce; Aloes one ounce, Diarrhodon Abbatis half an ounce. Let the purging things be bruised and beaten together, and put in a Glass with the Spirit of Wine so much as is sufficient, and let them be digested for eight days in a warm place, and then add the powder of Diarrhodon, and infuse them four days longer, then strain them and press them, and let the liquor so pressed forth be distilled in Balneo so long, till the Extract in the bottom of the Alembick grow so thick that it may make Pills, the dose whereof is one Scruple,

But the following Pills are ascribed to Fernelius, of which he affirmed he found by experience such excellency, that he never met with a Cephalalgia, Hemisrania, that is, half Head-ach, but he cured it.

Take of the best Aloes half an ounce, the powder of the Electuary of Pearls, the three Sanders, and red Roses, of each three grains. With Syrup of Wormwood and Violets make a mass. Give a dram thereof twice in a week one hour or two before Supper.

And finally, in a stubborn pain that is old all those Medicines are convenient, which were before mentioned in the cure of the cold distemper of the Brain; among which Epispasticks or Blister-drawing Plasters are not the meanest. Which also not prevailing, some are so bold as to apply Vigo's Emplaster with Mercury, which they say hath cured old Headaches sometimes, by causing them to spit much.

Baths of Brimstone and Bitumen are very efficacious in this case, used both to the Head and the whole Body.

Also in an old Headach sweating Decoctions are very good, and famous Authors declare, that many have been cured thereby.

Which not prevailing, Mercatus is bold to fly to the use of Stibium, and commends it highly in his first Book of the cure of Internal Diseases, and the eighth Chapter. But in an old Grief it is better to strengthen the Head often, than to use too many Evacuations: Therefore Powders and Caps, and other Topick and External Medicines are very necessary, before mentioned in the cure of the cold distempers of the Brain.

But Powders are more commendable, because the vertue of a Cap is not so much communicated to the Brain, and the pain may be increased by the filth which is contracted by the long wearing of them.

Moreover an Oyntment may be applied of the Oyl of Almonds, in which wilde Betony, Bay-leaves, Mastich, Lavender, Mints, Marjerom, Thyme, Penyroyal, Nutmeg, Cloves, and Cinna-mon, or some of these have been boiled, adding in the time of the boiling a little red wine.

Or this following Chymical Oyl.

Take

Take of Turpentine one pound; *Mustick*, Nutmeg, Cinnamon, of each one dram: Cloves, Zedoary, Galangal, Laudanum, of each one ounce and an half; the juyce of Ebuus or Dwarf-Elder, and of the wild Cucumber, of each one dram; the Oyl of Camomel and Lillies, of each half a pint; red Wine one pint and an half; wild Marjeron green one handful; powder those that are to be powdered, and put them into a Glass Retort, and extract an Oyl; with which anoint the Head after it is shaved.

Oyl of Amber is very good; and it will be sufficient onely to anoint the head therewith.

While you use the aforementioned Remedies, you may also use from the beginning of the Cure Specificall Medicines, such as this Epitheme.

Take of the powder of Zedoary one dram; the Water of Betony, Vervain and Elder, of each one ounce. Mix them and apply them hot to the part grieved with Scarlet-cloth.

Among the proper Medicines for the Head-ach, from what cause soever it ariseth, Vervain is the chief; whose Water distilled you may both apply externally, and give of it internally to the quantity of four ounces, with three drops of the Spirit of Salt. Green Vervain alone only hung about the Neck, hath cured two Patients when many other Medicines failed, as *Forestus* reports.

Zacutus Lusitanus in Lib. 1. *Praxis Med. mirab. observat.* 7, 8, 9, 10. propounds four Remedies confirmed by Experience; namely, an Issue in the back of the Hand, Horseleeches to the Temples, opening of the Vein in the Forehead and the corner of Eye, which you may read in the place cited.

These things are to be noted concerning those Observations.

First, That the Issue between the Thumb and fore-Finger is approved by other Experiments; and hath cured great Head-aches.

Secondly, In the Cure by Horseleeches, *Zacutus* is not content to apply two or three as ordinarily is done, but ten or twelve round about the Temples; whence comes a great attraction of blood which may draw forth the whole matter of the Disease.

Thirdly, In Curing by opening the Veins in the Forehead, we must observe, That the Vein was twice opened, whence it appears, that the first was not sufficient, when ordinarily our Practitioners do seldom open it the second time, if it hath been to little benefit.

The hot Cause of a Primary and Essential Head-ach, is Blood or Choler: And the like Remedies are proper for both, though they must be made stronger or weaker, according to the strength of the Disease.

First then, (after a Clyster is administered) begin with Blood-letting, drawing forth more when the grief proceeds of blood, than when it proceeds of Choler.

Then give a Medicine to purge Choler, not onely when Choler is the principal Cause, but when blood aboundeth, whose thinner part is easily turned into Choler.

If the matter offending is not sufficiently taken away by one Purge, you must purge again at a due distance.

After apply Repelling Medicines to the head, and Vinegar of Roses, such as were propounded in the Cure of the Phrensie, making choice of the mildest.

And after it will be very profitable to apply Creatures newly killed, or parts of them, to discuss the Relicks of the Disease, and to assuage the pain.

In an Head-ache which goeth with a continual Feaver, a Ships Lungs applied hot do much assuage the pain.

Also a Cataplasm of bruised Gourds and Houseleek to the Feet.

The opening of the *Saphena* after sufficient bleeding in the Arm, cures oftentimes a Head-ach with a Feaver very suddenly.

You must use Cupping-Glasses with and without Scarrification, and Frictions of the extreame Parts.

And in whole time of the Disease, if the Belly be not loose, must every day give an Emollient and cooling Clyster, and which doth gently purge.

After general Evacuations and Revulsions, you may rightly and with profit derive the matter by opening the Head-vein, or with Horseleeches applied to the Forehead, or with Vesicatories to the Neck.

In the mean while, let the whole mass of humors be qualified with Juleps, Emulsions and Broaths as was mentioned in the Cure of the Phrensie.

Lastly, If the pain be very violent, you must apply Narcoticks both externally and internally, at they are set down in the said Cure of the Phrensie.

Here also may avail the opening of the Forehead-veins, and Leeches to the Temples, commended from *Zacutus Lusitanus*.

Param, lib. 16. cap. 4. reports, That a desperate half Headach was cured by opening the Arteries

in the Temples, and says, there is no danger in doing it. The Artery is opened as a Vein, and six ounces of blood forceably leaping forth are to be taken. After apply a convenient Ligature, and open it not in four days.

Batallus also says, That it doth miraculously cure old Head-aches; and we also have cured desperate ones the same way, and never found any danger in the opening of the Arteries.

You must apply a Plaister to the Orifice of Frankincense, Mastick, Bole-armenick, and Hares Hair, with the white of an Eg, and then make your Ligature as you use to do in wounds of the head.

In all pains of the head, of what cause soever, if other means fall, and the greatness of the pain make thee run to extremities; a Vescatory applied over all the head after it is shaven, will cure it.

A Cautery upon the Coronal Suture sometimes hath perfectly cured a violent head-ach.

But it is more powerful if it be applied to the Temples, of which see *Poterius, observat. Centur. 3. Chap. 8.* and our Observations thereon.

The End of the First Book.

THE

THE
SECOND BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Eyes.

The Preface

THE Diseases of the Eyes are so divers, that it is very hard to lay them down clearly and plainly, and to distinguish one from the other; which that we may endeavour as much as may be, and clear up our Treatise for Practice, we will thus divide them; the Diseases by which the Sight is immediately hurt, may first be expounded, and afterwards the rest which happen to the Parts of which the Eyes are compounded, or which are near unto them, without any, or very little hurt to the Sight. The Sight is hurt when it is diminished, abolished or depraved. Sight abolished is called τυφλότης in Greek, in Latine Cæcitas. But Sight diminished hath divers Names according to the degree and manner of the diminution; of which the chief are Amblyopia, Myopia, Nyctalopia, and Acies Vespertina.

Cæcitas Blindness comes either from an absolute Obstruction of the Optick Nerves (and then it is called Amaurosis) or from a total Suffusion, or from some great fault in the Tunicles and Humors.

Amblyopia, in Latine Obscuritas, Hebetudo, or Caligo, dark or dim sight, when the Object not clearly seen at what distance soever placed, comes from the same Causes, but more light and imperfect, as an imperfect Obstruction of the Optick Nerves, a light Suffusion, want of Spirit or grossness of the same, and the like.

Myopia, in Latine Luscositas, or Purblindness, in which the Objects are not perceived, except they be very nigh and close to the Eyes, but not at all afar off, or very little and imperfectly: so that they perceive not their own Friends passing by. And according to the Opinion of Galen, and all Modern Physicians, from the thinness and smallness of the visive Spirits which stand not in need of a Medium much enlightned to make a perfect sight, but is thereby dissipated. On the contrary, they which have grosse and thick Spirits see things best at a distance, because that gross Spirits need more enlightning which is brought by the larger illumination of the Medium: But this Doctrine is demonstrated to be false, and to spring from ignorance in Opticks, whose Principles declare, that these diversities of sight proceed from the diversity of the situation of the Crystalline Humor. For when the Species of the Objects are received into the Crystalline Humor by a Pyramid, or sharp point thereof called Conus; if the Crystalline Humor be too much inward towards the Pupil

of the Eye, the remote Objects are better seen, because it is necessary that the Object should be at a further distance, that the Conus or Point of the Pyramis may come to the Crystalline Humor, and there be terminated. But if the Objects come nearer the Eye, the Conus goeth by the Crystalline, and they are seen more obscurely. Again, if the Crystalline lie too low, and too far from the Tunicle called Ulvea, the Objects must be nearer to the Eyes, that the Conus or Point of the Pyramid may come to it: whence it appears, that Myopia comes no other ways than from the Crystalline lying too low; and so this Disease becometh connatural, and not to be cured. But the effect of Myopia is contrary, in which the Object is better seen at a distance; and this happens for the most part in old Men, in whom some of the portion of the watry Humor is spent, so that the Crystalline goes to the Pupil of the Eye. Further By long holding down the head either with Reading, Writing, or otherwise, the Crystalline humor comes by degrees forward: This is demonstrated by the use of Spectacles, because that they who have Myopia, or are Purblind, see best with hollow or concave Spectacles, by which the Rays or Beams of the visible Species are dispersed, whereby it comes to pass, that the Conus of the Pyramis is more long, and so that thing which by reason of the great distance could not be seen, is now plainly perceived; because the Conus of the Pyramis is extended as far as the Crystalline, which before ended in the Pupilla, or in the watry Humor, or in the white Humor. On the contrary, Old Men are helped with Convex Spectacles, by which the Beams are united, and the Conus of the Pyramis is made shorter, and so things are better perceived whose Conus before passed by the Crystalline, which was too near to the Pupilla.

Nyctalopia, or Nocturna Cæcitas, is when men see well enough at day-time, at Sun-set worse, and at Night not at all: and it comes from the over-thickness of the Spirits, or Humors, or Tunicles, or the straightness of the Pupilla. For in these cases a greater light is necessary for true sight, which being wanting, at Sun-setting, or at night by a Candle, they see little or not at all.

Vespertina Acies, is when Men see worse by Day, and better by Night: and this sometimes is called Nyctalopia, as we see in Hippocrates, 2. Prognost. but the Modern Greeks have from long Custome used the word Nyctalopia onely for Night-blindness: it comes from the thinness of the Spirits which are spread abroad by too much light: or from the enlarging of the Pupilla, by which too much light goes into the Eye and hurts the sight: for a little light at Night doth more illustrate and shine to them, than to those who have the Pupilla enlarged.

After what manner the Sight is hurt by diminishing, abolishing, and depraving, we shall lay down more plainly when we explain the Diseases of all parts of the Eyes by themselves, For seeing all the parts of the Eye do conduce to the action of it, namely, Sight, when any part is distempered, the Sight must also suffer.

The Eye is compounded of Tunicles, Humors, and the Optick Nerve, for the action of which parts, the Animal Spirit doth concur as a principal and universal Agent.

And therefore that we may run through the Diseases of those Parts, we will begin from the Distemper of the Constitution of the Optick Nerve: next we will proceed to the Disease of the Humors and Tunicles. But the faults of the Spirits either depend upon the Distemper of the Brain, and then other Senses are also hurt: or from the Distemper of the Eye it self, which being cured, the Spirits receive their ancient and due Constitution, so that we need not make a particular Treatise of them. But in Curing Diseases of the Eyes, when sight is hurt, we must alwayes mingle those things which comfort the visive Spirits with other Medicines.

CHAP. I.

Of Gutta Serena, or Amaurosis.

When the Sight is gone, and no fault appears in the Eyes, it is called *Gutta Serena*, or *Amaurosis*: And it comes to pass, when the Animal Spirits cannot pass from the Brain to the Eyes; for when the Animal Spirits come into the Eyes from the Brain by the Optick Nerves, we must find out the stoppage of their influx in the Optick Nerves. The Optick Nerves are many wayes affected, but chiefly by obstruction or stoppage, astriction or binding, and by solution of continuity.

Obstruction is the most common and most ordinary cause of *Gutta Serena*, which comes of a watry Humor flowing down from the Brain upon the Nerves, even as other Nerves are obstructed in a Palsy by the same Humor, so that the Diseases may be said to be alike by reason of that Obstruction.

But

But it is most certain, that this Disease is also begot by adstriction and compression of the Optick Nerves, which compression may come both of a moist humour gathered about the Optick Nerves, and pressing upon them; as also of bloud, filth, or matter: whence sometimes certain Tumors rising in those parts, produce the like Disease. For experience teacheth, that sometimes blindness in one eye, sometimes in both, comes upon inflammation of the Brain, and from Phrensie in malignant Fevers. And *Platerus* reports, *lib. 1. observat.* That he saw a blindness which came from a round Tumor growing in the Brain, and compressing the Optick Nerves, which appeared by opening of the Head after the Patient was deceased.

Finally, Wounds in the Head, in which the Optick Nerves are divided, without controversie do cause that the Animal Spirits can no more come to the eyes.

SIGNS. This Disease is known, in that the eyes seem to be in their natural condition, and there is no fault apparent in them, onely the *Pupilla* seems blacker and larger. But in distinguishing the differences of Causes there is great difficulty: for although the Disease coming of bloud or matter is known by Inflammation, Impostume, or Wound going before, yet no certain sign can be given, by which we can distinguish a compression made with Flegm from an Obstruction; but we may in some part conjecture, for in the Obstruction onely of the Optick Nerve the Eye is onely affected, but if a compression be made of the same Nerve by flegm gathered about the roots of the eyes and processes, that matter possesseth other parts of the Brain, and then all or some of the other senses are hurt; but if it seize onely upon the Optick Nerves, there is more plenty of humour sent forth at the Nostrils, and the Patient perceives a heaviness in the forepart of the head, especially about the Eyebrows.

PROGNOSTICK. As to the Prognostick part, if this Disease be absolute, that is, if there be a total loss of sight, especially if it come from Obstruction of the Optick Nerves, it is for the most part incurable: as we see in Palsies also, that they are scarce or never cured which come from the obstruction of the Nerves, especially if the Patient be old. But if the obstruction be imperfect, which onely causeth a diminution of sight, but not blindness, there is more hope of recovery, although it cannot be brought about without much pain and long use of Medicines.

But if the Disease come of humours gathered in the forepart of the Head, which compress the Nerves, it may be more easily cured. So saith *Fabricius Hildanus, observ. 19. cent. 5.* That a certain man after a strong Vomit lost his sight, and that he cured him with giving him the same Medicine again; for as the humours being too much stirred by a violent Vomit, and cast upon the Optick Nerves compressing them, did hinder the passage of the Spirits to the Eyes; so the same humours being carried away by the same Medicine, the Disease became cured. Almost the like story is mentioned by *Sennertus*, of a certain Student, who taking too strong a Purge became suddenly blind. He also affirmeth, That certain Women, after they had conceived with child, became blind through the streightness of the Optick Nerves, and that the Disease went away after four or five moneths, or in the time of their Delivery.

We also have seen some which fell suddenly into extreme diminution of sight, who within fifteen days were cured by universal Evacuations and some Revulsions, and by the easiness of the Cure we suppose that the humour was not fastned within the substance of the Nerve, but onely gathered together in the Brain about the Original of those Nerves.

CURE. For the Cure of this Disease, the matter fastned upon the Nerves, or cleaving thereto, and that maketh the obstruction or adstriction, isto be evacuated, which cannot be done except first the whole body be cleansed, as *Galen* saith 4 *Meth.* The Eye is not to be cured before the whole Head, nor the Head before the whole Body.

And that Remedies may be set down in a convenient method, we will first set down a Course of Diet, which must be attenuating and moderately drying.

And first, the Air must incline to hot and dry, and a thick, cold, cloudy, and moist Air must be altogether avoided. Let him eat Meats of good and laudable juice, avoiding them which beget gross juice, as Pork and all Swines-flesh, Geese, Fish, Pulse, Cheese, and the like, as those which are windy and fill the Head, as Milk-meats and hot Spices, *viz.* Pepper and Ginger, &c. Let his Bread be made with Fennel water, or with the seeds thereof, being careful that the Wheat of which it is made be not mixt with Darnel, which all the Ancients believed to be very naught for the sight: Hence in the Comedy, he that derideth another for defect in his sight, I think (saith he) thou hast fed upon Darnel. In the Sawce to his Meat, and in his Broths, let him use things extenuating, as Hyssop, Fennel, Marjerom, Betony, Sage, Eye-bright, and especially Nutmeg, which strengtheneth the Brain and clears the Sight. He must eat Turneps often, which are thought to quicken the Sight; so do Sparrows, Pidgeons, often eaten. Cold Herbs must be forborn, and especially Lettuce, which hurts the Eyes.

Let him take but a small quantity of Meat at a time, and let the sick man never fill himself immoderately. Let his Supper be less than his Dinner, and to abstain from a Supper twice or thrice in a week is very good. At his Meat instead of Salt let him use this Powder following.

Take

Take of common Salt two ounces, Eye-bright dried two drams, Nutmeg one dram, Cinnamon two Scruples. Mix them into a Powder.

After every Meal let him take one spoonful of the Powder following.

Take of Coriander-seed prepared half an ounce; Annis-seeds and Fennel-seeds of each two drams; Cinnamon and Nutmeg of each one dram; Eye-bright dried three drams; Sugar of Roses a double weight to all the rest. Make a Powder.

Wine in this Disease is not good, because it is full of vapours and fills the Head, and is apt to cause defluxions; therefore a Decoction of Sarsaparilla sweetned with Liquoris, and aromatized with Coriander, will be very profitable. But because the Disease is of a long continuance, and all cannot abstain so long from Wine, if we must permit Wine, let that be chosen which is weakest and less vaporing: and it would be more beneficial if Eye-bright dried were first steeped therein. And that he may make Eye-bright Wine for a long time, in the Vintage let him put Eyebright into a vessel filled with new Wine, and let the Patient use that for his ordinary Drink.

Let his Sleep be less and shorter then usual, and let him lie upon his back with his face upwards as much as may be: let him avoid sleeping at noon, because it is very hurtful. Let his Exercise be moderate, and instead of Exercise let him use Frictions or Rubbing of the inferiour parts; let his Belly be always kept loose, and let him avoid disturbance of Mind.

The course of Diet being thus ordered, you must begin your Cure from universal Evacuation, and first you must purge with the following Medicine.

Take of clean Senna half an ounce; Fennel-seeds one dram; the leaves of Betony, Eye-bright, and Vervain, of each half a handful; Liquoris three drams. Boil them to three ounces; dissolve in the straining three drams of Diaphænicon, Syrup of Roses one ounce. Make a Potion, and give it in the morning with orderly government.

After this first Purge let the Physician consider seriously with himself whether he may bleed or not. For it is disallowed in this case by almost all Practitioners, because it is a Chronical Disease of long continuance, coming of a cold distemper and of a flegmy humour. Hence they fear lest by blood-letting the Brain should be made more cold, and so beget more flegm; and lest the conjunct cause of the Disease should be more incrassated or thickned, and so become more difficult to be discussed and dissipated. But although their Opinion may take place as to old men, and such as are of a flegmatick Constitution, yet it is not to be admitted to them that are young, or of a hot Constitution, especially if there be manifest signs that blood doth predominate, for then there is no doubt but seasonable blood-letting may much profit. Nay, where the aforesaid signs of blood do appear, it is profitable in the judgment of *Paulus* and *Atius*, after the Vein in the Arm is opened, to open the particular Veins in the Head, and those which are nearest the Eyes, namely the Frontal and Temple Veins, and those which are in the corners of the Eyes near the root of the Nose. But you may better apply Horsesleeches to the Forehead, as also behind the Ears. Some Practitioners do relate, that some by a wound in the forehead have been cured of blindness; in which it is most probable, that the cause of their blindness was the compression of the Optick Nerves by the Veins and Arteries adjoining, and swelling with too much blood, which the wounds aforesaid emptied forth. Whence *Spigelius* (as *Plempius* reports in his book of the Eyes) was wont in *Gutta Serena* with good success to open the middle Vein in the Forehead, and let it bleed while it stopt of it self.

But if the suppression of the Terms went before this Disease, you must draw blood from the lower Veins, or apply Leeches to the Hemorrhoids. If the Patient had formerly a flux thereof, which then is stopped, or if he have a very hot Liver, or be of a melancholy temper.

Afterwards the whole body is to be more exactly purged by this following Apozeme.

Take of Fennel-roots, and Sarsaparilla; and Flowerdeluce-roots, and Elecampane-roots, of each one ounce; the leaves of Betony, Marjerom, Balm, Eye-bright, Fennel, Vervain, and Celandine the great, of each one handful; Liquoris sliced, and Raisins of the Sun stoned, of each one ounce; Annis-seed and Fennel-seed, of each three drams; cleansed Senna two ounces; Gummi Turbith and Agarick newly made into Troches, of each two drams; Ginger and Cloves, of each one scruple; Flowers of Stœchas, Rosemary, and Lavender, of each one small handful. Boil them in five quarters, that is, a pint and a quarter of water; dissolve in the straining four ounces of white Sugar; make an Apozeme, clarify it, and perfume it with two drams of the best Cinnamon for four mornings draughts. After the Apozeme is done let him take these Pills.

Take of the mass of Pills *Lucis major*, and *Cochia* the less, of each half a dram; malax them with Betony water, make six gilded Pills thereof, which let him take early in the morning.

After this general Evacuation the antecedent cause is to be revelled, and the conjunct cause is to be derived and discussed. For this Frictions of the extreme parts, especially beneath, are to be used every morning.

Cupping-glasses must be applied to the Shoulders and Back without Scarrification; especially to the

the hinder part of the head with Scarrification; for they do so powerfully draw the humors from the fore-parts and the principle of the Nerves, that some presently after the application thereof have recovered their sight. At the same time apply a Vesicatory to the hinder part of the neck, and let the Blisters that are raised to be kept long open, with Beet or Colewort Leaves often applied.

When the Vesicatory is dried up; apply a Caustick to the hinder part of the head or neck between the second or third *Vertebra*, or (as it is now most usual) apply two Causticks to the Neck behind upon the fourth and fifth *Vertebra*; so that the back-bone may be untouched between them, and both may be cured with one Plaster.

Instead of Cauteries a Seton applied to the same part is most efficacious, but the tenderness of our Country men hath almost abolished the use thereof.

If the aforesaid Cauteries avail not, you may lay a potential Cautery to the Coronal Suture; which sometimes hath done the work when other Remedies have failed.

When these things are doing, presently after universal Evacuation by siege, you must order a sweating Diet of the Decoction of Guajacum, Saxaphras, and the Roots of Sarsa, according to the method prescribed by us in the *Cure Of the cold distemper of the Brain*. Observing this, that towards the end of the Sudorifick Decoction, you add those things which peculiarly respect the Eyes; as Vervain, Fennel, Eyebright and Celandine the greater.

And for the better drying of the Brain; let the Bags prescribed in the Chapter above mentioned be applied to the Temples if you fear not an Inflammation.

Also after the Sudorifick Diet it is very convenient to use Sulphurous and Bituminous Baths and washings of the head; because they are very proper for the correcting of a cold and moist distemper, for the consuming of flegm, and strengthening the brain.

Besides the Universal Evacuation of the body and head, particular may be ordered; as Medicines that cause spitting, called *Apophlegmatism*, by which the Rheum is brought out of the brain by the Palate; which may be made either in a form of a Gargarism or Masticatory; according to the forms prescribed in the *Cure Of the cold distemper of the Brain*.

Errhines and Sternutatories or Neefings are condemned by almost all Practitioners in this disease, because they draw humors to the eyes: but yet if some of the milder and gentler sort be used (after an exact purging of the whole body and head) for some few days; they may be profitable in regard they may by degrees draw forth and derive the humor which causeth the disease, and is fastned in the Optick Nerves, nor can they fetch any thing from the profound part of the brain to the fore parts: Otherwise in every derivation which is an evacuation by the part affected, or that which is near unto it; we should always fear lest there should be an attraction to the parts affected, which is easily hindered by universal Evacuations which ought to precede; and those Errhines may be made of the juyce of Beets and Marjerom with white wine in which Manna hath been dissolved.

But a stronger and yet safe Errhine may be made of the powder of Tobacco corrected with Cephalicks and Oxydoricks, or Medicines that help the sight; for by that the Rheum is drawn forth rather by the Palate than the Nostrils; and the brain is so fortified that it will not so easily receive the defluxion of humors from other parts. The Composition whereof is as followeth:

Take of dried Tobacco one ounce, the leaves of Sage, Marjerom, Betony, Eyebright, the flowers of Clove-gilli flowers, and tired Roses of each one dram: make a Powder to be snuffed into the Nostrils for some few days.

Neither is it sufficient once to cleanse the body of Excrementitious humors with universal Purging, but you must keep it in that condition all the time of the Cure; therefore with Purges intermixed, the excrements which daily increase must be brought forth; which may be done with usual Pills made after this manner:

Take of the best Aloes half an ounce, clean Senna, Turbith, Hermodactls, Agarick newly trochiscated, of each two drams: Diagridium one dram; Mace, Cloves and Eastern Saffron, of each seven grains: sprinkle them with the juyces of Marjerom and the greater Celandine; then dry them again in the shade. And with the Oxymel of Squils make a Mass of Pills, of which let him take half a dram or two scruples twice or thrice in a Moneth.

While these things are used, you must continually labour to strengthen the brain and the eye; and the Patient must take diversity of Medicines, lest by taking the same a long time, it prove nauseous unto him; and lest Nature be too much enured to a Medicine, and so it lose its Operation. Old Physicians say, Treacle is reputed to be of excellent vertue to this purpose, which may be taken by a dram every night with Fennel, Eyebright or Celandine water twice or thrice in a week. Nutmeg eaten every morning fasting, is much commended if it be long chewed that the vapor may be carried to the eyes; if you fear that the swallowing down thereof should offend by reason of the heat, it may be spit forth after it is chewed. Candied Myrobalans taken in the morning are thought to clear the sight exceedingly.

The usual Opiate is thus made:

M

Take

Take of Conserve of Betony and Rosemary flowers, of each two ounces, Candied Myrobalans two; old Treacle two drams, the Leaves of Eyebright powdered three drams, Fennel seed two drams: Nutmeg, Cinnamon and Cloves, of each one scruple; with the Syrup of the Juice of Fennel, Rue and Celandine make up with Honey; make an Opiate.

Let him take thereof the bigness of a Chestnut, drinking after it a little Wine mixed with Fennel water.

Nor must you omit external Medicines which strengthen, warm and dry the Head; of which sort is the Cephalick Pouder for the hair, a Cap and Fumigation, mentioned by us in the Cure Of the cold distemper of the Brain.

Finally, You may apply Topical Medicines to the Eyes to strengthen them: these are usual in Authors, but they are of little force which cannot reach to the Optick Nerves; but if any desire to try some of them, they may find enough of them in the Cure of a Suffusion.

In a desperate case when all other Medicines have been used in vain, a Vesicatory applied over the whole head (being shaven) in form of a Cap hath many times been very successful: if it be twice or thrice used after the drying up of the former Blisters, it is more advantageous.

CHAP. II.

Of the Disease of the Vitrous, or Glassy Humor.

THE Vitrous Humor is next under the CrySTALLINE, and therefore it is made by Nature transparent, that the Species carried to the Optick Nerve may be pure and clean. If therefore the clearness of that humor be hindred by the mixture of another, and so made dusky: according to the degree of that duskiness or foulness, the sight is either diminished or abolished.

Moreover, this humor may be out of order in respect of its situation; namely, when any part of it by a blow or contusion shall be brought before the CrySTALLINE, for then the sight will be darkned, in regard the vitrous humor is more thick than the watery, and therefore the species of the objects cannot be carried pure and clear unto the CrySTALLINE.

The first affect, namely, the Mixtion of a humor with it, cannot be perceived by any signs, but only it is judged probable by reason, for the vitrous humor cannot be seen, or its condition known; and therefore Practitioners are constrained to confound it, and to make it one with *Gutta Serena*, because no fault appears in the eye, and this they do without offence to the Patient, in regard any humors that are mixed with the vitrous, are to be discussed with the same Remedies that a *Gutta Serena* is cured.

But you may know that this vitrous humor is disordered in respect of its situation, when it appeareth white under the *Pupilla*, yet it is not easily distinguished from a Suffusion, except the antecedent and first cause be diligently observed. For a Suffusion is caused by a simple defluxion of an humor; but this transposition or displacing of the vitrous humor useth to come of a Wound or Contusion.

This last disease is incurable, for the vitrous Humor being displaced can by no art be reduced to its former condition. But this by nature hath sometimes been done, and therefore the whole business is to be committed unto her.

CHAP. III.

Of the Diseases of the CrySTALLINE Humor.

THE CrySTALLINE Humor is the chief iustrument of sight, and therefore ought to be kept more pure and perspicuous than the rest, that that sence may more freely be exercised. And if it be foiled in the least measure, the sence of Seeing is much hindred.

The chief disease whereby the purity thereof is infected, is called *Glaucoma*, (or the changing of the CrySTALLINE humor into a fiery redness) and this happens when the CrySTALLINE humor is made thick by dryness, as in old people, from some drying and condensing cause it is often seen.

This Disease is known, by a plain appearance of a thick white about the *Pupilla*, and when all objects are apprehended by the Patient as through a cloud or smoak. But it is hard to distinguish this disease from a Suffusion which representeth such a weakness about the *Pupilla*: Hence it is that many Authors do not distinguish between a *Glaucoma* and a *Suffusion*, But they which diligently observe may distinguish them thus: In a Suffusion there is a white in the very *Pupilla*, and very near the Membrane called *Cornea*; but in a *Glaucoma* it lieth deeper.

This

This Disease is incurable, especially in old folk in whom the driness of the part cannot be amended; but if it be not manifest that the fault is in the Crystalline, and there is a suspicion of a Suffusion, you may use the Remedies prescribed for it.

Moreover, the Crystalline may be out of place, namely, when the broader part of it which is flat like a Fetch or Lentil is not directly against the hole of the *Pupilla*; but either is too high or too low, and then objects appear double when one eye only suffereth; because the parallel or streight line is lost, which ought to be one and the same in both eyes, that whatsoever thing is seen by both eyes may appear but one and the same. And if they be not in that order, things are seen double; which you may prove by depressing or lifting up one of your eyes with your finger: for then the parallel is lost, and things appear double. But this depravation of Sight by which objects appear double, comes not only of the cause now mentioned, but also from vapors, or water which hurt the Crystalline, by which the visive spirits are divided, whence it comes to pass that the Species of the same thing are received into two places, which Drunkards usually perceive when they see double.

Secondly, The situation of the Crystalline is altered, when it declineth backward, or cometh forward, if it comes forward to the *Pupilla*, then things near at hand are not so rightly perceived as those which are more remote, as in old men often. But if it decline backward towards the Optick Nerve, things near are truly seen, but not afar off, and then is this Disease called *Myopia*, which was mentioned in the Preface; where we shewed, that these Diseases are only cured by Spectacles.

Thirdly, The Crystalline is out of its place when it tendeth either to the right or left side, which is called *Strabismus*, or Squinting; when the *Pupilla* is not directly but obliquely upon the object, and appeareth not in the middle of the Eye, but in one side: so that there appeareth more white in one part of the Eye, than in the other.

This Disease comes not only from the displacing of the Crystalline, but also from the evil disposition of the Muscles which move the Eyes; which is either natural, or else proceeds from a Palsy or Convulsion of the said Muscles.

Of what cause soever it cometh, if it be connatural, it is incurable; but if it come from Palsy or Convulsion of the aforesaid Muscles, you may find out a way of Cure, in my Chapter of Head-Diseases.

Finally, Other depravations of Sight may come from the inversion of the Crystalline, be it greater or less; as when strait things appear crooked, or when the objects seem to be folded; which happened to a certain Physician (as *Sennertus* reports) who going up a Ladder to take a Book from a shelf, and turning his eyes violently upwards, saw all things afterwards turned upwards, as though men walked upon their heads, which came by the attraction and displacing of the Crystalline. For a quarter of a year after when again he turned up his Eyes violently, his Natural Sight returned, and all things appeared in right order.

Hence it appears, that by a violent motion of the Eye that the Crystalline may be displaced, and again by the same motion be set right. I suppose that the displacing of the Crystalline was thus, It was so inverted, that the fore-part of it (which is more depressed than the other) was not right against the *Pupilla*; but rather its side, which being more round and convex, might represent the species of the objects inverted, as we may also observe in round Glasses, which discover the object inverted; and this is true from the Principles of the Optick Art: for in a Medium that is convex and thick, the species are so broken, and as it were cross cut, that they which come from the upper part of the object, do represent the lower part; and so contrarily, but if the inversion of the Crystalline be less, so as both the depressed part of the Crystalline, and also the Convex part thereof, be right against the *Pupilla*, the objects may seem crooked. Although that depravation of Sight whereby objects seem crooked may come by other means; namely, when any part of the Crystalline is mixed with the watery humor, then by reason of inequality of the Crystalline in regard of thickness, the refractions are divers, which are the cause of depravation of Sight whereby things appear crooked. This may be demonstrated by a clear Example: A staff put half into the water appears crooked for this cause, namely, the species of that part in the water, when it is carried out of the water into the Air, from a thicker to a thinner Medium, is broken by the perpendicular; but that part which is in the Air is not broken, because it doth not pass through divers Mediums as that which is in the water. Hence it comes that the stick seems crooked. After the same manner the species of the object which is carried into the thicker part of the Crystalline is more broken, than that which is carried to the thinner, which is in its natural state, and not mixed underneath with the watery humor; and so by reason of the divers refractions the objects appear crooked.

But since Medicines are to no purpose, we shall prescribe none for these Diseases.

CHAP. IV.

Of the Diseases of the Watery Humor, and especially of a Suffusion.

THe Watery Humor is out of its Natural Condition, when it is distempered in quantity or quality. When the distemper is in quantity, it is enlarged or diminished, and makes the *Pupilla* be dilated or contracted, which diseases shall be mentioned in their places. When the distemper is in quality, it becomes thicker, and that comes from another humor mixed with it, and that is called Suffusion, which we here speak of. For although *Galen* 1. *de Symp. caus. cap. 2.* sheweth, that a Suffusion may come from the condensation of the watery humor, without the access of an excrementitious humor. Yet because it happens seldom, and is known rather by imagination than art, and is altogether incurable, omitting that, we shall speak of that Suffusion only which cometh from the afflux of another excrement or humor. This is called in Greek *ὕδαρμα*, in Latin *Suffusio*, by the *Arabians* Water, vulgarly a *Cataract*. Some Authors would distinguish these names, and make them signify divers sorts of this disease: They call it in the beginning (when the sight is only a little darkned) a Suffusion; but when it is grown older, and something gathered into the Pupil, appears like water, then they call it only *Aqua*, Water; but when the matter is grown thick in the Pupilla, and the sight almost gone, then they call it a *Cataract*. A Suffusion comes from a serous watery humor spread in the space between the *Cornea* and the *CrySTALLINE*: and since a Watery Humor is contained in that space, it may well be reckoned among the Diseases of the Watery Humor.

This is the cause of a true Suffusion; there is another Bastard-Suffusion which comes from vapors sent from the stomach and other parts into the Eyes. *Galen* 4. *de loc. aff. cap. 2.* taught, that vapors may be sent from the Head to the Eyes, and make a Bastard-Suffusion; but although Authors speak of two sorts of Suffusions, yet they are for the most part united, and a spurious or false Pleurisie is complicated or joyned with a true one; because vapors sent from the lower parts to the Brain, are easily carried to those parts of the head which are weakened with any disease, and this appears in that all troubled with Suffusions are less troubled, and see better in the morning than at noon or night, because after dinner or supper many vapors are sent up from the stomach to the eyes which disturb the sight. And Experience teacheth, that men so diseased have their sight more dull and dark presently after meat, than a few hours after. Moreover, all that have a Suffusion relate that they see in the Air little Bodies, as Gnats, Flies, Hairs, Cobwebs, and the like; which could not be but by the gross vapors which are sent to the Eye, and there move: for although Authors suppose that these representations depend upon some thick humors contained in the Eye, which make a Suffusion; yet this is not credible, because then it should always move in the Eye, to represent those little Bodies which fly in the Air, which is contrary to Reason. But rather without question, the vapors are in perpetual motion, and so can represent those flying fancies.

A Watery Humor is the chief and most ordinary cause of a Suffusion, yet other Humors at least in a small quantity may be mixed therewith: and if Choler be mixed, then it is citrine or yellowish; if Melancholy, then it is a black Suffusion.

And those Humors use to flow to the Eyes when they are weak, either Naturally, or by Accident.

From a Natural debility comes a thrusting forth of the Eyes, for they who have such Eyes, are very subject to a Suffusion; for such Eyes use to be great, and therefore the vertue spread abroad is less in them: as also by reason of their largeness they do more easily receive humors and vapors. External causes make an accidental or adventitious debility, as a stroak, contusion, baths, a Southern and rainy habitation or season, heat of the Sun, smoak, continual reading, especially by Candle light, and the like: All which may also cause a flux of humors to the Eyes.

Now the Humors flow from the Brain to the Eyes by the Veins, by the Tunicle called *Uvea*, and by the Optick Nerve. The Veins by which they flow are divers: either those which come from the *Pericranium* to the *Conjunctiva*, thence to the *Cornea* and *Uvea*; or those which come from the *Meninges*, from which some branches come to the Membranes of the Eye, from which Membranes, especially from the *Uvea*, the excrementitious humors may easily fall into the Watery Humor being so near.

Finally, Humors may easily be carried by the Optick Nerve from the Brain; by the *Tunica Rotiformis* and *Aranea*, to the *CrySTALLINE*; and then the matter of the Suffusion sticks upon the superficies of the *ChrySTALLINE* humor. Although a Suffusion for the most part comes by a defluxion,

yet

yet sometimes it may come by congestion or gathering, when that the nourishment of the Eye is no well changed, and the expulsive Faculty is so weak that it cannot expel sufficiently the remaining excrements, so that they are by degrees gathered together about the *Pupilla*, and so make a Suffusion, in which case other humors are ordinarily disturbed, and difficult diseases are produced.

DIFFERENCES. The Differences of a Suffusion are taken from the thickness and quantity of the humor causing it, and from the place in which the humor resideth.

In regard of thickness more or less, the sight is more or less offended, for if the humor be thin and serous, of which the Suffusion is made, which is cured by pricking, as *Galen* taught 14. *Meth. cap. ult.* The sight is little worse, and it is called a Suffusion only begun, if it be somewhat thicker, the sight is darker; if very thick, blindness followeth.

In respect of the quantity and the place, either the humor possesseth the whole Eye, and the sight is equally hindered which way soever it be directed; or it possesseth one part of the Pupil more than another, and so the objects are not seen wholly at one direct view, nor can many objects be seen at one time: but if the humor be very little, and possess the middle of the *Pupilla*, the objects appear with holes through them. But if the matter be divided into divers parts, possessing divers parts of the *Pupilla*, the forms of Gnats shall seem to be before the Eyes. All these differences are exactly distinguished by *Galen*, 1. *de symp. causis*, c. 2.

Moreover, in respect of the place or situation of the matter, other differences may be made, as sometimes the matter is in the very hole or cavity of the *Uvea* about the *Cornea*; sometimes about the *Uvea*, and between that and the watery humor, sometimes it is mixed with the watery humor. And finally, sometimes it is between the Crystalline and watery humor.

Some differences may be taken from the figure or shape of the matter, which *Galen* relates 1. *de sympt. causis*, cap. 2. and 4. *de loc. affect.* cap. 2. for as the figure of the humor adjacent to the *Pupilla* is various, so divers objects are present thereunto, as Gnats, Hairs, Cobwebs, Circles about the Candles, and other things.

DIAGNOST. The knowledge of this Disease, is first in distinguishing a true from a Bastard Suffusion, and then in the discovery of the differences of the true and right Suffusions.

A true Suffusion doth for the most part affect only one Eye, but if both be affected, they are not at one time, or alike affected, as in a spurious Suffusion.

Secondly, In a true Suffusion, some dark matter appeareth in the *Pupilla*, which doth not in a spurious or Bastard Suffusion. But this is not always a true sign, for if the Suffusion cometh of a thin and serous humor, because it is no thicker than the watery humor, there appeareth no change in the Eye, by which Physicians are sometimes deceived, not knowing that kind of Suffusion, they take it for *Gutta Serena*, perceiving no change in the *Pupilla*: but this kind is easily distinguished from *Gutta Serena*. First, in *Gutta Serena* the Sight is quite gone, or much diminished, no hurt appearing in the Eye. On the contrary, in a Suffusion which we cannot see, there is only a small decay of Sight, because the serous humor from whence it proceeds is thin and transparent, so that it may be pierced by the species of the objects like glass. Secondly, they differ in this, for the most part in a Suffusion, the Sight is not equally hindered in all parts of the *Pupilla*; but the objects sometimes are seen better when they are direct before the Eye, sometimes when they are opposite to the corner of the Eye, because the humor is thicker or thinner in one part of the *Pupilla* than the other.

Thirdly, In a true Suffusion the symptoms are continual, and have no intermission; in a Bastard Suffusion they are sometimes increased and remitted, as the vapors are more or less which are sent unto the Brain. So they are fewer when the stomach is empty, than when it is full, especially presently after meat, for then a greater company of Vapors do ascend, which sent to the Eyes represent to Sight, Flies, Gnats, Cobwebs, and such like small bodies, not always, but at sometimes only. Which little Bodies represented in the Air, do depend upon the Vapors as afore said: but in regard the Eyes are weakened by a true Suffusion, there is almost a continual sending up of vapors unto them, and therefore there is a continual appearance of these little Bodies flying in the Air. Moreover, there is a constant darkness of Sight in a true Suffusion, being always after the same manner, as if all the objects were seen through a cloud or thick glass, which is the proper Sign of this Disease; but in a Bastard Suffusion, there is sometimes a greater, sometimes a less, and sometimes almost no dimness at all of the Sight, even as the vapors are many, or few, or none that are sent to the Eyes.

Lastly, A true Suffusion grows in a short time, and is confirmed for the most part in Six Months; and sometimes it increaseth in a few days: and *Fernelius* saith, 5. *Pathol. cap. 5.* that a Suffusion was perfect in one day, which we also have often seen; but a Bastard Suffusion continueth many years without increase.

DIFFERENCES. The Differences among the true Suffusions are these:

In a Suffusion's beginning certain small Bodies, as Hairs, Gnats, Flies, pieces of Wooll, and Cobwebs, fly before the Eyes.

But when it is far gone, the Air appears cloudy, and the Objects are seen thicker, as through a glass;

glafs, the colour of the *Pupilla* is changed, and it appears either troubled or cloudy, or like filthy glafs; or of a Sky-colour when a Suffusion is perfect, the Sight totally perisheth: the *Pupilla* is either white, or of some other colour mixed with white.

SIGNS. Some Signs are taken from the Colour: for when it is like a Pearl in colour, it signifies that the flegm is still fluid and transparent; when it is white as Chalk, then it signifies a thick and compacted matter: when yellow, then flegm and choler are mixed: when black, it shews Melancholy.

The place in which the Suffusion grows, is thus known: For if the matter be placed between the *Uvea* and *Cornea*, the *Pupilla* appeareth more dark, because the matter is nearer to the beholder: Moreover, the *Pupilla* is dilated by the humor contained therein; and when the Disease is confirmed, white or red veins or swellings are perceived to be about the Iris, or circle of the Eye; or certain white spots appear about the *Pupilla*.

If the matter be contained between the CrySTALLINE and the *Uvea*, contrary symptoms will appear: as also the *Pupilla* will be contracted if the matter lie deep, and enlarged if the matter lie higher.

PROGNOSTICK. The Prognostick of this Disease is to be diversly made, according to divers seasons: For when a Suffusion is only begun, when the Patient can perceive an object as through a Cloud, it is curable as *Galen* saith, 14. *Meth. cap. ult.* and *Celsus lib. 6. cap. 6.* which Opinion wants a restriction: Namely, if the Patient be young, but in old it is incurable: and if the Eyes be not naturally of a weak constitution. We also have seen some that have been cured in fifteen days space, of a Suffusion newly begun, who have been above fifty years of age, only by universal Purging, sweating Diet, and a Velicatory, without any other application of Topicks.

This Cure is better wrought in a warm Air and in Summer time, because the Pores are then open, the matter or the Disease is more moveable and obedient; so that oftentimes it dischargeth itself by seege, which is very much to the Cure of this Disease; as *Hippocrates* sheweth, Aph. 16. Sect. 6. in these words: *It is a good sign, when men with sore Eyes have a loose Belly.*

If a Suffusion come from an acute Feaver, a *Peripneumonia*, a Phrenzy, or from a violent pain of the head, it is hard to be cured.

A Cataract or Suffusion confirmed when the matter is grown thick, cannot be dissolved with Medicines, but must be couched with a Needle.

This Operation is not safe, and often hath ill success: For either the Tunicle *Uvea* is torn, or by the pain and inflammation, a new Flux of humors is brought to the Eye, which hath been long before weak: and many other inconveniences by which the Sight is for ever lost. But since this Operation hath been sometimes successful, it may be tryed by those who have no other hopes of Cure; For it is better, as *Celsus* saith, to try a doubtful Medicine or Remedy, than none at all.

In a confirmed Cataract, if when the other Eye is shut, the *Pupilla* appeareth larger in the Eye affected, there is hope of cure by Couching; but if it be no larger, it is incurable, as *Galen* teacheth, 1. *de symp. caus. cap. 2.* because the Optick Nerve is obstructed, and the spirits cannot come to the *Pupilla*, though it be open.

But if the Patient perceive no light when the *Pupilla* is enlarged by the shutting of the other Eye, he cannot be recovered by the Needle, because the visive spirit is troubled and obscure, and therefore unfit for Sight.

A black Cataract, free from all brightness, can neither be cured by Physick, nor Chyrurgery, because the visive spirits are destroyed; but a clear Cataract that hath some splendor, is curable.

These also are incurable for the most part, a green, dark, very yellow and hard Cataract: and that which moveth and is coloured like Quick-silver.

A Cataract which representeth objects full of holes, is not to be tampered with: For since the matter is of the Center of the *Pupilla*, it is to be feared lest when the Needle is thrust in, the whole *Pupilla* be filled with the matter, and so the Sight be utterly lost.

The operation of the Needle is more successful in a full Eye, and that which keeps its natural greatness: But if the Eye be small and decayed, it is less successful.

In old men this Operation is not to be tryed, nor in Children, in them the Disease is incurable: in these the Humors are too soft being not ripe; there is most hope of success in young persons.

If this Operation be, when some part of the Suffusion floweth down (if the Eye be compressed) and appeareth more large, and after returneth to its former station and figure, it is not successful, because the Cataract is not yet ripe, but thin and crude. But if by a compressing with the finger there is no change of the shape and figure of it, it is then ripe, and may be couched with a Needle. But we must take notice, that the ripeness or thickness of the Cataract ought to be moderate, and not too much compacted, that it may be easily couched: for it ought to be like a thin skin which may be rowled about the Needle, and so couched down; for if it be too thick and solid, it cannot be couched, which

which you may perceive when it is like Chalk or Hail. Contrarily that which is fit for touching useth to be Sky-coloured and Sea-green, of the colour of Iron or Lead not black.

CURE. The Cure of a Cataract must be directed not only to the Conjunct, but to the Antecedent cause. And therefore you must purge the whole body, and especially the Brain very exactly. After you must discuss that humor which obstructeth the *Pupilla*, and some way soften it.

Which intentions, when they are almost the same which were propounded in the Cure of *Gutta serena*, we may use the same Remedies for diet, evacuation or purging of the whole body, for revulsion of the humor offending, and for the strengthening of the head and the eyes, so we shall not in vain repeat them.

Having therefore first used all that Method which was laid down for the Cure of *Gutta serena*, we will declare unto you those Medicines which belong properly to the taking away of the matter about the *Pupilla*. And though Topical Medicines are counted little worth according to *Galen's* Opinion, 2. *Katà tòpous*, who saith that they promise more than they can perform; yet their lawful use is not to be rejected, and experience hath taught by very good Authors confirmed, that Cataracts in their beginning after universal Medicines used, have been cured with Topicks, that is, Medicines applied to the Eye.

First therefore begin with mild dissolvers, and such as dry not overmuch lest the matter grow hard, and be made unfit to be dissolved; then use mollifiers with your dissolvers, that induration may be hindered, and it may more easily be dissolved. For this purpose the following Fomentation may be first used.

Take of the Leaves of Rue, Fennel, Eyebright, the greater Celandine, of each one handful; Fœnugreek seeds one ounce; Camomel and Melilot flowers, of each one pugil: Boyl them in three parts of spring water, and one part of White-wine added towards the end of the Decoction. Foment the Eyes with a soft sponge dipt in the strained Liquor morning and evening.

Of the same Decoction you may make a Fumigation, covering the head that it may be received in to the Eyes.

In the beginning of the disease, while the defluxion is new, and that revelling Medicines are used, it is good to wash the eyes with only red Wine, which by its attrition hinders the defluxion, and by its spirits discusseth and dissolveth it.

In the progress of the disease, a Fomentation of White wine, in which *Crocus Metallorum* hath been infused, is most profitable.

It is no less profitable to let a child eat sweet Fennel seeds in a morning, and afterwards breath into the Eyes.

As also to let him lick them, or to let a Dog lick them.

Also Bread hot from the Oven, in which is sweet Fennel seed cut in the middle, may be so placed to the Eyes that they may behold it when they are wet with the Vapor.

These Medicines are to be used in the morning.

At night you may apply this Cataplasme.

Take of Fœnugreek seed beaten one ounce, Aloes half an ounce, Saffron one dram: make them into fine powder, put it into White-wine wherein *Crocus Metallorum* hath been infused, and make a Cataplasme to be applied to the Eyes at night.

Many commend Pigeons blood put hot into the eyes, for with the Natural heat of that Creature the part will be much strengthened, and the excrementitious matter dissolved: but because the heat will quickly depart from the blood, it is better to take a young callow Pigeon, and slit it in the back, and apply it to the Eye.

With these Medicines you may discuss the matter if it be possible.

Topical Medicines called *Collyria*, which are dropped into the eyes, are of little force, and those are they which *Galen* said did promise more than they perform; for all their virtue is spent in the *Cornea*, neither can they reach to the internal parts, except they be made very sharp, by which pain would be caused, and a greater defluxion: hence many that have used them immoderately, have from a light infirmity become stark blind. But because many of those *Collyriaes* are found in Authors which have good report by them; lest we should seem defective, we will shew some of the choicest, that they who please may try them.

Take of the best Honey two pints, Fennel Roots, and the Roots of long round Birthwort, of each one pound; the leaves of Rue, Eyebright, Celandine the greater, and the tops of Fennel, of each six handfuls: Centaury the less three handfuls: Roses four pugils, the Urine of a Boy two pints. Mix them all in a glass Vessel, and distil them in *Balneo Mariæ*. Drop this water often into the Eyes.

Or you may make Bread with the Bran in it, with the powder of Rue, Celandine, Eyebright, Betony and Fennel, with a little honey, which as soon as it is drawn and cut in pieces, must be put between two Pewter or Silver Dishes from whence will come a Water, which *Zechius* affirmeth, dropped into

into the Eyes doth wonders. Also this following is highly commended.

Take of white Violet Leaves, done handfull; Radish seed one dram, Ammoniacum half a dram, mix them and powder them, then steep them twenty four hours in one pint of Fennel water, then let them boyl a little space: add to the straining one ounce of the clarified juyce of Fennel: the Balsom of Peru, two drams, make a Collyrium, which Zechius saith, dropt into the Eyes morning and evening, after the Body is sufficiently purged, doth so cleanse the Eyes, that it takes away a Cataract wonderfully without Couching.

Hollerius describes a water, that he saith, cured one that was Nine years blind: Which is this.

Take of the juyce of Smallage, Vervain, Germander, Burnet, Avens, Sage, Celandine, Rue, Knot-grass, Chickweed, the powder of Cloves, of each one; gross Pepper, Nutmeg, Lignum Aloes of each three drams, steep them all in the Urine of a Boy, and the sixth part of Sack: Let them boyl a little, then strain them and press them, put it in a Glass close stopt: drop every night some of it into each Eye.

The Juyce of Brooklime only, being often dropt into the Eyes, hath sometimes cured a young Suffusion, when a Cautery also hath been applied to the Coronal Suture.

The Juyce of Celandine and Calcitrap mixed together, are as good.

Quercetan in his Dispensatory doth much commend Water in which *Crocus Metallorum* hath been infused, which is thus made:

Take of the water of the great Celandine, six ounces: *Crocus Metallorum*, one dram, infuse them, and drop three or four drops of this water warmed into the Eyes for three or four times a day for a long continuance.

Fonsēca saith, That he knew one cured by this water, who was very dim sighted many moneths: This is the excellency of it, which few other Medicines have: It cleanseth very powerfully without any sharpness.

The same Fonsēca says the water following is admirable:

Take many Swallows, beat them with their feathers in a Mortar, put to every pound of them four ounces of bread crums, of white Wine four pints: infuse them six days, and distil them in Balneo till they are dry: then set that water in a Glass in the Sun for twenty days, and drop it into the eyes morning and evening.

There is a water made of Rosemary flowers, which discusseth Films in the Eyes after this manner:

Take of Rosemary flowers as many as are sufficient to fill a Glass, which must be well stopt, and set it in the Wall against the South Sun, thence will an Oyl come, which with a feather anoint the Eyes with.

Some Authors commend the Galls of Beasts because they cleanse and discuss strongly, but they cause pain with their sharpness, and therefore are seldom used.

Forestus, Obs. 35. Lib. 11. commends a certain Fish in his Country, out of whose Liver there comes a moisture, by which he saith Cataracts are presently, as by a miracle, Cured. See in the place cited the use of it. William Lozellus saith, That he hath Cured many stark blind, after universal Medicines have been used, with this Water:

Take of the Liver of a sound Goat, two pound: Calamus Aromaticus and Honey of each half an ounce: the juyce of Rue, three drams: the Waters of Celandine, Vervain, Fennel, Eye bright, of each three ounces: Long Pepper, Nutmeg and Cloves, of each two drams: Saffron one scruple, Rosemary flowers bruised, half an handfull: Sarcocol and Aloes, of each three drams; the Galls of Ravenous Birds, Capons or Partridges, one ounce; let those that are to be sliced be sliced, and those that are to be bruised, be bruised; then mixed together, with two ounces of white Sugar and six drams of Honey of Roses, cast them into an Alembick of Glass: and distil them in Balneo Marie with a gentle fire, keep this water in a Glass close stopt, for precious; which you may drop twice or thrice in a day into the eye affected.

Zacutus Lusitanus commends the water following in these words, For an old Disease in the Eyes, called Ophthalmia, or any other which cometh of overmuch moisture, gross humors and mists; as in thicknes, whiteness, the Haw and Suffusion; this Water is the best in his Experience, if after sufficient Purging, you drop six drops cold every night three hours after meat into the Eyes, then about two hours after, you shall have water flow out of them in abundance.

Take of Aloes, three drams: Rue, Fennel and Betony, of each two handfulls: Vervain and Tormentil, of each one handfull: Sarcocol three drams: the froth of Nitre, two drams and a half, Sugar Candy three ounces: Syrup of Roses, four ounces; the Urine of a young Boy, half a Pint: Lizzards dung, three drams, Horehound three handfulls: Eyebright one handfull and a half; Ginger, Spicknard, long Pepper, Cloves and Tutty, of each two drams: Balsom three drams;

Drams : Honey of Roses two Ounces : Verdegreece one Dram : Licium two Scruples : Radish-leaves one handful. Powder those which are to be powdered, mix them, and infuse them in the best White-wine in a Still, putting to a fourth part of the best Honey for ten days, and stir them daily, then distil them, keep the Water.

The same Zacutus commends the Oyntment following, in these words : For the drying up of moisture flowing from the Head into the Eyes, and for purging them by the corners very strongly ; this Magistral Oyntment is excellent, being applied after universal Evacuations from the Head and the whole Body ; let the upper Eyebrows be anointed lightly therewith Morning and Evening twice in a day three hours after meat, one hour after there will flow plenty of water from the corners of the Eye, especially from the great corner.

Take of the Oyl of Roses three Ounces : Rosewater nine Ounces : Camphire one Dram : Tutty one Scruple : Honey two Ounces : the Gall of a Goat half an Ounce : Lupin meal half a Dram : Aloes-Succotrine one Dram : Sugar-Candy half a Dram : the juice of Horehound, Fennel and Rue, of each half an Ounce : Myrrh one Scruple : Ammoniacum half a Dram : Sarocol one Dram and an half. Powder them that may, mix them, and boyl them a little with a gentle fire, and the grease of a Goat or Sheep, and a little Wax : Make an Oyntment according to Art.

Finally, When all Medicines fail, when the Disease is almost desperate, it were good to try an Experience with the Oyntment of Quicksilver, which *Fonseca* saith was his invention, yet seldom used, for in his 19. Consultat. lib. 1. he thus saith : I have thought sometimes that the Unction used for the Cure of the French-Pox, hath power to take away Cataracts in their beginning and increase ; by the same reason that it takes away the Humors remaining in the Eyes from the French-Pox : for by it the Head may be so purged, that a Cataract may be cured ; and I have determined to make tryal of it. *Fonseca* had much commended his Judgement if he had seen *Skenius* his Observation 309. Lib. 1. which is taken out of the 5. Book of *Alexander Trajanus Petronus*, of the French Pox, Cap. 1. One (saith he) before he had the French-Pox was blind of the Eye with a Cataract or thick Suffusion : by the Unction with Quick-silver was freed wonderfully from his Pox and Cataract both at once : Neither is it without reason that Cataracts may be dissolved with that Unction, when we see by Experience that very hard Tumors of thick and gross slegm are powerfully dissolved by the Unction of Quick-silver.

When a Cataract can be dissolved with no other Medicines, the last remedy is the Chyrurgical Operation, which with a Needle put into the Eye, after the matter of the Cataract being thick and turned to a little skin, thrusteth it to the lower part of the Eye, so that the sight is restored as if a Window were opened. This Operation is succesful sometimes, but often not : But when the case is so that no hope remains of other ways, it is better, according to the Opinion of *Celsus* formerly commended, to try an uncertain Medicine than none. But it useth not to be tried by reason of its uncertainty by ordinary Chyrurgeons, but Quack-salvers who go to and fro practising ; and therefore the time and manner of the Operation is to be left onely to them.

But because those things ought not to be hid from a Physician, you may find them exactly treated on in divers Practical Authors when the Cataract is cured.

Whether it be with dissolving Medicines, or Manual Operation you must use a course of Physick long after, because there is a great fear of a Relapse : For the Eyes having been much weakned by a long Disease, are very ready to receive any Defluxion again from the Brain. Therefore you must follow the usual purging ; you must have Issues continually for diversion, and use often strengthners of the Eyes, such as are prescribed in *Gutta serena* : to which you may add a washing of the Eyes, which must be done every day thus.

In the morning first chew sweet Fennel-seeds some space of time, then fill the mouth with Wine, and after it is warm in the mouth, wash the Eyes therewith till they begin to smart, which will cease when you leave washing.

Moreover, Spectacles are very good to preserve sight which do make the Objects neither bigger nor less than they naturally are. And it is profitable to refresh the sight with green or sky-coloured Spectacles.

And lastly, You must avoid all things which hurt the sight, and use those things which help it, as is declared in the Diet for the Cure of *Gutta serena*.

CHAP. V.

Of the Enlarging or Dilatation of the Pupilla.

THe Tunicle is called *Uvea* out of *Galen*, 1. *de sympt. cause cap.* 2. is obnoxious to divers Diseases, and especially to Ruption, Distortion Dilatation and Constriction.

A Ruption may come both of an external Cause, as a stroke or contusion; and of an inward, when much humor distendeth and breaketh the Tunicle: but this being incurable concerneth not us.

A Distortion of the *Uvea*, cannot be but in the first constitution of it, because it adhereth to the *Cornea*. Therefore *Galen* in the place quoted doth onely reckon it among the different Symptomes of the *Uvea*, and doth not stand to explain it, because it is of no concernment in the practice of Physick. We therefore omitting the first two Differences, will only insist upon the explaining of the Dilatation and Constriction of the Pupilla.

The Dilatation of the Pupilla, which is a hole in the *Uvea* Tunicle, by which the Species of Objects pass into the Eye, is called in *Greek* *Mydrasis*; this hurts the sight, because too much light goeth into the Eye: hence it is that they which have this Disease see better in a darkish place than in a light. Which appears by natural and ordinary change in the Pupilla in bright and obscure places; for when the sight is exercised in a clear light place, the Pupilla is contracted that the light may go less into the Eye, and not hurt it too much, by dissipating and dispersing the Spirits: and hence it is that they which go out of a very light place into a dark, see almost nothing at their first entry, because the Pupilla being formerly contracted doth not in an obscure place receive light enough to make a perfect sight. After, when they have continued a while in an obscure place, the Pupilla is by degrees dilated to receive more light for the clearing of sight, and then those things which at first entrance were not seen, are clearly perceived. On the contrary, they which go out of a dark into a very light place, cannot at first indure the light, and their Eyes are much dazzled, because the Pupilla being much dilated before in the dark place for to get light enough into the Eye, when it comes suddenly thus enlarged into a great light, too much light gets into the Eye, and so makes it dazle and disturbs the sight. Whence it appears, that light necessary to sight ought to pass into the Eye in a moderate quantity, and for the receiving thereof, it is necessary that the Pupilla be moderately large.

CAUSES. Now the preternatural Dilatation of the Pupilla is either in the first Original, which is not to be tampered with, or comes of preternatural Causes, which are either Internal or External.

The nearest and most immediate of the Internal Causes is the stretching of the *Uvea*, which comes either of driness or repletion.

Driness doth stretch the *Uvea*, and makes the form of the Pupilla larger, as when Leather pierced through, when it is dried hath the hole larger: And this dry Distemper comes from long Watching, Feavers, and other dry Causes.

The Repletion of the *Uvea* when it distendeth it on every side makes the Pupilla larger, and this is produced either of vapors and wind sent into the Eye, or of humors flowing thither, or from the extraordinary increase of the watery humor of the Eye; or lastly, from the swelling of the Tunicle *Uvea* it self. To these Causes we may add, the Convulsion of the *Uvea*, which appeareth chiefly in Epileptical fits, for then all the Nervous and Membranous parts are distended, and so is also the *Uvea*; and this appears chiefly most manifest in Epileptick Children, in whom the Dilatation of the Pupilla is so great, that it is over all the Circle called *Iris*, and therefore the sight is abolished.

The Internal Causes are a stroke, or a fall, or a retention of the Spirits, as in Women in Child-birth, and Trumpeters. A stroke or fall makes a Defluxion to the Eyes, hence comes extending of the Pupilla; retention of Spirits makes wind and humors, from whence comes Distention.

DIAGNOSTICK. The knowledge of this Disease is not difficult, because it may be seen with your Eyes, especially if the Physician knew before it became infirm how large naturally the Pupilla was; as also if there be a hindrance of the sight by reason of the over-largeness of it.

Moreover the natural largeness of the Pupilla is known by this: If when you shut one Eye, the Pupilla of the other is larger, which will not be in a preternatural dilatation, because then the *Uvea* cannot be further extended.

Lastly, If this dilatation of the Pupilla be onely in one Eye, it is preternatural, and signifieth one Eye onely is affected.

PROGNOSTICK. As to the Prognostick, the Dilatation of the Pupilla from the Original so, is incurable: but that which cometh after is hardly cured, especially that which comes of driness, but that which comes of other causes if it be of small continuance, is incurable; because young Diseases

Diseases of the Eyes, according to *Galen's* Doctrine may be cured, but old may not but with very much difficulty be cured.

CURE. The Cure is to be varied according to the variety of the Cause; and if it come from driness, which can scarce come from an internal cause, but also the whole Body must be so afflicted; therefore we must refresh the whole Body with moist Remedies and Nourishments, and such as are restorative, such as we use in Heſtive Feavers; but more peculiarly the Body is to be moistned with a Bath of warm water and new Milk, which also must be often put into the eyes, especially Womans Milk.

If it comes from a Humor which filleth the eye, because it floweth from the Head, you must purge the Head and the whole Body also, and then you must discuss the Humor that is fixed in the eye. Which seeing they may be sufficiently performed by the Remedies propounded for the Cure of a Cataract or Suffusion, we shall not in vain repeat them here, but send you to the aforesaid Treatise for them, where you shall find all things necessary for the discussing and dissipating Humors contained in the eyes: yet you may after use some Astringents which may make the Pupilla which is too much enlarged more narrow; for this end you may make use of this following Collyrium or water for the eyes:

Take of red Roses dried two scruples; Saffron, Spicknard, the Bark of the Frankincense-Tree, of each half a scruple; Turky prepared, burnt Ivory and Acacia, of each one scruple. Bring them into a Powder, and put them in a thin Linnen Cloth and tie it; then hang it in three ounces of Rose-water, and wash the Eyes often with the Water, dropping into them, squeezing the Cloth as often as you use the Water.

If it comes from Wine (after universal Evacuations) those Medicines are to be used which discuss Wind in the whole Body, and especially in the eyes, and so they may be fomented with the Decoction of Fennel, Rue, Dill, red Roses, Myrtles made in Rosewater with the fourth part of White-Wine.

Finally, If it come with a stroke, you must alter the manner of Cure, according to the greatness of the Contusion; and if there be an Inflammation, you must cure it as an Ophthalmy; but if there be no Inflammation, you shall at the first apply a Cataplasim of Bean-flower, Plantane leaves, and red Roses made up with Rosewater. After that, you shall often drop therein the blood of a Pigeon, which is a most excellent Remedy in all Wounds and Contusions of the eyes.

CHAP. VI.

Of the streightness or Contraction of the Pupilla.

THE Pupilla being to streight hindereth the Sight, as the being of it too large, as was shewed in the former Chapter, because a moderate largeness of the Pupilla is necessary for receiving perfectly the visible Species. So when the eye is in its natural condition, and is in a light place, the Pupilla is contracted lest it should take in too much light, if suddenly it be in a dark Room, the thing therein contained are little or scarcely seen at the first entrance, by reason of the aforesaid contraction. Afterwards when the Pupilla is dilated, all things are seen rightly, therefore in a place moderately light, the breadth of the Pupilla ought to be moderate, that it may receive moderate light, not too much, nor too little for making a perfect sight: But if the Pupilla be too narrow, it receiveth not light enough; therefore they who are so affected, the sight is diminished, yet they see well in a very light place, because at that time light sufficient will pass through a narrow hole, if no other Disease of the eyes be joyned with it.

CAUSES. Now the narrowness of the Pupilla cometh either from the Original, or first Constitution, and then it little hindreth; for if they who are so affected see less in a dark or dusky place, than they who have a Pupilla of its moderate natural breadth, yet in a clear light place they see better. Hence *Galen* said in 1. de symp. caus. cap. 2. That they who are born with small Pupilla's see best.

Or the streightness of the Pupilla comes from preternatural causes, namely, over-much moisture, driness or defect of the watry humor, and want of Spirits.

The Pupilla is contracted by humidity, when the *Uvea* is relaxed, and so makes the hole less or narrower: For although the dilatation of the Pupilla come of the same humidity, yet contrary effects come not of the same cause, because if the cause may be called the same, it ought to have the same relation to its effects, but Humidity is not in the same manner when it makes a Dilatation, for it makes that by filling and distending the Membrane; but it makes the *Angustia* or narrowness by relaxing it, it relaxeth when it is united to its substance.

Concerning driness, there is the same difficulty, since it is mentioned among the Causes of dilatation the Pupilla. But this is the difference, When the *Uvea* is dried, and the Humors of the Eye remain

main in their due quantity, then it makes a dilatation of the Pupilla, because it loseth not the Extension which it formerly had, as was said in the precedent Chapter concereing Skins extended when dried make their holes larger; but if the Tunicle *Uvea* when it is dried, wrinkled, falls together and loses its former Extension from the defect or diminishing of the humors of the Eye, then is the hole of the Pupilla made straighter.

And so the constriction of the Pupilla by dryness will be almost the same with that which happeneth from a defect of the watry humors of the Eye; although it may come without driness, when by the pouring forth of the watry humor the *Uvea* falls down.

Lastly, The narrowness of the Pupilla comes from the defect of Spirits, or from the fewness of them, when by reason of the Obstruction of the Optick Nerve or some other cause, the Visive Spirit cannot come to the Eyes, which when it is filled with Spirit keeps its Tunicles extended; but when it wanteth Spirits, they grow lax and fall together. Hence the constriction of the Pupilla usually cometh: This appeareth in very old men, in whom the Pupilla is made narrow by reason of the want of Spirits.

DIAGNOSTICK. This Disease is known easily being open to the sense, for if one Eye alone suffer, by comparing it with the other, you may perceive the straightness of the Pupilla; but if both suffer, by looking upon the Eyes of another man who is sound sighted, you find it out.

PROGNOSTICK. As to the Prognostick, a straightness in the Pupilla which cometh from the loss of the watry humor in the Eye is incurable, because when that is once lost it cannot be recruited, especially in old folk; in young people sometimes the watry humor of the Eye hath been let forth by a Wound, and hath been repaired again. A constriction of the Pupilla from driness can scarce and very hardly be cured; but that which comes from moisture in the beginning and being young, may easily be cured, but an old one very hardly.

CURE. The Cure of this Disease differeth not from the former, for they come both from the same Causes, namely, Driness or Moisture, which Distempers although they produce contrary Effects, after the manner before explained, yet are they to be cured by the same Remedies.

CHAP. VII.

Of Albugo, or the White Spot, called Pin and Web, and of other Colours of the Cornea changed.

THE Natural Constitution of the Cornea Tunicle is destroyed when it loseth its brightness and transparentnes, or when it is infected with another colour.

It loseth brightness when it is grown thicker; now the Cornea doth grow thick by driness, as in old men, which is incurable: or by gross humors fastned upon it, which happeneth often in Ophthalmy, when either by too much use of Resolving Medicines the inner parts of the Humor are dissolved, and the thick remain. Or when by an extraordinary use of cold Medicines the humors are thickned; and the Cornea doth not onely become thicker in that part unto which the humor is fastned, but it also contracteth a white colour, which is called *Leucoma* or *Albugo*; sometimes this also comes from a Scar after an Ulcer, whereby the Cornea is made thicker in that part, and loseth its transparentnes.

DIFFERENCES. The Differences are divers, as they are more or less thick; one doth possess onely the Superficies of the Cornea; another lies more deep and pierceth the whole Cornea; another is greater, and possesseth the whole Pupilla or the greatest part thereof; another is less, and comprehendeth but a little space of the Pupilla, and then it is properly called *Macula*, or *Pin and Web*.

The Cornea is altered in colour when it is blood-shot, which Disease is caelld *Sugillatio*, and then all Objects appear red: Or when Choler is got into it, as in those who have the Yellow Jaundice, and then the Objects use to appear yellow according to *Galen's* Doctrine, which is to be understood of a great effusion of Choler upon the Cornea, for if it be only lightly dyed therewith, which often happeneth, (for the Tunicle *Adnata* receiveth more Choler than the Cornea) then the Objects will not seem yellow, but as they naturally are.

DIAGNOSTICK. These Diseases need their peculiar Diagnosis for the knowledge of them, because they are apparent to the Senses, but especially *Albugo*, which is thicker and more white, and more hindreth the Sight: So also that which is more superficial is more white; but that which is deeper declineth unto black, because it is nearer to the *Uvea*, which being its self black, communicates its colour unto that.

The Causes which produce these, are easily known by what hath been said; namely, if an Ophthalmy or Wound or Ulcer went before.

PROGNOSTICK. As to the Prognostick, an *Albugo* which comes of Flegm, or a thick Humor remaining after an Ophthalmy, it is easily cured, especially if it be not inveterate; but that which cometh after a Wound or Ulcer, and is a Scar, is very hardly cured, because in a part which hath exquisite sense, sharp Medicines, such as are proper to wear away a Cicatrice or Scar, cannot be endured.

CURE. The Cure of an *Albugo* congealed or gathered in the *Cornea* from Flegm, is done by Emollients, attenuating and discussing Medicines, but by always using universal Medicines first which may take away the Antecedent Cause, and hinder a new Defluxion from the Eyes, which would be caused by applying Medicines to the place, especially if they be sharp or hot, except the matter be first removed.

Therefore first make universal Evacuations, then Revulsions, then Derivations, as is set down in the Cure of *Gutta Serena*, and a *Cataract*.

Afterwards apply a Fomentation to soften the hard matter (with soft Spunges) made of the Decoction of Fenugreek, Melilot, Celandine and Fennel.

Or, let the Vapor of it be taken into the Eyes; and to this purpose you may make this that followeth;

Take of Marsh-mallow-Roots one ounce; the leaves of Mallows, Eyebright, Celandine the great, of each one handful; Linseed and Fenugreek, of each three drams; Melilot-flowers one Pugil. Make a Decoction of these in Spring-water, and let the steam or vapor of it be taken into the Eyes Morning and Evening.

Afterwards use Discussives, such as are prescribed in the Cure of a *Cataract* or Suffusion, for they also will do well here. And so *Collyria* (Eye-waters) which do attenuate and resolve the Humor fastned in the Eye, may be taken from thence, and especially those which are made of Honey and things which quicken the Sight: For the water of Honey distilled used alone, is very good to take away all blemishes in the Eye if you continue the use of it any time.

Sugar-Candy is good for the same, dissolved in the Water of Eyebright, Celandine or Fennel.

As also it would be very good to let a Child that hath chewed Fennel-seed to lick the Eye often.

Amatus Lusitanus reports, That he cured thick Clouds in the Eye of a Girl of twelve years of age, after he had given the Decoction of *Sassa* twenty days, with this Medicine;

Take of Honey from the Hive two pints; the tops of Fennel, the Flowers of Elder and Eyebright, of each two Pugils; Sugar-Candy four ounces; distil them in Balneo Mariæ, and let the Water be dropped into the Eyes.

The Seeds of Clary put into the Eye at Bed-time purge the Eye from filth, and so cleanse it, that it conduceth to the Cure of *Albugo*.

The Juyce of Fennel doth potently discuss an *Albugo* if newly made, and mixed with a drop of the Balsom of *Peru*.

The same doth an Oyl made of burnt Rags mixed with the spittle of a Child, and laid on with a Feather: It is made by burning of a linen Rag, and quenching it between two dishes, when it is cold you shall find the Oyl in drops upon the Dish.

But *Albugo* coming of a Scar, is cured with Remedies that are good to mollifie, attenuate and dissolve Scars; but since such are always sharp, you must be more careful in applying, first universal Medicines and Revulsives, lest a flux of Humors be brought to the part. Having therefore used them as aforesaid, first it is good to apply emollient Fomentations or Fumigations above prescribed: then use abstergent and discussing Remedies; first, those that are gentle, such as are above mentioned, especially the compound water of Honey. After you may come to stronger, such as are the Galls of Fishes, of the *Uranoscopus* or one-ey'd Fish; of the *Pastinacha*, or Fish like the Ray, or of the Pike; as also of other Creatures, as of a Partridge, Cock, Goose, Oxe and others. After the same manner may be used the Juyce of great Celandine, of the lesser Centaury, of Brooklime and the like, which must be mixed with Honey, both because Honey hath a cleansing and discussing quality, as also because liquors that are put into the Eye flow to the corners, and stay not in the Pupilla in which their operation is required; but being thickned with honey, they cleave well to the Eye: but if their sharpness cannot be endured, the said Juyces or Galls may be thickned with the Mucilage or slime of Gum-Tragacanth, of Fleabane, or of Quinces, being drawn with the water of Fennel, Eyebright, or other proper to the Eyes.

The form of a *Collyrium* made of Juyces, is thus;

Take of the juyce of Fennel, Celandine and Brooklime, of each three drams; the juyce of the lesser Centaury half an ounce: white Honey one ounce. Mix them like a Liniment. If with the Albugo there be redness of the Eyes, the Collyrium made of Salt, White-Wine and Wheat, prescribed

in the Ophthalmia, is very good. Or this,

Take of Aloes and Agarick, of each one scruple, Powder them, and tye them in a clout, which steep in the water of Eyebright or Fennel, and wipe the Eyes therewith Morning and Evening. Aloes doth cleanse, strengthen and stop the Defluxion. Agarick doth powerfully cleanse.

Sugillatio or Bloud-shot, or that red colour in the Eye which cometh of bloud sent thither, if it be young, is easily cured with Pigeons bloud dropped in; but in the want thereof you may use Womens-milk with a little Frankincense and Saffron. Or you may apply the yelk of an Egg with Wine, which is commended by *Galen* 4. de comp. Med. sec. loc. cap. 8. But if the Disease be stubborn, you must foment the Eye with the Decoction of Fenugreek, Marsh-mallows, Fennel, Rue, Celandine; or let the fume of the same be received into it. And finally, all Medicines prescribed in the Cure of a Cataract may be very proper for the Cure of this; but more especially when the Disease is old, and the redness turneth back, *Galen* commends dried Hyssop tyed in a Rag and put into hot water, applied to the Eye: and Experience teacheth that this Medicine is of such force, that the bloud is drawn away by it sticking to the clout.

And lastly, The yellow colour of the Jaundice, which most appears in the Eyes when the Jaundice is cured, is easily discussed. If you would hasten the Cure, take the Fume of Vinegar into the Eyes.

CHAP. VIII.

Of Ophthalmia, or Inflammation of the Eyes.

THE Tunicle called *Adnata* is so joyn'd to the *Cornea*, that many diseases are in both; as the Inflammation of the Eyes, though it is proper to the *Adnata*, yet it is often extended to the *Cornea*, and produceth divers Diseases in it, namely, Ulcers, *Hypopyon*, when matter is underneath *Albugo*, or *Pin* and *Web*, and others. So also Pustules and other Tumors, Wounds and Ulcers are common to both Tunicles. Therefore because all the Diseases of these Tunicles cannot be spoken of severally, we will only speak of the Diseases of the *Adnata* before we speak more of the *Cornea*.

Beginning with an Ophthalmy; We say, that it is as the word in Greek sheweth, only an Inflammation of the Eye, and by all Authors it is used for the Inflammation of the *Adnata*, or *Conjunctiva*. It is called by the *Latines* *Lippitudo* or bloud-shotness, since *Cornelius Celsus*.

DIFFERENCES. This Inflammation as it is greater or less, hath a threefold Difference. The first is called in Greek *Taraxis*, in Latine *Conturbatio*, which according to *Paulus* cometh from an external Cause, namely, the Sun, Smoak, Dust, Oyl, and the like: but it may also come of an internal, namely, by fault of the Stomach after drinking of Wine, or other Distempers; and this is a light Inflammation called *Phlogosis*, with a small pain and redness, yet it sometimes turneth into a true Ophthalmy, and is the Original of it.

But a true Ophthalmy comes always from an internal Cause, and it is a true Inflammation with which Tumor, redness and pain, it is called by *Celsus*, *Lippitudo* or bloud-shotness, because there cleaveth a thick Excrement, which the *Latines* call *Lippa*.

The third is called *Chemosis* in Greek, in Latine *Chemosis* also, and it is when an Inflammation groweth so high that it is very great with vehement pain; and both the Eye-brows are inverted, so that the Eyes can scarce be covered therewith; and the white of the Eye stands higher, and the red doth cover most part of the *Iris* Circle. In Children, and such as have great Eyes, this hath often happened, and it comes from a greater repletion, and from Flegmy humors.

There is another difference of the Ophthalmy taken out of *Hypocrates*, *Aph.* 14. *Sett.* 3. by which it is divided into a moist and a dry Ophthalmy: The moist Ophthalmy is that which is already described, and hath a weeping. But the dry Ophthalmy called by *Hypocrates*, *Xerophthalmea*, which cometh in dry weather, is made of Choler, or burnt or adust Melancholy, and is such as wanteth humidity in part, and therefore there is no weeping. There are other subdivisions from the adjuncts, for if there be an itching joyned with it, it is called *Psfrophthalmia*; but if it come with hardness of the Eye-lids, it is called *Sclerophthalmia*.

There is also another difference of Ophthalmies taken out of *Galen*, 2. de diff. februm, Cap. 11. where he saith, That some are Periodical or such as come by fits, to those which have a very hot and moist head and weak Eyes, fit to receive a Defluxion. These after many years have a consumption of their Eyes and lose their sight; hence it is called *Tabida Ophthalmia* or a consuming Ophthalmy, or an Ophthalmy which ends in a consumption of the Eye.

There is also another difference taken from the immediate causes which is Defluxion or Congestion,

on, that is, gathering of Humors. It comes for the most part by Defluxion, but by congestion onely, when there is either a Distemper or weaknes of the Conjunctiva, by which there is no equality, or *Omoiosis* in the part; but many Excrements are gathered together, from whence through the weaknes of the part cometh an Inflammation.

CAUSES. The Conjunct cause of an Ophthalmy is cholerick or watrish or melancholick bloud flowing into the eyes, or gathered into them. The Causes of a Defluxion are manifold, both external and internal ordinarily known. But the causes of Congestion or Cumulation are all such as distemper or weaken the Eyes; so that an Ophthalmy, which at the first came onely by defluxion in time, by weakening of the part may spoil its concoction, and so it may be said to be an Ophthalmy partly from Defluxion and partly from Congestion, which is often seen in old Ophthalmies.

But when an Ophthalmy comes by way of Defluxion, it is certain that it comes for the most part from the Head, and almost all Authors acknowledge this. Notwithstanding Experience teacheth that many violent Ophthalmies come from the Liver, and the Humors that come from thence to the Eyes, insomuch that Cauteries applied to the hinder-part of the Head, increase the Disease, which otherwise are good Remedies when the Defluxion is from the Head, for they draw up the Humors; and we have often seen that old Ophthalmies, which were accounted incurable, have suddenly gone away of their own accord, by stopping of an Issue which hath long been kept open, namely, when the motion of the Humors from the inferiour to the superiour parts hath ceased, which before was caused by the Cautery or Issue in the Neck, by Nature sending part of the Humors to the weakned Eyes not far distant from the Issue.

That Defluxion which cometh from the Head, either is carried by internal Veins which are under the Skull into the Eyes, or by the external Vessels, which is most frequent, namely, by the Veins and Arteries which come from the Pericranium by the Forehead and Temples to the Conjunctiva.

An Ophthalmy is easily known, because the bloud diffused upon the Conjunctiva may be easily seen, and if redness appear without a Tumor coming of an external Cause, it is called *Taraxis*, or Conturbation. But if besides the redness there be swelling and heat with weeping, it is a true Ophthalmy, and at length if it so increase that it cover the black of the Eye, and the Eye-lids be inverted, then it is called *Chemosis*.

SIGNS. Hence we fetch the Signs of the Causes; for if it comes from Repletion and of bloud alone, not only the Tunicle *Adnata*, but also the whole face will be red; as also there will be a swelling of the Veins, drowsiness of the Senses and whole Body, and a manifest swelling.

If it come from cholerick bloud, there will be sharpness of tears, and not only the corners of the Eyes, but also the very cheeks will be corroded, there will be a pricking and intollerable pain, a little swelling with redness inclining to yellow; and the Patient hath formerly used immoderate exercise, been inflamed by the Sun, subject to anger, and eating of sharp things, his Complexion is cholerick, or he is young, and the Disease cometh in hot Weather.

If it come from Flegm, there will be heavy pain, little heat, not much redness, little shooting, no sharp tears, but many and slimy Glutinations.

If it come of Melancholy, the Tumor will be small, the redness will be dusky, few tears, little clamminess, but very thick, a melancholick Constitution, and the like signs of Melancholy.

If the Defluxion come from the inner parts of the Head, there will be a pain in the head internally coming to the roots of the Eyes. But if the Defluxion come into the Eyes by the exterior Vessels, the pain of the Head will be more external, the Veins of the Forehead will be distended, and also there will be perceived a great beating in the Temples.

PROG. The Prognostick is either in respect of an Ophthalmy coming, or already begun.

An imminent *Lippiada* is known by an itching and pricking in the Eyes, with heat also, and the disposition of the Eyes to receive Defluxions doth give advantage to the Prognostick of it; wherefore they who have great Eyes are most subject to this Disease. Moreover, the season doth much conduce to the breeding of it, as *Hypocrates* teacheth, Ap. 11. Sect. 3. If the Winter be dry and full of North winds, and the Spring rainy, and with South winds, in Summer you shall have sore Eyes very common, especially in Women, and men of moist Constitutions.

A Flux of the belly coming upon an Ophthalmy is good, according to *Hypocrates*, Aph. 17. Sect. 6. because the Superfluity of Humors is discharged and caried downwards.

An old pain in the Eyes is very dangerous, for it signifies the cause to be violent, and it is to be feared lest an Imposthume, Suppuration or Ulcer do follow.

An Ophthalmy beginning in one Eye useth ordinarily to pass to the other.

CURE. For the Cure of an Ophthalmy, the external Causes must be first removed, as also the Antecedent Causes are to be evacuated, revelled and repelled; the Conjunct Cause is to be derived and discussed and the part affected strengthened. For the performing of which Indications there are these usual means to be applied.

First, Let his Diet be cooling and moistning, of Meats that breed good Nourishment boyled rather

ther than roasted; of suppings rather than solid things, because the Eyes are moved in chewing: let him avoid sharp things, Salt and Pepper: As also things that fume and will fill the Head with Vapours, as also such as quickly turn into Choler, as Milk, Sugar, Honey, and all sweet things: Wine especially is not good, but instead thereof use Barley-water with Liquoris and cooling things.

Sleep is very profitable, because then the Eyes rest from motion which is apt to stir up pain and defluxion; besides pain is asswaged by sleep, and the matter causing the disease is concocted: Let the Patient sleep with his Head high; and more inclined to that side which is least affected.

Let him avoid all motion of his Body, for rest is so profitable, that *Celsus* commands that the first day of Cure they speak not, lest by that motion matter be carried to the Head.

The Belly must be kept soluble, for *Hypocrates* saith, It is good for him that hath sore Eyes to fall into a looseness.

Let him avoid Passions, especially Anger.

Let the Air be temperate and pure, without Smoke, Dusts and Winds, and somewhat dark; for the light by moving the Spirits causeth defluxion: Let him have a black, green, or sky-coloured cloth before his eyes, and keep not only his sore, but his sound eye shut or covered: for while the sound eye is moved towards the Objects also; the sore is moved whence the pain increaseth; and this is the reason why men have greater pain when one Eye is affected, than when both.

The Diet being thus ordered, let us lay down the Cure of the Disease; and since it comes for the most part of External Causes; first let them be removed lest they nourish it: Next make a *Collyrium*, or Eye-water, of Rose and Plantane-water, with the White of an Egg and Womans-milk, and let that be instilled into the Eye often in a day, as also let a linen clout be dipped therein and applied.

At the same time let him sleep as much as he can, for sleep is very profitable to concoct and discuss the matter causing the Disease. If it yield not to these, you must use the Remedies proper for a true Ophthalmy in this Order.

First open a Vein (having given a Clyster) on the contrary Arm, and do it often, till you have made sufficient Evacuation and Revulsion: For *Avicen* teacheth, That in a true Ophthalmy you may let blood till they faint. But *Galen*, lib. de curat. per sangu. miss. cap. 17. tells a story of a Steward which was freed of a great Ophthalmy by blood-letting, first three pound, and four hours after one pound: And in his 16 cap. of the same Book he affirmeth, That Ophthalmies are often cured in an hours space onely by Phlebotomy: which could not be but by losing of a great quantity, as they did in those times in that case.

Phlebotomy must be regulated and moderated according to the temper, age, sex, strength, and kind of the Disease; for in a Pléthorick body, and when it comes from blood, you must take a greater quantity: But in a cholerick body, or melancholy, or flegmatick, and other Circumstances which prohibit blood-letting, you must take less.

If the whole Body be full of blood, first open the Liver or Median-vein; after the Head-vein; but if you intend to lose but little blood, begin with the Head-vein.

But in them who have a stoppage of any ordinary accustomed Evacuation by the Terms or Hemorrhoids, you must open the Veins beneath, or apply Leeches to the Hemorrhoid-veins.

After you have bled enough, you must labour to make Revulsion by applying of Cupping-Glasses to the shoulders and the back, both dry and with scarification.

Frictions are good for the same, and Ligatures in the lower-parts.

To the aforesaid Revulsions you must add means to derive, which are by the opening of the Veins of the Forehead and Temples; to which some add the opening of the Veins in the corners of the Eyes: others apply Horseleeches to the Temples, others behind the Ears; all which derivations are very profitable after sufficient Evacuation.

Galen 13. Meth. Cap. 22. Commended the opening of an Artery in the Temples, when the Disease comes of very hot blood: And though this way of practice is not used in our times, yet it is very excellent and profitable, without any danger; for in those lesser Arteries the blood is stanch'd by good Ligature and bondage only: nor is the Plaister mentioned by *Galen* in the same place necessary, which is made of Bole, Mastick, Frankincense, and the hair of an Hare, with the White of an Egg: yet for the better security, they who are afraid of the opening of an Artery, may make use of it: you may see what we have said concerning the opening of Arteries in the Cure of the Headach.

Vesicatories also are very profitable in this Disease, both applied to the Neck and behind the Ears.

When you have bled sufficiently you must purge, that the Cholerick Humors, especially such as make the blood hot, may be evacuated: And *Hypocrates* saith, it is very requisite, *Aphor.* 15 *Sect.* 6.

Se^{ct}. 6. For it is good for him that hath an Ophthalmy to fall into a Flux. And Galen, 13. Meth. cap. 11. saith, That he hath seen some who began to have sore Eyes to be cured in one day only by a Purge. But it must be made of gentle ingredients, and such as do allay the heat of the blood, taking heed of all Medicines that have Scammony in them, and they be made thus;

Take of Tamarinds half an ounce; clean Senna three drams; Annis seeds half a dram; Endiv; Succory and Fumitory, of each half a handful; boyl them to four ounces, and when it is strained, infuse in the Liquor of the best Rhubarb and yellow Myrobalans rubbed with the Oyl of sweet Almonds, of each one dram; yellow Sanders half a scruple; After strain it again and dissolve of Manna and Syrup of Roses, of each one ounce. Make a Potion.

Or in Form of a Bolus, thus:

Take of Cassia newly drawn six drams; Diacatholicon three drams; Powder of Rhubarb one dram: make a Bolus with Sugar.

So many times we prescribe Pills in an Ophthalmy which comes of Flegm, namely *Lucis majoris* of Agarick and the like: which though they are very good in the state of the Disease, yet it is better to abstain from them in the beginning, lest the Humors moved with too violent a Medicine should fall more upon the part.

Nor is one Purge sufficient, but you must repeat them at a distance, if the Disease be old; first giving good Preparatives by Apozemes or Juleps proper for the Humor offending: therefore in the beginning allay the heat of the Humors with cooling Juleps, and such as thicken; or with Emulsions made of the greater Cold Seeds, Lettuce and white Poppy-seeds, in some cooling decoction, with a little Rosewater.

After universal Revulsions and Evacuations come to Topical Medicines with that part, which from the beginning must be repelling; yet the soundest Practitioners do warn us not to use repelling Medicines to the Eyes at first, because for the most part they stop the Humor and retain it in the Eye, and so increase the grief and inflammation: For *Galen* Comment. Aphor. 3. 1. Se^{ct}. 6. reproves a certain Oculist which used these kind of Medicines in the beginning of the inflammation; for they may be suspected in the beginning not to stay violent Defluxions, but rather to keep them from coming forth. Hence it cometh to pass, that when the Humors are sharp, the *Cornea* is sometimes ulcerated, but when they are many it is streaked and sometimes broken. But *Avicen*, sen. 3. lib. 3. tract. 1. cap. 9. saith, That it is fit, that if possible we abstain from *Collyriums* the first three days. And a little after he saith, That we ought not in the beginning to apply strong Astringents and Thickeners, because they thicken the Tunics or Coats, and hinder Resolution and increase pain.

Yet we need not be so exact in the time and number of days, because the Disease is in some older, and in some younger: but we may with profit apply Astringents at the beginning to the Forehead and Temples: for by those, the Veins by which the Humors flow to the Eyes are stoppt, and they driven back.

The form of this is as followeth;

Take of Bole-armenick, Sanguis Draconis, Frankincense, Mastick, of each one dram; red Roses, Balaujs, or Pomegranate flowers, and the Powder of Lentils, of each two scruples: mix them with the White of an Egg and Vinegar of Roses, and make a Cataplasim for the Forehead and Temples.

Moreover, a Cataplasim made of the juyce of Nettles and Wheat-flower, applied to the Forehead and Temples, is excellent to stay a Defluxion, by reason the juyce of Nettles hath a special Virtue for the stopping of all sorts of Bleedings, as it doth the bleeding at the Nose or Mouth.

But if the pain be very great, which useth to increase the Defluxion upon the Eyes, you must apply Anodines or Medicines asswaging pains, upon them. Among which new milk, especially if it be that which a sound Woman giveth, is best, if it be often milked fresh into the Eyes from the Breast, and not be used stale, for then it will grow sour and be offensive to them; instead thereof you may use fresh Cheese made of Sheeps-milk, which you must often change, lest it turn like Butter, and so inflame the Eye.

The White of an Egg well beaten till it turn to water, is commended of *Galen*, for it asswageth pain, and gently stays the Flux.

Also an Apple roasted in the Embers doth much asswage the pain of the Eyes.

The Mucilages or slime of the Seeds of Fleabane, Quinces, Fenugreek drawn with Rosewater, do take away pain; but they must be renewed every day or they will grow sour.

Of these things you may make divers kinds of Medicines. As for Example;

Take of the Pap of a sweet Apple roasted in the Embers, one ounce; the Mucilage of the Seeds of Fleabane and Quinces drawn with Rosewater, of each six drams; the White of a new laid Egg beaten into Water and Womens-milk, of each one dram. Make a Cataplasim and apply it to the Eyes, Or,

Take of the Pap of a roasted Apple one ounce; Crums of White-bread half an ounce; one Egg mixed with Breast-milk. Make of these a Cataplasm.

Thin slices of Goats-flesh, Veal or Mutton, often applied to the Eyes, do very much assuage pain.

A Cataplasm may be made more easily with Crums of White-bread, and Womans-milk mixed with Rosewater.

If the pain be intolerable, you must fly to Narcotick or stupifying Medicines, which you must use sparingly and with good advice, because they do thicken the Visive Spirits, and make the Humors and Tunicles gross, by which the sight will become dim.

Among Narcoticks for the Eyes, the white Troches of *Rhasis* are principal, made with Opium thus:

Take of Rosewater two ounces; the water of an Egg well beaten one ounce; the white Troches of *Rhasis* with Opium one dram. Make a Collyrium or Water for the Eyes.

When the pain is assuaged, you must come to repelling Medicines, which must be gentle and mixed with Anodines continually: for this end make this Collyrium following:

Take of Plantane and Rosewater, of each one ounce and an half; the Water of the White of an Egg beaten one ounce; the white Troches of *Rhasis* with Opium one dram. Make a Collyrium and drop it often into the Eyes.

If the pain be very great, you may put to it Womans-milk, and the Mucilages aforesaid.

This following Medicine doth powerfully resist Inflammation, and stay the Flux.

Take of the white of an Egg, beat it in a Pewter-dish with a piece of *Allum* very well, till it come to the consistence of an Ointment, which you must spread upon a linen-cloth, and apply it warm to the Eyes: After two or three hours take it away, lest by its long continuance having an extraordinary astringent quality from the *Allum*, it retains the Humors in the Eyes.

Also the water of *Allum* distilled in an Alembick, laid to the Eye with a Linen-clout, doth allay the Inflammation thereof.

The Salt of Lead dissolved in Rosewater, or Water and Vinegar, or mixed with Pomatum, doth powerfully cool the Inflammation.

In the increase of the Disease you must mix Digestives with Repelling Medicines, and therefore you must put in the Water of Eyebright, Fennel, Celandine, and the Mucilage of Linseeds, *Althæa* or Marsh-mallows and Fenugreek. *Gal. 13. Meth.* commends especially the decoction of Fenugreek, because it digesteth, concocteth and moderately repelleth: but you must sift the Fenugreek to take out the dust, and after wash it often in warm water; before you boyl it or make the Mucilage of it, you may thus make a Collyrium;

Take of the Mucilage of the seed of Fenugreek, and Quinces drawn with Rose and Eyebright Water, of each one ounce and an half: the white Troches of *Rhasis* with Opium one dram; Tutty prepared half a dram. Make a Collyrium.

When the disease is at the height, you may put Sarcocol to it, which is of a more digestive quality; since it is apt to hurt the Eyes by its over-driness and sharpness, it must first be steeped some few days in Milk, often changed, and you must prepare but a little at one time, for if it be long kept it will grow sour and hurt the Eyes. You may use it thus:

Take of the Flowers of Camomel, Melilot and red Roses, of each one Pugil; the Seeds of Fenugreek cleansed one dram; boyl them in Plantane-water. Dissolve in four ounces of the straining, Sarcocol one dram; Tutty prepared, and of the white Troches of *Rhasis* without Opium, of each half a dram. Make a Collyrium.

Authors do commend some Waters to be very powerful.

Quercetan commends the infusion of *Crocus Metallorum* made in Eyebright and Fennel-water, which is strong enough, and is no ways too sharp for the Eyes as others are.

Crollius and the rest of the Chymists, do highly commend the Salt of Lead dissolved in Rosewater, to which they put a few grains of Sal-Armoniack. The manner is thus:

Take of the Salt of Lead twelve grains; Sal-Armoniack three grains; Rosewater three ounces. Mix them, and drop some into the Eye Morning and Evening.

There is also a Water made of calcined or burnt Lead or Litharge, or Menium infused in Vinegar, which laid to the Eye with a Linen-clout, presently cureth their Inflammation.

The Water of white Vitriol is most common, being dissolved in Rose and Plantane-water; this mitigateth Inflammations, discusseth and hindreth defluxions. Thus they are proportioned.

Take of white Vitriol one scruple; Rose or Plantane-water four ounces: Dissolve the Vitriol in it at the fire: strain the water and drop it into the Eyes. If it be too sharp, you may qualifie it as you please with more Rose or Plantane-water.

This following Medicine is not so sharp, and more dissolving:

Take of Flowerdeluce-Roots and red Roses, of each one scruple; Rose and Plantane-water, of

of each three ounces : Boyl them to the third part with a gentle fire. Add to the straining white Vitriol powdred eight grains. Make a Collyrium.

Many Oyntments also are used for the Eyes, of which these three following are the best, and sometimes do wonders. The first is in *Renodius* his Dispensatory, called *Unguentum Ophthalmicum*, made thus;

Take of Bole-Armenick washed in Rosewater one ounce; Lapis Calaminaris washed in Eye bright-water, and Tutty prepared, of each two drams; Pearl finely powdered half a dram; Camphire half a scruple; Opium five grains; Butter as much as will be sufficient to make an Oyntment according to Art, for to be applied to the corners of the Eyes and Eye-lids.

The second is *John Crato's*, which is set down in his Physical Counsels gathered by *Lawrence Scholzius*, Conf. 6. thus :

Take Butter made in May, if you can get it, or other that is fresh and well worked, or the Marrow of an Ox or Deers Shank, and mix therewith as much of the fine Powder of Lapis Calaminaris as it will receive; make an Oyntment.

The third is from *Panotus in denario*, thus made;

Take of Tutty prepared one ounce and a half: Camphire one dram: Verdegrece twelve grains. Beat the Tutty with the Camphire together in a Mortar, the Verdegrece by it self, all very fine: Then take of fresh Butter one ounce: Rosewater one dram: boyl them gently together, and then take them from the fire, and first put in your Camphire with your Tutty, then your Verdegrece by degrees: stir them very well, and reserve them in a Glasse. Make an Oyntment and strain it through a Sarsenet: Anoint the in-side of the Eye-lids, especially about the corners, and the Patient will soon recover. This is a most approved Medicine against Inflammations both with matter and dry, against the itching of the Eyelids, and weeping.

There is another very good, though sharp, and therefore must be onely applied to the Eyelids; it is thus made: (and when all have failed, this hath cured the most desperate Ophthalmy) namely, Of May-butter and juyce of Tobacco boyled to an Oyntment, which must be applied to the Eye-lids being closed and in a dark Room: as soon as the Patient opens his Eyes, it will begin to bite, and will certainly cure.

In the height of the Disease, you must apply more Resolving than Repelling Medicines, therefore they which were prescribed in the increase of it are good in the height or state of it, if you increase the quantity of the Resolvers, and diminish the Repellers. But especially these two following Oyntments may be used not only in the state and height, but in the declination, to the perfect Cure of the Disease.

First, Fomentations to discuss the matter are good in the height of the Disease, made thus;

Take of the Flowers of Camomel, Melilot and Roses, of each one Pugil: Fenugreek-seeds prepared as before shewed, two drams. Make a Decoction, with which foment the Eyes with four double clouts. This is good in the end of the increase, and the beginning of the state of the Disease; and in Winter you must use it hot, in Summer onely warm.

In the end of the state and declination, you must make a more resolving Fomentation, which is done by adding to the former Ingredients, the leaves of Eyebright, Marjerom, Betony and a little White-wine.

The best and rarest Secret for the Cure of an Ophthalmy, is made of the Oyl which cometh from Linen burnt between two close Dishes; one drop of which mixed with the Spittle of a Child must be dropped into the Eye with a Feather.

In the declination, not onely the Remedies aforementioned, but also Waters more Resolving are to be used, as thus;

Take of Frankincense and Aloes, of each half half a dram: Sarcocol washed with Breast-milk one dram and an half: Saffron half a scruple: the Mucilage of Fenugreek half an ounce: Fennel and Eye-bright-water, of each one ounce and an half. Make a Collyrium.

But if you will dry more, and also digest,

Take of Sarcocol one dram and an half: Tutty prepared one dram: Aloes one scruple: Myrrh half a scruple: the Mucilage of Fenugreek half an ounce: Vervain and Celandine water, of each one ounce. Make a Collyrium.

In a Defluxion which comes of Flegm you may use strong Resolvers, not onely in the declination, but also in the state and increase of the Disease very confidently.

Moreover, in the declination Authors do set down two special Remedies, namely, the use of Wine and Baths, which first were delivered by *Hippocrates*, Aph. 3 1. Sect. 6. in these words; Drinking of Wine or Baths, or a Fomentation, or blood-letting, or a Potion, do take away pains in the Eyes.

Galen in his Commentary thereon, distinguisheth the Case and the Time in which these Remedies are good, which we have explained as to Blood-letting, Fomentations, and Purging: But *Galen*

in the place, cited, *Cap. 22. lib. 13. Meth.* teacheth, that Baths are then good when an Ophthalmy comes of sharp Humors, and when the Body is sufficiently cleansed by purging and bleeding; because they qualifie the sharpness of humors, and stays their motion and defluxion: the chiefeft part of them being sent forth by insensible transpiration, and that which remaineth of the cholerick humor is easilier overcome by Nature.

Galen also commends a Bath in a Flegmatick Ophthalmy, always using before Evacuations necessary, because the thick Humors fastned in the Eyes are extenuated by Baths, and so are easily dissolved.

So *Galen* in the same place saith, That the drinking of pure Wine is good for those who have thick blood in the Veins of their Eyes, and have not gross or Flegmatick bodys; because Wine doth dissolve, diffuse and discuss the thick blood, and also openeth Obstructions.

For the taking away of the remainder of Redness and Inflammation, make this Fomentation following:

Take of the Leaves of Eyebright and Penyroyal, of each one handful; the Flowers of Camomel, Melilot and red Roses, and of Oaten Chaff, of each one Pugil; Fenugreek seed three drams; Fennel-seed one dram: make a Decoction adding in the end a little White-wine, foment the Eye with this, dipping therein linen-cloaths, or with Bags being half filled with the aforesaid Ingredients.

Fennel-water alone mixed with astringent Wine is a good Fomentation to discuss the reliques, and strengthen the Eyes.

An Egg boyled hard, and the shell taken off and cut in the middle, laid hot to the Eye, takes away the remainder of redness.

So doth a Fomentation made only of the Decoction of Hyssop.

An old Ophthalmy requires another and longer way of Cure, and is sometimes very troublesome to a Physician; because he can hardly hinder a delicate and noble part from receiving a Defluxion by which it hath been long weakned.

Moreover, this Disease is not only nourished by Defluxion, but by Congestion, whereby there is distemper brought into the part, which also is hard to cure.

But for the Cure of it you must first observe whether the Disease come not from a hot distemper of the Liver, as often it doth; and then you must first administer such things as amend that. And chiefly after convenient purging and bleeding, Baths are good, Whey, and Mineral Waters of Vitriol, as also Horleeches applied to the Hemorrhoids.

But if the matter of the Disease come onely from the Distemper of the Brain through which watry Humors flow to the Eyes being mixed with some blood: then you must fall to purging the Head with ordinary Pills, twice, thrice or four times in a Month, after you have given Universal Medicines, as Apozemes or the like, which you may make according to our description in the cure of the cold Diseases of the Head.

If the aforesaid Purges with other Medicines now described do not prevail, you must use Mercurial Purges as the most excellent by way of Intermission.

Moreover, A Cautery applied to the hinder part of the head is very profitable to divert the Humor flowing.

Instead whereof you may apply a Seton to the Neck behind, with better success to them who can indure it.

A Vescicatory applied to the fore part of the Head, as *Forestus* reports, *Obs. 11. lib. 11.* did a wonderful Cure upon an Old Woman with sore Eyes.

But *Rondoletius* sayes, That a Cautery applied to the Coronal Suture, is better than to any other part.

Masticatories are profitable for the deriving of the Defluxion, but not Errhines, because they are applied so near the part affected that they may draw humors to it.

But if the Brain doth seem to want drying, you must have recourse to your sweating Diet-drink of *China Sarsa*, and the like.

To these you may add Topicks which resolve and strengthen the Eyes, such as are Fomentations and Unguents before-mentioned for the state and declination of the Disease, which also are excellent for old Ophthalmies: nor must you forget the washing of the Eyes as above mentioned with Fennel-water and red Wine, to take away the remainder of the redness, and to strengthen the Eyes every Morning.

For which purpose also,

Take of the best Aloes, and of Tutty prepared, of each six drams; white Sugar one ounce; Rosewater and mild White-wine, of each six ounces; set them in the Sun forty days in a Glass well stopp'd: put some drops of this Water not strained into the Eyes. Or,

Take of White-wine three Pints; Rosewater half a Pint; Tutty prepared three drams; Powdered

dred Cloves one dram; Camphire half a dram; mix them in a Glass close stopp, and shake them for two hours, and set in the Sun one whole moneth, remembring every day a little before Sunsetting to take it out of the Air, and never bring it forth till the Sun is risen. Two or three drops of this Water strained by filtration must be put into the Eye before he go to sleep, or in the morning one or two hours before he rise.

This takes away the oldest redness, it dries up weeping and Fistula's, it consumes all superfluous moistures upon the outward Membranes, and quickens the sight. This also following is excellent.

Take of Wheat two handfuls; Powdred Salt one handful; put them in a Copper-vessel, and put White-wine to them two fingers breadth above them; cover the Vessel, and let them stand in the shade six or seven dayes till the Liquor turneth green, stirring them often with a wooden Spatula; after pour off the Liquor by inclination without the dregs, and if need be filter it. One drop into the Eye, takes away redness and Defluxion, and all spots or blemishes thereon, and quickneth the sight.

Solenander commends highly the Decoction of Quince leaves, which are to be gathered without breaking in the beginning of the Spring, and kept diligently that they be neither dusty nor musty, nor otherwise defiled; and when you use them, boyl one handful of them in pure water, and let the Eyes be often washed therewith: It is a wonder (saith he) to see how it doth preserve, cleanse and stops Rheums in the Eyes.

Sometimes in an inveterate Ophthalmy much filth-like matter is gathered in the Eyes which can scarcely be cured with Collyriums or other Remedies: but in this case fine Cotten dried at the fire and laid like a small Pillow upon the Eye and rowled down, is very good; for the next morning you may take much filth away with it. And with this Remedy used many Nights together many Eyes have been cured which could not otherwise; and this kind of Medicine prevails chiefly among Children that have sore Eyes.

For a Conclusion of this Chapter, it will not be amiss to set down the Experimental Medicines of *Zacutus Lusitanus*, who cured an Old Ophthalmy which would no otherwise be removed in a whole year with a Mercurial Unguent, although there was no sign of the French-Pox: being perswaded by *Mercurialis*, who in his Book of the French-Pox saith, *When you see any Disease that will not be cured by ordinary means, imagine it to be the French-Pox.* He asked the Patient if ever he had the French Disease, or ever lay with a foul bodied Woman? He denied all, but only confessed that he lay with one Man once in the Bed, whom he suspected to be Frenchified: Upon this Conjecture, the Physician prescribed a Sudorifick Diet of Sarsa for twenty days, but to no end. And though the Disease was chiefly in the upper parts, so that it was to be feared lest if he Fluxed him at the mouth with Mercury, that the humors should fall more into the Eyes; but in regard it was old, and the force of the Defluxion was attained, he prescribed the Unguent of Mercury after his Body was well purged, and by it in seven days space after plentiful salivation or spitting, his pains ceased, that Inflammation was gone, the itching abated which was before in his Eye lids, with much Acrimony. And so leaving him only an Issue in his Arm to breath the Brain, and prescribing a good Diet, which he kept, the Patient returned to his former health.

The same *Zacutus Lusitanus* in his *Praxis ad Hist.* commends that Water and Oyntment which we mentioned in the Cure of a Suffusion for an old Ophthalmy.

CHAP. IX.

Of Hypopyo, or Matter under the Cornea.

WHen the Inflammation of the Eyes are great and swelling sometimes they cannot be resolved, but they will be suppurated; which is much to be feared, and to be prevented by all means, for from them Ulcers will come, and sometimes Matter is gathered under the Cornea, which Disease is called *Upopuon*, and this comes often from a stroke, or contusion and blood-shotness; sometimes it covereth all the Pupilla, and hinders the sight; sometimes it compasseth the Circle of the *Iris*, and is like the paring of a Nail, and thence it is called *Onux* or *Unguis*.

DIAGNOSTICK. This Disease is known not onely by the whiteness which is like Matter, but also from the Inflammation and blood-shot that went before; for when the Eye is moved, there appears a motion of Pus or Matter under the Cornea. There is a redness in the Eye, and Pulsation, or at least went before it.

CURE. For the Cure, first using Universal Medicines, if there remain any reliques of Inflammation, you must take them away by the Remedies prescribed in the Ophthalmy: then you must apply gently Discussients mixed with Emollients, lest when the thin part is resolved, the Matter become thicker,

thicker, and less fit to be dissolved. Therefore make your Fomentations of the Decoction of the flowers of Camomel, Melilot, the Seeds of Fleabane and Fenugreek; to be used with linen or bags. You may add the Leaves of Eye-bright, Celandine and Fennel-seed. Or use this following Collyrium.

Take of the water of Vervain, Rue, Celandine, Roses and Fennel, of each half an ounce; the best Aloes and Tutty prepared, of each half a dram; Sugar-Candy one dram. Powder and mix them; with a little Breast-milk make a Collyrium, of which drop some into the Eyes twice or thrice in the day.

This following is excellent;

Take of Saffron, Aloes and Myrrh, of each one dram; Wine three drams; Honey six drams. Dissolve the Saffron in the Wine; then mix them with the Aloes and Myrrh, then put them to the Honey and anoint the Eyes.

Lastly, Those Medicines which were prescribed in the declination of an Ophthalmy, in the spots or Macule of the Eyes, and in Suffusion or Cataract, are good here.

If the Matter cannot be dissolved with Resolving Medicines, you must seek others. Gal. in 14. Meth. reports, That there was one *Justus* an Oculist in his time, that cured many of this Disease by shaking their heads; for setting them streight upon a Seat, and taking hold on both sides of their head, he shook them till he perceived the matter to descend.

But if the matter which hindreth the sight cannot be thus cured neither, Galen in the place cited flies to Manual Operation or Chirurgery, whom *Aetius* and others do follow, which is done by pricking of the Eye, which is used also in a Cataract. Which Operation as it is little used in our times, so it requireth the hand of a most Skilful Chirurgeon; and it is much to be feared, lest when the Cornea is opened, the watry humor come forth with the Matter.

CHAP. X.

Of Phlyctenæ, or Blisters in the Eyes.

IN the Cornea and the Adnata Tunica, as in the parts of the Body, there breed sometimes little Blisters full with water, like bubbles or bladders, which come from the heat of the Humor *Phlyctenai* in Greek, and called in Arabick *Bothor*; and they are little Tumors like Gromwel-seeds, coming from a sharp watry Humor.

DIAGNOSTICK. They are easily known. They in the Adnata are red: in the Cornea blackish, if they be outward; but white if they be in the inner-part of it.

PROGNOSTICK. As to the Prognostick; *Phlyctenæ* which grow in the Adnata, are less dangerous than they in the Cornea. The more superficial these Pustles are, the less dangerous they are; the more inward, the more danger; for it is to be feared lest the whole thickness of the Cornea be eroded, and so either the watry humor will flow forth, or else the Uvea will start out.

CURE. The Cure consisteth wholly in the resolving of the matter conjoyned, and the averting of the Antecedent Cause. And we must take heed lest we bring these Pustles to suppuration, lest they turn into Ulcers.

Therefore those universal Evacuations, Revulsions and derivations, which were declared in the Cure of the Ophthalmy, must here be used.

Afterwards, we must apply Topicks or Medicines to the part, which at the first must gently repel and discuss; such as were laid down for them in the Treaty of the increase of Ophthalmy, which are most proper when there is an Inflammation also, as it often falleth out.

Afterwards you may use more drying and dissolving Medicines, such as are described for the state and declination of Ophthalmy, and especially the Oyntments there set down, which are very proper to discuss and dry up Pustles.

CHAP. XI.

Of the Ulcers in the Cornea and Adnata.

AFTER an Ophthalmy there followeth often Ulcers in the Tunics called Cornea and Adnata, when it comes to Suppuration. They follow also the *Phlyctenæ* or Pustles, which breed in the Cornea, but not till they break. They also use to come from sharp corroding Humors flowing into the Eyes.

There are divers sorts of these Ulcers mentioned in Authors, taken from their divers circumstances, as they are superficial or profound, broad or narrow, and according as they differ in shape and figure, and the like. So a hollow narrow and hard Ulcer is called *Bothrion*, or *Fossula* like a little Trench,

Trench: A broad and not so deep an Ulcer, is called *Coil-oma*. That which cometh in the Circle *Iris*, is called *Argemon*, or *Ulcus Cornale*. Finally, that which is deep and hard, is called *Epicaymia*, and *Encaymia*.

DIAG. The knowledge of Ulcers is easie, for they may be seen: If the Ulcer be in the *Cornea*, there will be a small white blemish in the black of the Eye; If in the *Adnata* there will be a small white blemish in the white of the Eye, because the Veins of the Tunicle *Adnata* are full of blood.

PROG. The Ulcers of the Eyes are dangerous and hard to be cured; but more in the *Cornea* than in the *Adnata*. An Ulcer in the Pupilla is more dangerous, because after it is cured, it will leave a Scar, which will hinder the perspicuity of the *Cornea*, and so the sight will be hurt; and if the whole Tunicle be corroded, the watry Humor will flow out, and the *Uvea* start forth.

CURE. The Cure of this Disease, as of other Ulcers, is by cleansing and drying means, but they must be very gentle by reason of the tenderness of the part, and exquisiteness of the Sense. But you must first use such things as reveal and hinder the Flux of Humors from the Eyes: as in Ophthalmy either old or new, were declared. And if there be an Inflammation with it, you must mix things that are proper for that. With which also you may use things that assuage pain, if there be any.

These things do moderately dry and cleanse: Sugar, Honey, Saffron, Myrrh, Frankincense, Aloes, Sarcocol, Tutty and Cerus; of which you may make these following Medicines:

Take of Barley and Fenugreek-water boyled four ounces; the best Honey half an ounce, or of the syrup of dried Roses one ounce. Make a Collyrium to wash the Eyes often.

Take of Vervain and Plantane-water, of each two ounces; Sugar-Candy half an ounce. Mix them for a Collyrium.

Take of the Water of Honey distilled in Balneo, and of Rosewater, of each equal parts. Or,

Take a hard Egg peel'd, cut it in two pieces, and taking out the Yelk, fill the hollow with the Powder of Sugar-Candy; tie it fast, and hang it in a Wine Celler, and you shall have a Water drop from it, which is excellent to cleanse the Eyes without pain.

But if you will have a stronger, mix the Powder of Myrrh with your Sugar-Candy.

Montanus highly commends this Powder following:

Take twenty Whites of new-laid Eggs, put them in a Pewter-dish in the Sun till they are dry; then powder them finely with as much Sugar: and this Powder put into the Eyes doth much good without causing pain.

In the Progress of this Disease, if you will cleanse and dry more, put to the former Medicines the White Troches of *Rhasis*, Frankincense, Aloes, Myrrh, Sarcocol, or the like, but in a small quantity lest it be too sharp, and also mix them with Milk, White of an Egg, some Mucilages, and other Anodines, or things that mitigate and assuage pain.

Tutty is the best, for it causeth no pain, and dryeth and healeth; therefore Collyriums or Unguents are good that are made thereof; And chiefly the Oyntment prescribed in the Cure of Ophthalmy, which hath in it a great quantity of Tutty.

This following is very cleansing, drying and healing.

Take of Sarcocol steep'd in Rosewater, Cerus and washed Aloes, Myrrh and Tutty prepared, of each half a dram; Sugar-Candy one dram: With the Mucilage of Gum-Tragacanth drawn with Rosewater make a Collyrium, with which anoint the Eyelids.

Chap. 12. Of a Cancer in the Cornea.

AS a Cancer may come in other parts, so sometimes it breeds in the Eyes. And though the knowledge and cure of a Cancer is in the Treatise of external Diseases, yet we will speak briefly here of those things which properly belong to a Cancer in the Eye.

A Cancer is either occult, or hidden or ulcerated. The occult is reckoned among Tumors, and it is called a Cancerous Tumor, or a Cancer of the Eye: But the ulcerated is called a Cancerous Ulcer in the Eye.

But in both there is an unequal hardness, a blew Lead-colour, a strong pricking pain, especially about the Head and Temples; the Veins adjoining are blew and very full. Sometimes adust and sharp blood floweth from the part affected, when the Cancer is ulcerated. And this pain is increased by any warm Medicines.

The Disease is incurable as well in the Eye as in any other part when it is fixed: except it be taken away by manual Operation.

CURE. Authors propound two ways of Cure, namely, a True and a Palliative. A true Cure (as was said) cannot be wrought but by Chirurgery when the Cancer is fixed: but when it is new in the beginning, it may be cured by often Evacuation of the Cholerick Humor, first having let blood, as *Galen* teacheth, 2. ad *Glaucanem* cap. 10. where he boasteth that he hath often cured this Disease, with taking a convenient Diet with the aforesaid Physick. A Pal-

A Palliative Cure which tends onely to the mitigation of Symptomes, is done not only by the aforesaid Evacuations, but also by convenient Topicks.

First, then you must appoint a convenient Diet, such as is good against burnt Choler; and it must be cooling and moistning.

Then draw blood on the same side, and apply Horseleeches behind the Ears, and also to the Hemorrhoids if they do appear, applying Cupping-Glasses to the Shoulders, and use other kinds of Revulsions.

You must also prepare and purge Melancholy by Potions, Apozemes, opening Broaths, by Magistral Syrups and the like. But above all, for the purging of Melancholy, black Hellebore well prepared is the best; and by giving the Extract thereof twice or thrice, we have sometimes cured a Cancer in the beginning.

These Remedies do exceedingly diminish the Humors that flow to the Eyes, and take away pains and other symptomes; for which purpose also Topicks are good, such as are prescribed in Ophthalmia for asswaging of pain, especially the Collyria made of Mucilages, the white Troches of Rhasis, and prepared Tutty, with the Water of Roses, Nightshade and Plantane.

This following Water is a good Collyrium to wash the Eyes with:

Take of the Roots of Pilewort and Herb Robert, of each two handfuls; Ribwort, Nightshade, Borrage, Bugloss, Purslane, Eyebright and Betony, of each one handful; green Frogs, and Whites of Eggs, of each twelve in number; the seeds of Fenugreek and Quinces, of each one ounce; let the Roots and Seeds be bruised, and the Leaves cut: then pour upon them of Eyebright and Rosewater, of each one pint: mix them and distill them in a Pewter-Still.

The Flesh of Chickens is very powerful to assuage pain; and some say that the Disease it self hath been cured by it alone. So *Maritius Cordens*, Comment 7. in lib. 1. *Hip.* of Womens Diseases, relates a History of a Noble-Woman, who had the right side of her Face a long time infected with a Cancer ulcerated, and having tried all means she could from Italian, French, German and Spanish Physicians, was at length cured with this vulgar Medicine by a Barber: He took Chickens and cut them in thin broad pieces, which he often applied to the Cancer. Others apply the flesh of young Pigeons so cut while it is warm.

Finally, The true Cure of a fixed Cancer is onely by taking it out by the Roots, and is by a taking out of the Eye; which *Fabricius Hildanus* saith may be done very safely, and he sheweth the manner and circumstances thereof at large, *Observ. 1. Cent. 1.* so that we shall not here repeat them.

CHAP. XIII.

Of the Rupture of the Cornea.

Sometimes the Cornea Tunicle is so divided, that the watry Humor, and sometimes the Uvea also cometh forth, and this is called the Rupture of the Cornea.

CAUSES. The Cause of this is an Ulcer, or a Wound in the Membrane or a great afflux of Humors, by which the said Membrane is so distended, that it cracks the middle and the humors contained are let out: As *Paracelsus* reports it happened to a certain Woman in *Paris*, lib. 16. cap. 13.

PROGNOSTICK. This Disease is for the most part incurable, and takes away sight, because the Humors of the Eye cast forth cannot be repaired; but if the Wound be small, so that only a portion of the watry humor is only lost, it may be cured; for the watry humor may sometimes be renewed, as *Galen* taught, 4. de sympt. caus. cap. 2.

CURE You must use astringent and glutinating Medicines, having first bled and purged, if necessary, as the White of an Egg, with the white Troches of Rhasis dropt into the Eye.

Let the part be fomented with a Decoction of red Roses, of Solomons Seal, Bramble-buds, Shepherds-purse, and Plantane boyled in red Wine if there be no Inflammation; but if there be, in Spring-water.

Take of Quinces half a pound; red Roses three Pugills; Acacia two drams, Saffron one scruple. Boyl these in red Wine, and make a Cataplasim to be applied to the part.

For the perfect Consolidation and Cure, use this Collyrium;

Take of washed Aloes, Tutty prepared, and Sarcocol steeped in Breast-milk, of each half a scruple; Saffron five grains; with the Mucilage of Gum-Tragacanth make a Collyrium.

Chap. 14. Of the coming forth of the Uvea.

Differences Upon the Rupture of the Cornea, often comes the shooting forth of the Uvea, which is called in Greek, *Proptosis Ragoidous*. There are four kinds mentioned by Authors, especially by *Paulus*, of which the first is called *Mucocephalon*, because it is like the head of a Fly, and this is when a small portion of the Uvea comes forth. The second is called *Staphyloma*, and this is when a great part of the Uvea comes forth, so that it is like the stone of a Raisin. The third is called *Melos*, when there is so great eruption of the Uvea that it seems like an Apple. The fourth is called *Elos* or *Clavus*, when the Uvea being come forth groweth hard.

PROGNOSTICK. The cure of this Disease is difficult, and the more when the Uvea comes most forth; but when it is small, as in *Mucocephalon*, it is curable by moderate Astringents, such as we prescribed in the Rupture of the Cornea.

CURE. The Ancients, as *Paulus Aetius* and *Celsus*, do labour to cure them when old and not moveable by Medicines with Chirurgery; but this is now out of fashion, by reason of its great difficulty and doubtful success: but if any will try it, he shall find the way exactly set down in *Jerom. Fabricius ab Aquapendente, cap. de staphylomate*.

CHAP. XV.

Of Ægylops, and Fistula Lacrymalis.

Hitherto we have spoken of the Diseases of the Eyes which happen in the Humors and upon the Tunics; it remaineth that we speak of the Diseases of the Corners of the Eyes and Eyelids.

And first of the Tumor in the great Corner of the Eye, by the root of the Nose called *Ægylops*, and *Anchylops*, if not broken.

This little Tumor is either with or without Inflammation.

CAUSE. When it is inflamed it is like a small Phlegmon or Bile, red about, with a shooting pain. And it comes of thin and cholerick blood that flows into the part by the Veins of the Temples, Forehead and Face, and so impostumeth; which being often, produceth an Ulcer, which speedily turns hollow, and then it is called *Fistula Lacrymalis*. And if this continueth one year, there is a Caries or foulness of the Bone, as *Hippocrates* saith, 45. Sect. 6. In Ulcers of a year old the Bone is foul. And this Caries is known by the Cavity which is known by the finger and by the stinking matter flowing from it.

Sometimes it comes without Inflammation, and then it is bred of a thick slimy humor, like Pulse or Honey: As the Tumors called *Atheromata*, *Stertomata*, *Meliceris*, which are without pain.

PROGNOSTICK. The Cure of an *Ægylops* is very hard, both in regard Medicines are ill to be applied to it by reason the sight is so nigh, and because an Imposthume will quickly ulcerate in such a tender part as aforesaid; but it is most difficult when the Imposthume breaks out at the Nose, and the Matter flows through the Nostril, because thereby the Bones will be putrified.

Sometimes the *Ægylops* turns to a Cancer, which comes with a pricking pain, extension of the Veins, hardness and blewness of the Skin, and then it is better to let it alone, because Medicines will enlarge it and increase pain.

A *Lachrymal Fistula* that is newly begun, and which hath an external Orifice to be seen, is curable by Medicines; but that which is deep and old, and hath fouled the Bone, is scarcely cured without burning.

CURE. The divers times of these Diseases require divers Medicines.

And first in the beginning of an *Ægylops* you must revel the defluxion from the part by bleeding and purging, and use repelling Medicines to the Forehead, by which sometimes the Progress is stopt before it come to Suppuration.

For this end use the following *Ceratum*;

Take of Pomegranate-peels, Acacia, Pomegranate-flowers, Galls, Cypress-Nuts, Roch-Allum, Bole-armeniack, of each one dram; white Wax four ounces; Turpentine three drams. Make a *Cerate*.

After the use of Repercussives, you must apply Resolvers to the part affected, as this decoction:

Take of pure Honey and Aloes, of each two ounces; Myrrh one ounce; Saffron one dram
P and

and an half; Water two Pints. Boyl them gently to the consumption of half: dip a piece of soft Spunge therein, squeeze it a little, and apply it hot to the part, bind it on, and do thus often.

Amatus Lusitanus, *Curatione* 68. Cent. 5. prescribes a Cerate against *Egylops*, which he highly commends, which is this:

Take of the Powder of Cockleshells two drams; Myrrh, washed Aloes and Frankincense, of each half an ounce; Sarcocol, Dragons-blond and Cerus, of each three drams; Opopanax dissolved in Wine, Vinegar and blond-Stone, of each one dram and an half; Saffron two scruples; Wax and Rozin, of each three ounces. Mix them according to Art at the fire, and make a Cerate to be applied to the corner of the Eye.

If the Tumor will not be resolved with the former Medicines, but will come to Suppuration, you must help it forward with a Plaister of simple Diachylon; or if there be pain or inflammation, you may apply a Cataplasim of Crums of Bread. If it will not break, open it with a Lancet, and delay not lest the matter contained do corrode the parts and make an incurable Fistula. Many open it with a hot Iron, but the cold is best.

After the Imposthume is opened, you must cleanse the Ulcer, and heal it as others. But if the Fistula, cure it thus:

First make a general Evacuation by bleeding and purging. You must divert the defluxion from the Head by Cupping-Glasses, Vesicatories and Causticks applied to their peoper places, and then use the decoction of China or Sarsaparilla for many days. And at the same time dry the Brain with Fumes and Head-powders, as in a Catarrh.

Instead of a Caustery you may apply a Seton to the Neck: For *Fabricius Hildanus* reports *Obs.* 41. Cent. 1. that it hath done it alone without other means.

If the distemper of the Liver be the cause of the defluxion (as it often is) you must have a special care to administer Medicines proper for that.

When you use Topicks, open the Orifice of the Ulcer, and dilate it by degrees with a Tent made of an Elder-pith, a Spunge made fit, or a Gentian Root. When it is large enough, apply this following Medicine commended by *Forestus*, *Obs.* 17. *Lib.* 11.

Take of Honey two ounces: Verdegreece one dram: Water of Rue four ounces. Powder the Verdegreece very fine and boyl it with the rest at a gentle fire till the third part be consumed, and make a warm Injection of the Strained Liquor with a Syringe: if this be too sharp, wash the Ulcer every day with the Water of Rue, and after apply a little Unguentum Apostolorum. Continue this course for three weeks, laying on some convenient Plaister, and defending the Eye with Rosewater.

When the Ulcer is sufficiently purged, use this following Collyrium to incarnate and cicatrize:

Take of Frankincense, Aloes, Dragons-blond, Pomegranate-flowers, Allum and Antimony, of each one dram; Verdegreece five grains. Powder them fine, and with Rue-water make a Collyrium to be dropt in with a stalk of Rue thrice in a day, and put in a Tent wet therewith, laying upon it a Diapalma Plaister. Lessen your Tent by degrees, and at length take it quite out, onely washing the part with the aforesaid Collyrium, and laying on Diapalma.

Forestus in the place cited, saith, That new Fistula's have been cured thus by a famous Chirurgeon of his time.

If it appear that the Bone be foul, it must only be cured by an actual Caustery; the manner of which is exactly described in *Parasus*, *Fallopianus*, and *Aquapendente* in their Works: But *Fabricius Hildanus*, *Obs.* 22. Cent. 5. boasteth that he cured a Fistula Lachrymalis with foulness at the Bone, that was four years old and counted desperate, in a Child of thirteen years of age, with Medicines alone dilating of it with prepared Spunges, and after sprinkling Euphorbium into it, and that very much and often, and after applying onely an Emplaister of Gum Elemi. Having used these things diligently for the space of divers Weeks, he perceived a scale of the bone, which he drew forth; and then with half a drop of Tolutan balsom upon a little Lint once in a day conveyed into the Ulcer, he perfectly consolidated the Fistula in a short time.

Chap. 16. Of Rhyas and Encanthis.

ANother disease often followeth the Fistula Lachrymalis called Rhyas; and this is the consuming or diminishing of the small flesh in the great corner of the Eye, from whence it is enlarged: This comes also of other Causes, as sharp Humors falling upon the part, or from cleansing Medicines formerly misapplied.

Encanthis is contrary to Rhyas, which is the immoderate increase and swelling of the Caruncle, or

or little flesh in the great corner of the Eye, and this comes from much blood flowing to the part, and the not orderly curing and drying up of the Ulcer.

The Cure of *Rhyas* is by Incarnatives, such as follow:

Take of red Roses one Pugil; Cypress-Nuts and Myrtles, of each two drams; Aloes one dram and an half; old Wine one Pint. Boyl them till the fourth part be consumed; wash the part often with this Decoction. Or,

Take of Aloes and Frankincense, of each one dram; Dragons-bloud half a dram; red Roses and seeds of Sumach, of each one scruple; Rosewater one pint, Boyl them to the consumption of the fourth part. Make a Collyrium.

Encanthis is cured by taking away of the superfluous flesh growing in the corner of the Eye; this is done with eating Medicines, beginning with the mildest first; therefore first use burnt Allum, after proceed to *Unguentum Apostolorum*, *Egyptiacum*, or burnt Vitriol: But if these will not do, cut it out, or burn it with an Iron. But before you do these things, you must prepare the Body with convenient Evacuations, lest you cause a new Defluxion; but in the cutting, burning or consuming of this Carbuncle with Medicines, you must take heed that you take it not wholly away, but onely that which is superfluous, otherwise it will turn to *Rhyas*.

Chap. 17. Of Epiphora.

THe word *Epiphora* signifieth any Defluxion into any part: But through custom it is used especially for the Defluxion of a thin Rheum from the Eyes; hence it is called involuntary weeping which flows daily from the corners of the Eyes.

CAUSES. For the producing of which Humor flowing preternaturally, there is an evil disposition in the part from whence it cometh, and in the part receiving it: the part that sends this Humor is the Brain, which when it is too hot or too cold, gathereth a watry humor, and so sends it to the inferiour parts, which are fit to receive it; the part receiving is the Glandule or Kernel by the great corner of the Eye, and the Caruncle upon the corner; the thinness or thickness, or other weakness of which parts causeth that they easily entertain the humors that flow thither. Therefore an *Epiphora* happeneth often in an *Ægylops*, a Lacrymal Fistula, a *Rhyas* and *Encanthis*, because the superfluous humors use to be easily received into the parts affected.

This humor is carried from the Brain into the Corners of the Eyes, sometimes by the internal Veins, sometimes by the External, as we shall shew hereafter by their proper signs.

But the Humor which maketh an *Epiphora*, is sometimes cold, and brings no other inconvenience but only Defluxion: sometimes it is salt and sharp, and causeth pain, heat and redness, and exulceration of the Eye-brows.

SIGNS. There need no sign to be given of tears they are visible: It will appear by what hath been said, whether they are cold, or hot and sharp: but we must distinguish whether they come by Internal or External Vessels: When by the Internal, there is pain in the inside of the Head, and sometime violent Needing. But if they come by the External without the Skull, the Vessels of the Forehead and Temples are stretched, and the Head seems to be bound about, and astringent means outwardly applied to help.

PROGNOSTICK. New *Epiphora's* coming from outward Causes are easily cured, especially in youth: but old, and in old men very hardly. They which proceed from other Diseases, as *Ægylops*, Fistula Lachrymalis and the like, have their cure with the Diseases whence they came.

CURE. The Cure of this Disease consists in taking away the Defluxion, and strengthening the part receiving.

You must take away the Defluxion with Evacuation of the Humor offending, Revulsion, Derivation, and strengthening the part from whence it cometh.

The Peccant Humor which is a Water superfluous in the Brain, must be evacuated with bleeding and purging.

Bloud-letting is not good in a cold distemper of the Brain, except there be manifest signs of Plethory or foulness: but in a hot distemper when the Humors are very sharp, is very good, and you may use it twice or thrice if need be.

You may purge by Potions, Apozemes, Pills and the like, which you may proportion to the condition of the Patient.

Make a Revulsion of the Humors flowing by Cupping-Glasses often applied to the Shoulders by Vescicatories to raise Blisters behind the Neck, or with Cauteries to the hinder-part of the Head, and Issues in the Arms.

In a stubborn *Epiphora*, a Vescicatory applied to the fore-part of the Head doth wonders, as *Forrestus* sheweth, *Obs. 11. lib. 11.* concerning an old Woman who had sore Eyes weeping and matter,

tery, with great pain and itching, and could by no means be cured, that with applying a Plaister of *Cantharides* with Honey and Leven to her Head, being shaven, he perfectly cured her.

Rondeletius saith, That a Cautery applied to the *Commissura*, doth more good than when it is used to any other part.

For Derivation, use Leeches behind the Ears, and Masticatories every morning.

But lest the Humors once evacuated should breed again, the Brain must be strengthened and dried; and if it be too cold, you may use all our Remedies prescribed in the Cure of the cold Distemper of the Brain. But if it be too hot, those things which we prescribed in the Cure of a hot Catarrh, especially such as respect the Brain most, are here to be used.

While the former Medicines are used, you must apply Topicks to the part receiving: And first, if the Humor comes through the external Veins, apply Astringents to the Forehead and Temples: and if the defluxion come from a sharp hot humor, use the following Cataplasim:

Take *Bole-armeniack*, *Dragons-bloud*, *Pomegranate-flowers* and *Mirtles*, of each one dram and an half: *Acacia* and *Hypocistis*, of each one dram: *Frankincense* and *Mastick*, of each two scruples: red *Roses* one *Pugil*; Powder them and mix them with the white of an Egg and a little Vinegar; make a Cataplasim: which spread upon a cloth and apply to the Forehead and Temples, and renew it as fast as it groweth dry.

If it come of a cold humor, apply this following Cerate:

Take of *Frankincense* and *Mastick*, of each one dram and an half; *Gum Anime*, *Tacamahaca* and *Bloud-stone*, of each one dram; *Gum of Juniper* two scruples; *Turpentine* and *Wax* as much as will serve to turn; Make a Cerate.

But you must apply Astringent and drying Medicines to the part affected; which are thus made:

Take of *Tutty* prepared one dram; *Sarcocol* half a dram; *Frankincense* and *Mastick*, of each a scruple; *Spicknard* six grains; make *Troches*, which being mixed with the white of an Egg or the Juice of *Quinces*, may be applied to the Corner of the Eye. Or,

Take *Tutty* prepared in a fine Rag, and tye it with a string, and put it in sharp Wine, and with this often wash the Eyes. Or,

Take *Tutty* prepared, *Egg-shells* powdered, the best *Aloes*, of each one dram; tye them in a Rag and make a little Ball, which steep in *Fennel-water*, and squeeze the Ball often into the Eyes.

Onely *Aloes* powdered and made into a Ball (as above) and put into *Rosewater*; is very good. Or,

Take *Aloes*, *Cypress-Nuts*, *Frankincense*, *Mastick*, *Myrrh*, of each two drams; *Tutty* prepared, and *Sarcocol*, of each one dram and an half; *Sanguis Draconis*, *Barberries*, *Sumach*, red *Roses*, of each one scruple. Powder them finely, and with *Fennel-water* make a *Collyrium*.

In a hot Defluxion this is excellent:

Take of white *Troches* of *Rhasis* without *Opium*, *Sarcocol*, *Lycium* or *Box-thorn*, *Acacia*, *Olibanum*, of each one dram; the *Stones* of *Myrobalans* calcined, of white and red *Coral*, of each half a dram; *Pearl* half a scruple; as much of the Juice of *Pomegranates* boyled to half, as will make a *Collyrium*.

If Redness be joyned with it, this following is profitable:

Take of the *Seeds* of *Sumach* bruised, one scruple; hot *Plantane-water* one ounce; macerate them awhile, then press them strongly, and put of *Roses*, *Eyebright*, and the water of the white of an Egg well beaten, of each half an ounce; *Sugar-Candy* finely powdered and strained, with a little water, one scruple, Make a *Collyrium*.

Lastly, Those Medicines which were prescribed for an old Ophthalmy, are good in this disease.

CHAP. XVIII.

Of Pterygium, or Haw in the Eyes, called
Unguis.

THis is a hard and Nervous little Membrane, which coming out of the great Corner of the Eye, first covereth the White and after by continuance the Black, and covering the *Pupilla* hindreth the Sight.

Sometimes it is thin and white; sometimes it is fleshy with many red Veins, and it is called a *Panicle*, and *Sebel* by *Avicen*; although some distinguish a *Panicle* from a *Haw*, or *Ungula*; because *Ungula* is a Nervous Tunicle without repletion of Veins, and is only in the *Adnata*: But *Sebel*, or *Panicle* covereth the whole Eye, and is very red and full of Veins.

This Disease comes from Ulceration of the flesh in the Corner of the Eye, or of the *Adnata*, whence there comes a roughness or inequality in the part, which while the nourishing Faculty labours to make equal, it fills with blood and begets a preternatural increase, or covereth it with a skin.

And because many Excrements do use to flow to an Eye disordered, therefore the Haw is not bred of pure blood, but of many Excrements also, whence arise many sorts of Haws: Because, Some are hard, others soft, some white, some red, some yellow, some brown, others are easily separated from the *Adnata* and *Cornea*, others stick fast; some are simple and without malignity, others are Cancerous and filthy.

DIAGNOSTICK. The Diagnosis or knowledge of this Disease is known by what is said; also the Causes, namely, the Humors of which it is made, may be known by their colour: for a red Haw comes of pure blood; a yellow of Choler; a white of Flegm; a dark and black one of Melancholy.

PROGNOSTICK. As to the Prognostick, this Disease is scarcely to be cured, and that in a long time, because sharp Medicines which are proper for to eat it away, cannot be used but by degrees, by reason of the exquisite sense of the Eyes.

If the Eye effected grow smaller, it is an evil sign; for it argueth the Debility of the part.

A new Haw and small may be cured with Medicines; but an over grown, old, and one covering the black of the Eye, cannot but by Chirurgery.

A Haw which is thick, turn'd out, stretcht forth, hard and black cannot be cured, for it is of a Cancerous nature.

CURE. The Cure is to be directly by the Antecedent and Conjunct Cause.

In respect of the Antecedent, first good Diet is to be enjoyed, such as is mentioned in other Diseases of the Eyes from Fluxes.

Also the aforementioned Evacuations and Revulsions may here be used, namely, Purgations, Bleedings, Cuppings, Vescatories, and the like.

And when the Body is sufficiently purged, we must come to Topicks, which may consume the Haw.

Beginning first with mild, such as were they which we spake of, in curing of the spots in the Eye called *Phlyctena*, which not prevailing you must use stronger, which are frequent in Authors.

Foreſtus commends this following:

Take of the Juice of Fennel four ounces; the Juice of Celandine three ounces; the Juice of Rue two ounces; the Juice of Mallows two ounces and an half; Aloes one dram; Vitriol two scruples; Verdegreece one scruple; Ginger and Cinnamon, of each half a scruple; the Gall of an Eel half an ounce; the Gall of an Oxe or Hog two drams; Sugar Candy two scruples. Let the Juices boyl with the rest, and then clarify it, and make a Collyrium.

This is also by him commended:

Take of Bloud-stone two drams; white Vitriol and Verdegreece calcined, of each three drams; Myrrh and Saffron, of each one dram; long Pepper half a dram; Sugar-Candy half an ounce; Powder them very fine, and mix with one dram of this Powder two drams of Radish-water, and apply twice or thrice in a day, as the Patient can endure it.

Before you use these Remedies, you must Foment the part with an Emollient Decoction, which you must do also afterwards to assuage the pain.

Among

Among the Mildest this following is best :

Take of Cuttle-Bone one scruple, Sugar-Candy one dram : Vitriol half a scruple : Tutty prepared half a dram. Mix them, and make a fine Powder to lay upon the Haw.

If it cannot be taken off with these Topicks, you must fall to Chirurgery, and taking up the Ungula with a Hook at the bottom or root, draw a double Thread through it with a Needle, then laying it down close on both sides beneath, cut it off with your Sissers : as is more at large shewed by *Celsus*, *Paulus*, *Aetius*, *Ferom ab Aquapendente* in their Chirurgery, and by others.

Having made Incision, lay on a little Lint dipped in Rosewater and the white of an Egg, to assuage pain and hinder Inflammation.

And lastly, you may heal it up with drying Medicines, as Collyrium of Tutty, Frankincense, Aloes, the white Troches of *Rhasis*, and the like.

The End of the Second Book.

THE

THE
THIRD BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Ears.

The Preface.

THe Ears, as Galen sheweth in 1. de Symp. caus. cap. 2. have divers Diseases Similary, Organick and Common; which because they are not to be known, but by their Symptoms, I determine to reduce them into a Series of Symptoms. The Symptoms in the Ears either are such as come from the Action hurt, or the fault of the Excrements. The Action is hurt either in the Ear alone, or in all Instruments of Sense. The Action proper to the Ear, namely Hearing, is hurt by being abolished, or diminished and depraved. It is abolished by Deafness, diminished by thicknes of Hearing, depraved by a noise in the Ears. The Action common to all the Instruments of Sense is Feeling, by which they are subject to pain. The fault in the Excrement is seen by all those things which come preternaturally out of the Ear. So this whole Book hath Four Chapters. The first is of Deafness and thick Hearing. The second of noise in the Ears. The third of pain in the Ears. The fourth of those things which preternaturally come forth of the Ears.

CHAP. I.

Of Deafness and thick or dull Hearing.

WE comprehend Deafness and thick Hearing in one Chapter, because they come of the same Causes, differing only in Degrees, so that when they are great they take the Hearing quite away, when less they diminish it: And both these are called vulgarly Deafness, for they who cannot hear any but such as speak very loud, are called Deaf Folk.

But *Surditus* properly or Deafness, is called in *Greek* *Cophosis*, when the Hearing is totally gone, so that the Patient either heareth no noise, or if he do, he cannot distinguish it. These are often dumb if they are born so; not only because men learn to speak by Hearing, but by reason of the great consent that is between the Instruments of Hearing and Speaking by the Nerve of the fifth Conjugation, whose chief Branches are brought to the Ear, but some of them reach to the Tongue and Throat; whence it is, that when the inner Ear is pulled, there is a cough raised; and the reason is plain, for they who are born deaf, if they had their Instruments of Speech corrupted, would by a

Natural

Natural Instinct send forth some Articulate Voyce: as other Creatures, although they are kept from their birth from other Creatures of the same kind, so that they never hear them, yet they produce their connatural Voyce: but men born deaf never sent forth an Articulate Voice, but onely a confused sound, which argueth a manifest hurt of those parts which serve for Speech. Now the hurt of those parts is chiefly from humidity, which affecting that Nerve which goeth to the Ears, Tongue and Throat, must needs hinder both Speech and Hearing.

Thick Hearing is called in *Greek Barnecoia*, and they who are so, hear difficultly, and understand not what men say, except they speak very loud. Others cannot hear so well, and not except the speakers whoop and hollow in their Ears.

CAUSES. Both these Diseases come from the Distemper of the Brain or Ears.

A cold distemper of the Brain, or Repletion or Weakness, or some other hurt in that part, especially in which is the rise and progress of the hearing Nerve, may cause Deafness or thick Hearing.

SIGNS. The Diseases of the Ears are either in the inside or outside thereof.

In the Exterior Cavity, a perfect or an imperfect stoppage from a Tumor, Imposthume or Bloud, Matter, Flegm, and other things coming either from within or without, may cause a defect in the hearing. But you must observe, that the stoppage of the external passage cannot make a perfect and absolute Deafness, but only a thick hearing, because sounds may be carried by the Mouth also to the Ear: For there is an open way from the internal Cavity of the Ear to the Palate, by which sounds do easily pass and insinuate themselves into the Ears, and this passage is made for the purging of the Ears. And many Experiments do shew, that a sound may pass through the open Mouth to the Ears. We may observe, that they who are very thick of hearing, will open their Mouths that they may better hear those that speak unto them. And if you stop both Ears close, and strike a Musick Instrument with a stick held in your Teeth, you will hear the sound better. And when you travel in the Night, you will better hear any man coming afar off, if you put one end of your Sword or Staff between your Teeth, and fasten the other end upon the ground.

The Humors which are gathered into the internal Cavity of the Ear, and especially such as flow from the Head do cause deafness or thick hearing in the inner-part of the Ear, and these are for the most part flegmy, and sometimes cholerick; as appears *Aph. 28. Sect. 4.* where *Hippocrates* saith, That cholerick Evacuations are good for deaf men; sometimes bloudy are good, for it is manifest, that the deafness accompanied with the Crisis comes from the Flux of bloud to the Ears. Now the humors are sometimes sent from the whole Body to the Ears, as in continual Feavers, and especially those that are malignant. The ill composition of the Instruments of Hearing produceth the same effects; as when the Tympane or Drum groweth too loose by a violent noise or over-moistness: and for this reason deaf people are more thick of hearing in Southerly-weather, because the Membrane is relaxed by the moistness of the Air; or when the Tympane is over-stretched or dried after a violent Disease, long watching or fasting; or when it is broken by violent motions, or eating by a corroding humor: Sometimes bloud cometh forth after a great hurt and matter without hindrance to the hearing, because the passage is between the Bone and the Membrane. Or when any parts of the Ear, either originally, or by some outward cause, as stroke, fall, or the like, are put out of their natural order. Moreover, a cold Distemper useth to produce this Disease, coming either from the cold Air, or very cold Water poured in, or over-much use of stupefactive Medicines called Narcoticks.

'Tis very hard to distinguish all these Causes by their proper Signs, but by Art and Conjecture thus:

If Deafness come from the distemper of the Brain, either other Senses suffer, or there appeared some peculiar diseases in the Head, as Head-ach, Drowsiness, Apoplexy, Lethargy, and the like.

The stoppage of the External Cavity of the Ears is discernable by the Eyes, if you look upon them in the Sun, for then it will appear whether it be a Tumor or thick Matter, or any other Heterogeneous substance of another Nature which filleth the Cavity. As also the Patient will tell you if any thing fell into the Ears.

But if the Internal Cavity be filled with a Humor, we may conceive it to be Flegm, if the Patient were formerly subject unto defluxions of that sort.

But that this comes from Choler, is known by some Cholerick Feaver that went before, or now possesseth him, or by some violent pain. But when it comes from bloud there is a heavy pain, and abundance of bloud in the whole Body, and this appeareth often in critical disturbances.

The looseness and moistness of the Tympane is known by the causes preceding which were moist, and distempered some other part; for it can scarce be, that moist causes should onely affect that part and no other.

You may also know the distention and dryness of the Tympane by the dryness of the whole Body, and by the drying causes foregoing.

And

And for the breaking or corroding of the Tympane, you may know that, if there were formerly any vehement Causes that could breake or gnaw the same.

PROGNOSTICK. You must make your Prognostick thus :

Deafness by birth, and of long continuance, if it be absolute and total, is not curable ; and that which is not absolute, if it be old, is never or hardly cured.

Deafness from Choler or blood which happeneth only in sharp continuing Feavers, used to be cured with these Feavers.

Thick Hearing if it be not speedily cured, endeth in perfect deafness ; witness, *Galen. 3. de comp. med. sec. loc. cap. 3.*

The Membrane of the Tympane being broken, or a scar left thereon, makes an incurable deafness.

A deafness encreasing and decreasing by degrees is curable, for it signifieth that it comes from a moveable humor, which sometimes is more, sometimes less in quantity.

A deafness coming from distemper of the brain, is more easily cured than that which comes from a proper disease of the Ear.

CURE. As to the Cure : That deafness which depends upon any disease of the Brain, requireth no other Cure, than that which belongs to such diseases, which you may find in their several Chapters. That which comes from a Tumor, if it be hard and old, admitteth no Cure ; but if it be hot, you may find the Cure for it in the Chapter of pain in the Ears. But if it come from Matter gathered in the Ear, you may find the Cure in the last Chapter of the Treatise, where we shall speak of those things which preternaturally come forth of the Ear.

If the disease comes of driness, it must be cured by the way of *Rhasis*, that is by moistning things, long sleep, and washing of the Head with warm water ; as also putting of moist things into the Ear, as Oyl of sweet Almonds, and the like. If deafness or thick Hearing come from any thing that is fallen into the Ear, that must be taken away with washing, shaking, or extracting : or if any Vermine are got into the Cavity of the Ear, they must either be taken forth, or killed there : they are washed forth by making the part moist and slippery, and enlarging it with either Milk, the Oyl of sweet Almonds, or some mollifying or relaxing decoction : they are shaken forth by needling, for so by the force of the air the parts being moved, that which lieth in the passage of the Ear is excluded, and the sooner if they be first made slippery and enlarged with Medicines (as we said.) It is good also to hang down that side of the head, and to hop upon the leg on that side ; by which way the Boys after swimming get the Water out of their Ears ; If these will not do, you must endeavour to draw it forth with an Ear-picker ; taking heed, lest when you put it in, you thrust that which you would draw forth, further in ; therefore let the spoon of the Ear-picker be very thin that it may easier pass by the thing in the Ear. Or you may lay hold of it, and take it out with a pair of Forceps made on purpose, rough on both sides within. And if this avail not, when the body is hard, as a nut or stone, it must be laid hold on with an Instrument and broken, and then the Ear must be washed as aforesaid. If the Ear-picker will not enter, arm your probe with a little Cotton all over, and then dip it in Turpentine, or in some other clammy substance, and put it in the Ear that it may stick to that which is there, and stoppeth the Ear. The same may be done with a Wax-Candle touched with Bird-lime ; and if any of the Bird-lime stick in the Ear, you may afterwards take it out with the Ear-picker. There are some which put a hollow quill into the Ear, and draw out things with sucking.

The worms in the Ears are inticed forth by laying to such things as they love, as milk with Sugar laid to the Ear in a sponge, or easily put in ; or a Fig turned inside out ; or the Pap of a sweet Apple, or Bacon, and turning the Ear to the Sun at that time ; and especially if Horse-leeches get in, they are drawn forth by an Injection of blood. Fleas are drawn forth with dogs hair ; but if they be living they must be killed, and then they will less hinder the hearing, and will be drawn forth more easily : And they are killed with fasting spittle, or your own Urine dropt into the Ear.

Bitter things do sooner kill those Vermine, as the juyce of Wormwood, Centaury, or the decoction of Aloes or beasts Gall. Also sharp things, as Vinegar, juyce of Onions, and the like.

And because the usual cause of deafness is a cold distemper and a defluxion of moisture to that part, you must labour most to oppose that.

But because this defluxion comes originally from the brain, therefore we must begin the Cure there, as in the cure of the cold distemper of the brain ; which a Prudent Physician will moderate according to the degrees and violence of the distemper.

The brief way of Cure is, first attenuating diet, moderately warm and drying, such as is prescribed in *Gutta serena* : and then avoiding of Southernly winds, by stopping the Ears ; and vaporing nourishment, as Garlick and Onions ; as also things that beget thick and flegmy Humors ; First, Let a general Evacuation be made by Pills, Cephalick Purging Apozemes ; then by Phlebotomy if need be ; to which add if the disease be stubborn, a sweating diet ; and then use particular Remedies that reveal the defluxion, as Cauteries, Vescicatories, Needling, Masticatories, Gargarisms : but

Mastichatories or Chewings, are peculiarly necessary in this Disease, by reason of the passage which comes from the internal Ear to the Palate, and throws out the excrements of the Ears.

And finally, When the Disease grows old, you must use ordinary Pills, Magistral Syrups, Cephalick Opiates, Pouders and Caps to strengthen the head, and the like. All which are laid down in the Treatise of the Cold Distemper of the Brain.

In time of Diet, if the Disease be stubborn, Bags are good applied to the Head after the sweating Potion is administred, as in the said Treatise is prescribed, not only the forepart of the Head, but to the Ears also.

Brimstone and Bituminous Baths are very proper in this Disease, with washing of the Head, for by them sweat is provoked, and the matter of defluxion is drawn out. But by washing of the Head the Brain is strengthened and dried, and the humors fixed in the Ears are dissolved. The way of using them is described by *Penotus*, and much commended in these words: *There is nothing in the Cure of Deafness more prevalent after the use of an hundred Medicines, than that the Patient after his Body is first well purged, and then his Head, Wash his Head well in Brimstone Baths, thus: Let him wear a great Cap reaching to his Eyelids, and beneath his Ears, made of Sponges sewed together; let him sit under the cock or spout in the Bath, and let it run upon his Head; which water the sponges will suck up, and so keep the head in a continual heat; and so opening all the Sutures of the Head, and Commissures, it will take away all the vapors: or it will breath away the matter compacted in the Nerves, and the passages for Hearing, or so change it, that it will quickly be gone: It is good for him to sit so twice in a day for two hours, and presently after to sweat in his bed, and use a slender Diet of Juices and Broth, and to beware of Wine except it be very weak.*

Then you must use Topicks to discuss the matter fastned in the Ear, which may be thus applied.

Take of the Leaves of Organ, Wormwood, Pennyroyal, wild Marjerom, Sage, Mints, Centaury the less, Mallows, and Marsh-mallows, of each one handful: the flowers of Camomel, Melilot, Stæchas, and Rosemary, of each one pugil: Cinnamon and Cloves, of each half an ounce: Boyl them in equal parts of white Wine and Water: Foment the Ear with the straining hot in a sponge morning and evening.

Of the same Decoction you may make a Fumigation into the Ear by a Funnel which must needs be excellent, because the vapor arising from the hot Decoction must needs reach into the innermost parts of the Ears.

Instead of a Fomentation you may apply a hot Loaf made with Caraway-seeds, and cut it in the middle.

Or take ordinary Bread from the Oven, and break off the lower crust, and dip it in the Spirit of Wine, and let the Patient endure it at his Ears as hot as may be, that the vapors may be received in. Bread made of Bran is better with Caraway seeds, Bay berries, Juniper berries, and Nutmegs mixed before it be baked: then after it is a little baked, break it and apply it hot to the Ears.

If you desire a stronger Decoction for Fomentation and Fume, you may add one or two drams of the Pulp of Coloquintida, and the root of white Hellebore. You may make this Decoction in white Wine alone, or with Vinegar, that it may pierce more, and discuss.

The Fume of Cloves may be taken with much profit to the Patient by a Funnel into the passages of the Ear when the Head is covered with a warm cloth.

After Fomentations and Fumes, you must put some liquor into the Ears, and then stop them with Muskified Cotton.

Take of the Oyl of bitter Almonds and Rue, of each one ounce: Mix them and put them hot into the Ears. Or,

Take of white Lillies and Castor, of each one ounce: the Oyl of Dill half an ounce: white Hellebore half a dram: Aqua-vita one ounce. Boyl them in Balneo Mariæ till the Aqua-vita be consumed; strain them for the use aforesaid. Or,

Take of Cypress-roots, Bay-berries, Annis and Cummin seed pondered, of each one dram: Poulder of Castor half a dram: Oyl of Rue as much as will be sufficient; Mix them and put them into a great hollow Onion; roast it, and strain out the Liquor to be dropped into the Ears.

Chymical Oyls work most powerfully; as Oyl of Rosemary, Marjerom, Sage, Fennel, Spike, Cloves, which are too strong to be used alone, therefore you must mix a very small quantity of any of them with the Medicines mentioned, thus:

Take of the Oyl aforesaid two ounces: Oyl of Spike, Cloves, or the like, half a dram or a dram: Mix them.

There is also some Waters, which if dropped into the Ears do much good. Some Authors commend the Water of an Ash, which is made by putting one end of a green Ash into the fire, and taking the Water out of the end: this is best when the deafness cometh of a hot cause, and you fear to use hot Medicines. But if not, then you may mix as much Aqua-vita therewith. *Mathiolus* mixeth this

this Water with Juices, and commends it highly in these words: *We know that the Water which comes out of Ash, when it is burnt, mixed with the Juice of Sowbread, Squills and Rue in equal parts warmed together, to be excellent against Deafness, if it be dropped into the sound Ear when the Patient goeth to bed, and lieth upon that Ear which is deaf: but when both Ears are deaf, then into that which is least affected.*

The Spirit of Wine wherein white Hellebore hath been infused, being dropped into the deaf Ear, is very efficacious.

Others commend the clarified Juice of Ivy mixed with strong white Wine.

The Galls of Beasts, as of Hairs, Goats, Partridges, are much commended if they be used fresh, with an equal portion of Honey, and warmed in the shell of an Onion:

The fat dripping of an Eel is much used, Put a great Eel upon the Spit, and take the dripping upon Bay-leaves and drop it warm into the Ears.

Zechius commends Ants Eggs, in these words: *Ants Eggs mixed with the Juice of an Onion, and dropped into the Ear, do cure the oldest deafness.*

The blood of a young Wolf, dropped hot into the Ears doth the same.

Lastly, if the Disease be so stubborn that it will not yield to the Medicines prescribed, it will not be amiss to use the last Remedy which is prescribed, by *Fonseca*, *consult. 58. tom. 2.* namely, an Unction with Quick-silver, because when Deafness comes of the *French Pox*, it is so cured, and it may be when it comes otherwise; and the reason is, because Quick-silver doth dissolve and discuss hard tumors, when they are gathered upon any part, and therefore when Flegm is gathered in the Ears which no other means can dissolve, Quick-silver may dissolve it. But this Remedy must not be tried but in a desperate condition; for it is doubtful what the event will be, and the Unction with Quick-silver doth much weaken the Brain, and cause defluxions. So that some who have been cured of the Pox by Quick-silver, have after fallen deaf by defluxion; although sometimes (as I said) deafness coming of the *French Pox* is cured thereby, and Quick-silver rightly used after due Purgation doth no hurt to the Brain.

This you must always observe in the use of Topicks, that you never put cold things, but warm, into the Ears, and you must not dress them till the old Medicine be taken out. And after dressing you must stop the Ear with Cotton Muskified, for that only conduceth much to the Cure: as *Forestus* saith, *Obs. 15. lib. 12.* in these words: *A woman of Delf after a long disease fell deaf, which after sufficient purging abstained from Physick: at length she was perswaded by an old woman to put a grain or two of Musk into her Ears with a little Cotton, and so doing she was wonderfully cured. I have cured many the same way whose Ears have run.*

Chap. 2. Of Noise in the Ears.

THe Sense of Hearing is hindered by noise in the Ears; for as the Eyes must be void of all colour that they may truly perceive the colours of all Objects, and when they have a preternatural colour, as in the Jaundice, the sight is depraved; so the Ears must have no sound in themselves, that they may more distinctly receive all other sounds; and if there be any noise in them, the Hearing is depraved. This is called in *Greek Paraconsis* in *Latin Obauditio*, vulgarly a noise in the Ears.

CAUSES.

This comes from preternatural motion of the Air which is naturally contained in the Ears; for as *Aristotle* saith, Though the natural Air in the Ear do move, yet the noise is not heard except you stop the Ears with the hollow of your hand, or the like, for then the hearing is more inward when the outward Air is kept out. This is seen by experience, when one stoppeth his Ears, and holds the handle of an Instrument in his teeth, the sound will be four times greater than when his Ears are open, for it passeth through the mouth; there is a natural motion of Air in the Ear by the *Spiritus Aconsticos* continually working. But if it be too violently moved, then there is a preternatural noise in the Ear which hindreth the hearing.

The Causes are many of this preternatural motion, but chiefly a Vapour or Wind sent from other parts into the Ear, or bred there; either coming from the whole body, or from some peculiar part.

In Feavers it comes from the whole body; whence *Hippocrates* saith in *Coacis*; A noise in the head coming in an acute Disease is deadly, for it comes of wind sent by the Arteries from the whole Body into the Ears; it useth to come chiefly in the beginning of a fit, and before bleeding. Wind is also sent to the Ear from a peculiar part, namely, the Stomach, Liver, Spleen, Midriff, Womb, and the like; whence it comes to pass, that in great Vomitings, in Hypochondriack Melancholy, and fits of the Mother, there is for the most part a noise in the Ears. Often there is a wind sent from the head coming of a cold Flegm, through want of heat of the Ears by the Veins and Arteries, and the Nerves of the fifth Conjugation, by which passages also vapors come from the inferiour parts. Wind

is bred in the Ear also, of flegm contained therein; whence it comes to pass that thick Hearing is always accompanied with a noise in the head. For by the humor there is a stoppage, from whence comes deafness, and from the wind that proceeds from that humor, comes the noise.

There are other Causes of this noise, as a great stroke upon the head, a great sound, Ulcers in the Ears, a hot distemper, weakness, and exquisite sense.

A stroke, by moving the Spirit in the head too violently, causeth a noise.

A great sound doth violently move the natural Air.

And Ulcers by the heat of the matter boyling and working, make a noise; and by the Spirits gathered thither, and moving the Natural Air.

A hot distemper fills the inward Arteries of the Ear with much Spirit: whence a great beating noise proceedeth. Sometimes too much Spirit is sent by those Arteries into the Ears, and the Natural Air is thereby moved, from whence cometh a noise. And from this cause may come a continual noise for some moneths or years.

Weakness of Hearing useth to make a noise in the Ears, as in sick people, because every sense debilitated is hurt by every violent or moderate object: so they who have weak sight, are offended by a small light.

And lastly, When the sense is most exquisite, as *Galen, lib. 3. de comp. med. sec. loc. cap. 1.* there will be a noise in the Ears, because even moderate objects are too vehement for it. Now this exquisite sense must be preternatural, for the exquisiteness of sense cannot of it self produce a depraved action, but rather the more exquisite it is, the less it will err. The preternatural exquisiteness of sense comes from a hot distemper, Ulcer, or the like: as parts inflamed do depravedly, that is painfully feel moderate touchings. Or if the exquisiteness of sense be Natural, you must suppose that the cause of the noise is preternatural; for the vapor which is so little that it cannot be felt of dull sense, and so the action not be hurt, will be felt of him that hath exquisite sense, and will cause a noise; so that in one it is Preternatural, in another Natural.

DIFFERENCES. There are divers sorts of sounds in the Ears, which proceed either from the quantity of the vapors as they are more or few, thinner or thicker, swift or slow in motion; for if the vapor be much, thick, and of quick motion, it will make a noise like swift running water, or like a Drum, or like some such Musical Instrument, or a rushing Wind or the like; but if it be little, thick, and move quick, the noise is like the falling of a Tree or House.

If it be much thin, and swift in motion, it causeth a hissing, or is like falling of a gentle water. If it be little, thin, and quick in motion, it causeth a tinkling. If it be much, thick, and of slow motion it makes a murmuring noise. If the matter be little, thick, and slow in motion, it makes a kind of whispering noise. If it much, thin, and of slow motion, it causeth a hissing. And lastly, Because the degrees of thickness and thinness, of greatness and smallness, of swiftness and slowness, are infinite, therefore there are innumerable sorts of sounds in the Ears.

DIAG. There is no certain knowledge of the causes aforesaid, as *Galen teacheth 3. de comp. med. sec. loc. c. 1.* but we may make conjecture from the precedent causes and circumstances.

We conjecture that the noise comes from Wind, because sometimes it ceaseth, and returneth again; as also when the Patient hath formerly used to eat windy meat.

It cometh by consent from other parts, when there is some peculiar disease in them.

It appears to come from the Brain when pain and heaviness of the Head went before, and when other senses also are hurt.

That the fault is in the Ears, appears by a continual noise without any intermission.

We know that the disease comes from a cold matter; if the Patient be better for the use of hot things, and if in time of health great noise be not much disturbance.

The difference of sounds above mentioned, do shew whether the disease comes of thick or thin, many or few vapors, it will easily appear by what hath been said.

When it comes from the weakness of the faculty of Hearing, as from some Diseases aforesaid, of which the Patient is scarce recovered.

We conjecture that it comes from a hot distemper, and from an exquisite sense coming thereupon when the Patient perceiveth a heat in his head about his Ears; when some hot causes went before, and Medicines that discuss wind do encrease the disease: as also when the Patient in time of his health could not endure any great noise by reason of the exquisiteness of the sense.

PROGNOSTICK. As to the Prognostick. A new begun noise in the head is easily cured, but an old, hardly; and the more if it come from the French Pox. That which proceeds of a hot cause is more easily cured than that which comes of a cold.

An old noise coming of flegm contained in the Ear, turneth to deafness, for when the matter is encreased, the passage of Hearing is stopped.

CURE. The Cure of this Disease is divers in respect of the diversity of Causes.

And

And first the Cure of Noise in the Head coming from consent with other parts depends upon the Cure of the Diseases of those parts, and must be taken from their proper Chapter.

But that which comes principally from the Ears distempered, must have its proper Cure : And if it come of a cold distemper and thick vapor, it will be cured as in the Treatise of *Thickness of Hearing* ; for they are alike, and one is sometimes changed into the other, and sometimes they are complicated and joyned together : For Noise in the Ears is the fore-runner of thick Hearing and Deafness.

Therefore all Remedies both Universal and Particular, may be used here which we prescribed in the former Chapter of Deafness and thick Hearing.

If the Noise come from an Ulcer in the Ear, it requireth no other cure than that which is proper for the Ulcer. And that shall be laid down in the following Chapter.

If it cometh from weakness of Sense, as in them who are lately recovered of some great Disease, it will vanish of it self as the Body gathereth strength : yet you may drop some proper temperate Oyls sometimes into the Ears to mitigate, as Oyl of Camomel, Dill, Sweet Almonds, and the like.

And Finally, If it come from a hot distemper and exquisite Sense, you must prescribe a Cooling and moistning Diet ; as also drop cool things into the Ears, beginning with mild first, and after proceeding to stronger.

And first, use the decoction of Barley, Violets, Lettuce, Water-Lillies, to which you may put a little Balm or Camomel to make it pierce : which not prevailing, you must use the Juyce of Lettuce, Purslain, Henbane : *Galen* alloweth the juyce of Poppy and Opium it self, but these must be used sparingly and with much Caution, lest by weakning the natural heat of the parts, the Hearing grow more dull.

Chap. 3. Of pain in the Ears.

PAin of the Ears called *Otalgia* in *Greek*, is a violent disease, both in respect of the part affected, namely, the inward Membrane which goeth about the Cavity of the Ear, as also by reason of the nearness of the Brain which often suffreth at the same time.

But since all pain comes from the solution of Continuity, all those things do cause pain in the Ears, which do dissolve the Continuity of those sensible parts which compass the Cavity of the Ear : the chief whereof are Distempers both without and within, Matter, Wounds, Ulcers, or things fallen, or put into the Ears Externally.

A cold distemper doth sometimes cause pain in the Ears, and it comes from cold Winds, cold Baths, and very cold causes.

A Hot Distemper without Matter, seldom or never produceth a pain in the Ears, as Cold doth : For Cold is an Enemy to these Nervous and Membranous parts, but Heat is a Friend to them. Nor can it cause any pain but that which is excessive, and will cause a defluxion of Humors to the parts, and then it is not without Matter. For this Cause, neither *Galen*, nor any of the Ancient *Greeks* made mention of a hot distemper, although *Avicen* of the *Arabians* hath mentioned it.

Now the Cold Matter which causeth pain in the Ears, is either flegm or water which comes from the Brain into them, or else Wind from the Brain or the inferiour parts.

But the Hot Matter is either Choler that falls from the Veins and Arteries into those parts, or Blood, from whence cometh Inflammation.

The aforesaid Cause produceth an occult Solution of Continuity from whence cometh Pain. But manifest Solution of Continuity ; as Wounds and Ulcers are more evident Causes of Pain. Wounds come from external Punctures, as Cuts and Contusions. But Ulcers come either after Inflammation and breaking of an Imposthume, or from sharp Humors that corrode the parts.

Finally, Things that get into the Ear outwardly, if they be hard, sharp, or any ways piercing or biting, will cause pain.

You may know all these Causes thus, If the distemper be without Matter, there will be no heaviness, distention or tumor : and you may know that the distemper is cold, when cold Causes have preceded, as travel in Winter, when the pain increaseth in cold Weather, or with cold Medicines and decreaseth with hot : but you may know a hot distemper by hot causes preceding, as being long in the Sun or heat, and when hot Medicines hurt, and cold do profit.

If the Pain come from Flegm, there will be a heaviness in the Ear and the Head ; as also a Rheum will fall upon some other part, besides cold causes did precede, as cold and Northerly Weather, cold Meats ; or it is Winter, and the Patient is old, and the like.

If it come from Wind there will be a great pain without weight or heaviness, not constant, but intermitting and with noise.

That it comes from Water, the Patient will have other Diseases from the same, as sharp and thin defluxions upon the Teeth, Eyes, Ears, Breast and other parts; and Evacuation of serous Matter by Vomit, Stool, Urine or Sweat.

If it come from a Cholerick Humor the pain will be sharp and pricking, and there will be sensible heat; it will be mitigated with cold things, and choler will sometimes come forth of the head: the Body is of a Cholerick temper, the Party young, the Weather hot, and Diet also with the like, by which the Patient is often distempered.

DIAGNOSTICK. An Inflammation is known by a great beating pain, with great heat and redness about the Cheeks and Temples; to which there is joyned a continual violent Fever; sometimes Doting, Swooning, Convulsion and coldness of the extreame parts.

A Wound is known by the blood which will come forth of the Ear, but an Ulcer by the filth, or matter; but because sometimes there is a defluxion of filth from the Brain by the Ears, we must distinguish, for if it comes from the Brain, there went before it an Head-ach and other signs of an Imposthume in the Brain. And first the matter is sent forth in great abundance, and after by degrees while it is all spent. From an Imposthume in the ear may come plenty of Matter, but then there were signs before of an Inflammation there, and afterward followed an Ulcer, which you may know whether it came from an Imposthume or a defluxion of sharp Humors by these signs following; there is a constant Flux of a little filth or matter by degrees: there is felt a pain burning and shooting in the Ear, especially if it be pricked. Moreover, We may conjecture of the difference of the Ulcers, for if it be in the bone, it is known by the thin matter yellowish, and by the long continuance of the disease. If it be deep, you shall know it by much Matter. If it be clean, by the laudible Matter. If it be foul, by the thickness and plenty. If it be virulent by the thinness. If putrid by the stink of it. If it be corroding, by blood following. If fistulous, from the oldness of the Ulcer, the virulency of the Matter, the callosity and hardness of the Flesh.

Finally, If there be any thing fallen into the Ear, either it may be seen or related by the Patient.

PROGNOSTICK. The Prognostick of pain in the Ears is divers, according to the diversity of the Causes. That which comes from a bare distemper is easily cured. That which comes from a cold slegmy serous, or windy matter is not very dangerous, but useth to continue long. But that which cometh from hot humors, and especially such as cause inflammation is very dangerous, for the Brain being nigh must needs consent, and be also affected: from whence Dilliriums and Convulsions use to proceed. In this Disease young men are in most danger: for they being of a hot temper, and their blood hot, the Inflammation is greater: and this dissolveth the natural heat of the Brain, and killeth the Patient. Hence it is that they die for the most part within seven days. But old men who are colder, have less Inflammation, and so are in danger.

Ulcers in the Ears are hard to be cured, because the Brain being nigh, doth send its excrements to those parts: But those which follow an Imposthume are easier cured, especially if the Matter be laudable. But where the Matter is virulent, stinking or the like, it is difficult, especially if the Ulcer be cavous, and the Bone foul.

CURE. The Cure, as the Diagnostick and Prognostick, is to be varied according to the Cause.

For if it comes from a bare cold distemper, hot Medicines applied to the Ears are sufficient, such as are in the cure of Deafness, especially Fomentations and Fumes, as also the warm Oyls there described. But when a hot distemper comes without matter, it may be cured with Topicks which are cooling, which we will shew afterwards, and especially with the White of an Egg beaten with Breast-milk, and put into the Ears.

If it come from a cold distemper with matter, as Flegm, Water or Wind, you must use the Medicines prescribed in the Cure of Deafness. First Purge the whole Body, then correct the distemper of the Brain, and apply warm Topicks that discuss, unto the Ears.

If it come from a hot distemper with Choler, which is of long continuance, or comes by fits, First revel the humor that floweth to the part by Phlebotomy, by which the hot distemper of the whole body with the Liver, in which Choler is made, is amended. Then purge the humor with proper Medicines. You may amend the hot distemper of the Liver with Juleps or cooling broths, with Whey of Goats milk, with sharp Vitriolat, Mineral Waters, with hot Baths and the like. And lastly, All things are proper for it which are prescribed in the Cure of the Head from a hot Cause. But you may use cooling Topicks and Anodines that take away pain, which we shall shew afterwards concerning the Inflammation.

Inflammation of the Ear is cured first by blood-letting, according to the quantity of the humor, for revulsion of it from the ears, first having given an emollient and cooling Clyster: This must be done in great quantity at divers times, for the greatness and violence of the disease requires it. You must open

open the Head Vein on that side the Ear is that is pained. If you think it comes from stoppage of Terms or Hemorrhoids, open the lower Veins, first having let blood in the Arm. When the cause is not from thence, it will do good for revulsion to apply Leeches.

Also you may make good Revulsions by Frictions and Ligatures of the Arms and Thighs, by cupping the Shoulders and Back with Scarrification, or without.

Sometimes for Derivation it is good to apply Cupping-glasses behind the Ears, with Scarrification; as *Zacutus Lusitanus* teacheth, *Observ. 64. lib. 1. Praxis Admiranda*, in these words: The Divine old man in his Second Book, *Epid. Sect. 6.* towards the end saith thus: For pain in the Ear, clap on a Cupping-glass. This worthy saying gave much help to a poor man which was in pain; and when all things failed and he grew weak with watching, and Mad with a continual Feaver, being ready to depart, having opened a Vein, and applying Cupping-glasses to the Shoulders and Neck, and taken revelling Clysters and purging and the like; as also Anodines into his Ear without any profit, he was cured only with a Cupping-glass with Scarrification applied by the Glandules of the Ears, which drew much blood, and took away the Inflammation.

The same *Zacutus Lusitanus* in *Paraxi ad Historias*, commends four Horseleeches applied behind the Ear, which he saith gave much ease to a young man which had a violent Inflammation in his Ears.

The cutting of the Arteries in the Temples of the Forehead, doth produce rare effects for the appeasing of the greatest pain in the Ears, by taking away the hot and windy blood which produced that grievous symptom. The way of doing it, is set down by us in the Cure of the hot Head-ach.

A Purge against Choler is good, for so the Choler mixed with blood, which by it is made so fluid, is drawn down, and sent forth.

Afterwards the whole mass of humors is to be tempered with cooling Juleps, made of the Decoction of Lettace, Purslain, Plantane, Sorrel and the like, with Syrup of Lemmons, Pomegranats, or Wild Poppies.

In the mean while, these Medicines are given; you must always apply Topicks, which must always be Anodine, by reason of the vehemency of the pain, the mitigation whereof must be your chief intent; and this will be more rationally done, if in the beginning and the encrease of the Disease you mix things that do gently repel; but in the state and declination things that resolve, such as these following:

Take of new Breast-milk two ounces; the white of an Egg beaten to Water half an ounce: drop these mixed together warm into the Ear.

Or Milk alone squirted into the Ear from the Breast, this doth much assuage.

Take Plantane and Nightshade, of each one handful; the flowers of Camomel and Melilot, of each one pugil: Make a Decoction, and let the Patient receive the fume thereof into his Ear by a Funnel.

Take of the Oyl of Water-Lillies and Roses, of each one ounce; Mix them and drop thereof into the Ear, after the fume.

† Sows infused in the aforefaid Oyls and strained, are the best Anodines; for these Creatures have especial force to appease pain, and therefore are used in the Tooth-ach, Hemorrhoids, and the like: or take them alive, and boyl them with Water in the Oyls till the Water be consumed.

† Called a Cheslip, or Kitchen-bob, with many feet; which being touched gatherth it self round like a ball.

If the burning be very violent, you may mix cooling Juyces with the aforefaid Oyls, thus:

Take of the Oyl of Water-Lillies and Roses, of each one ounce; the Juyce of Nightshade and Plantane of each half an ounce: Mix them and drop thereof into the Ear.

Rose Vinegar is used of some Practitioners made of two parts of Oyl of Roses, and one part of Vinegar, Which ought to be suspected, as all strong repelling Medicines; for there will be danger, lest the humor flowing thither should return to the Brain: and it is a general Precept always to be observed, That you never lay repelling Medicines to inflammations which are near unto noble parts: but you may mix gentle Repellers with Anodines and Relaxers; for so they will moderately repress the Defluxion, nor will they drive it far back. Such are the aforementioned, to which you may add this following.

Take of the Oyl of Roses and Water-Lillies, of each one ounce and an half; Rose and Plantane Water, of each half an ounce: Breast-milk one ounce, the Mucilage of the Seeds of Eleahane and Quinces drawn with Rose water, of each six drams: Mix them. Put some drops thereof warm into the Ears, and bind clouts dipped in the same Liquor about the Ears.

In vehement pain we are constrained to fly to Narcoticks or Stupifacives; but you must use them seldom and with much care, because they offend the Brain. *Galen* saith, 3. de comp. med. sec. loc. I know one, who only with the use of Opium took away both speech and sense from his Patient, that he could be cured neither with Opobalsum, nor any other hot Medicine injected. Therefore if necessity constrain, thus they are to be prescribed.

Take

Take of Oyl of Poppy seeds one ounce and an half: Camphire and Opium of each two grains: mix them, and drop them into the Ear.

Take of the Oyl of Sweet Almonds two ounces, the Juyc of Mallows half an ounce, Myrrh half a dram, Saffron half a scruple, Opium three or four grains: mix them for the use aforementioned.

In applying of Topicks, the Rule of Galen is diligently to be observed, which is in *lib. 3. comp. medic. sec. loc. cap. 1.* that an Inflamed Ear be not touched, but let the Medicines be injected, by an Instrument for to see into the Ear, or a Probe armed with lint and dipt in the Medicines. Then that you ask the Patient if he feel it warm, and if he can endure it hotter? and let it be used so long as he can suffer: You must put the Probe so armed gently into the hole of the Ear that the Medicine may soak from it into the Ear, you must do thus till the passage of the Ear be filled with the Medicine, then you must dip Lint in the same Medicine, and lay it to the hole of the Ear, and round about.

In the state of the disease, you must mix gentle resolving Oyls with Anodines, thus.

Take of Oyl of Camomel, sweet Almonds and Violets, of each one ounce: the Oyl of Lillies half an ounce; Mix them.

But these Fomentations and Fumigations which are made of the following decoction, do resolve more powerfully.

Take of Marsh-mallow Roots one ounce, Mallows, Nightshade, St. Johns-Wort, of each one handful: Linseed half an ounce, the seeds of Mallows, Marsh-mallows, and white Poppies, of each two drams: the Flowers of Camomel, Dill and Roses, of each one Pugil: make a Decoction in Water and Milk for a Fomentation and Fumigation. Water taken out of Ashen sticks, being dropt into the Ears easeth pain and dissolveth the cause of it. You must put green Ashen sticks into the fire, and take the Water that comes from both ends.

If the Tumor cannot be dissolved, but it seems to tend to suppuration; which you may perceive by the encrease of pain, the greater Pulsion, and a stronger Fever.

You must help the motion of Nature, and apply this following Cataplasim.

Take the feces of the former Decoction made for a Fomentation and Fumigation, and put to them of Ducks and Hens grease, Marrow of Teal, and the Mucilage of Fleabane and Fœnugreek seeds, of each one ounce: the Oyl of Camomel and Violets, of each one ounce: Fresh Butter one ounce and an half: Saffron half a dram: Make a Cataplasim.

A Cataplasim of Crums of Bread is also very good; for it asswageth pains, and furthers suppuration gently without Inflammation: and therefore it is very proper in all Phlegmons or Tumors. You must make it thus.

Take of the Crums of white-bread one pound: boyl it in Goats milk to a Pultis, then add of the two yelks of Eggs, the Oyl of Roses two ounces: Saffron one scruple. Make a Cataplasim.

The Cataplasim made of an Onion, is much commended of Victorinus Faventinus. Made thus:

Take one Onion: fresh Butter two ounces: Oyl of Camomel and Roses, of each one ounce: Saffron one scruple: Make a Cataplasim, apply it warm.

The Suppuration being made: the Imposthume breaketh, and the Matter comes forth either by the Membrane of the Ear made thin, or else corroded, and then the Patient must ly upon the Ear that is pained, that the Quittor may come forth; and you must drop such things into it as may cleanse.

Take of the Decoction of Barley four ounces, Honey of Roses one ounce; drop this warm into the Ears at several times.

If an Ulcer come from sharpness of Matter, you must have a peculiar way of Cure; such as is used to an Ulcer caused from a Defluxion of Humors.

And first, because according to the Opinion of Galen. 4. de comp. Med. sec. loc. we may not apply Topicks to any part, except the whole Body be first often purged: we must use ordinary Evacuations by bleeding and purging according to the nature and temper of the Patient; and these must be repeated through the whole time of Cure, as often as need requireth.

Then we must apply drying and cleansing Topicks or Medicines to the place affected, beginning with the mildest first.

The Examples of which are these.

Take of the best Honey and old White-wine of each three ounces: boyl them, and skum them: drop off this into the Ear, and stop it with Cotton dipt in the same.

After that it may be stronger; mix the juyc of Horehound, Smallage, Wormwood, and the lesser Centaury, or of Sowbread with Honey: boyl them gently, and drop thereof into the Ear.

Or, Take of the Juice of Bees one ounce, Horehound half an ounce, the best Honey six drams: boyl these a little, then add of the Syrup of Wormwood two drams. Mix them.

You

You may make a stronger Medicine thus :

Take of the juyce of Sowbread one ounce ; Myrrh one dram ; Saffron half a scruple ; Frankincense one scruple ; Verdegrece half a scruple ; old Wine one ounce and an half ; boyl them gently till the Wine be consumed. Drop of this twice or thrice in a day into the Ear.

Observe, Before you drop any Liquor into the Ear, you wash the Ear in warm Hydromel, or Water and Honey, and wipe it well with Lint upon a Probe armed.

When the Ulcer is sufficiently cleansed, you must come to Cicatrizing. Thus ;

Take of Round Birchwort, Pomegranate-peels and Galls, of each half an ounce : boyl them in equal parts of Wine and Smiths forge-water, to half a pint ; when it is strained add to it of the juyce of Plantane and Polygonum, of each one ounce ; Honey of Roses two drams ; mix them, and drop of this into the Ear. Or,

Take of Enankincense and Myrrh, of each one dram ; Gum of Juniper half a dram ; Sarcocol, and Labdanum, of each one scruple. Make a Powder of them and mix it with Turpentine into Balls, which you must lay upon the Coats, so that the Patient may take the Fume into his Ear by a Funnel.

Or you may mix that Powder with some of the aforesaid Juyces, and drop thereof into the Ear.

Or you may mix burnt Allum with White Wine, for this hath a very great drying quality.

If the Ulcer be stubborn and old, it is nourished by a defluxion, which you must labour to remove by usual Purges, Diets of Lignum-vitæ and Sarsa, by Errhines Mastichatories, Cauteries, and other Remedies that will divert.

Then you must use stronger Medicines to dry the Ulcer ; such as we prescribed of juyce of Sowbread, Myrrh and Verdegrece.

Or this following Medicine of *Valescus*, with which he said that he cured a Priest that had an Ulcer in his Ear from the eighth year of his age :

Take of Honey ten drams ; Vinegar eight drams ; boyl them, take off the scum, and put to one dram of Verdegrece : Mix them.

These must be dropt morning and evening into the Ear, after it is washed with this Decoction ;

Take of Wormwood, Marsh-mallows and Agrimony, of each one handful ; boyl them in equal parts of Water and White-wine put to it towards the conclusion, to half a Pint : Dissolve in the strained Liquor Oximel simple one ounce and an half : Allum powdered one dram : wash the Ear with this warmed, and after dry it with an armed Probe.

If the pain come from sharp Medicines, drop in the Oyl of sweet or bitter Almonds with Myrrh, Aloes and Saffron ; and if it be violent mix a little Opium, or drop in the Oyl made of yelks of Eggs in a Leaden Mortar.

If the Ulcer be very foul, you must use *Egyptiacum*, dissolved in the aforesaid Juyces.

Lastly, *Galen*, *Ætius* and others, both *Greeks* and *Arabians*, do much commend the Rust of Iron for the drying of Ulcers in the Ear.

Galen 3. de camp. med. sec. loc. useth Scales of Iron ground or boyled with the sharpest Vinegar.

Hollerius in his Comment upon that Chapter doth prefer the *Arabian* Preparation, for they first grind the Iron with Vinegar, then they dry it ; thus they do seven times ; then they make it very fine, and boyl it long with the best Vinegar, while it is as thick as honey, and then they dry it and use it with Honey or other Liquors.

If the Pain of the Ear come from any thing fallen into it, as a little stone, Cherry-stone or the like, which will be very grievous, and sometimes cause Convulsions, Inflammations and Death ; as *Mathæus de Gradi* saith of a Boy of ten years old had a Cherry-stone in his Ear, and through the ignorance of the Chirurgeon, he endured great pain, and after dyed.

You must draw out these things thus :

First, You may try with an Ear-picker, which you must carefully attempt, lest your Instrument force it further, which often happeneth.

Therefore if that which is fallen into the Ear do fill the hole, it is better to abstain from the use of the Ear-picker, and try these Remedies :

Paulus useth to dip his armed Ear-picker in Rosin, Turpentine, Gum, or the like ; and to put it the Ear, turning of it till you get it out by degrees.

If thus you cannot, put hot Oyl continually into the Ear to relax the part, and make the thing contained slippery, so it will easier come forth.

Use Neefings with the Mouth and Nostrils shut, for it so will be forced out of the Ears.

These are to be followed till the party be freed ; for if it continue long in the Ear, it will be inflamed

med, and then the thing will be more difficult and dangerous to be drawn forth.

Arculanus upon *Rhusis*, affirmeth that the head of a Lizard applied to the Ear will draw out any thing, and confirmeth it by his own Experience, in these words: *In my Experiences for drawing things out of the Ear, this is one; Tie a live Lizard, or one lately dead, with his head to the Ear for the space of three hours, and when you take it away, you shall find the thing sticking to the head of the Lizard; and this is good for the extraction of any thing wheresoever it is fastned.*

Lastly, If the former Medicines do not prevail, you must come to the use of a chirurgical Instrument, which is at large elegantly declared by *Fabricius Hildanus*, *Cent. 1. Observ. 4, 5, 6.* and by *Aquapendent* in his Chirurgical Operations, in his Chapter of the Chirurgery for the Ears.

Sometimes Fleas get into the Ears, and moving themselves in the Cavity bring much disturbance. For the taking out of them, make a little ball of Dogs hair, and put it into the Ear, so will the Flea by reason of its affection to dogs come into it. Or make a tent, and put it often into the Ear, with a little Turpentine.

Oftentimes through swimming, or washing of the Head, water getteth into the Ears, which is very troublesome: this is shaken forth by hopping on the contrary foot, and holding the Ear down. If this will not do, you must suck it out with a Reed, or pain of Bellows. If you arm the pipe with tow to make it stick close, and keep the Air out of the Ear it will be better.

Galen and *Actius* continue in powring in of Oyl, suppling the Ear, and then wiping it with wooll; and after using Oyl for divers times.

And lastly, Put soft and dry sponge into the Ear often, till it come out dry.

CHAP. IV.

Of those things which come forth of the Cavities of the Ears preternaturally.

MAny Preternatural things come out of the Ears, which we will set down particularly with their Remedies.

First, After an Imposthume is broken which came after an Inflammation, or from an Ulcer coming from sharp Humors, filth or matter useth to come forth; whose Cure is laid down in the former Chapter.

Sometimes blood comes out of the Ears; as in wounds of the head, or blows by which the Veins of the Ears are broken or rent. If this Flux be small, it is not to be stopt, because by the being retained it would cause Inflammation; but if it be great or of long continuance, it must be stopt by bleeding in the Arm, and Cupping-glasses applied to the Shoulders with Scarrification. Then you must drop cooling and binding things in, as juice of Plantane, Polygonum, or the decoction of Madder, red Roses, Mastich, Acacia, Hypocistis, Pomegranate flowers, Sumach, and the like, made in Wine and Vinegar, or Smiths Forge-water.

Sometimes Water comes out of the Brain into the Ears, as in children; which must not be stopt, for if it be suddenly stopt, it causeth the Falling-sickness, or some grievous disease of the Brain; for Nature casts forth Excrements by that way, though not proper; and the great moistness in childrens heads is not only purged by ordinary ways ordained by Nature, as the Nostrils and Palate, but also by the Ears, Eyes, and the whole Head, from whence it becomes fore. But when this Evacuation is symptomatical, and the humor begins to ulcerate the Ears and hurt the hearing, we will lay down a convenient Method for the Cure.

And first, The abounding humors in the Head are to be purged with gentle Medicines often repeated, and to be derived by Vesicatories to the Neck, and by Caustick.

Then you must cleanse the Ears, and dry them with this Medicine;

Take of the Juice of Agrimony and Wormwood, of each four ounces; White-wine, and Honey of Roses, of each one ounce: Boyl them a little, and drop into the Ear after it is wiped; then stop it with Cotton dipped in the same.

Take of White-wine four ounces; the Juice of Agrimony, Wormwood, and Centaury the less, of each one ounce. Boyl them, and drop into the Ear.

In elder people, if water floweth out of the Ears long, you must purge the whole body and the Brain with a Cephalick Apozeme that is purging; then you must consume the superfluous Humidity

dity with a Sudorifick Diet ; derive it with Vesicatories, Cauteries, and Cupping-glasses ; and use other Remedies which are set down in the Cure of the Cold Distemper of the Brain.

Lastly, There are Worms sometimes in the Ears coming out of the filthy Ulcers, which are cured with the Ulcer ; but because the Ulcer cannot be speedily cured, you must therefore endeavour, the Cure of the Worms.

Take this one Medicine as an Example :

Take of the Oyl of bitter Almonds, the Juicye of Smallage, and the less Centaury, of each two ounces ; Vinegar two drams. Boyl them a little ; then add of Myrrh and Aloes, of each one scruple. Mix them, and drop into the Ear.

If you will make it stronger, put half a scruple of Coloquintida thereunto.

The End of the Third Book.

R 2

THE

THE
FOURTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Nostrils.

The Preface.

THe Nostrils use to have many Affects which are referred either to the Series or Method of Diseases, or of Symptomes. These are Diseases, An Ulcer, Ozæna, Sarcoma, and Polypus. These are Symptomes, the loss of Smelling, Stinking in the Nose, the Coryza or Pose, Neezing, Bleeding. Therefore this Fourth Book shall be referred to seven Heads; The First Chapter is concerning the Ulcer of the Nostrils and Ozæna. The Second, of Sarcoma and Polypus. The Third, of the loss of Smelling. The Fourth, of the Stink of the Nose. The Fifth, of Coryza, The Sixth, of Neezing. The Seventh, of Bleeding at the Nose.

CHAP. I,
Of the Ulcer of the Nostrils, and Ozæna.

THe Ulcer of the Nostrils is either New and Simple, or Old and Stinking. This last is called Ozæna.

CAUSES. The New Ulcer which is Simple, either comes of an External Cause, as a Wound or Contusion. Or from an Internal Cause, as the sharpness of Humors flowing to the part; and especially salt Flegm coming to the Brain.

Ozæna cometh from a simple Ulcer neglected, or from the Malignity and Acrimony of the Cause by which it becometh putrid and filthy.

DIAGNOSTICK. The Diagnosis of both is this; A Simple Ulcer causeth little or no pain, but only sends forth blood often, especially when it is meddled or tampered withal; otherwise it is covered with a dry black Scab which sometimes is cast forth. But Ozæna causeth great pain, the Scab is fouler, as also stinking Matter cometh from it. The Patient is not only annoyed therewith, but noysome unto others: and the *Greeks* call it Ozæna from the stink. Often this Ulcer creepeth, or either eateth the Gristle of the Nose, or the parts between, or the tender Bones thereof, and putri-
fieth

fieth them and sometimes destroyeth the Palate, especially if it turn to a Cancer, or if it come from the *French Pox* as it often doth, or from an *Elephantiasis*.

PROGNOSTICK. As for the Prognostick. Ulcers that are new, and come from a gentle humor that hath little malignity are easily cured: but old Ulcers that are solid and putrid are hardly cured, and if they turn into a Cancer, never. If they come of the *French Pox* or *Elephantiasis*, they cannot be cured, except those Diseases be first cured.

CURE. For the Cure. First you must appoint a good Diet, which may assuage the sharpness of the humors, and hinder the breeding of them; then you must Evacuate the whole body by bleeding, convenient Purging, and Cupping-Glasses with Scarrification: And if the Defluxion of humors into the Nostrils be very stubborn, it must be derived by Vescicatories and Causticks applied to the hinder parts, and then you must give things to strengthen the head.

After Universal Remedies you must come to Topicks. And first take notice if the Ulcers be crusty and hard, and before you proceed, take away that with a little warm Water and fresh Butter, or Goose-grease, or Hens-grease, Oyl of sweet Almonds, or the like.

The Scabs being mollified must not presently be taken off by force, lest the Ulcer be exasperated with a Defluxion; but you must expect till they fall off of their own accord blowing the Nostrils; or at last you may take them gently off with a little Oyl of sweet Almonds upon the top of your finger.

After the Scab is off you must use astringent and drying Remedies.

In a simple Ulcer it is sufficient to wash it with Barley water, and Honey of Roses, and then to anoint it with Oyntment of Tutty, or with the white Oyntment of *Rhasis*, or the Oyl of yolks of Eggs, which will be of more force if it be made in a Leaden Mortar.

But for the Cure of *Ozæna*, you must prepare these following Medicines:

Take of Barley one Pugil; Agrimony, Plantane, Wormwood, and the lesser Centaury, of each one handful; Red Roses half a Pugil: boyl them in Forge-water; in the straining, dissolve of Honey of Roses four ounces. Make an Errhine to be often snuffed into the Nostrils.

After it is somewhat clean, you must use this following Decoction:

Take of the Flowers and Rinds of Pomegranates, of each two ounces; Plantane, Horstail, Fleabane, and Rupture-wort, of each one handful; the Roots of Bistort, or Snakeweed, one ounce; Crude Allum one ounce and an half. Make a Decoction.

Allum Water is also good; as also those Remedies which shall after be prescribed for the Cure of *Polypus*, in the following Chapter.

Agyptiacum dissolved in Barley Water is good for the same.

After this make Oyntments which may astringe or bind, cleanse and dry exceedingly, as of *Pompholygos*, with Allum *Chalcitis*, and the Pomegranate Peels.

Or this following:

Take of Oyl of Olive half an ounce; Pomegranate peels and Flowers, of each three drams; Myrrh, Allum, Labdanum, of each two drams; *Chalcitis*, Aloes, Frankincense, of each one dram; Oyl of Roses and Myrtles, of each two ounces; Red Wax as much as is sufficient. Make an Oyntment, which apply to the Ulcer; or dissolve it in Wine, Plantane, Rose or Myrtle Water, which often snuff into the Nose, the mouth being filled with Water.

If these things prevail not, wash the Ulcer with sublimate Water, twice, thrice or four times in a day, for it dryeth very much, and cleanseth without any pain or biting. You must make it thus:

Take of Plantane water four ounces; Crude Sublimate powdered twelve grains: boyl them in a Glass to the Consumption of half, you may encrease or diminish the quantity of the Sublimate as you desire to have it stronger or weaker.

When the Ulcer is well cleansed, you must proceed to the drying of it up, for which purpose the Powder of Red Roses blown into it, is very good.

Rondeletius witnesseth, that there is nothing more efficacious for the drying of Ulcers after sufficient cleansing than a Fumigation, because it entrencheth deep into the parts and drieth, and he saith it must be made of powerful dryers, as of Orpiment and Cinnaber, to which you must add some sweet things, from whence there will arise a fume or smoak to dry the Ulcer; as Mirrh, Frankincense, Mastich, Benjamin, and the like, which may be brought into this form:

Take of the best Labdanum, Hypocistis, Mastich and Mirrh, of each three drams; red Storax, and *Styrax Calamita*, Frankincense bark, Sandarach, and Orpine, of each two drams. Make them up with Turpentine into Troches, with which let the Patient be fumed morning and evening in his Chamber.

It is excellent also to burn Candles of red Wax; for the smoak of them will powerfully dry the Ulcers,

Ulcer in the Nose, especially if the Patient be kept in a close room. And *Rondeletius* saith, That we may perceive that the smoak of a Candle doth affect us by receiving it: for if at any time we sit long in a little Study by Candle light, our Spittle and Snot will appear afterwards black; And by this means he saith he cured an Ulcer, which neither *Italian* nor *French* Chirurgeons could Cure.

Chap. 2. Of Sarcoma, and Polypus.

Sometimes there is not only an Ulcer, but an excrescency of flesh in the Nose, which maketh preternatural Tumors called *Polypus* and *Sarcoma*.

Sarcoma is flesh growing in the Nostrils without any certain shape, but like the proud flesh of an Ulcer.

But *Polypus* is an Excrescency of flesh growing with small roots, and spreading and hanging down to the lower part of the Nose, like the Fish called *Polypus*, from whence it hath the name. *Rhasis* calleth it the Hemorrhoids of the Nose, because like those of the Fundament, This flesh is soft, sometimes white, sometimes red and blew, and if it grow big, it hangeth out of the Nose; but if it grow in the highest part of the Nose, it sometimes hangeth down to the Palate, and stops the common passages, and may easily be seen behind the *Uvula*. In Southernly weather, and at the Full Moon, it is much swelled. But in a Northernly dry time, and at New Moon, it is less. It differs from *Sarcoma* in this; *Sarcoma* groweth chiefly in the lowest part of the Nose, where it is fleshy; but *Polypus* grows in the highest part by the Root of the Nose.

CAUSES. The Cause of both is a gross slimy humor coming from the Brain mixed with Blood: sometimes with Melancholy, and then you may fear a Cancer. *Sarcoma* often cometh from the superfluous nourishment of the Nose turned into proud flesh, and therefore is more easily cured.

DIAGNOSTICK. The Knowledge of these Diseases is easie by what hath been said, they being apparent to the Eyes.

PROGNOSTICK. The Prognostick is thus made:

A *Sarcoma* is easily cured for the most part; *Polypus* hardly. But that which is soft, white or red, or white and red, is more easily cured; but that which is hard and livid or blew, is difficultly cured, and is like to be a Cancer. Also that *Polypus* which groweth low or in the middle of the Nostril, is more curable than that which is rooted high, because Remedies will not so well reach it.

CURE. Both are cured with the same Medicines, which are so to be ordered that the superfluous flesh may be taken away; but first you must remove the antecedent Cause, that is, the slimy humor which cometh from the Head, which you must do by a drying and attenuating Diet, general purging, by Revulsion, derivation and drying of the head; all which may be done by those Remedies which are prescribed in the cure of the cold distemper of the Brain, being discreetly used; and although many Authors commend the Decoction of Guajacum with a drying Diet, you must take heed lest by so doing you mix the Flegm with hot humors, and so it turn into a Cancer.

After this, you must take off the superfluous flesh with Causticks, or with Sissers made purposely, and then cicatrize. But in the beginning of this disease, it may be cured with only strong driers and astringents; and constantly you must apply such kind of Medicines first, before you come to stronger.

First of all, try the Medicine made of the three sorts of Pomegranats prescribed by *Galen lib. 3. de comp. med. sec. loc. cap. 3.* thus; Take three Pomegranates, one sour, another sweet, and the other of the middle sort: let them be ripe, bruise them in a Mortar; then take the Juice, and boyl it to a Liment; dip a Tent therein, and often put it into the Nose. This dryeth and astringeth without sharpness, and consumeth the Excrement.

This following Water doth it more powerfully:

Take of unripe Grapes three pound; Pomegranate peels and flowers, and Sumach, of each two pound; macerate them in Vinegar, and distil them, then put to it Allum one pound; Vitriol three ounces; then distil them altogether again, and touch the part affected often with that water.

If these things will not do, you must use stronger, by putting Sandarach and Orpiment to the aforesaid Water.

Or you may mix the Spirit of Vitriol, or the Water separating Gold, commonly called the second Water, with Plantane Water, and touch the *Polypus* often therewith.

Or with the Mercury Water prescribed in the Cure of an Ulcer in the Nose.

Or you may put in a Tent dipped in the juice of Cuckoo-pintle roots, and if it be too sharp, mix it with Plantane Water.

Mercury Precipitate which is red, is accounted the best Medicine to consume proud flesh without pain, if it be often washed. This Powder is to be mixed with Honey of Roses, and applied with a Tent.

There

There are also Plaisters of the same virtue to consume a *Polypus*, without pain, as this:

Take the Emplaister de Mucilagibus half an ounce; the Powder of Saven two drams; Incorporate them, and put thereof into the Nostrils. Or,

Take of Verdegreece, Orpiment, Vitriol, and Allum, of each one ounce and an half; Antimony six drams; steep them in Vinegar, then beat them fine, then dry them: Thus beaten and steeped eight times let them be steeped in Plantane-Water, and then dried. Then take the Oyl of Roses four ounces; Litharge two ounces. Boyl them, and about the conclusion add two drams of the said Powder. Make a stiff Plaster thereof, of which make tents.

In the use of Causticks, first you must observe that before they be applied, you defend the Nostrils with the cooling Oyntment of Galen, or with Nutritum, or Populeon, or white of an Egg beaten with Oyl of Roses, and the like.

Secondly, lest the Causticks should hurt the Nostrils they must be applied through a silver pipe, so that it may compals the Polypus, and the Medicines may be conveyed to it without touching the Nostrils.

Thirdly, You must observe, that these Medicines are to be used in the decrease of the Moon, for the Tumor then is less, and therefore Medicines may easily be conveyed to the root.

Lastly, If *Polypus* cannot be taken off with Medicines, you must come to Chirurgery, or Manual Operation; which is described in *Paulus Agineta*, *Cornelius Celsus*, *Jerom*, *Fabricius de Aquapendente*, and other Writers.

Chap. 3. Of the loss of Smelling.

THe Sense of Smelling is hindred and hurt three ways, as other Actions are, that is, by diminishing, abolishing and depraving.

CAUSES. The Causes are the same that diminish and abolish the Smelling, only they differ in degrees, namely, distemper, obstruction and striction.

A cold and moist distemper joyned with Flegm, as it can easily make any Sense dull, so doth it especially hinder the Smelling, or abolish it; hence it is that the Smelling is often hurt when there is a Catarrh, or a *Coryza*, for cold doth either diminish or abolish the Sense, because it doth dull and weaken the Natural heat, which is the producer of every action.

Obstruction comes also from Flegm which fills the sensible Passages, as the Nostrils; and also the insensible; as the Pores of the Brain, and the Processus of the Temples, called *Mamillares*, so that the scents and smells cannot come to the parts; it may also come of a *Sarcoma*, *Polypus*, or other cause filling and stopping the Nostrils.

Striction sometimes may come from Flegm gathered in the fore-part of the Brain, and compressing the *Processus Mamillares*, as we said of the diminishing of sight, from the striction of the Optick Nerves. This striction may also come from the natural shape of the Nostrils; when they are so straight that there is no free passage for the Scents.

The Cause of Smelling depraved is a stink always coming to the Nostrils, either from an Ulcer there, or from stinking Flegm in the Nostrils, and *Os Ethmoides* for those things which putrifie either in the very sense of Smelling, or near it in the *Meninges*, are not smelt by the Patient, but by them that stand by; for it is fit that whatsoever toucheth the sense of Smelling, should be brought from other parts. Moreover, a foul stinking Vapor arising from other parts, as the Stomach, Jaws, and Brain be carried to the *Processus Mamillares*, and so infect them, that all the Scents that are brought thither shall smell thereof; as when the Tongue is foul with Choler, all things which you tast seem bitter.

DIAGNOSTICK. The Causes are easily known. A cold and moist distemper of the Brain, and slimy Flegm coming from the Brain shew an abundance of Flegm.

An obstruction of it coming from Flegm shall be known by the same signs. If it come from *Sarcoma* or *Polypus*, you may learn the knowledge thereof from their Chapters.

Now the place in which the matter causeth obstruction is contained, is known thus: If it be in the passage of the Nostrils, the voice is hindred, because the Nostrils conduce to Speech; but the voice is perfect if the matter be in the *Processus Mamillares*, or the fore-part of the Brain.

You may know by the default of the parts, from whence comes the scent which hurts the Instrument of Smelling.

PROGNOSTICK. As to the Prognostick. When the Smelling is newly hurt and coming of a simple *Goryza* or defluxion, is easily cured; but when it is of long continuance, and from a settled distemper, hardly: that which comes from the ill shape of the Nostrils, is incurable.

CURE. You must order the Cure diversly according to the diversity of the Causes: If it

come

come from a cold Distemper, you must use those Medicines which are prescribed for a cold Catarrh.

For the taking away of the obstruction or stopping of the Nostrils and *Processus Mamillares* by Flegm fastened there; You must use Medicines that purge those parts, as Errhines, Neelings, and Gargarisms; which are propounded by us in the Cure of the Cold Distemper of the Brain.

If the Nostrils be stoppt by a *Sarcoma* or *Polypus*, you must fetch the Cure from the Precedent Chapter.

Chap. 4. Of the Stinking of the Nostrils.

THe stink of the Nostrils, and of the Breath, do much differ; for that comes only from the Nostrils, and this from divers parts; as from the Stomach, Lungs, Gums, or Jaws being Ulcerated, which you may know by Sense, or by their proper signs.

CAUSES. But the stink in the Nostrils comes of stinking Vapors either bred in the Nostrils, as in *Ozæna*, *Sarcoma*, or *Polypus*; or sent thither from putrid Humors contained in the fore-part of the Brain, or about the *Processus Mamillares*, or *Os Cribrosum*. Now the Humors do putrifie in the said parts when they are too long retained in them, especially if the Brain be hot and moist; and they are retained either by the stoppage or striction of the parts, as in flat Noses.

DIAGNOSTICK. The Diseases of the Nostrils which produce this Stink are known by their proper signs above mentioned; but if you find none, you must conjecture that the stink comes from a putrid Humor in the Brain, *Processus Mamillares*, or *Os Cribrosum*.

PROGNOSTICK. The Prognostick of the Stink in the Nose coming of an Ulcer, *Polypus* or *Sarcoma*, depends upon their Prognostick: but that which comes from corrupt Humors contained in the fore-part of the Brain, if it be New, is easily cured; if Old, incurable: especially if it come from a depression and flatness of the Nose.

CURE. The Cure is performed by removing the Causes, and appeasing the Symptoms. The Cure of an Ulcer, *Sarcoma* and *Polypus* is above mentioned: but you must take away the putrid Humor in the Brain, *Processus Mamillares*, or *Os Ethmoides*, by emptying and cleansing means. And first, You must use universal Evacuations for cleansing the whole Body and the Brain from Flegmy Excrements, by Pills, Apozemes, and the like; to which you may add, if there be great plenty of Humors, a Sweating Diet: afterwards administer Errhines that cleanse and bring forth the Matter conjoynd.

And first of all, Let him morning and evening snuff up White Wine from the palm of his hand in which the lesser Centaury and Calamints have been boyled.

Then let the juyce of Beets extracted with the Water of Marjerom be used in like manner. Or, Take of Cyprus Roots and *Calamus Aromaticus*, of each half an ounce; Red Roses one Pugil; Myrrh two drams; boyl them in White Wine for an Errhine.

That you may draw down the Flegm more violently, make this:

Take of Flower-de-luce Roots half a dram; white Hellebore and long Pepper, of each half a scruple; Annis-seeds and drid Marjerom powdered, of each one scruple; Euphorbium one grain; Oyl of Spike, Clove, Violets, of each as much as is sufficient: make a soft Oyatment, in which dip the top of your little finger, and anoint the Nostrils within; or put it with a Tent or Pledget as big as a Pease into the Nostrils.

Lastly, To oppose the Stink, you must snuff up sweet things, as *Galla Moschata* dissolved in sweet Wine, Angelica water, or the like.

Chap. 5. Of Coryza, or Pose.

CAUSES.

Coryza, called in Latine *Gravedo*, is a Catarrh falling from the Brain into the Nose; which Defluxion is of a crude Humor contained in the fore Ventricles of the Brain, and comes for the most part of an External Cause, as from the heat of the Sun, drinking of much Wine, hot Baths, and the like, which do melt and dissolve the thick Flegm gathered in the Brain. It comes also of External Causes which cool the Brain, for then it is squeezed like a sponge, and so it sends down the Humor into the inferior parts: as also by overcooling the Brain there is an encrease of Flegm; for through want

want of heat the Excrements are not concocted; therefore are they sent forth through the open passages by the Expulsive Faculty.

DIAGNOSTICK. This Disease appears of it self, for the Humor is set in abundance out of the Nose.

PROGNOSTICK. Among all kinds of Catarrhs, that which is through the Nose is most safe and gentle, easily cured if it be new, and comes of an external Cause; but that which is old, and comes from a stubborn distemper of the Brain, is difficult.

As also, when it proceeds of a hot distemper of the Liver, which sometimes causeth sharp and hot Catarrhs; by which the Nose is often ulcerated and ill affected other ways.

CURE. The Cure of this Disease is by curing the Catarrh; for it requires the same Evacuations, Revulsions, and Derivations; except that here you must not use Errhines, lest they should draw the Humors to the part affected; But Gargarisms and Masticatories after Universals, are very good.

And besides these, Authors do commend those things which properly do belong to the stopping of a Catarrh; as the vapor of boyled Marjerom; or of Marjerom water taken into the Nose. The fume of Vinegar sprinkled upon a red hot Iron is good for the same; and the better if red Roses have formerly been infused therein. If the Defluxion be very cold; dry Fumigation of Nigella, Frankincense, and the like, thrown upon Embers are very good; for by these the cold Distemper of the Brain is amended, and the superfluous moisture consumed.

Chap. 6. Of Sternutation, or Neezing.

Although Neezing come often to sound men, and useth to be so light an Affect that it deserveth not the name of a Sympton; yet sometimes it is so troublesome, that it requireth a Physitian: As we may read in *Forestus, Obs. 127. Lib. 10.* in his History of a certain Maid which had so grievous a Fit of Neezing from a sharp salt Catarrh, that she had the Advice of many Physitians. This is confirmed by the old Custom of saying, *God bless you*, to him that neezeth: which some say came from hence, In the time of Gregory the Great, there was an ordinary Disease of Neezing, by which the Patients died; albeit some say that Custom is more ancient.

Sternutation is a swift motion of the brain, with which the breath is forced out of the Nose for the throwing forth of things that offend: By the brain we understand not only the substance thereof, but the whole body with its Membranes; especially the fore Membranes, which are especially contracted in this disease, which we may gather from hence, because when we hold up the head we Neeze more easily; for then the matter provoking (which for the most part is windy and tends naturally upwards) is more easily carried to that part.

But the motion which happens in Neezing belongs to the natural Expulsive Faculty of the brain and its Membranes according to *Galen 2. de symp. caus. cap. 1.* where distinguishing Neezing from Trembling and Palpitation, he saith, That Palpitation comes only from a disease: Trembling from Nature and a disease: but Neezing from Nature only.

But *Galen* at the first sight seems to contradict himself; who in *Cap. 4.* of the same book saith That a Cough and Neezing are Symptoms of the Voluntary Faculty, but it is no contradiction: and *Galen* clears himself wisely saying, That in Neezing the Animal Faculty doth concur only secondarily; because in Neezing, breath is sent from the Head, and from the Lungs; yet the Head gives the original of the motion to the Breast; for when it hasteneth to send forth those things that offend in the Nose, it useth both ways at once to send forth breath. One way which it maketh by it self, another way which maketh by the Nerves, descended like long arms into the breast; whence *Galen, Com. Ass. § 1. Sect. 7.* teacheth, That Neezing comes with antecedent inspiration, or taking in of breath, when Nature gathers it together to make Sternutation, then the Air which goes forth of the breast, joyned with that which is drawn by the Nose into the brain, doth expel with noise and violence whatsoever offendeth the Membranes of the Nostrils which have most Exquisite Sense.

From this place of *Galen*, we may gather, That the irritation which causeth Sternutation is made chiefly in the Nose; which is confirmed, *Aph. § 1. lib. 7.* where he saith, *They only Neeze of those thus affected which have a sharp moisture flowing from the head, as when you put sharp things into the Nose: For as a Cough is a certain natural motion to purge the Arteries which are in the Lungs; so doth Neezing the passages of the Nose.*

But it may be objected, That many standing bare-headed, or otherwise in the cold Air, do presently neeze; that one would think the brain was provoked immediately at that time. We Answer, That cold Air is the Cause of Sternutation not while it doth immediately act upon the brain: but because through compression of the brain and its Membranes, it causeth a sharp matter to descend to the Nostrils; although therefore in this Symptom the Membranes of the brain may be provoked: yet

Neezing is not produced before a sharpness of tickling come to the Membranes of the Nose which are exquisitely sensible.

CAUSES. The Causes of Neezings are known by what hath been said, namely, What things soever can provoke the internal coat of the Nostrils, such are sharp humors or vapors, either coming from the Brain, or sent from the inferior parts; hence men neeze in Feavers, saith *Avicen*, because sharp vapors are sent from the whole body into the Head: or it is caused when sharp things are externally put into the Nose, as sharp Medicines called *Piarmica* Neezings. These are the external Causes which provoke neezing immediately. There are many other mediate Causes which make internal Causes, or move them, as all alterations of the Air, as abovesaid of cold Air. *Galen* in his Book *de instrum. odoratus*, cap 6. saith, That Neezing is provoked by beholding the Sun, because the Spirits of the Brain like to a vapor, are dissolved by the Sun.

DIAGNOSTICK. The knowledge of this Disease is manifest. The outward Causes appear by the relation of the Patient; but the internal from the signs of the parts affected, by which the matter provoking is sent to the Nostrils, and fore-part of the Brain.

PROGNOSTICK. As to the Prognostick: This Disease is of it self without danger. But in the beginning of a Catarrh or Coryza it is very hurtful, because it keeps the Humor from concoction by its motion. Sometimes in Feavers it is so strong that it takes away all strength, and causeth bleeding at the Nose; sometimes it is no ways hurtful, and in sound men it expelleth the superfluities of the brain; in sick men it is held a good sign. It promiseth help in Feavers, especially in malignant Feavers when all things are desperate. If Neezing happen to a Woman in fits of the Mother, or that hath hard Travel, it is good, *Aph. 35. Sect. 5.* Neezing provoked with Medicines is good against Apoplexies, and other great diseases of the brain. And if being provoked they do not neeze, it is a sign of death; for it signifieth that Nature leaves to act.

In Diseases of the Lungs, especially in a Pleurisie, and *Peripneumonia*, or Inflammation of the Lungs, neezing is evil, *Hip. 2. Progn.* because from the shaking of the brain in neezing, the parts of the Breast are violently pulled and torn; from whence the Inflammation is encreased, and there is no other evacuation of the matter causing the disease; but for the expelling of Flegm contained in the Gristles of the Lungs, which could not be cast out by a Cough. *Galen* sheweth that Neezing is good, *Gal. 2. de symp. caus. cap. 5. & 6.*

CURE. The Cure when it is necessary, or when neezing bringeth inconveniencies, is made first by removing of the external Causes, if it come from them. If it come of an Internal Cause, you must remove that also, by Evacuations, Revellers, Derivers and Discussers.

If a hot distemper of the brain or any other part send sharp vapors to the Nostrils and inward Meninges, Then you must open a Vein, and then purge, then revel the vapors with Frictions and Ligatures, with Cupping-Glasses to the Shoulders, also use other Revelling, Deriving and discussing Medicines, comb the Head, pull the Ears, rub the Eyes, blow the Nose, and hold the breath.

Lastly, To take away sharpness, and hinder the Nostrils from being provoked, it is good to take the vapors of hot water into the Nose; or to anoint the Nostrils with Oyl of Roses, sweet Almonds, Violets, or with fresh butter; or to snuff up warm Milk into the Nose; by which only Remedy *Forrestus* presently cured the Maid mentioned formerly.

CHAP. VII.

Of Bleeding at the Nose, called Hæmorrhagia.

THe word *Hæmorrhagia*, vulgarly signifieth any Flux of blood coming from any part. But peculiarly, when it is named simply of *Hippocrates*, it signifieth only that Flux which cometh from the Nose, as the first and most evident kind, as *Galen* observeth, *Com. 1. in 1. Epid.*

An *Hæmorrhagia* of the Nose, is a Symptom in the excretion of those things which are wholly against Nature. For blood coming through the Nose, either comes from the Veins and Arteries into the Brain, or coming from the Palate to the Nostrils, which are like the Hemorrhoid Veins in the Womb and Fundament.

CAUSES. But since every Symptom depends upon a Disease as its immediate Cause, the Cause of this will be either an Organical, or a Common Disease.

The Organical is two-fold: The opening of the Vessels which is called in Greek *Anastomosis*; and the thinning, or rarification of them, called *Diapedesis*.

The Common Disease is two-fold: The breaking of the Vessels called *Rexis*; and the Erosion called *Diabrosis*.

The Causes immediately producing those Diseases, are either exceeding in quantity or quality of blood.

Bloud

Bloud offending in quantity can either break the Veins, or open the Orifices of them.

In quality, if it be too hot, or too thin, it will flow out by *Anastomosis*, because heat doth dilate the Orifice, and thinness maketh it flow more easily. Also the same qualities make a *Diapedesis*: for heat maketh the coats of the Vessels thin, and the thinness of the bloud makes it easie to pass through the pores of those coats.

Lastly, The sharpness of the bloud gnaweth the Tunicles of the Veins, and ulcerateth them, from whence cometh a *Diabrosis*.

The external Causes also do concur to produce this Disease, either mediately, or immediately.

Immediately, as falls, strokes, wounds, and the like, which break and divide the Veins.

They work mediately, which do encrease, warm and make thin the bloud, as plentiful Diet, Drunkenness, Idleness, too much Exercise, great Noise, Heat, long staying in the Sun, and the like.

DIF. The Differences of *Hæmorrhagia* are these: Some are Critical, some Symptomatical.

Critical *Hæmorrhagia's* are in acute Feavers, by the force of Nature endeavoring to expel the cause of the Disease this way, as especially in those Diseases which are joyned with the Inflammation of some Entrail, especially of the Liver, or of the Spleen, which are many times discharged by these ways; sometimes it comes without a Fever, when Nature dischargeth her self of the superfluous bloud, whence we see many in their youth have an *Hæmorrhagy* by fits, and others bleed other ways.

A Symptomatical *Hæmorrhagy* happeneth chiefly in Chronical Diseases, in which filthy bloud is produced by reason of the debility of the Liver, or some other great distemper, which either flows through those Veins by the weakness of the retentive faculty, or is sent forth by the expulsive, as an unprofitable burden, because impure bloud is not fit to nourish the Body.

DIAG. *Hæmorrhagia* is known of its self; But its Causes are thus distinguished: That which cometh by *Anastomosis* hath this common with that which comes by *Rexin* or rupture, in that in both the bloud floweth plentifully; but in this they are distinguished: If a blow or a fall went before, we should suppose it to be *Rexin*. But when Ruption cometh from *Plethora*, or much bloud; as also a per-
tion of the Veins; thus they may be distinguished: When the Vessel is broken, the bloud floweth constantly; when it is opened, at a distance, and by fits only; because the Orifices of the Vessels use to be knit and closed when there is less plenty of the Humor which dilateth flowing thereof; but broken Vessels stand always open, and therefore bloud continually floweth till the solution of continuity be united. Moreover the opening of a Vein is distinguished from the breaking by the substance of the bloud: For if it be thin, it comes from a Vessel opened; if thick, it comes from a broken Vessel. Hence it is that *Hæmorrhagy* comes in young men for the most part by the opening of the Vessels, because their bloud is thin; but in old men from Ruption, because theirs is thick.

If it comes from Erosion of the Veins, there will be signs of *Cacoehymia*, or ill juyce in the body of an Ulcer; and matter sometimes comes forth, or at least a salt Catarrh hath gone before. If it comes by *Diapedesis*, or Rarification, the bloud is thin and little.

The Causes antecedent and external, are easily distinguished; for if it come from plenty of bloud, there is a red face and large veins: as also the Diet hath been large and hot, or there hath been some external cause which hath melted and made thin the bloud, and these especially befall them who have very hot Livers.

If it come from evil Juyce, it is known by its proper signs which declare whether Choler or Melancholy doth abound: Moreover, the bloud will appear corrupt either from the Nose, or taken from the Arm.

If it come from the weakness of the retentive faculty, the face will be pale, and the whole body weak; as also some Disease hath gone before, by which the Liver was first weakned, and then very little bloud comes forth, and by degrees.

If bloud comes immediately from the Veins of the Nostrils, it is easily stopt with astringent Medicines applied thereto, and there will be no pain in the Head. Contrarywise, If it come from the Brain, there is some pain in some part of the Head, the flux is hardly stopped, and things put up into the Nose do no good. Sometimes bloud comes from other parts, as the Liver, Spleen, Womb whose signs are the pains and extensions in those parts.

If bloud flows from an Artery, it comes with force, it is hot, pure, fresh and clear; but when it comes from a Vein, it is dark, red, thick, sometimes foul, and comes forth with small force.

PROGNOSTICK. The Prognostick of *Hæmorrhagy* coming, especially if it be Critical, is taken from the hurt actions, when the excrements and qualities are changed: as watchings, and streams of red things, a great pain of the head and neck, heaviness in the temples, and great beating of those Arteries, ringing and noise in the Ears, dulness of the Eyes, with redness thereof and the whole face, hating of light, involuntary tears, itching of the Nose, a drop of bloud upon the day that declares the Crisis, difficulty of breathing, an extension of the Hypochondria without pain.

The Reason of which signs is: When the bloud begins to be carried to the Head, it begets in the Head Phantasms of red things both waking and sleeping: as it happened to a young Roman which

Galen mentioned, *lib. de prasag. ad Posthumum, cap. 13.* he had an acute Disease, and thought he saw a red Serpent about the Chamber Seeling, at which being frighted, he leaped out of his bed: Hence *Galen* foretold an Hemorrhagy at hand, and hindered the letting of blood which other Physicians had prescribed.

The pain of the Head and Neck comes from the translation of the blood into the superior parts which by distending and pulling the Membranes causeth pain.

The Arteries in the Temples beat by reason of their compression which is caused by the fulness of the Veins.

The noise in the Ears comes from vapors flying in abundance into the Head.

The sight is dim because many thick vapors sent up do stop the passages. Hence it is that when passage is denied to the Animal Spirits, the sight is dim.

The things flying before the Eyes called *Marmariges*, are nothing but thin bodies divided, and of divers colours contained between the *Cornea* and the *Crystalline*, coming from Vapors ascending: which though they be inward, yet through deception of the sight they seem to be outward: because the Eye being used to see External things, supposeth whatsoever is within, to be without.

The Redness of the Face and Eyes comes from blood in those parts encreased: there is a detestation of light, because the Eyes being distended with plenty of humors, will be more distended with light, because it disperseth the Spirits: Hence the Eye is dilated, which causeth pain, which that the Patient may avoid, he avoideth the light.

The involuntary Tears come from the repletion of the Eyes, and the parts adjacent, which being too much Distended to press the Glandules that contain the moisture of which tears are made.

The Itching of the Nostrils comes from vapors ascending upwards.

Drops of blood upon the day of demonstration, namely, the fourth or eleventh, sheweth that there will be an Hemorrhagy upon the day of judgment, namely, the seventh or the fourteenth, because in those days Nature begins to transfer the Humors to those parts.

The breathing is difficult, because while the blood flyeth upward it compresseth the *Diaphragma*.

Lastly, There is a stretching of the *Hypochondria*, because the blood begins to move in its fountain, and in the roots of veins: but this distension is not constant, and is without pain, as the difficulty of breathing is: for if they should last long and increase they would be signs of the Liver inflamed.

PROGNOSTICK. The Prognostick of a present Bleeding at Nose, is thus:

If blood flow moderately out of the Nose in the day of judgment it is a sign of Health; although *Galen* doth confirm this, yet *Fernelius* denieth it, saying, *lib. 2. de sanguinis miss. cap. 1.* That no discharge of blood, although critical, is a sign of health; for though it ease madneis, watchings, head-ach, and other Symptomes, yet it scarce ever cureth the Disease, because the purer portion of blood is sent forth, and the impure remaineth: and this is thus proved: because the blood coming from the Nose is of a laudable colour and substance, when blood at the same time taken out of a Vein in the Arm or elsewhere, shall appear to be corrupt.

This Doctrine of *Fernelius* is very plausible but altogether to be received: It is true, That in acute Diseases, especially malignant Feavers, an Hemorrhagy doth not always Cure the Disease: as Sweat is not always a sign of Health in those Diseases, because these Evacuations being forced by Nature before the time, come for the most part from the malice of the matter of the Disease: Yet sometimes acute Diseases are cured by *Hæmorrhagia*, as *Galen* taught in his Third Book *de cris. cap. ult.* and elsewhere. And the reason why blood out of the Nostrils is always pure, is because it comes by drops, and therefore would be so quickly cold that the impure parts could not be separated: and the purer parts mixed with the rest would make the whole mais red. But blood taken out of the arm, because it comes flowing freely, keeps the colour long in the Vessel from which the impure parts are separated, so that the thick and droisie part goes to the bottom, but the choler and flegm which is more altered and impure swims at the top, and so the blood seems impure and fardid.

On the other side, If blood should drop from the vein it would appear pure, because it presently goes together before the *Heterogeneal* parts can be divided by the heat; nay, if blood flow freely and be caught in a large vessel, it will appear pure because it is quickly cold.

Hemorrhagies that are very great are the worst, for they tend to a Convulsion: For sometimes it comes to pals that Nature being burdened with much blood, and stirred up, to throw it forth, cannot observe a mean, and makes an over Crisis, which Physicians must stop.

An Hemorrhagy in the beginning of the Disease is evil because it is Symptomatical, and comes from the malignity of the matter of the Disease, Nature being stirred up to send it forth before her time.

An Hæmorrhagy which is on the same side with the part affected is good, but otherwise it is evil; so in the Inflammation of the Liver when blown forth out of the right Nostril, it is good, but out of the left bad.

Contrarily, When the Spleen is inflamed, if blood come forth of the left Nostril, it is good; but out of the right bad: because all good evacuation ought to be *Kata hixin*, in a right line.

A few drops coming from the Nose are evil: for it signifies that weakness of nature, and the malignity of the Disease.

For all Excretions are condemned by *Hippocrates*, in acute diseases if they be begun only and not finished, because there is greater security in those Feavers in which nature putteth forth nothing, than in which she puts forth little to no profit.

For then it is to be supposed that she tends to concoction; but if a drop appear, it is a sign that nature was stirred up before her time.

But a drop coming upon the day of Indication, and signs of Concoction also appearing, it signifies that there will be an Hæmorrhagy upon that Critical day.

Hæmorrhagies continuing long foreshew the weakness of the Liver, and the coldness also, and an evil habit with a Dropsie to be at hand.

To them that have bled at the nose in Quartane Feavers, it is evil, *Hippocrates Aph. 87. Sect. 7.* For as *Avicen* saith bleeding in Melancholy and Phlegmatick people is hurtful, because it cooleth too much.

To them who in Feavers have lost much blood at the Nose, or any part, when they amend, their belly will be loose, *Hip. Aph. 27. sect. 4.* For as *Galen* saith in *Com.* when the natural heat is debilitated by bleeding, neither can their meat be well concocted, nor turned into blood, nor distributed into the body: and therefore it is likely they should be loose bellied, until Nature recover her strength.

CURE. In the Cure of *Hæmorrhagia* first observe whether it be Critical or Symptomatical: For a Critical is not to be stopped, but you must suffer it to flow in a great quantity: For *Avicen* saith That blood hath come from the Nose to the quantity of four pints by a Crisis without any decay of strength. And this seems to be taken out of *Galen* who in his Book *de Prognad Posthum. cap. 13.* suffered a young *Roman* to bleed four pints and an half, before he would stop it.

Which as it may fall out well in very Plethorick people, so in others it may endanger life; and it is certain that a Critical Hæmorrhagy, although it is the work of nature, yet sometimes is beyond measure; for Nature being burdened with blood, and stirred up to expel it, sometimes cannot keep within measure, but maketh too great an Evacuation: whence we ought to fear a great dejection of strength, and death, and then it is stopt, as often as any notable infirmity followeth.

So also that blood which customarily floweth without a Feaver is not to be stopped; but to be left to Nature's ordering, except it be immoderate: for many by such bleeding have been free from great Diseases, into which after, upon suppression thereof they have fallen.

But a Symptomatical Hæmorrhagy is to be stopt, which may be done by revulsion of the blood from the Nose, and by repelling to the parts adjacent, by stopping of the Veins which are open, by staying the disorderly motion of the blood, and by evacuating the sharp and thin humors mixed with the blood, which are the chief Cause of Hæmorrhagy, by correcting them, and hindring their encrease, and by strengthening the retentive faculty of the Liver and Veins: All which may be done with the Remedies following.

And first, blood-letting is the chief thing for Revulsion, which must be done quickly before the Patient grow weak, and that out of the Vein on the same side the Nostril is, out of which it cometh: on the right side, if from the right Nostril: on the left, if from the left. And *Galen lib. de sang. miss. cap. 11.* confirmeth the efficacy of this Remedy, affirming that he hath presently stopped violent bleedings at the Nose only thereby. But it must be taken in a large quantity if the Patient be strong, and from a large orifice: Although most of the Ancient and Modern Physitians think otherwise: and say that blood must be let out at a small orifice by little and little often, by which means they say the Revulsion will be better. But that you may make the blood move the contrary way, you must have a stronger motion for hinderance of a weaker: therefore by how much the larger the orifice, and the more violent the motion is of the blood from the Vein opened, by so much the sooner will the blood at the Nose be stopped: But if by once letting blood, and applying other Remedies, the Hæmorrhagy be not stopt, you must repeat blood-letting according to the strength of the Patient. You may also open the Vein in the Foot, that a Revulsion may be made at a great distance, which also availeth much, as *Avicen*, *Paul* and *Trallian* say.

After Blood-letting, as also before, rub and bind the extreame parts, and clap great Cupping-glasses to the Hypochondria: to the right side, if the right Nostril: to the left, if the left do bleed: For *Galen* stopt an Hæmorrhagy in a young *Roman*, by a Cupping-glass to the Hypochondrion without blood-letting, as he saith *lib. ad Posthum. cap. 11.*

Not

Notwithstanding the applying of Cupping-glasses to the Hypochondria is not altogether safe, for the blood then being hot may be drawn in too great a measure into the Liver, or the Spleen, and inflame them. Of which there is an example in *Fabricius Hildanus*, *Obs.* 47. *Cent.* 2. of a Courtier who bled violently at the Nose; to whom, with other Remedies, there were great Cupping-glasses applied to his Liver: The blood stopt, but there followed a great Inflammation of the Liver. Therefore you must be wary in applying Cupping-glasses to the Hypochondria, and never use them, but when all other Remedies fail, and after divers Phlebotomies: For after the plenty of blood is taken out of the Veins, there is less danger of attracting too much blood to the Liver to inflame it; but which way soever they are applied, they draw blood and Spirits to those parts whereby their heat is encreased, which seems to be contrary to the opinion of *Hippocrates*, *Aph.* 13. *Sect.* 5. where he saith, That in those parts from whence blood cometh, or is about to come, you must use cold things. The Interpreters say, that cold things are to be applied to those parts from whence the motion of the blood beginneth, as the Liver and Spleen.

Forestus commendeth Cupping-glasses to the Feet, by Experience, *Obs.* 14. *Lib.* 13. in these words: When a Gentleman exceedingly bled at the Nose, and no Remedies would help him, having lost at least twelve pound of blood from both Nostrils; I was sent for, and after he had bled a whole day, I commanded two Cupping-glasses without Scarrification to be applied, one to his Liver, the other to the Spleen, and the blood seemed to stay a little; but after my departure, when his Wife perceived him to bleed again out of both Nostrils, and that his cupping had done no good, she commanded that the cupping should be set upon his feet, and the blood wonderfully stopped beyond expectation: But after the Cupping-glasses had been a while fixed, the Patient fell into a swoon; and therefore they took them off, and threw water in his face, by which he recovered; and then being refreshed with the scent of Wine, he came to himself, and was restored to his former health from his bleeding, as it were by a Miracle or Inchantment beyond all expectation.

Moreover, Cupping-glasses applied to the Shoulders both dry, and with scarrification do draw back the blood from the Nose. But they be not always safe, for they may attract blood from the inferior parts, and so give occasion to a further bleeding.

Some Practitioners do apply Cupping-glasses to the Biceps Muscles of the Arms, by which they make Revulsion.

Cruce in his Counsels, reckoneth the bending of the little finger on the same side among the revulsives: for by the great pain that will be caused thereby, there will be a drawing back of the blood.

But the blood and Spirits are drawn inwardly more strongly by swooning, whereby we saw a Bishop in the year 1629. cured of a violent Hemorrhagy; for being in a malignant Feaver with the inflammation of the right Kidney, which after in the twenty seventh day of his sickness turned to an Impossibility, he was taken with so violent a bleeding, that in four hours he lost two pounds, and still bleeding and strength decaying, we bethought how we should stop it; and after the use of many remedies to no purpose, the Patient desired to ease his Belly, and could not be compelled to do it in his bed; we foretold him, that if he arose, he being very weak would faint away, but that would be good to stay his bleeding, and so it came to pass, for after he arose he swooned; from which with a little Wine he was recovered, throwing also Water in his face; after that he had a large stool, was brought to his bed, and bled with less violence; then giving a dram and an half of *Lapis Prunella* in cold Water, presently the blood stanch'd when the same and other Medicines. could not formerly do it. Although fainting be not vulgarly accounted a Remedy against bleeding at the Nose, yet *Hip.* *lib.* 3. *Epid.* *Sect.* 7. saith thus; These things stop the bleeding of the Veins, swooning, the alteration of the posture or figure of the Body, intrepion, a Tent, apposition, and deligation or binding: *Galen* in 5. meth. cap. 5. teacheth the same, in these words: Moreover Blood is stanch'd both by fainting, and by revulsion; and derivation to the parts adjoining, and by cooling of the whole Body, and especially the part afflicted; But you must observe that fainting doth not only profit when the blood floweth from the Veins which are terminated in the superficies of the body, which *Hippocrates* also hints at, when he prescribeth tents, bandage, and the like. For when blood cometh from the internal parts, as in an Hemoptosis, or spitting of blood, in moderate flux of the terms, or internal wounds, then fainting will increase the bleeding, the heat being thereby drawn into those parts from whence the blood cometh.

Zacutus Lusitanus *Lib.* 10. *Praxis admiranda* *Obs.* 66. reports that he cured a desperate Hemorrhagy, which would yield to no other Medicines, by an actual Cautey to the soles of both feet; which Remedy he saith had like success in a great bleeding at the mouth coming from the opening of the Vein called *Ranuncula* under the tongue by corrosion from a sharp Catarrh; and when the Blood had flow'd two days to the quantity of twenty pounds, and many Astringents and Emplasters had been used, as also Revulsives and thickning Medicines, with Narcoticks or Stupefactive, by a Cautey in the sole of the foot it was stanch'd.

If still he bleed after all the aforesaid Revulsions have been tried, you must come to repelling Medicines

dicines, such as are vulgarly called *Anacolle mata*, things to be applied to the Forehead and Temples, which are thus made :

Take of Bole-Armeniack, Terra Sigillata, Sanguis Draconis, Frankincense, Mastick and Aloes, of each one dram ; Bran and the Hair of an Hare cut small, of each half a dram ; one white of an Egg, the Juyce of Plantane, and Nightshade, of each as much as is sufficient to make a Cataplasim for the Forehead and the Temples.

In extremity you may quickly make a Cataplasim of Bole-Armeniack only, mixed with the white of an Egg and Vinegar for the same parts.

The most excellent is made of Time and Vinegar, and applied to the Temples and the Forehead as thick as two fingers ; and if the application do it not, let it be repeated, and it will certainly cure.

Amatus Lusitanus commends a Cap made with the afore said Powders, mixed with Vinegar and Water, laid upon the Head being shaven ; which you may try in great extremity.

Also you may make a Fomentation of very cold Water, or Water and Vinegar to the Temples and Forehead, changing your cloaths as they grow hot.

Or you may make a Fomentation of the Juyce of Plantane, Knot-grass, Hors-tail, Shepherds-purse, and the like, with a little Vinegar to make it pierce. Where mark, That the Head is not to be washed with cold Water, nor repelling Medicines to be laid to the Forehead, before you have made sufficient Revulsions ; otherwise the blood being struck in with cooling will fill the Veins above, as *Galen* sheweth, 5. *Meth. cap. 6.* and so the Flux will be increased, by the heat increased through *Antiperistasis*, by which the motion and force of the blood is increased ; or if the blood be stopt, there will follow a Convulsion, Apoplexy, short and difficult breathing, called *Dyspœna*, or the like.

Vinegar alone will stop blood if the Forehead be fomented therewith in a Sponge.

Or if you dip a Sponge in Vinegar, and put into the Nose.

To throw cold Water in the Face doth not only drive back the blood, but also draweth inward by fear, if done on a sudden, and unawares. As a Syncope or Swooning, as we said before, stancheth blood by the retraction of it inward ; by the same reason doth fear also. A great quantity, namely, two or three Glasses must be cast into the face divers times in a short time.

Ordinarily they use to hinder the ascent of the blood with fomenting of the Neck with a cloth dipped in cold Vinegar and bound about the Neck, changed often before it turn warm.

Vinegar and Water held in the mouth, doth drive the blood down, and keeps the blood from falling into the Throat.

Also Vinegar put into the Ear next to the Nostril bleeding, is good to close the Vein.

A Bean or piece of Mony bound to the root of the Nostril, between the Eyebrows, stoppeth the Flux.

Also you must observe if the Veins or Arteries in the Forehead or Temples do swell, for then you must bind them down with Mony, or a dry Bean slit in length, and this is a special Remedy. And for the better Compression, you must lay a Pledget dipt in the white of an Egg beaten with Time, upon the Bean or Money.

The fume of Vinegar sprinkled upon a hot Iron, taken into the Nostrils, will close the opened Veins.

As also Vinegar and Water often snuffed up.

Besides those things which repel, we must use things that close and glutinate the Veins. For which end, many Remedies may be put into the Nose.

Galen lib. de paratu facilibus, cap. 13. used Frankincense and Aloes powdered, with the white of an Egg, and the hairs of an Hare, upon lint.

Or you may make a tent thus :

Take of Frankincense, Aloes, Dragons-bloud, Bran, Cobwebs, and the hair of an Hare cut small, of each half a dram, made up in a Tent with Juyce of Plantane.

The same Powders may be blown into the Nose. For which purpose also great Practitioners do commend the Powder of Egg-shells and burnt Paper. But you must remember besides the use of these Powders, at the same time to fill the mouth with cold Water lest the Medicine get into the mouth.

The Cotton of an Ink-horn squeezed a little, and made into a Tent, doth powerfully stop.

As also laid and bound to the Forehead.

If it yet continue, you must come to Escharoticks, which by burning the mouths of the Veins, produce a Scab, and so stay the blood. But these must be used warily, for when the Eschar falls off, they will bleed again.

Burnt Vitriol is the best, which besides the Escharotick quality, is good to stanch blood.

If you will make it gentle, you must mix other Medicines thus.

Take

Take of Galls half a pound; Alum a quarter of a pound; Calcine them, and blow the Powder into the Nose. Or,

Take of Bole-Armeniack, Dragons Bloud, Frankincense, Aloes, Time, burnt Vitriol, Sarcocol, and Mastich, of each one dram. Make a fine Powder.

White Vitriol is more gentle than burnt Vitriol, and is not very Escharotick; yet it stays bleeding very powerfully, by astringing the Orifice of the Veins, if it be put into the Nose with a Tent.

You may make Remedies to stop blood, by restraining its motion by cooling, thickning, and coagulating thus:

Take of Sal Prunella one dram; Troches of Amber half a dram; Bloud-stone and red Coral prepared, of each one scruple; the Syrup of dried Roses one ounce; Plantane Water three ounces. Make a Julep to be taken twice or thrice in a day.

Take of Conserve of Roses and Quinces, of each one ounce; Troches of Spodium, or Ivory and Terra Sigillata, of each one dram; Coral prepared, and burnt Harts-horn, of each one scruple. Make an Opiat, of which let him take the quantity of a Chesnut twice or thrice in a day.

Vinegar and Water called Oxycrate, drunk plentifully stays an Hæmorrhagy.

Outwardly to cool the blood, and to hinder its motion, you must apply cold Water, or Water and Vinegar to divers parts, pouring it upon the Arms, and putting the feet therein, and applying to the Cods, as also to the Back, because the *Vena Cava* runs that way, and so the blood will be cooled when it is exceeding hot, when the aforesaid Medicines cannot remedy, some wet the whole body with Vinegar and Water, or put him into cold water which is not without danger, when the Patient is weak.

It is excellent to temper the heat of the blood, to lay Epithems to the Liver and Spleen made of warm Vinegar and Water.

Finally, in the most desperate Case, when no Medicines will prevail, you must use Narcoticks, or Stupratives, which presently stop all Fluxes and Evacuations and motion of Humors: and among the rest, three or four grains of Laudanum is the best. But take heed that you give it not to the Patient being very weak, for it is to be feared that the native heat being very little, will be thereby quite extinguished. One ounce of the Syrup of Poppies given in an astringent Julep at night will do the same.

At length you must come to proper Remedies which by an occult secret quality stop bleeding. The most usual and best are these:

The Juice of Nettles is extolled for stopping any blood, of what part soever, and therefore it is both given inwardly to four ounces once or twice, as also snuff into the Nose, and applied to the Forehead and Temples made like a Cataplasim with Bran, or the whole Nettle beaten. Some say that the Root held in the mouth will do the same.

Hogs Dung is one of the best Specificall Medicines, if it be applied hot to the Forehead and Temples, or smelt unto, or put dry into the Nose, of which this is a form.

Take of Hogs Dung dried three drams: the Powder of Roses to take away the scent of it, half a dram. Mix them with juice of Plantane, and dip a Tent therein to be thrust into the Nose.

Asses Dung used thus is also commended. And Rodericus a Castro lib. 1. de morbis mulierum. cap. 5. saith. That a Physitian of seventy years old given to violent bleeding, carried always Asses Dung not quite dry in a box about him, than which he confessed he never knew a better Medicine; especially if when it was dry he mixed it with Juice of a Nettle, or if wet he put it alone into his Nose.

Zacutus Lusitanus, lib. ult. praxis Histor. cap. 2. saith, That he cured one of Seventeen years of age that was weak and lean, after he had lost seventeen ounces of blood and used many Medicines; only with this, He gave him the Dung of an Ass very finely powdered in all his Drink and Broth, he made Tablets of the same with Sugar, and gave them with steeld water, by which means only the Patient recovered in seven days space.

The blood it self which comes out of the Nose, is not only vulgarly commended, but by the learned to stop an Hæmorrhagy by a specificall quality: they fry it in a Pan and give it the Patient to eat, he not knowing of it.

As also they Calcine it in an Earthen Pot, and mix it with the mentioned Astringents.

Others commend the Powder of Snails burnt with their Shells: and others put the Powder of Frogs calcined into the Nose.

Pereda speaks of an old Woman of Montpelior, that she was Cured of a Flux at the Nose of three days continuance, by only Mints put into the Nose.

Among other Remedies this is excellent and usual, The fine Powder of Spiknard taken the quantity of a dram in Broth, Plantane water, or other Liquor, not only by a specificall force, but also by strengthening the Liver it stops bleeding.

Finkim

Finkius witnesseth, that a dried Toad powdered and put in a fire-red Sarfnet under the Armholes, or held in the hand still it grow warm, will stanch blood presently: And that the blood will be immediately congealed as if it apprehended some terrible thing.

Others hang a Toad in the Air while all the flesh is consumed, and keep the bare thigh bone which they put into the Nose, and then it stops bleeding presently.

While you use the aforesaid Remedies, you must think of the taking away of the Cause, which usually is a thin watry humor of Choler which abounds in the blood, and makes it move disorderly, and provoketh nature to throw it forth: whence it comes to pals, that when it is purged away and the blood cleansed, that then Nature embraceth blood most familiarly as its chief Friend, and the treasure of Life, and will not labour to cast it forth.

Therefore you must purge twice or thrice if need be with binding and cooling Medicines, thus made:

Take of Tamarinds half an ounce; Plantane Leaves one handful: boyl them to four ounces, being strained infuse of the best Rhubarb one dram; yellow Myrobalans half a dram, Spicknard seven grains; strain it, and dissolve therein one ounce of Syrup of Roses, and add one scruple of the Powder of Rhubarb. Make a Potion.

In an old Disease that returneth often, such a Purge repeated once every Week, is excellent.

And after every Evacuation, Astringent Juleps, or Opiates, that are above mentioned: you may make Juleps thus;

Take of the Roots of Snakeweed, and the greater Comfrey, of each one ounce; Plantane, Knotgrafs, Rupture-wort, and Fumitory, of each one handful; of the four great coldseeds, of each one dram; boyl them to a pint, and dissolve in the strained Liquor, of white Sugar three ounces; Make a Julep for three mornings draughts.

Instead of Juleps or Opiates, or after they have been used awhile; you may give a Syrup made of the Juyce of Nettles, and an equal proportion of Sugar, two spoonfuls at a time every morning.

Nor is it sufficient to take away the present Cause of the Hemorrhagy, namely, To evacuate the Peccant Humor, but you must see that it return not again.

The Bowels are to be strengthened, and their Distempers amended; especially the Liver in which those Humors use to breed.

And the Juleps formerly prescribed will do this, as also the Tincture of Roses to cool the Liver and strengthen it, is very good.

Outwardly you may apply Epithems made thus:

Take of the Water of Roses, Plantane, Purslain, Sorrel and Succory, of each four ounces; the seeds of Purslain, Sorrel and Succory, of each one dram; the Troches of Camphire and yellow Saunders, of each two drams; Vinegar two ounces; Make an Epithem.

To these you may add all the Remedies which are prescribed for the Cure of a hot Liver.

Sometimes the hot Distemper of the Spleen and Reins is the Cause of this Disease; and then you must apply cooling Medicines to those parts also.

To these you must joyn a good order of Diet, which from the beginning of the Cure must be diligently observed.

And therefore, first the Air where the Patient is, must be cool; and if it be Summer time let it be altered, by sprinkling the floor with Vinegar and Rose-water, and strowing of the Leaves of the Vine, Willow, or Water-Lillies, or the like.

Let his Meat be thickning, of little nourishment, as Calves-feet, Sheep and Goats-feet, and the like; Rice, new fat Cheese, hard Eggs, and the like.

Let him eat Fruits that are somewhat sharp, binding and bitter; as Pears, Quinces, Medlers, Services, and Sawces of the Juyce of Pomegranates, Lemmons, Orenge, Sorrel; some commend the use of Lentils or Pease boyled in Vinegar, because they have virtue to thicken, astringe, and allay the Acrimony of the blood.

Let the Patient abstain, especially in the beginning of the Disease while his strength is good, from Wine, Flesh, and Rear Eggs, which breed much and thin blood: you must give him moist Meats and Suppings in the time of his bleeding; as cooling Broths made of Barley, Oats and Rice with Water, for chewing doth provoke bleeding; if he be weak you may give him Flesh-broth and Panadoes, in which there is Starch dissolved, which is made without Chalk or Gum Arabick.

Let his Drink be steeled Water, and let all his Meat be boyled in the same, which will be of more force if Nettle Roots be first boyled therein.

Command him to rest, so that he neither Walk nor Cough, nor speak loud, or at all, for the motion of the Tongue and Jaws provoke bleeding.

Let his Head be covered, and let him not see the blood, for thereby the imagination being moved he will bleed faster.

Let him sleep, for long Watchings make the blood more sharp, Cholerick and thin, but sleep doth temperate the Humors, and restrain the motion thereof.

Lastly, Let him avoid the Passions of the Mind, which cause the blood to ascend, as Anger, Laughing, and Joy.

The End of the Fourth Book.

THE

THE
FIFTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Tongue.

The Preface.

THE Tongue is the Instrument both of Speech and Tasting, but both those Actions are hindred by divers Tumors which grow thereabout: And especially every Action is diminished, abolished or depraved by its peculiar Cause. That all these may be severally described, this Fifth Book hath four Chapters, Of which, the first is of the Inflammation, and other Tumors of the Tongue. The Second is of the Ranula under the Tongue, which though it belong to the kinds of Tumors, yet it is handled by it self, because it requires a different Cure from all the rest. The Third is of the Tact hurt. The Fourth of the Palsy of the Tongue, and other hinderances of its Motions.

CHAP. I.

Of the Inflammation of the Tongue, and other Tumors of the same.

AS all the parts of the Body, and especially the fleshy parts, use to be inflamed; so also the Tongue by blood flowing into it; which blood as it is either pure, cholerick, flegmatick, or Melancholick, produceth either a true Phlegmon, or a Phlegmon Erisipelous, œdematous, or schirrous, which sometimes comes to suppuration: of which there is an Example in *Forestus, Obs. 24. Lib. 14.* of a Brewer which had a great Inflammation of his Tongue that brake, which came to suppuration.

Also the Tongue often suffers a soft and loose tumor, which is pure œdematous, by the falling of Rheum from the Head; of which *Galen* propounds an Example, *Lib. 14. Meth. cap. 8.* in a certain man whose Tongue was so swoln, that he could not contain it in his mouth.

Sometimes the Tongue grows very great, which cannot be accounted any kind of Tumor; as *Galen* teacheth, *lib. de diff. morb. cap. 9.* That he saw a tongue which grew exceeding great without any

sense of pain, neither would it pit or yield to the finger, but it was a bare encrease of quantity in the tongue, and the substance was no way hurt, which came by too much nourishment brought and converted into the substance of it.

And *Claudinus Consult.* 9. gives an example of this in a maid of twelve years old, whose tongue grew to a great bigness, and the Tumor could neither be called an Oedema, nor a Schirrus, because it was without pain; neither could it yield to the hand pressing of it, nor take an impression or pit, nor was it without Natural Sense.

CAUSES. The Original of it was a forceable breach of the bridle of the tongue, by the pain whereof blood was attracted to the part; which being sent thither continually caused this largeness. But in this case *Claudinus* observeth that it is bigger at night, and less in the morning, and always livid or blewish: The reason whereof he saith is, because in the Concoction and assimilation of the blood (which is flegmy otherwise, such as is bred in children by reason of their moist Nature and intemperance many vapors are raised, especially at night, when the heat is drawn in and contracted, by which the Tumor is enlarged; but in the day they are dissolved by the motion and heat of the tongue, by which means it becomes less.

The reason of the blewness is the Air, to which it always is open; for by the coldness of the Air, the blood which cometh to the superficies of the tongue, before it comes to be like in the substance, doth congeal somewhat, and so turns livid. For *Galen* saith that blood waxeth black with cold, 3. *de symp. caus. cap.* 2. which yet is not so in other parts, because there is no superfluity sent to them, but as much as is sufficient for nourishment.

DIAGNOSTICK. The knowledge of these Tumors is not difficult, because the preternatural greatness of them is visible.

DIFFERENCES. But the Differences of these Tumors are these; If there be any inflammation, then there is pain, heat, and redness also in the tongue, wherewith also the face is somewhat infected; but if the Tumor come originally from flegm, the tongue is white, and there is much spittle, whose taste is sweet or without taste. If there be only a bare increase in the tongue, there are no signs of other Tumors or Vicious Humors.

PROGNOSTICK. As to the Prognostick: Tumors in the tongue for the most part do not endanger the life unless they grow so big that they cause suffocation, or come from a malignant melancholick humor; from whence they prove Cancers, which is known by their hardness, blewness and pricking pain.

CURE. You must begin the Cure of the Inflammation of the tongue with Repulsive and Reppelling Remedies, and therefore first, after you have given a laxative Clyster, open a Vein, and take away as much blood as the Patients strength will permit.

Then apply Cupping-glasses, with scarification to the Shoulders.

After that use cooling and repelling Gargarisms, and among the rest the Juice of Lettuce is commended of *Galen* to wash the tongue with often, *Meth.* 14. *Cap.* 8.

Or you may make one more compounded of the Decoction of Plantane, Nightshade, Pease husked and Pomegranate Peels, adding some Syrup of dried Roses, or *Diamoron* that is, Syrup of Mulberries.

After bleeding, appoint a Purge made of things to purge Choler and Flegm, because Flegm from the Head doth peculiarly concur to the production of those Tumors.

After the flux is stopped, you must labour to derive the humor fixed to the part by Evacuations, Revulsives and Repercussives; and to this end open the vein under the tongue, which if you cannot reach by reason of the largeness of the tongue, you must apply a Cupping-glass with Scarification under the Chin.

If it tend to suppuration, it must be furthered with a Fig slit in the midst, often applied, or with a Gargarism of the Decoction of Barley, Mallows, Violets, Figs, Raisins, Quince-seeds, and Fennugreek seeds, with a little Syrup of Violets and Jujubes.

Suppuration being made, if the Imposthume will not open of it self, make incision; then cleanse it with the decoction of Barley, Agrimony and Plantane with Honey of Roses.

But a soft and lax humor coming of flegm, is cured first by a Revulsion with Phlebotomy if the Patient abound in Blood, then give him a strong Purge, such as *Pilula Cochlearum minores*, made of Aloes Scammony, and Coloquintida, which were happily used by *Galen* to one of sixty years old i. *Meth.* above mentioned. But if he cannot swallow Pills, make him a Medicine of Senna, Agarick, Dia-phoenicon and the like.

After these Evacuations you must first apply cooling and repelling Medicines, as we shewed in Inflammation. And *Galen* in the place quoted, cured a Patient of sixty years, only by washing with the Juice of Lettuce after purging.

Moreover, You may with good success wash the mouth with, juice of Lemmons, Pomegranates Sorrel and Plantane, because they do not only repel with their coldness, but also with their sharpness.

ness draw forth the moisture that is fastned in the tongue.

Also the tongue may be embrochated with Oxymel simple, unto which you may add a little Ginger, Sal gem or Sal-armoniack.

You may also wash the Mouth with the Decoction of Origan and Pellitory, with Hydromel, or Honey and Water.

Zacutus Lusitanus, lib. 1. in his History Of the chief Physicians, Obs. 47. in a desperate case, when the Tongue grew to a wonderful bigness, so that he feared Suffocation, after emptying and revelling Medicines used in vain, applied four Horse-Leeches to the tongue, and in a short time, after plentiful bleeding, it became thin and small, and the Patient escaped.

The same *Zacutus* Obs. 48. of the same Book, says that he cured a child of ten years old, who had a tongue swollen by a defluxion, so big that it could not be contained in his mouth (after Revulsions by bleeding, Cupping-glasses with Scarrification, and sharp Clysters) because the Tumor was soft and loose, only by profound scarrification of the tongue, and after he commanded that it should be washed with salt Water, from whence there came such abundance of humors that the child presently recovered. Which Observation he took from *Joachim Camerarius*, who saith in his Book of Observations, that one who was almost suffocated with a swollen tongue, cured himself by cutting it across with a sharp Pen knife after he had lost much blood.

Finally, A fleshy Tumor of the tongue, or the over-growing of the tongue, coming of the superfluous flesh, although it seem to be incurable; yet it is shewed by *Claudinus* by Chyrurgery to be done, in the place cited; namely, if whatsoever be superfluous be taken away with an Incision-Knife first having fit preparations, all which are prescribed by him in the same place.

CHAP. II.

Of the Tumor called Ranula under the Tongue.

ALthough in the former Chapter divers Tumors of the tongue are laid down by us, yet there remaineth one called *Batrachos* in Greek, in Latin *Ranula*; for since it differs from the rest in Nature, and requires a different way of Cure, we thought it best to describe it in its proper Chapter.

Ranula is a Tumor under the tongue in that part by which it is bound to the Ligament; and for the most part it is so large that it is above the lower Teeth; a cleft being in the middle dividing the right side of it from the left, it representeth the hinder parts of a Frog, from whence it is called *Ranula*, a little Frog. Others say it is called so, because they who have it, have an impediment in their Speech, and croak like Frogs, when they speak. It is like the Tumor Oedema, or Meliceris, from which when it is opened, there comes as it were the white of an Egg, or matter like Honey. And because the said matter is contained in a Bag, therefore it is accounted Meliceris. In these bags sometimes is found a stone as many observe, which *Schenkijus* also observeth. Obs. 388. Lib. 10.

DIAGNOSTICK. The knowledge of this disease is not difficult, for when the tongue is lifted up, there is seen a certain loose and soft carnosity, and on both sides of the Ligament there is a certain round swelling like a Pease, Bean or Chestnut.

PROGNOSTICK. This disease is commonly without danger: But in Children sometimes it threatneth suffocation by reason of the nearness of the Larynx to the rough Artery. In Men if they have pain and a Fever there is danger, for it may turn to a Squinancy. Also that *Ranula* is dangerous which is black or dusky and hard, and inclining to the nature of a Cancer, and this must not be touched.

CURE. For the Cure of this Disease, first you must take away the antecedent Cause by blood-letting and with purging agreeable to the age and nature of the Patient.

And if the Disease be old you must use Cauterie and sweating Drinks.

Then you must endeavour to dissolve the Tumor with Topicks, thus:

Take of Pomegranate Peels, dried Hyssop and common Salt, of each two drams; make a Powder thereof to hold under the Tongue, and use it often.

Forestus speaks of a Girl of twelve years of age, that was cured in two days space with this only Medicine; whose Author is *Nicholas Florentinus*, who instead of common Salt, useth *Sal Armoniack* to men, because it pierceth more, and dissolveth better. And *Forestus* useth the said Powder to a Student made with common Salt; as also a Decoction made of equal parts of Galls, Allum, and Pomegranate flowers: And lastly, he commanded the part to be rubbed with parched Salt, and *Sal gem* and the Patient was cured without manual Operation, which is seldom seen, because those Tumors are of the nature of Imposthumes, and are contained in a little bag, so that when the matter hath bin discussed, they have been filled again.

If this Tumor cannot be cured with discussing Remedies, you must open it, which must be commonly done, for it is very seldom discussed.

You

You must not make a small Orifice when you open it, because the matter contained in the Bag will be again gathered and the bag filled (unto which the part being loose and soft, is very much disposed) but you must make a very long Incision through the height of the Tumor in both sides, that the whole matter may be discharged at once: then you must wash the Ulcer, first with gentle things, as the Decoction of Mallows: and then with Clensers, as white Wine and Honey of Roses, or Diamoron, and after with Oxymel till it be clean and free from the Bag: And finally, to heal it up, wash the mouth with red Wine in which Allum is dissolved.

Forests Cured the like in a Woman by an Incision made on both sides, and after by washing with Wine and Water mixed with a little Salt.

If the Disease be old, and the Ulcer will not be cured by the aforesaid Remedy, let it be touched with Oyl of Sulphur twice every day, mixed with Rose-water, one drop of Oyl to six of Water; for so the Distemper will be corrected, and the part dried, which must be often washed for confirmation, with red Wine with Allum dissolved in it.

If after the use of these the Disease return, you must come to an actual Cautery, the manner whereof is taught by *Paracelsus*, lib. 7: cap. 5.

CHAP. III. Of the Taste being Hurt.

THE Taste as other Senses, and all actions of the Body, is hurt three ways; By being Diminished, Abolished, Depraved: It is lessened when it scarce perceiveth remiss favors and strong favors but a little: It is Abolished when it no ways perceiveth those favors whether they be great or little: It is Depraved when the objects seem to be of another taste.

CAUSES. The Causes of Diminishing and Abolishing the taste are the same, only they differ in degrees; for if they be light and weak they Diminish; if great, they Abolish the taste.

And these Causes are either a Defect of the Animal Spirit in the part, or a Distemper of the third part of Nerves which come to the tongue; or the tongue it self is Preternaturally affected.

The Spirits fail, either by reason of their scarcity, as in dying men; or of the obstruction of the Nerves of the third Conjugation by which they are carried, or by reason of a Tumor bred in that part of the Head from whence those Nerves do arise.

The tongue is either covered with a moist slimy matter, or hath Tumors, Pustules or Ulcers, and by these the proper action of Taste may be diminished or abolished.

The taste is depraved when the tongue is infected with an evil Humor, as in Feavers, when the tongue is infected with Choller, all things tasted are thought bitter; otherwise if it be with Salt flegm or Melancholy all things appear to be salt or sour, for the outward objects being brought to the tongue do move the vicious juyce of it, which at that time striking upon the tongue most, leaveth its favor thereon, and so those things which are tasted, seem to be of the same taste.

It happeneth also sometimes that the tongue perceiveth the favors of the juyces contained in its self, although no external Object be applied, as *Galen* teacheth, 1 de symp. caus. cap. 4. And it is confirmed by daily experience in men in Feavers, whose tongue is covered with Choller; which if it be very bitter, they find a continual bitterness on the tongue though they take nothing into their mouths.

DIAGNOSTICK. The Diversity of the Causes aforesaid is known by the diversity of the tastes and disposition of the Tongue, for a sweet taste and redness of the tongue signifieth blood, bitterness and yellowness Choller, whiteness with sweetness Flegm, blackness and sharpness Melancholy, a Nauseous taste sheweth that evil humors are contained in the stomach; Pustules, Tumors and Ulcers are manifest to the Eyes. And lastly, if the taste be hurt, and there appear no change in the tongue, you must suppose that the Cause lieth in the Brain or Nerves.

CURE. The Cure is various according to the diversity of Causes, and therefore if the Disease lie in the Brain or Nerves, you must apply Remedies thereto, especially such as use to be prescribed for the Cure of the Palsy; but when the taste is depraved by ill humors, commonly that Symptom depends upon other Diseases especially upon Feavers, which being cured the Symptoms also are removed.

If the Taste be offended by Tumors, the Cure thereof depends upon the Cure of the Tumors above mentioned.

Finally, If it come from Pustules or Ulcers of the Tongue, you must Cure them by blood-letting and purging of sharp humors; to which you may add Cooling, drying, and binding Topicks in form of a Gargarism; and if foul Ulcers be found, let them be cleansed with honey of Roses, with a little Oyl of Sulphur or Vitriol, in such a quantity as may gently touch upon the Tongue.

Or,

Or, if you will dry more violently, let the part affected be often touched with the aforesaid Oyls, pure and not mixed, for so the *Aphthe* or Thrush and all Ulcers of the Mouth and Tongue are quickly Cured.

CHAP. IV.

Of the Palsey of the Tongue, and the Hurt Motion thereof.

THe chief Acting of the Tongue, is Speech, and this is Abolished, Diminished, and Depraved by divers Causes, which are referred to Similary, Organick, or Common Diseases.

As for the Similary, A moist Distemper with Matter maketh the Tongue more soft and loose, so that it cannot freely exercise its motions.

Dryness doth too much foul the Tongue, as in Feavers.

But Organical, or Diseases of the Instrument, are when the Tongue is enlarged, as we said before concerning Tumors, which hinder the free motion of it: also when the figure or shape of it is deformed, as when the Tongue is naturally too short, or by being partly cut off, or if it tyed too strait; as also when the seventh pair of Nerves which come from the Brain to the Muscles which move the Tongue, are stopped.

Lastly, Common Diseases are Solutions of Continuity or Wounds in the part.

Too much moisture maketh Balbuties, a kind of Stammering, which keepeth Men from pronouncing of the Letter R.

And this is either Natural as in Children by reason of their much moisture, who are Cured by Age when the superfluous moisture is consumed.

But in some there is a moist distemper all their Life, and they are always Stammerers; of which *Hippocrates* speaketh, *Aph. 32. Sect. 6.* thus, *Stammerers are most subject to long Fluxes of the Belly.* *Galen* in his Comments saith, *That they who naturally stammer, have either a moist Brain or Tongue, or both.* From the moist Brain much moisture may fall into the Belly, whence the Flux is caused. And when the tongue is naturally too moist, it is probable also that the Belly will be loose and weak through moistness; because the stomach and the tongue have both the same Tunicle; Now the proper passion of a moist Belly is a Looseness.

But *Avicen* seems to be against this Doctrine, saying, *Fen. 1. lib. Tract. 4. cap. 18.* That Stammerers are given much to Melancholy, and Melancholy cometh from a dry Brain; but this contradiction is reconciled, thus, *Avicen* meaneth by Stammerers, not such as are properly so called and cannot pronounce R, but such as Stutter, and repeat the same Syllable often before they speak a word, this cometh from a hot and dry distemper of the Brain; in which the thoughts are so quick that they out-run the tongue, and hastens its motion, whence comes that disturbance.

But the Stammering aforesaid coming from the Birth is incurable.

In some an accidental Stammering cometh by a Catarrh, and great defluxion of Rheum upon the jaws and tongue, which is cured by Evacuation, Revulsion, and Derivation of the Humors; as also by Strengthening and Drying the Brain, but because the Remedies are the same with those for the Palsey of the tongue, of which we shall now speak, they may be taken from thence.

Two pair of Nerves go to the tongue, the third pair to exercise the act of Tasting and Sense; And the Seventh pair for Speech and adversity of Motion, by the Obstruction and Relaxation of the seventh, cometh the Palsey of the tongue, which is a Privation or diminishing of the motion of the part; and this useth to follow an Apoplexy when the hinder part of the Brain is too moist, and then other parts of the body, and for the most part half the body hath the Palsey: sometimes it is only in the tongue when the Nerves and moving Muscles are too moist; also by cutting of those Nerves there cometh a Palsey of which there is an example in *Avicen*, *Fen. 6. lib. 3. tract. 1. cap. 12.* in these words, *A certain man was Cupped and Scarrified, and the small hair-like Nerve was cut with Scarrification, which is in the substance of the Pannicle joyned with the Tongue: wherefore the Tongue was relaxed.* We may suppose that these Cupping-glasses were applied to the Neck and hinder part of the Head, for since the Nerves that move the tongue, come from the beginning of the Spinal Marrow which is in the Neck: It is most certain that the Scarrification was made so deep that some branch of them was divided.

But although the matter producing this Disease be Flegm, yet sometimes it is thicker and colder; sometimes thinner and hotter as the humors which predominate in the Body, the knowledge whereof is from *Avicen*, *Fen. 6. lib. 3. tract. 1. cap. 6.* in these words, *And sometimes the redness of the Tongue and hotness shew that the matter is bloud, and sometimes much watery spittle sheweth that*

the matter is thin, and when there is little benefit by Resolving Medicines, and much by binding and astringent.

This Disease, if it come from the Brain, and follow an Apoplexy, so that other parts also are affected, is seldom cured, especially if the Patient be in years; but if it be single, and in that part only it is to be cured, and the easier if the Patient be young.

CURE. The Cure of the Palsy in the Tongue, is by taking away the antecedent Cause, that is the humor abounding in the Brain, and by discussing and dissolving the conjunct cause, namely, the humor which is fastned upon the Nerves that move the Tongue.

The Antecedent Cause will be taken away by the Medicines prescribed in the Cure of the cold distemper of the Brain.

And first you must purge with Pills, or a Potion there mentioned. After if blood abound, and be either the Principal, or the assistant Cause of the Disease, take so much as age and strength will permit, then administer a Cephalick Apozeme; and if the Disease seem stubborn, give a sweating diet; all which are formerly prescribed in the place mentioned.

After general Evacuations, come we to the derivation of the matter causing the Disease, by Cupping and Vescicatories applied behind; as also by Cauteries. *Avicen* applied a Cupping-Glass under the Chin, which is now also allowed.

Open the Vein under the Tongue and it will profit, if before you have made general Evacuation to derive the Humor from the Muscles of the Tongue.

For the discussing and drawing forth of this humor, let the Gargarism following be thus used:

Take of Flowerdeluce Roots half an ounce; Organ, Sage, French Lavender, Rosemary, of each half a handful; Cubebs three drams, Liquoris one ounce: Boyl them in equal parts of White Wine and Water to a pint; dissolve in the straining, Oxymel of Squils two ounces. Make a Gargarism, to which if it work not strong enough, you may add two or three drams of the Decoction of Pellitory of Spain, or of Mustard-seed. You may add Castoreum if it offend not the Patient with the scent.

To this end you may often rub the Tongue with Oxymel of Squils alone, or mixed with Mustard-seed.

A bag of Sage is much commended for to rub the Tongue with often, to which you may add Mustard seed also.

Also these following Pills ought to be held often upon the Tongue:

Take of the Juice of Betony and Liquoris, of each one dram and an half; Castor and Affaetida, of each half a dram; Nutmeg and Spickard, of each one scruple; incorporate them with Honey, and make them into the form of Lupines.

Here also Gargarisms, Mastichatories and Errhines, which are prescribed in the Cure of the Cold Distemper of the Brain may be used.

Also for the strengthening of the Brain, and dispersing the reliques of the humors therein contained, Fumigations and Powders for the Hair, with Caps mentioned in the same Chapter, are here to be used.

Lastly, You must prescribe the usual Medicines against encrease of Flegm, namely, *Syrupus Magistralis*, or ordinary Pills, with a strengthening Opiate, as is there declared.

The End of the Fifth Book.

THE
SIXTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

*Of the Diseases of the Teeth, Gums, Jaws, Palate,
and Wind-pipe, or Larynx.*

The Preface.

THE Parts contained in the Mouth and Jaws suffer divers Diseases, the Chief whereof we only desire to lay down, and to omit those that are ordinarily Cured by Chirurgeons: Therefore this Book shall contain Seven Chapters. First, of the Tooth-ach. Secondly, Of the blackness and consuming of the Teeth. Thirdly, Of the Eating away, and Exulceration of the Gums, Fourthly, Of the Flux of Bloud from the Gums. Fifthly, Of the Ulcers of the Mouth and Jaws. Sixthly, Of the Relaxation or Falling down of the Palate. And Seventhly, Of the Angina, or Quinzy.

CHAP. I.

Of the Tooth-ach.

GALEN in his Fifth Book of the Composition of Medicines, cap. 8. & 16. of the Use of Parts, cap. 2. saith, That the teeth are not only sensible in respect of their Nerves at the Root, and Membrane which inwardly covers their Cavity, but also in their proper substance; and saith, That the teeth and other parts of the Mouth doth tast, as also doth the tongue. And in his Book of Bones, cap. 5. he saith, Of Bones only the Teeth are partakers of the tender Nerves of the Brain; and for that cause they alone do manifestly feel.

Therefore pain reacheth not only to the Nerves and inward Membranes, but also the substance of the teeth.

CAUSES. The tooth-ach comes from a flux of Humors either Cold and Flegmy, or Hot and watery, Salt and sharp: hence comes the Distension or Convulsion of the parts: and these Hu-

more either flow to the Membrans of the Jaws and of the holes wherein the teeth are, or to the nerve which is inserted in the root of the teeth, or to the substance of the teeth. Although some think that the teeth cannot receive into their own substance an afflux of humors and distention, because they are most hard and thick; yet this is taught by *Avicen*, *Fen. 1. lib. 1. doct. 1. cap. 5.* and *Fen. 7. lib. 4. tract. 1. cap. 4.* And sometimes (saith he) there is matter which doth imposthume the Tooth it self. Which Opinion he confirmeth and treateth of chiefly, *Fen. 1. lib. 3. Tract. 3. Cap. 1.* in these words; It is not as some Physicians think, that the Brain it self will not imposthume, reasoning thus; That which is soft, as the Brain, and hard as a bone, is not extended, and that will not imposthume which cannot be extended. But this is erroneous, because that which is soft, if it be viscous or clammy may be extended, and bones are imposthumated, as *Galen* teacheth, and we will shew in our Chapter of the Teeth. Moreover, we say, that whatsoever is nourished is extended and increased with the nourishment, and it is likewise possible that it may be extended and augmented with its superfluity, and that is an *Imposthume*. This *Avicen* teacheth from the Doctrine of *Galen*, who *Lib. 5. de com. med. sec. loc. cap. 8.* saith, Because the teeth cannot grow without nourishment, they are only obnoxious to these two Diseases following, namely, of want and superfluity of nourishment; by want of nourishment they grow drier and thinner, and by superfluity of it, there will be an Inflammation about the fleshy parts. Thus *Galen*. But its probable that pain is more usual (if it be vehement) in those parts which have most exquisite sense, namely, the Nerve and the Membrane in the hole of the tooth next to the root, which doth not only suffer distention and vellication, but also sometimes inflammation of the humors flowing down; for if blood be mixed with other humors, then the pain hath two causes, namely, Distention and Compression, which come from the hardness of the tooth, which the Membrane being inflamed cannot indure: and this Inflammation of the Membrane is for the most part accompanied with the Inflammation of the Gums: which also is reckoned by *Galen* and *Avicen* among the causes of the Tooth-ach.

Now the Humors commonly flow from the Head upon the teeth and parts adjoyning, sometimes from the inferior parts; for when any bad humors, especially watery bred in any part, are abounding in the Veins, Nature desiring to cast off her burden, sends them to weakest parts. And if the teeth by reason of the distemper, foulness or erosion are such, the Flux will chiefly come thither. *Charles Piso* propounds an Experiment of this (who also thinks the tooth-ach comes chiefly from a serous humor) *lib. de morb. ab illuv. sec. abs. 7.* where he reports that himself being troubled with the tooth-ach for many days, half an hour after he had taken a purging Medicine vomited up above a pint of clear water with such success that ten years after he was never troubled with it. By which Experience he always prescribed Medicines that purge water to them who were so troubled, and with good success. Moreover, he striveth to prove that it comes from this cause, by this sign, Because they who have the tooth-ach do continually spit.

Besides the Causes mentioned, there are also Worms in rotten teeth, and they breed of any matter which is contained and putrified in the Cavities, whether it be Excrementitious, or come of putrifying meats, especially flesh and sweet meats, which by reason of their clamminess stick to the Cavities of the teeth.

Others think that the tooth-ach comes sometimes from Wind contained between the Cavity and the Nerve, which doth violently stretch the inward Membrane, whence comes such intollerable pain.

The principal external causes of Tooth-ach are all those things which cause defluxions; the chief are, Cold Air, South-Winds, staying in the Sun or Night Air, Surfets, and all faults in Diet. Add to these, things that debilitate the part, and make it more fit to receive a Defluxion, as rottenness and hollowness in the teeth, which sometimes make violent pains.

DIAGNOSTICK. The diversity of Causes is known by divers signs. For pain when it comes from hot humors is stronger, the constitution hotter, the age younger: if Summer there is heat sensibly in the part, and inflammation of the Gums oftentimes; it is better for the use of cold, and worse for hot things. But if it come from a cold humor, the signs contrary to these will appear.

If Worms are the cause of pain, it will be intermitting, coming and going often, and sometimes the motion of the Worm will be felt.

When it comes from Wind, it is known by the excess of pain, and sensible stretching, and it ends in short time, and is easily cured with discussing Medicines.

PROGNOSTICK. The Prognostick is divers, according to the variety of the Causes; for that pain which comes from a hot, thin, watery, sharp and salt humor is more violent, but sooner at an end, by reason of sudden change of the humor; but that which comes from a cold and flegmy humor, is less, and lasteth longer.

A Tumor rising in the Gums or Jaws takes away the pain of the teeth, for the Flux is carried to the external parts, so that it no longer lieth in the internal Cavity of the tooth.

CURE. The Cure must be directed for the taking away the Cause, and mitigating the pain; for although

pain; for although Anodines profit but a little except the defluxion be stayed, yet sometimes we are constrained not only to use them, but also Narcoticks or Stupefactives before we take away the Cause; therefore the humor flowing to the teeth is to be revelled, evacuated and repelled, and that which is there, is to be derived and disscussed.

First therefore, if the pain comes of hot Humors, open a Vein in the Arm on the same side, by which the humor flowing will be revelled. But if it come of cold, bleeding is not so good; but in regard of the defluxion it may be used, because it is the chief reveller. But then you must take less blood, except there be a Plethory, in which regard, although it be from Flegm, you may bleed freely according to *Galen*, who said, that a large evacuation of blood agreeable to the Plethory is the best remedy for all pains, which we have found true by experience, not only in the pain of the teeth, but in other parts.

Let him purge the day following, with that which is proper for the humor: in the form of a Potion, if a hot humor; with Pills if a cold humor be the cause of pain.

After this, if the pain continue, apply Cupping glasses to the Shoulders with Scarrification, or one great one between the Shoulders without Scarrification. A Vescatory applied to the neck, or behind the Ears, doth violently draw back the humors.

Also to hinder the defluxion, apply astringents to the Temples, as Emplaster of Gum Elemi, or Mastich only upon a piece of Silk, and heat with a bras pebble; the Shop of Emplaster of Mastich, or that against Ruptures called *ad Herniam*. Or this following is good;

Take of Frankincense, Hypocistis, Labdanum, of each one dram and an half; Pitch and Mastich, of each one dram, Opium half a scruple; Oyl of Mastich as much as is sufficient. Make a Mass of Emplaster.

The Root of Comfrey fresh and bruised, applied to the Temples, doth intercept the defluxion very well.

There is also a good Plaster made of Powder of Allum, and Galls mixed with Pitch.

Riverius the Chief Physician to *Henry the Great*, had this Plaster as a Secret:

Take of Cyprus Nuts, red Roses, Mustard-seed torried or parched, Mastich and Terra Sigillata, of each one dram and an half. Let them be steeped in Vinegar of Roses twenty four hours; then dry them: Opium dissolved in Aqua Vite three drams; Pitch and Colophonia, of each one dram; yellow Wax melted in the expressed Oyls, Henbane and white Poppy as much as is sufficient. Make an Emplaster; apply it to the Arteries, and the part affected with pain.

And because the small Veins by which nourishment is carried to the teeth do run by the ears, you may put Medicines into them for the Cure of the Tooth-ach; as Oyl of bitter Almonds to the ear on the same side, or the fume of Vinegar, in which Pennyroyal and Origan have been boyled.

Others put Vinegar into the Ear, by which the defluxion is mightily stayed, especially if the Flux be hot.

But in a cold defluxion, the Juyce of Garlick mixt with Treacle and dropt warm into the Ear, doth wonderfully assuage the pain of the teeth. A Clove also of Garlick peel'd and put into the ear, is good.

Also Astringents in the beginning of the defluxion, may be applied to the part pained, cold, if the matter be hot, but if it be cold, you must put hot things with your repellers: But in every cause, if the pain be great, you must mix Anodines with Repellers. As,

Take of the Roots of Snake-weed, Five leaved grass and Tormentil, of each one ounce, the Leaves of Vervain, Plantane and Maudlin, of each one handful: Cypress Nuts, Galls and Acorn Cups, of each two drams: red Sanders and Crystal, of each one dram and an half: red Roses and Pomegranate Flowers, of each one pugil: boyl them in red Wine and Vinegar, and wash the part grieved often therewith warm.

This may be used in the beginning of a hot defluxion; but in a cold, Cypress Roots, Box Bark, Ivy Leaves, and the like.

A plainer Medicine is made of Plantane and Rose-water, with as much Vinegar like an Oxycrate.

Or boyl Galls in Vinegar, and wash the teeth therewith. Or,

Take of the Root of Cinquefoyl half an ounce: Willow Leaves half a handful: Galls two drams: boyl them in red Wine, and wash the mouth. This stays the defluxion, and takes away pain.

Then you must use these Remedies, which assuage pain, and take away the cause, of which there is in Authors, and vulgarly a multitude: we will give you the best: of which you must make your choice with this judgment, That those which do not only dissolve and disscuss, but also astringe and stop the Flux, be used in the beginning and the encrease, but things that only disscuss in the state and declination.

Take of the Juyce of Houseleek and Nightshade, of each two ounces: Cows or Sheeps milk eight ounces:

ces; Oyl of unripe Roses one ounce and an half; Opium and Saffron, of each three grains: mix them, and apply it warm with a cloth to the Jaw of the same side often.

Take the Pap of sweet Apples two ounces; Bran steep'd in Vinegar three ounces; Oyl of Roses one ounce; Saffron half a scruple; Opium two grains: mix them for a Cataplasim to the part pained. Or,

Take of Barley and Bean meal, of each three ounces; Oyl of Roses and sweet Almonds, of each half an ounce: the juyce of Housleek one ounce and an half; Milk as much as is sufficient; make a Cataplasim to be applied often warm to the part. Or,

Take two whites of Eggs, beat them with Rose Water, and dip stufis therein sprinkled with two drams of Pepper powdered; Apply them to the pained side over the whole Cheek.

But here observe, That you apply not astringents to the Jaws if they be swoln, for it is to be feared, That the Humor will so be repelled to the Throat, and the Patient choaked. An Example of which *Valesius Taranta* giveth, of a Physician troubled with the tooth-ach and Inflammation of the Jaws, who applied only Oyl of Roses with Vinegar, which brought to a Quinzy, and he died.

Other Waters may be made to wash the mouth, thus:

Take of the best white Wine four ounces; white Henbane Roots two drams; let them boyl to the Consumption of the third part: strain them and add one ounce of Vinegar; Varnish one dram; let them boyl a heat, and let the mouth be washed often therewith.

The plain Decoction of Vervain is commended of many for the same.

Also a Decoction of Guajacum made with Wine and Water, and a little salt. Or,

Take of Arsmart, and the Barks of the Roots of Henbane, of each equal parts, boyl them in Rose Vinegar, and wash the mouth.

And if the pain cometh from a hot Cause, only boyl a Henbane Root in Vinegar.

If the Arsmart be too sharp, take a less quantity: Nay you may leave it quite out in a defluxion coming of a hot Cause, and put *Persicaria Maculata* instead of it, which is Astringent and Cooling, and his juyce may be given safely at the mouth in all Defluxions that are sharp and Cholerick. Also you may use the Leaves of Henbane instead of the Root.

Some use the leaves of Henbane and *Persicaria Maculata* as a sweet Magnetick Charm, they boyl them in Vinegar, they burn the leaves being boyled with a gentle fire, and wash their teeth with the Vinegar, and they say as soon as the leaves are burnt the pain will be gone: But I rather think it is cured by the Vinegar with which the teeth are washed.

In the aforesaid Decoctions if the Vinegar be so sharp that the Patient can scarcely endure it, you may mix half Wine; and in a cold Cause make them of Wine only.

Amatus Lusitanus Commends exceedingly *Sandarach* boyled in Vinegar and Wine; thus:

Take of *Sandarach* one ounce; Wine and Vinegar of each half a pint; boyl them, and let the strained Liquor be held a long time in the mouth.

The Decoction of the Roots of the great Nettle, with a little Nutmeg and Saffron made in equal parts of Wine and Vinegar and held warm in the mouth, doth wonderfully draw the Humors forth.

But at the first, the pain will seem to encrease; Ent afterwards, it will be mitigated and cease.

The root of the sharp Dock gathered in the Spring before it groweth forth and dried, applied to the tooth pained, doth appease the pain by a specifical propriety: which is confirmed by the Experiment of *Forestus*, in *Obs. 6. lib. 4.* where he saith, That he applied this root green, and cut in small pieces, to the tooth of a Maid with good success; and that he cured many other therewith after he had given them universal Medicines.

If the Body be well purged, and the head be not very full of Flegm, Mastichatories to draw the Humors from the part affected will do very well; which are made either of Pellitory of Spain a long time held in the mouth and chewed: Or as followeth;

Take of Mastich, Pellitory of Spain, Staphisagre, of each one dram; the seeds of Henbane half a dram; Powder them, and mix them together; and make little Balls thereof in a thin linen Rag, which let him long chew to make him spit.

Commonly the Oyl of Cloves is used in a little Lint to stop the tooth if it be hollow, or otherwise; for so the humor adhering to the part is drawn forth, and the part strengthened.

Oyl of Camphire is very profitable for the same purpose.

Or Dissolve eight grains of Camphire in one dram of the Oyl of Cloves; and use it as above.

But

But above all the rest, the Oyl of Box is extolled, which being but once dropt into the tooth presently stays the pain.

This Oyl is made of Box cut in small pieces, and then distilled by descent in two Vessels, the one put into the Earth, the other above, upon which you must make a long fire, and so the Oyl will fall into the lower Vessel.

Besides the aforesaid Oyls, the Chymists commend the Oyl of the Hazel Nut used in the same manner.

If the pain be so great that it will not away with the aforesaid Medicines, you must come to Narcoticks, which are let down by Practitioners under divers forms; although their effect is as uncertain as others; but they do surely stupify the pain. Among the rest Laudanum is chief, which doth not only appease the pain, but also stop the Flux; and it may be given safely after universal Remedies to the quantity of three or four grains, if it be well prepared.

Many Topicks made of Narcoticks are carried about; These two following are the best;

Take of Opium, Myrrh, and Labdanum, of each one dram; Powder them, and with white Wine boyl them into a Liniment, which put with Lint into the tooth.

The other is the Emplaster of *Riverius*, Chief Phisitian to *Henry the Great* above mentioned.

If Worms be in the teeth you must kill them with bitter things: And this following is good for that;

Take of Aloes one dram; Camphire half a scruple; Aqua Vita half a dram; mix them them and apply thereof with Lint to the tooth.

It is to be observed, That the teeth do seldom ake except they be hollow to the Nerve; therefore to take away the sense of pain, burn the Nerve with an actual Cautery, or with *Aqua fortis*, or Oyl of Vitriol, which often done to a very hollow tooth, it will be broken in pieces, and so drawn forth.

If the pain still continueth, and the tooth be very hollow, you must draw it out, and then the pain will presently cease and never return.

But you must take heed that you draw not the tooth when the Defluxion falls violently, or when the Head aketh, or the Gums swell, or when there is great pain.

And the Chirurgion is to be admonished, That he pull it not out violently at one pull lest the Brain be too much shaken, and the Jaw bone broken; from whence comes a great Flux of blood, a Feaver, and sometimes death.

After it is drawn, close the part with your Fingers, then let the mouth be washed with warm Oxycerate; and let him take heed of Cold Air, lest a new Defluxion fall upon the other teeth.

But if the blood flow so fast that it will scarce be stanch'd, which sometimes happeneth by the breach of the Vein and Artery, without the breach of the Jaw: And *Variola* reports of one that had his tooth pulled out without Iron or force, but with the Fingers, and yet bled a pint at one time, and as much the next day from the Artery under the Gum. This Flux of blood is stopt by laying a hard piece of Lint like a Ball, and holding it down for one hour or two with the fingers: If that will not prevail, apply burnt Vitriol, and lay a Rag upon it dipt in Vinegar, and compress it with your finger till you make an Eschar. The last Remedy is an actual Cautery by which the blood will presently be stopped.

If any fearful people refuse burning and require other means, you must try those which Authors prescribe; As Paste made of the milk of Spurge, and the Powder of Frankincense mixed with a little Starch, the Root of Crowfoot, the Bark of the Mulberry root, the Powder of Earth worms, Pellitory of Spain steeped in Vinegar, and the root of wild Cucumer so steeped, and the like. But the Leaf of Elleboraster rubb'd upon the tooth is best; but you must not touch the other lest they also fall out.

A Countryman troubled with the Tooth-ach, was perswaded by another to rub his tooth with Elleboraster; he unwittingly rub'd all the teeth on that side, and presently almost all his teeth fell out: Therefore if any will try this Medicine, I advise them to defend the other teeth with soft Wax.

Although when there is a Tumor in the Jaws, the pain for the most part ceaseth; because the matter is carried outwards: Yet for the quick dissolving of it, use this Liniment;

Take of fresh Butter and Hen grease, of each one ounce; the Powder of Flower-de-luce Root, one dram; Saffron half a scruple; Oyl of Camomel and sweet Almonds, of each half an ounce: make a Liniment.

A Cataplasim made of Figgs, Bread and Vinegar, is better.

A Nettle bruised and laid to the Jaw, doth quickly assuage the pain.

This

This is the Cure of the tooth-ach for the present. But if it return often, as is usual, you must use preventions, which is to hinder the breeding of those humors that flow thither; and let the teeth be strengthened that they may be less capable to receive them. Therefore if it proceed from a hot cause, you must use such Medicines as were prescribed in the cure of a hot distemper of the Liver, and a hot Catarrh. If from a cold cause you must take that course which is prescribed in the Cure of the cold distemper of the Brain; but you must strengthen the teeth with the Medicines in the Chapter following.

CHAP. II.

Of the blackness and rottenness of the Teeth.

MAny times the teeth do contract a black, livid or yellow colour, from the evil Humors cleaving unto them, which by long continuance do also corrode them, and make them rotten: and these Diseases come from filthy vapors that fly upwards, and are engendred of evil nourishment, or from the Distemper of the stomach, which corrupteth good nourishment.

Quick-silver doth black the teeth, whether it be used to the whole body, as in the Pox, or only to the Face. Hence it is that Women which use Mercury to make them fair, have black and ill coloured teeth.

CURE. For the Cure you must first remove the antecedent Cause, and if it come from evil humors in the stomach, they must be discharged, and the distemper of the parts which produce them must be corrected, and a good diet prescribed, and those things forbidden which do corrupt the teeth, especially sweet things.

Infinite Medicines are prescribed by Authors for making teeth white, which may be experienced. We are contented with one, which presently makes them white, cleanseth them, and keeps them from rotting, namely, the Spirit of Sulphur or Vitriol, in which you must dip a little stick, and rub the teeth with the end thereof, and then wipe them with a clout. In a great foulness you may use the Oyls by themselves, otherwise you must mix them with Hony of Roses, or fair water, left by the often use of them the Gums should be corroded: *Montanus, consil.* 113. reports, that he learned that at Rome, of a Woman called *Greek Mary*: to whom when he came when he was young, and she twenty years old, and after when she was fifty, he found her almost in the same condition, and she confessed that her beauty and strength was preserved by the Spirit of Vitriol, and that her teeth which were very bad in her youth, were by that made very fair and firm, and also her Gums; and also that she perceived her self by the use thereof to seem more youthful, and she used every day one drop or two to rub gently her Teeth and Gums.

The Ashes of Tobacco is very good also to cleanse and make white the teeth.

For prevention, and to preserve the teeth, first cleanse them with a Tooth-picker made of Mastich Wood or the like; then wash the Mouth with Wine, and rub the teeth with this Powder:

Take of the Roots of Snakeweed, Allum and white Coral, of each one ounce. Make a Powder to rub the Teeth.

Or wash them with this Powder:

Take of the fine Powder of burnt Allum two drams; whole Cinnamon half a dram; Spring and Rose Water, of each four ounces: boyl them in a Glass upon hot Embers to the consuming of the third part. Wash the Teeth therewith every morning with a cloth dipped therein.

Chap. 3. *Of the Erosion or eating away, and of the Exulceration of the Gums.*

THe Gums are eaten away and exulcerated by sharp corroding humors which come unto them. The parts from whence they come are, the Brain, Stomach, Spleen and others. Men that have diseases in the Spleen, are most subject to Ulcers in the Gums, as in the Scurvy; sometimes the erosion of the Gums comes from worms, or the corrupt humors which cause worms, so that it is a plain sign of worms when it continueth long. So saith *Fabricius Hildanus, Obs.* 59. *Centur.* 1. the Son of a Citizen of *Dusseldorp* was long troubled with erosion of the Gums, and died, after the use of many internal Medicines and Topicks: when he was opened we found abundance of worms, which had eaten through his Guts, and many in his Stomach.

CURE.

The cure is first to be directed to the antecedent cause, and the vicious humors are to be evacuated by blood-letting and purging; the sharp and hot humors are to be tempered with Apozemes, Juleps, and

and Physical Broths and the like. The Flux of the same is to be diverted by Cupping-glasses, and Cauteries fitly applied. And lastly, the faults of the parts affected are to be corrected.

Afterwards you must use Topicks, which are to be altered according to the greatness of the disease so that to a simple Erosion you must apply only those which astringe and dry, as this Water following:

Take of unripe Galls, Acorn Cups and Flowers of Pomegranates, each one ounce; red Roses one pugil; Allum three drams; boyl them in two parts of Forge-water, and one part of old red Wine, and wash the Gums often therewith.

If the Erosion be not taken away with that, use this Opiate:

Take of Dragons blood three drams; Lignum Aloes, red Roses, Spodium, and burnt Harts-horn, and Cypress nuts, of each one dram; Myrrh and Tobacco Ashes, of each three scruples; Allum one dram. Make them into a Powder; and mix them with Hony and a few drops of Spirit of Vitriol, or Sulphur. Make an Opiate, which must be spread upon a linnen cloth and laid to the Gums at night.

The Spirit of Vitriol and Sulphur, as they cleanse and whiten the teeth, so they take away the rottenness of the Gums, either alone, or mixed with Hony or Roses or Water, as in the former Chapter.

If the Ulcer be deep and foul, anoint it with this;

Take of choice Myrrh and Sugar Candy, of each equal parts; powder them, and fill the white of a hard Egg cut in the midst therewith; then tie with a thread and hang it in a Wine-Cellar with a Glass under it, and there will come forth a Liquor or Balsom, with which anoint often.

But if by the use of the aforesaid Medicine the disease be not cured, if the tooth near the Ulcer rotten, you must pull it out, and then it will be presently cured, otherwise never.

Chap. 4. Of Bleeding at the Gums.

Sometimes abundance of blood flows from the Gums either critically, or Symptomatically, although the former be very seldom, yet it is sometimes; so we may see by Experience, and by reading. So saith *Dodoneus, Obs. 14.* A certain Quarrier having the Small Pox had a Flux of blood from his Gums, and being stopt, it made his Urine bloody, which being stopt, it returned again to the Gums, and there continued till he recovered of the Small Pox. *Amatus Lusitanus, Curat. 5. Centur. 5.* says that some have had benefit by bleeding at the Gums, and have been worse when it was stopped. Also *Zacutus Lusitanus, Obs. 86. lib. 1. Praxis admir.* speaks of a Goldsmith, who when he fell into a Fever by labouring at the Furnace, being of a strong constitution, lost much blood by opening a Vein, and amended, so that the seventh day (having had an itching of his Gums, and a pain in the lower Lip) the blood gushed from the Veins of his lower Gums for three days in such a quantity, that he lost above five pints more, and the more he bled, the more his Fever abated, and when it was gone the blood stopped.

The Gums bleed Symptomatically when the blood is sharp, and the Liver or Spleen distempered: So that in the Scurvy this Flux is ordinary.

Sometimes after a tooth is drawn, there is so great a Flux of blood by reason the Artery is torn, which is the root of the tooth, that sometimes Men have died thereof.

CURE. The Cure of a Symptomatical Flux is by bleeding and purging, and other Remedies for the Bowels. As also by Topicks astringing made into Gargarisms, Powders Liniments or Opiates.

If it come from a tooth drawn, you must let blood and Cup to make Revulsion, and apply astringents to the part, as a Cataplasim made of Bole Armeniack, Terra Sigillata, Sanguis Draconis, and the like astringents made up with the white of an Egg. Also Thyme alone with the white of an Egg is good. But if they do not suffice, you must lay the Patients finger upon the part, and let him hold it there till the blood congeal above the Orifice of the Artery. If it cannot be stopt with slight things use stronger. *Valeriosa, Obs. 3. lib. 5.* reports, that an old Woman who had a Tooth taken forth with the fingers only, had a violent bleeding upon it from the Artery under the Gum; which he stopt with burnt Vitriol when other things failed; which is excellent both for astringency and burning. *Zacutus Lusitanus, Obs. 84. lib. 1. Prax. Med. admir.* relates a History of one who having a grievous Tooth that aked drew it violently forth, and after had a great flux of blood from the Artery torn, which when it could not be stopped by Blood-letting, Cupping and Astringents, nor by laying on the finger, nor by burnt Vitriol, at last by his advice the place was filled with Gum Arabick, which stopt it in three hours space, for it hath power to stop, cool, glutinate and dry. The same *Zacutus, Obs. 85.* of the same Book, reports of a certain strong Souldier, who after great pain drew a tooth violently, and bled much from the Artery under the tooth for two dayes: the best Physicians use all Astringents

gents to the part, with Revulsives, and burn the Artery with a hot Iron, but all in vain, for he bled still even unto death: *Zacutus* being called, applied the Plaister of *Galen* made of Frankincense, Aloes; the hairs of an Hare powdered, and mixed with the white of an Egg, by which in a few hours the blood stopt and the Patient recovered.

Galen boasteth that he invented this precious Medicine, *lib. 5. meth. cap. 7.* and stopped the Artery in the Elbow. And *cap. 4.* of the same Book, and in his Book of Curing by Blood-letting, Chapter the last; he confirmeth the Excellency thereof by many stories.

Chap. 5. Of the Ulcers of the Mouth and Jaws.

THe small and superficial Ulcers of the Mouth are usually *Aphtha* or a Thrush, although in *Galen* and *Hippocrates*, it is sometimes used for Ulcers in other parts; but they which are deeper are absolutely called the Ulcers of the Mouth and Jaws: Such as are in the French Pox.

CAUSES. These Ulcers breed of sharp Humors or Vapors coming from divers parts into the Jaws; so in malignant Feavers they often happen, or to those that have hot Livers, or foul Bodies: So the Children have the Thrush, as *Hip. Aph. 24. Sect. 3.* either from sharpness of the Milk which ulcerates those tender parts in its passage, as *Galen* teacheth in his Comment upon the same Aphorism, or from the Corruption of the milk in the Stomach by which sharp vapors are sent to the mouth, as *Galen* affirms, *9. de compos. med. sec. loc. cap. ultimo.*

DIFFERENCES. Now these Ulcers are divers, as some are slighter, and some more dangerous; some are in Children, some in Men; some are joyned with Inflammation, some are without; these divers degrees are according to the variety of the Humors of which they come. For they proceed either of Blood, Choler, Flegm, or Melancholy, or Choler Aduſt, which hath not only a burning, but often a malignant quality, and begets evil conditioned Ulcers.

DIAGNOSTICK. These Differences are known by their proper signs, for if the Ulcers be Reddish they come of Blood; if Yellow, of Choler; if White, of Flegm: if Livid or Blew, from Melancholy, if they stink they are foul.

PROGNOSTICK. As for the Prognostick.

Aphtha or a Thrush is easily Cured, but deep Ulcers and putrid, called in Greek *Nomai*, are hardly Cured: And in Children they are more dangerous by reason of their tender flesh which they sooner devour: As also because strong Medicines cannot be applied to them; hence sometimes Children die of them, when they are malignant and putrid.

Also in respect of the Cause, those Ulcers which come of Flegm are least dangerous: those that come of Blood or Choller more; and those that come of Melancholy most of all.

Black and Crusty Ulcers are deadly, especially in Children.

The Jaws ulcerated in a Feaver are hard to be Cured, as *Hip.* teacheth, *3. Prog.* Because as *Galen* explaineth they shew the malignity of the matter.

CURE. The Cure is first by good Diet, which cooleth and dryeth, and hindreth the Generation of the antecedent Cause: Therefore when Children have it from their suck, let the Nurse be changed, or eat good Diet, as also let her bleed and be purged, if need be: especially let her eat Cool Astringent things, as Quinces, Pears, Medlers, Services, Lettuce and Purslain, prescribe the same to men, and let them avoid sharp things, salt, and pepper.

Then you must look to the antecedent Cause, with Universal Evacuations according to the age; And first Phlebotomy doth powerfully reuel the Humors, and tempereth their sharpness, by cooling the whole body.

After this Cup and Scarrifie, put Horsleeches behind the Ears and under the Chin, and apply a Vesicatory to the Neck behind.

The next day after you have let blood, you must prescribe a Purge, agreeable to the humor offending and the age of the Patient.

From the beginning of the Cure use Topicks, called by *Galen* *Stomatika*, or Medicines for the Mouth: and at first they must be mild, as Gargarisms, Mouth-waters made of Plantane, Honey-suckle, and Roses; Water with Syrup of dried Roses and of Mulberries: or Decoctions of Plantane, Bramble Leaves, Knotgrass, Pomegranate Flowers, Red Saunders and the like; with Syrup aforementioned.

And if there be Inflammation, you may do well if you add the Juyce of Nightshade, Houleek, and Purslain, with as much Sal Prunellæ as will not make it too sharp; Or a little crude Allum.

If there be no Inflammation, the chief and only Remedy is Spirit of Vitriol or Sulphur, which may be used alone to men, upon a little lint at the end of a stick, gently touching the part, by which it will be presently cured if it be a simple *Aphtha*: But to Children you must mix the Spirit aforesaid with

Hony

Hony of Roses, so that it may be but a little sharp, and with a little Lint at the end of a Probe often apply it, and they will be quickly cured.

If the Ulcers are very painful and inflamed, they must gargle with Milk often, or with an Emulsion of the cold seeds, or the Mucilage of Fleabane seeds and Quince seeds extracted with the waters of Roses, Plantane and Nightshade.

If the pain will not be removed with these Revulsions and Topicks, but the humors are still drawn thither by it, which causeth want of sleep, and Consumption of the Body, which endanger the life: the last Remedy is Narcoticks, which will assuage the pain, and stop the flux: you must give it according to the strength and age of the Patient.

I once saved a Childs life (by Gods assistance) of four years old with one grain of Laudanum, when his Jaws and Tongue were deeply ulcerated with such an Inflammation, that he could neither take Broth or Topicks; the humors flowing so fast from his mouth that he lay night and day complaining without any rest.

If the Ulcer be sordid, First wash it with the Decoction of Barley and Hony of Roses: and in Children, with Milk chalybated, or in which Steel hath been often quenched, mixed with Conserve of Roses; then use stronger Medicines, and principally Hony of Roses above mentioned made a little sharp with some drops of Spirit of Vitriol.

If these will not do, you may add to the Waters decoction above mentioned burnt Allum, the Collyrium of *Lanfrank* and *Egyptiacum*, in a quantity agreeable to the Disease.

Lastly, If it come from the French Pox, it will not be cured the Pox be cured.

Chap. 6. Of the Relaxation of the Uvula, or Falling Down of the Palate.

CAUSES.

THe Relaxation of the Uvula comes from a Rheume falling from the Brain upon it, with which there is sometimes Blood mixed, and then there is an Inflammation also, and this often falls upon the Tonsils or Spongyous Kernels: the Inflammation whereof shall not here be treated of, because it is cured by the same means with the Inflammation of the Tongue, and of the Ulcers of the Mouth.

A watery humor falling upon the Uvula or Collumella, doth so moisten, soften and relax it, that it will be extended to the upper part of the Oesophagus, and Wezand, and cause a Nauseousness and the Patient will seem to have something in his Throat which he cannot swallow down, by which you may know it without looking into the mouth.

CURE. The Cure is first by the Antecedent Cause, that is, by evacuating the humors flowing from the Head, by revelling and deriving them with such Medicines as were prescribed in the cure of a Catarrh.

The chief Topicks are Astringents and Repellers, such as were prescribed in the Cure of the Ulcers of the Gums and Jaws, and shall be prescribed in the Chapter following of the cure of the Angina, to which afterwards you must add some Resolvers and Dryers: And though the Gargarisms in those Chapters mentioned are here good, yet when there is no Inflammation, the use of Powders is better: for with them the Uvula relaxed is more powerfully dried and astringed.

And therefore, First apply Pomegranate peels powdered, and after mix it with a little Pepper.

Or,

Take of red Roses and Pomegranate flowers and peels, of each half a dram: the roots of Snake-weed and Tormentil, Galls and Flower-de-luce Roots, of each one dram: burnt Allum two scruples: Make a Powder. Ordinary Chyrurgeons apply the Powder of long Pepper, but it is dangerous, for it is to be feared, lest the Humors should be drawn violently from the Brain to the part.

The manner of applying this Powder is to depress the Tongue with a Speculum Oris, and then blow up some powder in your Uvula spoon: do this often till the Humor be spent: The Instrument invented by *Fabricius Hildanus*, Obs. 21. Cent. 2. is the best for this.

And if the Uvula relaxed cannot be brought to its former condition by these means, but continueth extended and painful, your last Remedy is to cut off a piece thereof: in which Operation you must take some Cautions. The first is from *Hippocrates*, 3. Progn. Text. 21. where he saith, That Uvula's are cut and scarrified, and burnt when they are red and swollen, but not without danger, for an Inflammation followeth, and a Flux of Blood: but you must endeavour to extenuate these accidents by other means at that time: But when the Uvula hangs down, and the lower part of it is greater than the higher, and round, then it is safe to operate: but it is better first to administer a Cly-

ster, if time will permit. Galen in his Commentary upon these words of Hippocrates saith, That an Uvula inflamed, is not to be cut off or scarrified; but after the Inflammation is gone, so that the superior part is lessened. Another Caution is taken out of Paulus Aegineta, lib. 6. cap. 31. you must not touch the Uvula with an Iron to cut it when it is lived or blackish, that is, when it hath malignity in it, and inclineth to be a Cancer. But out of the same Author we have a lawfulness of the operation, when they are long and white, or as Hippocrates saith, small at the Top. We have an Example of the good success of this operation in Amatus Lusitanus, Obs. 65. Cent. 3. upon a Student, who had his Uvula hung down like a thong, long, and without blood in it; which when Medicines could not cure he cut off, and after touching the part with a little Spirit of Vitriol, he cured the Patient.

The third Caution is, That you cut not off too much; for then the Voice and Breathing will be hurt, according to Galen, 11. de usu. part. cap. 11. and consumption and death it self will ensue as often is seen in the French Pox.

Chap. 7. Of Angina, Quinzie or Squinzie.

THE word *Angina* taken generally, signifies every Disease of the Jaws and Throats, by which breathing and swallowing are hindered, when there is no defect in the Lungs and Breast.

DIFFERENCES.

And this is twofold, a legitimate and proper Quinzy, and a Bastard or improper.

A Legitimate Quinzy comes from an Inflammation, by which the Muscles of the Jaws and Throat being swelled, do stop and contract the ways of breathing and swallowing. This Inflammation doth either possess the Throat or the Jaws, called *Pharynx*. Both these parts have both internal and external Muscles; And though for the most part the *Pharynx* and *Larynx*, Jaws and Throat, do suffer in an *Angina* by reason of their nearness, yet one is more affected than the other: Hence many differences of Symptoms do arise, in respect whereof Galen in 4. de loc. aff. cap. 5. makes four sorts of *Angina's*; which the *Gracians* before his time named too curiously. One is called *Sunanche*, another *Cunanche*, the third *Parasunanche*, and the fourth *Paracunanche*. If the Inflammation be in the inward and proper Muscles of the *Larynx*, it is called *Cunanche*; if it be in the inward Muscles of the *Pharynx*, *Sunanche*; if in the outward Muscles of the *Larynx*, *Paracunanche*; and in it the outward Muscles of the Jaws or *Pharynx*, it is called *Parasunanche*.

Not only the Muscles of the Jaws and Throat are for the most part inflamed as aforesaid, but also the parts adjacent, and the outward part of the Neck, as shall be said in the Diagnostick and Prognostick of this Disease.

In all these kind of *Angina's*, when there is great danger by the difficulty of swallowing, then those things which are given use to fly out at the Nose, especially if they be liquid things, which are more hard to be swallowed at that time; because they spread themselves abroad, and therefore cannot so easily be comprehended of the Muscles to be sent into the *Oesophagus*, which Muscles cannot sufficiently contract themselves by reason of the inflammation; but solid nourishments being more corpulent, need only the superficial action of the Muscles, and are swallowed down by a small contraction of them. But it sometimes falls out that solid things are harder, and liquid things easier to be swallowed, which dependeth upon the diversity of the part affected: For the Muscles of the *Larynx* are ordained for to swallow Meat, as well as for the voice: and when the meat is thrown into the *Oesophagus*, the *Larynx* is lifted up with the Tongue. But for to swallow drink, We use the Tongue most, which while it is drawn inwards, it brings the drink from the Lips to the Jaws. If therefore the Muscles that move the tongue are most affected, it is harder to swallow down drink. But if the Muscles of the *Larynx* are more hurt, it is harder to swallow meat.

Here by the way, We must mark, That Hippocrates sometimes by the word *Angina* doth understand only the inflammation of the *Larynx*, and so it is taken more strictly, of which there is an example 6 *Epid. Sect. 8. Text 1.* where he saith thus, Some had inflammations of their Jaws, some had *Angina's*; where by the name *Angina*, he understands the Inflammation of the Muscles of the *Larynx*, and distinguisheth it from the inflammation of the Jaws.

A Bastard *Angina* is without a Fever, and is twofold.

The first and most ordinary comes of Rheum falling upon the Jaws, and parts near unto the *Larynx*.

The other comes from the Luxation of the *Vertebra's* of the Neck, by which the passage of the Gullet and the Throat is pressed and made narrow.

CAUSES. The Cause of a true *Angina*, as of other Inflammation, is either pure blood, or mixed with Choller, Flegm or Melancholy, which falls upon the parts aforesaid out of the branches of the Jugular Veins, and this is either attracted by the heat or pain of those parts, or sent from other parts, because these parts are weak, loose and fit to receive a defluxion, especially if the whole body abound

abound with humors, or the head, or the parts near the Jaws. For when evil blood aboundeth in the whole body, and is carried unto the head, if the Brain be strong it will not receive it; but sends it down by the same Veins into the lower parts; hence come divers Inflammations, As Parotides, or Tumors under the Ears, Ophthalmies, Angina's and the like.

Young men are more subject to the Angina then old; because they have much cholerick blood, and because they are full bodied, and have much blood, especially in the head.

Some Authors say that men are most subject to the Angina's then Women: which it seems *Hippocrates* observed, 6 *Epid. Sect. 7.* where describing an Epidemical Constitution, in which Angina's, Coughs and Peripneumonia's, or Inflammation of the Lungs were frequent: he affirmeth that few Women were sick, and he gives no other reason, but because they were less abroad than men, and therefore were not so subject to injuries from the Air: Which reason doth not agree with the universal Proposition, That women are less subject to Angina's than men: but this may be a true reason because women have colder blood, a less *Larynx* or Wind-pipe and narrower Veins of the Throat. For which reason those parts do not easily receive defluxions.

The precedent diseases may be reduced to their internal causes, as continual, putrid, burning and especially Epidemical Feavers, such as were mentioned by *Forestus, Obs. 2. Lib. 6.* which happened in the year 1517. at which time all that were infected had an Inflammation of the Jaws, and died within sixteen or twenty hours, except they were let blood within six hours. But in this Angina the Feaver is not Symptomatical, but Essential, and the Angina is a symptome to it, because part of the matter causing the disease is sent to this place: for in Epidemical Feavers, Angina's, Pleurifies, Inflammation of the Lungs, Disenteries and the like, do happen from some secret force and influence of the Stars, by which sometimes one part of the body, and sometimes another is more affected.

Whatsoever can cause a flux of humors to these parts may be reckoned among the external causes of this Disease: As Southernly Winds, according to *Hippocrates, Aph. 6. Sect. 3.* in time of much Rain many Diseases happen, as long Feavers, Fluxes of the Belly, Putrifications, Falling-sicknesses, Apoplexies and Angina's. Also for the producing of this last, the inequality of Weather doth much, when the parts are made loose by heat, and by cold suddenly coming thereupon, the humors are sent thither. A sudden cooling after heat and drinking of cold water doth the same, or if the Head be kept too hot or too cold.

The first cause of a Bastard Angina, is propounded by *Hippocrates, 4. de vict. rat. in morb. acut. text. 39.* where he saith, an Angina comes when in Winter and Spring time much slimy slegm falls from the Head to the Jugular Veins, which obstructeth the Passages of its Spirits with its cold glewiness.

There is another Cause of a Bastard Angina given by *Hippocrates, 2. Epidem. Sect. 2.* namely, a Tumor arising in the Vertebra's of the Neck, and especially in that which is called *Dens*, or the shape of a tooth by *Hippocrates*, by which the Vertebra are drawn inward, and therefore a Cavity appears in the external part. Now this Tumor either comes from slegm removing by its encrease, the Vertebra from its seat, or from blood falling upon the Muscles, from whence comes an Inflammation, by which the Muscles being contracted draw the Vertebra's inward, and then it is a true Angina coming from the inflammation of the said Muscles. There may also be a Luxation of the Vertebra by a slegmatick humor loosening their Nerves, and making them slippery between the Joynts. And lastly, it may come from an external cause, as a fall or stroak, as in other parts.

DIAGNOSTICK. An Angina is generally known, first by its proper signs, namely, difficulty of breathing and swallowing, when there is no fault in the Breast and Lungs, and when pain is felt about the Jaws and Throat: and in a true Angina, redness, heat and a Feaver are signs.

The Differences may be distinguished by their proper signs. In *Synanche* there is less difficulty of breathing, but great difficulty in swallowing, so that most things can scarce be swallowed, but come out at the Nostrils.

In *Parasynanche* there is less difficulty of breathing, nay very little, because the inflammation of the external Muscles of the Jaws doth little hinder respiration, there is pain and redness outwardly in the Neck, when the outward parts are inflamed.

In *Synanche* there is a great hinderance of Respiration, so as the Patient seems to be strangled, sometimes is strangled for a short time, and cannot breathe but with the Neck upright, and the Mouth open.

The Jaws are much pained, yet there is no redness or Tumor inwardly in the Jaws, not outwardly in the Neck: the tongue is livid, black and retorted, or bent by reason of the great fulness of the Veins about it. There useth also to be an acute Feaver, you may find an acute description of this kind of Angina in *Hip. 3. de morbis.* And this is remarkable, which is observed of few, The inward Muscles of the *Larynx* are not here only affected, but the Lungs themselves, from whence is difficulty of breathing and Suffocation, which *Dodonæus* observeth very well, *Obs. Med. cap. 18.* where he relates a History of a Butcher, who at noon felt a pain about his Jaws and Throat, and some diffi-

culty in swallowing, and died strangled in the same night; his Body being opened, the substance of his Lungs were found turned into Matter.

He gave other Examples, *Anno 1565.* in which year many had the Angina, with pain about the *Larynx*, which ceasing, they fell into *Peripneumonia*, and they being opened after death, had either their Lungs full of water or imposthumated; but nothing was perceived about the *Larynx* or its Muscles, which might shew an inflammation: And in these causes he supposeth that the *Larynx* did not suffer principally, but by consent; and it is probable that the *Aspera Arteria*, or rough Artery and its branches may be filled and extended with the Humor flowing from the Head; and then if the Humor be sent to other vessels, the *Aspera Arteria* and *Larynx* are freed from pain, and the Lungs are infected, and so an Angina may turn into a *Peripneumonia*. We may gather that the Lungs may be affected in an Angina, from *Hippocrates*, 4. *acut. text.* 30. & 31. where he lays down two kinds of Angina's from the diversity of the humors: one, in which a flux of Rheum in Winter and Spring is carried to the Jugular veins; another, in which Choler abounds, which is in Summer and Autumn. Of the last he speaks thus, When a hot and salt defluxion comes from the head, being sharp, it gnaws and ulcerates, fills with Spirits, brings an *Orthopnea* or difficulty of breathing with the Neck stretched forth, and much drought. Besides, there is no Tumor; the Tendons of the Neck behind are stretched like a Cramp, the voice is hindered, the breath is little, and often stopped, such have the Artery ulcerated, and the Lungs inflamed, so that they cannot beath. Thus *Hippocrates*, he saith also that a hot and sharp defluxion will bring an *Orthopnea*, because it biteth, ulcerateth, and filleth with Spirits, which are carried to the place hurt; hence comes the filling of the Lungs, from whence *Orthopnea* comes: when there is no room for receiving of the external Air, how much soever the Lungs be enlarged. *Hippocrates* affirms this, 3. *de morbis*. where in the Cure of a Quinzy, he saith, the vein under the Breast or Pap is to be opened, for in this part there is a hot Spirit from the Lungs, and a little after he saith, You must make hast to cause spitting, and that the Lungs may grow less, as if the lungs were swollen by the hot spirit contained therein. But it is most remarkable, that when the spirits are carried in great plenty to any part, there is also Blood carried therewith, which if it flow in such a quantity, that it cannot be well governed by Nature, it useth to make inflammations and imposthumes, from whence it is no wonder, if in such an Angina the lungs become purulent or full of water.

In a *Parasynanche* the breath is less difficult than in a *Synanche*; but more difficult than in a *Synanche*, when there is some redness and tumor about the Jaws.

A Bastard Angina is known by the Flegm, by want of a Feaver, by the plenty of humors flowing to the Mouth.

But a Bastard Angina coming of luxation is known by the hurt motion of the Head and Neck, and by the preternatural Cavity which appears in the Neck by reason of the *Vertebra* inwardly depressed.

The knowledge of Causes is taken from the universal and particular signs of the Humors predominating in the whole Body.

When an Angina comes of blood, there is heat and redness in the face, and a great distention in the part affected. When it comes of Choler, the pain and heat is greater with thirst, bitterness in the Mouth and sharpness. And if it comes from flegmatick blood, the pain and redness is less, and the Feaver little.

From the part affected, some knowledge of the humor offending may be had. For cholerick blood for the most part maketh an inflammation in the Muscles of the *Larynx*; but flegmy blood goes rather to the Jaws, for when the Veins of the *Larynx* are small, only thin blood goes thither; but the Jaws being loose and spongy, do more easily receive the flegmatick humors.

Finally, From the time of the year you may know the peccant Humor; for Cholerick Angina's do come chiefly in the Summer and Autumn, because in the Summer Choler breedeth, and in Autumn it is retained. But flegm breeds in Winter and the Spring, because the Humors gathered in Winter are then melted and sent from the head into the inferior parts.

PROGNOSTICK. A true Angina is a most acute Disease, and very dangerous by reason of the hinderance of respiration; and for strangulation, which sometimes happens by the stoppage of the Passages, by which respiration is made. Therefore by how much the greater the constriction, so much the more danger, and so the first kind of Angina is most dangerous, because the inflammation of the internal Muscles of the *Larynx* doth more stop the passage, Whence *Hippocrates Aph.* 34. *Sect.* 4. saith thus; If a Suffocation comes presently upon a Feaver, and no Tumor in the Jaws, it is mortal. Which Opinion he confirmeth in *Coac. & progn.* saying, that these kinds of Angina's do strangle in the same day, and in the second, third and fourth.

The second sort of Angina, though it be very dangerous, yet it is not altogether deadly as the first, because the inflammation of the external Muscles of the *Larynx* doth not make so great and so sudden a constriction. Of this *Hippocrates* speaks, 3. *Progn. text.* 17. thus: Whatsoever Angina's do resemble others in pain, and make a Tumor and redness in the Jaws, are very deadly, and are of longer continuance than others if they be very red.

The

The third kind is less dangerous, because the breath is less hindered than the swallowing from the inflammation of the internal Muscles of the Jaws: but the Swallow hurt is not so dangerous. Of this Hippocrates speaks in the Book above cited, Text. 18. in these words: *If the Jaws and Neck are red, these Angina's continue longer; but they are chiefly preserved who have red Necks and Breasts, and the holy fire without, not within.*

The fourth kind is least and safest, because the inflammation is furthest from the Throat. Hence Hippocrates, Aph. 37. Sect. 6. saith, *If a Tumor appear in the Neck in him that hath an Angina, it is good, for the Disease comes forth.* He confirms the same in 3. Progn. text. 20. thus: *But it is most safe to have a Tumor or redness come forth.*

Hippocrates seems to comprehend all these differences in one sentence, 6. Epid. Sect. 7. where speaking of the signs of an Epidemical Angina, he saith: *In the sum of all, to them that could only not swallow, the Disease was mild, and easie to be endured; but it was desperate to them who had withal a difficulty of breathing.*

If the matter causing the Angina be carried to the lungs, either the Patients die, or else turn fools or Emphyrick, that is, imposthumated between the breast and lungs; as Hippocrates, Aph. 10. Sect. 5. and 3. Progn.

In an Angina that is strong, if the Patient foam at the mouth it is deadly, Aph. 43. Sect. 2. for it shows a great streightness about the Heart, and violent heat, from which the proper moisture of the lungs is squeezed forth, and carried to the mouth in a kind of froth.

They who have an Angina, if they spit not concocted matter, but a little, viscid, slimy and thick, are desperate, Hip. in conc.

The Tumors of the Jaws in an Angina suddenly vanishing without reason, are deadly, Hip. in coacis. Without cause or reason, that is, without a precedent Evacuation by Art or Crisis; for it signifies the returning of the matter inward, from whence a more dangerous disease may be in the internal parts; or as it sometimes falls out, the matter returning to the same part makes a sudden Suffocation.

CURE. The Cure of the Angina is made by the same indications which are observed in the cure of all Inflammations, so the humor flowing to the part is to be revelled and repelled, that which is there to be derived and dissolved: but if it cannot be dissolved, it is to be digested and suppura-
ted; all which may be done as followeth.

First, Appoint a slender, cooling and moistening Diet of Barley, Cream, Chicken Broth or Capon Broth, with cool Herbs and the like. If the Patient cannot swallow by reason of the narrowness of the Oesophagus, so that from thence you fear lots of strength and death; you may free him from that danger by putting down a Catheter into the Oesophagus, to which you may fit a Syringe, by which you may send Broth into the Stomach. The Practical Physicians use nourishing Clysters, by which some Nourishment may be carried from the Liver to the Meseraick Veins. Let his Drink be Barley Water, and other things used in acute Feavers. Let the Air be temperate and without extremity, for the cold will stop the Pores, and the hot will increase the Defluxion and Inflammation. The Patient must lie with his Head high, and his Neck upright, that he may better breathe: he must avoid much sleep, as in internal Inflammations: for as Hippocrates saith, blood runs inward in time of sleep, and so the confluxion of Humors to the part affected will be increased.

But since Angina is a most acute disease, and sometimes kills a man in one day, you must use great Remedies with much diligence. Therefore in what hour soever the Physician comes, let him presently let blood on the same side that is affected out of the Head-Vein; or if that appear not, out of the Median, to a pound, or a pound and an half, or two pound, as much as his strength will permit, for in this there is most hope: but you must not take all that blood away at once, lest the Patient faint, by which he would be in danger: but by degrees and intermission, at every third and fourth hour. This kind of blood-letting is so necessary in this disease, that it may be hindered by no contrary Indication. So in the flowing of the Terms or at any other time you must take blood in a great quantity. Of which we have a President in Zacutus Lusitanus 2. Prox. admir. cap. 135. of a Woman which was in her seventh month great with Child, and was taken with a Quinzy: but being seven times let blood in one day was cured. If the disease be not violent, you must first give a Clyster: but if otherwise, afterwards.

While Phlebotomy is iterated, make other Revulsions in the same day with Cupping glasses, both dry, and with scarrification upon the shoulders and loyns, make frictions and painful ligatures upon the extrem parts.

Having bled enough, fall to purging the next day, not expecting the concoction of humors, because the disease admits of no parley: therefore give one proper to the humor, nay, if the disease do constrain you, let blood, and give a purge, both in the same day: as Trallianus did by his confession, Lib. 4. Cap. 1. in these words: *I surely remember that I (when occasion required) opened a Vein in*
the

the morning, and afterwards the Veins under the Tongue, and at night gave a purge of the extract of Scammony in Broth, and could scarce hinder strangulation for all that. And in another, after I had opened the Veins in both the Arms, I purged him the self same day.

Now your Purge must be of gentle things, if the Disease come of Choler, lest the humors should be moved too violently, and so come to the part affected. Also if the Inflammation come only of Blood, it is better to abstain altogether from purging. But if Flegm run with it, make stronger Purges, and give Agarick and Diaphœnicon with Senna: nay, in a strong flegmatick Angina you may rise to those Medicines which cause violent vomiting, and amongst the rest, the *Aqua Benedicta* of Dr. Rowland is the best, which given to the quantity of two ounces doth wonders, and for the most part cureth the Disease in the space of two hours. Moreover, it hath no evil tast, and so may easily be sipped up, which you cannot do in other Medicines, which by reason of their evil tast cannot be taken but at one draught by the Patient; therefore they can seldom be purged till the passages are a little opened. But that is supplied by often Clysters, and therefore they who cannot take *Aqua Benedicta* Rowlandi, by reason of its heat or their wetkness (because they must be strong who take it) nor any other Medicine, must use often Clysters that are very sharp to draw down the Humors.

For the same Revulsion, it is good to apply Cupping-Glasses to the Neck and Shoulders with scarification, Frictions and Ligatures to the lower parts, and to wash their Feet with hot Water.

But a Vescicatory to the Neck behind, doth more strongly revel the humors flowing from the head which you must do presently after Blood-letting.

After Revulsions are sufficiently and diligently made, you must derive the humor from the part, and first open the Veins called *Ranula* under the tongue, it is commended by *Hippocrates Galen* and the Modern Physicians, by which the blood which doth immediatly cause the inflammation, is drawn forth.

The Ancients in a desperate Angina open the Jugulars, which though some late Writers have approved, yet it is out of fashion being thought dangerous by reason of the bleeding, which can scarcely be stopped, by reason of the largeness of the Veins. But Experience hath taught that this operation is not so dangerous if it be well administered. First then, bend the Patients head on one side as much as you can, till his chin almost touch his shoulder; then open the Vein without a Ligature with a small Orifice, according to its longitude, for so it will more easily cicatrize: and having taken a sufficient quantity of blood, bring the head to its natural position, and so sometimes the Blood will stop of its self. But you must presently apply *Galens* Emplaster described 5 *Meth. cap. 4.* made of Hares hair, Aloes, Frankincense and the white of an Egg, so the flux of blood is surely stopped. *Trallianus* reports in *Lib. 4. Cap. 1.* that he cured many of the Quinzy with opening of the Jugular Veins: and *Zacutus Lusitanus, obs. 89. lib. 1. Praxis admir.* tells of a Spaniard which was cured of a most violent Angina.

A Cupping glass with Scarification under the Chin is good for derivation, by which *Zacutus Lusitanus, obs. 88. lib. 1. Praxis admir.* saith he cured a Woman of a *Cunagche*, or Dogs Quinzy.

Scarifications under the Jaws and upon the Neck are good, if deep, by which means *Benivenius*, saith in *lib. de abdit. morb. caus. cap. 38.* *Nicholas Rota* was cured of a desperate Angina, whose story *Sennertus* hath fully related, *Pract. Med. lib. 2. part 1. cap. 24.*

While the aforesaid Medicines are used, the inflammation of the Throat and Jaws is to be allayed with Topicks, and they are to be varied according to the time, as in other Inflammations, so in the first Repelling Medicines are good made into Gargarisms, that they may presently touch the part inflamed.

Take of Plantane, Nightshade and Woodbine water, of each three ounces: Syrup of Mulberries three ounces, Sal prunelle one dram and an half. Make a Gargarism.

Or of a Decoction thus:

Take of Plantane, Sorrel, and the tops of Brambles, of each one handful: the grains of Sumach half an ounce: one Pomegranate beaten with grains and peel: red Roses one pugil, make a Decoction to a pint: Dissolve it in straining Syrup of Mulberries, and the composition made of Nuts, of each one ounce and an half, Sal prunelle two drams: Make a Gargarism.

Concerning Gargarisms, you must observe, that they are to be suspected, because the parts inflamed are moved thereby which should be at rest: but you may remedy that, if you hold the Gargarism in the mouth, turning backwards, and move it.

Without Gargling, you may use the Spirit of Salt, Sulphur or Vitriol, which mixed with water to qualify their sharpness, are to be taken by little and little: for by passing through the part affected, they qualify its heat: and being sent from the Stomach to the Liver and Veins, it allays the heat of the Blood, which Remedy is also good in the Inflammation of the Jaws and Tonsils.

While you use repelling Gargarisms, you must apply outwardly to the Neck loosening and resolving Liniments, that the matter may be brought forth thus made:

Take

Take of Oyl of Camomel, Lillies and sweet Almonds, of each one ounce, Hens grease and fresh Butter, of each an ounce and an half: Saffron one scruple, Make a Liniment to be applied with greasy wooll.

This Liniment will assuage pain, which if violent, it may be qualified also with a Gargarism made of Milk, or an Emulsion made of the four great cold seeds, or of Mucilages of Fleabane and Quinces, drawn with Rose Water, adding Syrup of Violets, or Cassia dissolved in Whey, or in a Decoction of Marsh-Mallow Roots.

After the beginning of the Disease, when it encreaseth, or is at a stand, you must mix Digesters and Dissolvers with Repellers, which must be done the second day, because the Disease is most acute.

Take of the Leaves of Hyssop and Plantane, of each one handful: Liquoris, Raisins stoned, of each one ounce; fat Figs twelve: Red Roses and Barley, of each one pugil: Make a Decoction of a pint. Dissolve in the Strained Honey of Roses, and Syrup of Violets, of each one ounce. Make a Gargarism.

Observe, That as long as the Inflammation continueth, you must mix some things that repel with Dissolvers and Astringents, lest the part which by Nature is soft, should be more relaxed, and made more fit to receive a Defluxion.

But outwardly you must apply Dissolvers most with a Swallows-Nest, which by the Opinion of all Writers hath a specificall property against this Disease.

Take of the powder of a Swallows Nest, and of Album Græcum, of each one dram: the powder of Flower-de-luce Roots and Camomel, of each half a dram; Hen grease and Oyl of Lillies, of each one ounce, yellow Wax a little; Make a Liniment.

Or it may be made into a Cataplasm thus:

Take one Swallows Nest, Mallows, Violets, of each one handful: Althæa Roots, Lilly Roots, of each half an ounce; fat Figs three or four; Camomel and Melilot Flowers, of each one pugil; boyl them and beat them, then put to them Barley meal, Linseeds and Fœnugreek, of each three drams: Saffron one scruple; fresh Butter one ounce; Oyl of Camomel and sweet Almonds, of each as much as will make a Cataplasm to be applied to the fore part of the Neck.

In the mean while you may use Eclegma's, or things to be licked now and then, that the Matter which breaks forth of the part, or falls upon it from the head may be cleansed.

Take of the Powder of the Electuary of Diatrageacanth frigid two drams: Simple Diaireos one dram: Sugar-Candy and Penides, of each half an ounce: Diamoron one ounce: Syrup of Tujubes as much as is sufficient. Make a Lohoch.

If the Tumor will not be discussed, but tendeth suppuration, which useth to be upon the fourth or sixth day, you must assist it with the Cataplasm aforesaid, and other Emollients and Suppuratives, and he must hold those Medicines at the same time in his mouth, which were prescribed formerly for asswaging of pain. Or,

Take of sliced Liquoris and Raisins stoned, of each one ounce: fat Figs six: Althæa and Quince seeds, of each two drams: the flowers of Camomel one pugil: boyl them in Hydromel. Dissolve in the straining; boyled Wine two ounces. Make a Gargarism.

It is also good to hold Cassia new drawn in the mouth, that by degrees it may dissolve into the Throat, for it asswageth pain, dissolveth and maturateth.

If the Tumor come to suppuration, which may be known by the decrease of symptoms, and will not break, let the sick man, or some about him, put their fingers into his mouth, and endeavour to break the Imposthume, which if it cannot be done, let his mouth be wide opened with a Speculum oris, and then open the imposthume, with a crooked incision knife called a Bistort. Then let the Patient hold down his Head, lest the Matter fall upon his Lungs; after wash the Ulcer with Barley Water and Honey of Roses, Water and Honey called Hydromel, or Wine and Hony called Oinomel; after this, dry it up with Allum Water.

Others put a Wax Candle anointed with Oyl of sweet Almonds into the Oesophagus to break the Aposthume; which if they cannot do, they use a sharp wooden knife, or at last an incision knife.

Others touch it with the Oyl of Vitriol, which presently breaks it, Arculanus opens it with a Lancet fixed at the end of a stick, lest it should touch other parts. Faventinus commends the same, in these words; Take a little round stick, and in the end of it, fix a little sharp Iron as long as half a finger: then open the mouth, and put a stick between the Teeth, then let him open the Imposthume with the former Instrument: when it is open, let him bend forward with his mouth open, that the Matter may come forth.

Schenckius out of Dovynetus, used to break an Imposthume with the Decoction of Agarick, and confirmeth it by the following History taken out of Dovynetus, Apolog. lib. 3. cap. 1. A Noble Woman called Gabriella Groufier, Lady of Saulton, being taken with a Quinzy in Autum, which is

is most dangerous; I remembred that I read in Aetius, lib. 15. cap. 6. That Agarick doth destroy hidden imposthumes, or draw them forth; presently I took Agarick and cut it, and steeped it in the decoction of Althæa with the fourth part of White Wine and Figgs, and a little Ginger, with a little Syrup of Marsh-Mallows; and gave it to the Lady to drink, commanding that she swallow it not down suddenly, but hold it in the mouth a little, if she would be cured: she obeyeth, and while I was talking with her, behold abundance of white stinking Matter came forth of her Mouth, in so much that her Daughter that held the Basen fainted, the other People ran away, others came and took away the Matter, others perfume the Room: which done I came to the Patient, and found her delivered from the impediment in her voice, difficulty of breathing, and her Feaver; and out of all danger.

If the Matter seem to tend to the external parts, you must open it outwardly; which Lanfrank saith, he did with good success, Chir. mal. doct. 2. tract. 3. cap. 5. in these words: Because the Coururgeon is much confirmed by good experience; I will tell you what befel me in the City of Milan, with a Lady of fifty five years old, which had a flegmatick Quinzy in the whole Throat, inwardly and outwardly, but outwardly it appeared most swoln, and she could neither speak nor swallow: being sent for, I felt her Pulse, and found her exceeding weak; touching the part affected I found the matter very deep, and that she was more likely to be choaked, than that it should break either internally or externally: then I got ready my Rasor, and touched the place with my fingers, I found ripe Matter between the Chin and the Epiglot, and there I made a deep Incision, by which I drew forth a great part of the corrupt Matter, but willingly left a great deal behind, for a reason known; then her breath grew better, and pulse stronger; then giving her Broth, a great deal of it came forth of the Wound: then I invented a silver pipe which should pass the Wounds, being put into the mouth, and by which she should receive her nourishment, I used Mundifications and Maturationes to the whole Throat and Neck, till I drew out of the Wound a great piece of viscons Matter, and stinking like a Gut, as long as my finger, which was condensed by heat; which taken away, the place did no longer stink, and the Patient began to chear up; but I continued to mundifie, and after with Incarnatives and Cicatricsers, I heal'd up the Wound, and the Patient was cured.

Here may be related the History of Beniven before mentioned, of one in a Quinzy, who was left of other Physicians, and was cured by him with deep scarrification under the Jaws, and in the Neck, from whence much Matter flowed.

If the Aposthume break inwardly in the Mouth, let it be cleansed with Barley Water and Hydromel (as is said.) But sometimes the Ulcer is foul, and then you must use stronger, thus made:

Take of Scabious and Agrimony, of each one handful: Cypress-Nuts one dram: Flower-de-luce Roots, and round Birthwort, of each half an ounce: Myrrh half a dram: Red Roses two Pungils; boyl them in Hydromel to a pint; strain it, and wash the part ulcerated therewith.

This Decoction is very good to cleanse an Ulcer; but if it be not sufficient, use the Collyrium of Lanfrank, which is wonderful.

After it is well cleansed, you must endeavour consolidation with Bole-Armeniack mixed with Honey of Roses for an Eclegma, with Frankincense and Myrrh.

It comes to pass sometimes that the Inflammation decreasing, the Tumor will neither be dissolved nor suppurated, but grow harder; in which case you must use Emollient and Suppurating Cataplasms, made thus:

Take of Althæa and Briony Roots, and of the wild Cucumer, of each one ounce: Mallows, Pellitory, Origan, and the lesser Centaury, of each one handful; fat Figgs, six or seven; Linseed and Fennugreek, of each one ounce; Boyl them, beat them, and strain them, and then add of the Powder of a Swallows Nest burnt, and of Album Græcum, of each three drams; Brimstone one drame; fresh Butter, and Ducks Grease, of each one ounce: Oyl of Dill two ounces. Make a Cataplasma.

For Conclusion, We will speak something of Laryngotomia, or cutting of the Wind-pipe, which Antient Physicians mentioned, and the Modern approve and confirm by experience. As when in a desperate Quinzy, when the Patient is almost choaked, an incision is made in the rough Artery, by which there is a passage for Air into the Lungs, and for vapors coming out of them. This Avicenna alloweth, Fen. 9. lib. 3. cap. 11. Paulus, lib. 6. cap. 33. Rhasis, 3. continuentis. Alsabaravius, Avenzoar, Albucasis, and Halibbas in their proper Chapters.

Galen sets down the same out of Asclepiades in his Introduction, chap. 13. Of the Modern Brasavolus comment. in lib. 4. Of Hipp. concerning Diet in acute Diseases, Sect. 35. saith that he made this operation with his own hands, and had good success.

But

But this is seldom used by Chirurgeons for fear of disgrace through the death of the Patient: for men are more apt to make the operation the cause of death than the Disease, although the Physician hath been very careful, and foretold them the danger.

Moreover, In a desperate Angina the Lungs are often affected and full of humors, whence comes Suffocation, and then the Incision of the rough Artery will not profit. Which danger *Jerom Fabricius ab Aquapendente* observing, being a good Chirurgeon, saith, That he never undertook this Operation, nor any other in his time. But he confesseth it may be used, so that the Lungs and rough Artery be not full of filth: and he sheweth the manner of it in its proper Chapter most exactly, from whence any one may take it.

The End of the Sixth Book.

Y

THE

THE
SEVENTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Breast.

The Preface.

B*Y this Name Thorax or Breast, we mean those parts onely which serve for Breathing: for although the Heart be contained in the Thorax, yet the Diseases thereof shall be set down in a Book by themselves. But in this we will only speak of those which hinder breathing, and hurt the parts of Respiration; as Asthma, Pleurisie, Peripneumonia or Inflammation of the Lungs, Empyema and Phthylis: and we have ordained proper Chapters for each of them.*

CHAP. I.

Of Asthma, or Difficulty of Breathing.

DIFFERENCES.

T*He Breath is hindred by divers Causes, either by sympathy or propriety of part. The hindrance of breathing by propriety called Idiopathica, comes from the Lungs distempered, and therefore every disease of the Lungs hurts their action, which diseases are either in the substance of the Lungs, or in the Vessels thereof.*

In the substance of the Lungs come Inflammations, Pimples, Imposthumes, Ulcers, and sometimes a drying and atrophy of the part; sometimes a serous watry humor is sucked into the spongy substance of the Lungs, and hinders their free dilatation; sometimes (though seldom) there is a Schirrus, a stone or hard swelling in them.

In the Vessels of the Lungs there are often Obstructions, which hindring the free passage of the air cause difficulty of breathing.

Breathing is hindred by sympathy or consent from other parts which are not only near, but remote: so the Membrane that goeth about the Ribs being inflamed, or the Diaphragma, or Mediastinum, the breath is hindred. So there is a great and often breathing when the heart is inflamed, as in Feavers: and on the contrary, when the Heart is cold, as in dying men, it is diminished and

and ceaseth: the same happeneth in swooning or Syncope, when the action of the heart and consequently Respiration ceaseth.

So in the Empyema, or Dropsie of the Breast, when matter or water is collected in the Cavity of the Thorax, the Dilatation of the Lungs and Respiration is also hindered.

So the Muscles of breathing being hurt hinder Respiration, as in Wounds and Tumors of them, especially in an Apoplexy, when the influence of the Animal Spirits is kept from them.

Moreover, the inflammation of the Muscles of the Larynx makes difficulty of Breathing in a Quinzy.

So also the Diseases of the Hypochondria do hinder Respiration by consent, as Tumors of the Liver, Spleen, Sweetbread or Pancreas, do by their weight draw down the Diaphragma to which they are joyned, and so hinder the motion of it. Also vapors and wind sent from those parts compress the Diaphragma and hinder its action, from whence comes a flatulent *Asthma*. The same happeneth by the abundance of Wind or Water contained in the belly of an Hydromical man, and compressing the Diaphragma. Lastly, Vapors coming from the Mother hinder Respiration, from whence this Disease is called *Suffocatio Hysterica*.

Among the aforesaid hindrances of Respiration, the *Asthma* is handled by it self, because the other depend upon other Diseases, they shall be mentioned in their places.

Although *Asthma* used generally comprehendeth in a large signification all kinds of difficulty of breathing, yet it signifies more specially that shortness of breathing which comes from the stuffing of the lungs, and the obstruction of the Bronchion or Gristles of the Windpipe, which of its self essentially is without a Fever, although sometimes it be joyned therewith. And again, it is subdivided into three other kinds: as first, *Dyspnœa*, the second called also *Asthma*, the third *Orthopnœa*.

Dyspnœa is a difficulty of breathing, in which the breath is drawn oftner and thicker, from the stuffing of the lungs. This is less than *Asthma* or *Orthopnœa*, because the matter obstructing is less, and it rather stops the substance of the lungs than Gristles or Bronchia: hence it is that there is no rattling at all, which comes from the commotion of the humors contained in the Bronchia, with the Air continually passing through.

Asthma is a great and often breathing, in which the Diaphragma, the intercostal Muscles between the Ribs and the Abdomen are violently moved, joyned with rattling and wheezing. For in a true *Asthma* properly so called, the Bronchia of the Lungs are filled with Flegm, which (as is said) being moved by the Air, make that noise.

Orthopnœa is a great difficulty of breathing, in which the Patient cannot breath but sitting, and with the Neck extended upright; and the aforesaid Muscles are not only moved vehemently, but also those of the Breast and Shoulders.

The names *Dyspnœa* and *Orthopnœa*, as we said of *Asthma*, are used commonly for all difficulties of breathing which happen in Pleurisies or Inflammation of the Lungs, or the like.

The same may be said of *Apnœa*, which doth not only signify a depravation of breathing as the former, but also diminishing or abolishing thereof; and this happeneth in Syncope, Hysterical Passions and strong Apoplexies.

CAUSES. The humor which causeth an *Asthma*, is for the most part Flegm, which falls from the Head into the Lungs, and obstructs the Bronchia or Windpipe. Sometimes it comes from crude and serous humors brought by *Arteria Venosa* into the Lungs, and if these flow to the Bronchia, they produce a true *Asthma* with rattling; but if to the substance of the Lungs or smooth Arteries, they cause a Bastard *Asthma* without rattling.

This kind of *Asthma* which is unknown to vulgar Physicians (who will acknowledge no other cause but a defluxion from the head) is confirmed not only by not rattling, but from the thick and turbulent Urine of the Patient at that time, especially in the fit, because some part of those thick and crude humors in the Veins is sent to the Reins and Bladder. And some Asthmatical men are subject to stoppage of Urine, and when they are so, they are free from it. But when the Fit of the *Asthma* comes, the difficulty of Urine ceaseth, because the matter of the disease contained in the Veins, goes from one place to another. We have also seen some subject to a Flux in the Belly, who while they were so, were free from the *Asthma*, but when that stopped, the *Asthma* returned. Moreover, this kind of *Asthma* which is without rattling, is so directly opposite to bleeding, that when a Vein is opened in the Fit, as soon as it bleedeth, the Patients begin presently to breath better, and in the end, or after a little space, they are cured of their Fit. And finally, these kind of Asthmatical men are for the most part of an ill habit of body, and have an œdematous humor in their feet, which sheweth that the cause of the *Asthma* at that time came from the Liver, and is contained in the Veins, so that sometimes a Dropsie followeth in many. Hence *Aretæus* reckoneth a wind in the Midriff and belchings without reason among the signs of an *Asthma* at hand, which certainly do come from a crude matter moved in the Midriff.

That flatulent matter doth of its self sometimes produce another kind of *Asthma* which is called

Asthma flatulentum, or *Hypochondriacum*; when many thick vapors rising from the Hypochondria, do compress the Diaphragma and hinder its motion, whence comes great difficulty of breathing without ratling.

DIAGNOSTICK. The knowledge of this Disease and its kinds, may be by what hath been said. In a *Dyspnœa* the Breath is thick, without noise or anhelation, and with less trouble.

In an *Asthma* the breast is more heavy, the breath thicker and quicker, with anhelation, ratling and wheeling.

But in *Orthopnœa* the Patient cannot breath but with his Neck upright, and if he lie down he is ready to be choaked.

SIGNS. The Signs of the Causes are these:

If *Asthma* come from gross humors gathered in the Lungs, the difficulty of breathing comes by degrees, by little and little, and is continual.

But if the humors come at a distance from other parts into the Lungs, the difficulty of breathing is not continual. For albeit *Asthma* which comes from matter contained in the Lungs, useth to be increased by external causes, as Anger, Southernly winds and the like; yet in *Asthma* which comes from matter flowing from another part, the increase is more manifest. If this matter come from the Brain, there is a manifest Catarrh; but if no signs of a Catarrh appear, you must conjecture that the matter comes by the Veins to the Lungs, and the swelling of the feet and evil habit of the body called *Cachexia*, is a sign that the Liver is affected.

If a thick humor be contained in the *Bronchia* of the Lungs, the Respiration is with noise and a Cough; as also by spitting the Disease ceaseth or is diminished.

If the humor be in the Veins or substance of the Lungs, there is no noise, and there is seldom any spitting by Cough.

PROGNOSTICK. An *Asthma* is a Chronical Disease, and very hard to be cured, and often ends in a *Cachexia* or Dropsie. Young men are sometimes cured, and not without great labour, but old men never. Infants except they be speedily cured die by a Catarrh, which followeth.

They who grow crooked upon an *Asthma* or cough, die before they come to ripeness of age, because the gibbosity hindreth the convenient growth of the breast, nevertheless the Lungs get their due increase and bigness, but have not room enough to dilate themselves; from whence the heat of the heart being not sufficiently fanned, the Patient dieth.

A Pleurisie or *Peripneumonia* coming upon an *Asthma* is deadly, because the Lungs being weakened by a long disease, cannot resist so great a Disease coming thereupon and expel the matter.

CURE. The Cure of the *Asthma* is twofold, namely, in the *Paroxysm*, and out of it.

In the Fit presently you must open a Vein, a Clyster being given, if the blood do seem any way to abound, for when the Veins are empty of blood, the Respiration is more free. But if the Disease be elder, and blood hath been often drawn, it is better to abstain from bleeding, because by diminishing the natural heat it will encrease Flegm.

It is good to open the Veins in the Ancles in this disease coming by consent from other parts.

After bleeding, or if it be omitted as not thought fit, you must purge Flegm with the things prescribed in the cure of the cold distemper of the Brain, putting to them always things proper for the Breast as much as may be.

Vomits although disallowed by some in this disease, yet are they most convenient as frequent Experience hath taught, and sometimes the fit is taken away with a Vomit only.

Among these the chief is *Aqua Nicotiana*, or Tobacco-water given in the quantity of an ounce; and it may be made into a Syrup with Sugar: In want whereof you may use the salt of Vitriol, or *Aqua benedicta Rulandi*. Now the reason is excellent why Vomits do so much good in this disease, for while the thin humor falling from the head insinuateth it self into the *Aspera Arteria*, and the *Bronchia* of the Lungs, and the thick falls into the Stomach, and there is so fixed that it can scarcely be taken away: And while the weak heat of the Stomach doth stir the matter, thick vapors are produced, which puffing up the Stomach, compress the Diaphragma, and cause difficulty of breathing. Hence it comes, that when the Stomach is emptied, the fit ceaseth, or is much less. Moreover, an *Asthma* sometimes (nay often, according to *Sennertus*) cometh of crude humors about the Liver and in the Veins, which are carried by the *Vena Arteriosa* into the Lungs, and compress the *Bronchia* from whence cometh an *Asthma*. For the evacuating and revelling of these humors from the Lungs, a Vomit is very good. As also for this cause, the remedies purging humors downward are very excellent.

The juyce of Flowerdeluce doth gently move and purge downward, taken to the quantity of half an ounce, with one ounce of Hippocras, which *Platerus* in his Observations saith, he hath used with good success.

You may give two ounces of the juyce of Flowerdeluce, if the former did not work sufficiently.

Also

Also you may use sharp Clysters often for Revulsion: But they must be given in small quantities, lest by filling the Bowels the Diaphragma be compressed.

You must also use Frictions to the inferior parts, and apply many Cupping-Glasses thereon, as also to the Neck. Afterwards you must extenuate and dissolve the thick humors, and discuss the vapors that come from them. For which purpose you may give a spoonful of Cinnamon-water either by it self or with Syrup of Violets: As,

Take of Cinnamon-water two ounces: Syrup of Violets one ounce: or instead of that, mix with the Water one ounce of Oxymel to discuss the humors better.

It is also profitable to give three or four or five drops of Chymical Oyl of Sage, Rosemary, or Anis-seeds with a little Wine: or sprinkle therewith the Tablets of Diatragacanth frigid, and so let the Patient eat them.

Others commend one scruple of Saffron given in a spoonful of Wine. Also *Aqua Claret* thus made, is very good:

Take of Aqua-vitæ four ounces; Water of Coltsfoot and Scabious, of each two ounces; Cinnamon six drams; strain them through an Hippocras Bag. Let them take two or three ounces.

Tobacco taken in a Pipe hinders the fit, so doth the leaf chewed, and also the smoke of Cloves in a Pipe.

In the mean time you must use expectorating Medicines, which bring forth the thicker matter upwards. As,

Take of the Syrup of Horehound, Liquoris and Coltsfoot, of each two ounces; Oxymel simple one ounce. Mix them, and let him lick it by little and little.

Take of washed Turpentine one ounce; Ammoniacum two scruples: Flower of Brimstone one scruple; mix them into soft Pills, of which let him take one every second hour with half an ounce of the Syrup of Hyssop.

Take of the Oyl of sweet Almonds new drawn without fire, six ounces: Sugar Candy two ounces. Mix them for a Linctive. Or,

Take of candied Elicampane three drams: Sugar Candy half an ounce: Syrup of Hyssop and Horehound, of each one ounce: Ammoniacum dissolved in Aqua-vitæ half a dram. Mix them for a Lohoch. Or,

Take of Conserve of Violets and Elicampane, of each six drams: the powder of the Electuary Diatragacanth frigid, Diaireos Solomonis, of each one dram: Syrup of Violets and Maiden-hair, of each as much as will make a Lohoch. Or,

Take of Althea roots one pound: Elicampane four ounces: Quinces or Marmalet thereof, sixteen ounces; boyl them in water till they are dry. Beat them and strain them, adding two Pints of Honey: boyl them again gently. Take them from the fire, and add of Cinnamon one dram; flour of Brimstone half an ounce: Liquoris perfumed with Musk and Rosewater, two drams. Make a soft Electuary; of which let him hold now and then as much as a Hazel-nut in his mouth: 'tis also very good to take half an ounce thereof Morning and Evening when the fit is off.

Also you must anoint the Breast with mollifying and discussing Oyatments and Liniments, thus made:

Take of the Oyl of Camomel, Flowerdeluce and sweet Almonds, of each half an ounce; fresh Hens grease one dram: the powder of Marsh-mallow-roots and Flowerdeluce, of each one dram: the Meal of Linseed and Fenugreek, of each two drams; Gum Ammoniacum dissolved in Wine one dram and an half; Wax as much as is sufficient. Make a Liniment. Or,

Take of the Mucilage of the Seeds of Quinces, Line and Fenugreek drawn with Scabious and Coltsfoot-water, of each six drams: the Powder of Flowerdeluceroot and Hyssop of each half an ounce; Saffron one scruple: Oyl of Lillies and sweet Almonds, of each two ounces: Wax as much as will make a Liniment.

If the fit be long, clap a Vesicatory to the hinder part of the Head.

Out of the fit you must stop the Defluxion, and so cut, cleanse and expectorate that which hath fallen into the Lungs.

For staying the Defluxion, all those Remedies are good which were mentioned in the Cure of the cold Catarrh.

But you must take a Caution concerning some of them.

First, In Apozemes, Syrups and the like, you must not make them too hot and dry, which by consuming of the thin parts, may make the remainder thicker, and so the parts will be worse; but you must rather mix moistners, as Raisins, Figs, Liquoris, Jujubes.

Secondly, Instead of Head-Medicines, you must use things fit for the Breast above-mentioned.

Thirdly, For the Derivation of the humors that abound in the Head, use Errhines, Sternutatories, Gargarisms or Apophlegmatisms, which last are not so proper, by reason of the nearness of the parts

part by which the humor runs to the Lungs. But Errhines and Sternutatories may be used safely.

Fourthly, To strengthen the head and dry it, Fumigations are there commended, which are not so proper in this, especially if taken in at the Mouth and Nostrils, because they make the breath shorter and bring the Fit: but with them you may air the Patients Caps without from the Chamber.

For to cleanse and expectorate the thick Humors that stick to the Bronchia of the Lungs, the Medicines already mentioned; or these following may be used:

Take of Elicampane-root and Polipody of the Oak, of each half an ounce: the Leaves of Origan, Catamints, Hyssop, Savory, Maiden-hair, Scabious and Colts-foot, of each one handful: the Seeds of Marsh-mallows, and Cotton, and Carthamus, of each three drams: Liquoris and Raisins stoned, of each six drams: Fijubes, Sebestens and fat Figs, of each five: make a Decoction to a pint and a quarter of Hydromel: dissolve in the straining a pound and a quarter of white Sugar: make a Syrup well boyled for a Lambitive.

You may make a better and a cheaper thus:

Take of Elicampane-roots three drams: Spanish Tobacco one dram: infuse them a whole Night in six ounces of Aqua-vita: in the Morning strain them, and add of the best Sugar four ounces: stir it well upon the fire, and add of the Syrup of Erysinum or Colts-foot two ounces: Oyl of Sulphur as much as will make it sharp. Make a Lohoch.

These following are proper to unstuff and clear the Lungs:

Take of Ammoniacum, Bdellium dissolved in the Vinegar of Squills, of each half an ounce; Flower of Brimstone three drams; the Leaves of Coltsfoot and dried Savory powdered, Diaireos simple, of each half a dram; with syrup of Hyssop and Oxymel of Squills make a mass of Pills; of a dram whereof make six Pills, and let him take three of them two hours before Supper twice in a week. Or,

Take of Aloes Succarrine half an ounce; Myrrh and Ammoniacum, of each half a dram; Saffron half a scruple; Flower of Brimstone half a dram: with the Syrup of Coltsfoot, make a mass of Pills, of which let him take a dram two hours afore Dinner for some days.

Let the Water which is taken out of a hollow Briony root be distilled in Balneo Maria to eight ounces, whereof mix half an ounce of Spirit of Vitriol or Sulphur, let him take every day a spoonful fasting.

Take of Tobacco leaves, Hyssop, white Horehound and Maiden-hair, of each two handfuls; the Roots of Flower-de-luce and Liquoris, of each half an ounce; boyl them to a pint and an half, dissolve in the straining of white Sugar one pound; of the best Hony half a pound: make a Syrup, well boyled, clarified and perfumed, with a little Saffron and Cinnamon, let him take a spoonful or two every Morning.

The Oxymel and Syrup of Tobacco invented by Quercetan prescribed in his Dispensatory, is of the same vertue.

The Tincture of dry Tobacco is drawn with Aqua-vita, a little thereof mixed with Hony, and that held in the mouth as big as a Peate or Bean, swallowing it by degrees, this draws Flegm in abundance from the Stomach and Lungs.

Hogs-lice called *Mellipedes* or *Aselli*, in number twelve, put into a linnen-cloth, are to be steeped in White-wine, and then strained and so given to be drunk, and do in a short time cleanse the Lungs.

Oleum Sacchari doth powerfully dissolve thick glutinous Humors in the Lungs, and causeth expectoration: but the compound Oyl following is the best:

Take of the roots of Flowerdeluce and Elicampane powdered, of each half an ounce; the Pulpe of Dates and Raisins, of each three drams; Citron and Orange-peels, of each one dram and an half: Benjamin two drams: Saffron one dram: infuse them two days in the Spirit of Wine well rectified: then take of the Liquor by inslination, dissolve as much Sugar-Candy powdered as you can therein, then fire the Spirit of Wine stirring them continually till it comes to a Liquor as thick as Oyl, then mix as much Oyl of Sulphur as will sharpen it.

A Decoction of red Coleworts taken many days with a little Sugar, doth help the *Asthma*.

But the juyce of red Coleworts with Sugar of Roses or Syrup of Coltsfoot, taken in form of a Julep for many days is better.

The Spirit of Sulphur doth dissolve sligmy Flegm and open the Bronchia, if four or five drops are taken in Broth or convenient Syrup.

Turpentine is much commended for this use, given oftentwo or three drams with the Oyl of sweet Almonds or Conserve of Violets: or you may make it into the form of an Opiate thus:

Take of Turpentine well washed in Coltsfoot-water one pound; fat Figs half a pound; Penids four ounces: Oyl of sweet Almonds one ounce: mix them into an Opiate.

Saffron in Sawce is good for the Breast: also a Junket made of Mustard-seed and Hony doth expectorate.

Oxymel

Oxymel also with Agarick taken two spoonfuls in a Morning doth purge the Lungs.

The flour of Brimstone made into Pills with fresh Butter, given three days together to one scruple, doth much help the *Asthma*. *Lac Sulphuris* doth the same better in eight Grains, which is the greatest Dose.

Also these Tablets following are excellent :

Take of the Pulp of Marsh-mallow-roots and of the greater Comphry, of each two ounces : Flour of Brimstone two drams : the flour of Benjamin half a dram : Sugar dissolved in white Lilly water eight ounces : make Tablets, which let the Patient hold often in his mouth.

The Decoction of an old Cock is commended, and it is thus made :

Take of the Roots of Elicampne and Flowerdeluce, of each half an ounce : Hyssop and Horehound dried, of each six drams : Carthamus-seeds one ounce : Annis and Dill-seed, of each two drams : Liquoris and Raisins stoned, of each three drams : the Powder of Fox Lungs prepared two drams. Beat them, and fill the Belly of an old Cock therewith : then boyl him in fifteen Pints of water till his flesh comes from his Bones. After it is well strained, set it in a cold place that the thickest may settle, and the thin may be taken off : of which let the Patient take six ounces with one ounce of Oxymel simple.

If you will make it purging, you may add two or three drams of Senna for every Dose, or half an ounce of Manna. Or if you will have it stronger, you may sometimes put in some Electuary that purgeth Flegm.

Platerus prefers the following preparation of a Cock before the rest.

Take an old Cock, kill him, pull him and draw him : stuff him with these things following : Fox Lungs fresh or prepared and dried, one ounce : Raisins stoned and Figs, of each two ounces : Elicampne one dram : Hyssop, Savory, Horehound, Thyme, Calamint, Pennyroyal dried, of each one dram : Fennel and Annis-seed, of each one dram : Carthamus-seeds bruised and Polypody, of each half an ounce : white Tartar one dram : Salt half an ounce : two Yelks of Eggs : fresh Butter half an ounce : Cut them and bruise them, and sew them into the Cock, boyl them till his flesh comes from his Bones, in a large Vessel, with so much water as you may need to add no more : then strain it, and put to ten pints, one pound of pure Honey that it may not quickly corrupt. Let him take a Porringer full every Morning : in which let him dissolve Manna and new drawn Cassia, of each half an ounce, continuing it for a moneth and longer, which will be the better, if presently after he take a dram of Turpentine with Penides in form of a Bolus, or otherwise.

Ludovicus Septalius In his Practical Observations condemneth these Cock-broaths as unprofitable or hurtful : his Reasons are, because they do not answer experience, and have been used in vain by him and other Physicians of Milane. For by long boyling, the nitrous parts (by which those Broths are thought most to profit) do settle, and are lost in the straining : but the slimy, glutinous, thick and fatty, from the skin, feet, wings, musculous and nervous parts do remain. Hence the matter is made thicker and less fit to be expectorated.

But Septalius his experience must not be preferred before so many famous Physicians experience, both old and modern : For if it did not profit some which he and others have cured, many other things might hinder, as namely the evil disposition of the Patient, and contumacy of the Disease, or other things not well ordered which concerned the Cure, or the Medicine it self not well made. And whereas he saith, that the nitrous parts do fall to the bottom by long boyling, and are lost in the straining, it is ridiculous ; for only the earthly parts do settle, but the nitrous part once taken into the Liquor, is never seperated. Hence it is that the longer you boyl Broth the saltier it is. But this Salt doth cut, extenuate and open, it is so far from incrassating being salt. Neither hath the fresh or other parts of a Cock such a glutinous substance as he imagineth, as you may find in Neats-feet or Calves-feet, but rather an attenuating quality, because it is full of nitrous substance. And if purging and altering Medicines be made according to the Precepts of Pharmacy and Art, they do leave all their strength in the Decoction because daily experience teacheth us, that such Broth of an old Cock doth purge. And if we may oppose our experience to that of Septalius, we can truly say, that we have found admirable effects of these Broths in violent *Asthma's* and Cholicks. But this we use to alter in these Broths, we give many draughts in a day lest it should be spoiled by keeping. But this is the Example of what we prescribe in this Disease :

Take of the Roots of Elicampne and Flowerdeluce, of each one dram and an half : Hyssop and Colts-foot of each one handful : Liquoris and Raisins stoned three drams : fat Figs four : Senna three drams : Polipody of the Oak and Carthamus-seeds bruised, of each half an ounce : Annis-seeds one dram and an half. Boyl them with the third or fourth part of an old Cock : make a Broth for twelve or fifteen days.

By this purging Wine following, Platerus cured a Woman of a *Dyspnœa*, inclining to a Drop-sie.

Take

Take of Flower-de-luce-roots one ounce; Elicampane and Squills prepared, of each half an ounce: Horehound one handful: Elder-bark and Danewort, of each one dram: Senna one ounce and an half: Agarick two drams: Ginger one dram: shake them well together, and add of Wine four pints, boyl them a little: she drank hereof six days together when she went to bed, the Dyspnæa ceased, the Tumor vanished, and she was finely Cured.

But we must observe that we repeat purging often in this disease, under divers forms, lest Nature should be used too much to one Medicine: So cleansing, cutting and expectorating Medicines, and the rest are to be altered for the same season.

Chap. 2. Of Pleuretis, or a Pleurisie.

DIFFERENCES.

A Pleurisie is either True, or Spurious, called a Bastard Pleurisie.

A true Pleurisie is the inflammation of the Membrane that goeth about the Ribs, or of the internal intercostal Muscles.

But a Bastard Pleurisie is the inflammation of the external intercostal Muscles.

There are also other pains of the Side and other parts of the Breast which are improperly called a Bastard Pleurisie, viz, When the *Mediastinum* is inflamed, the Lungs cleave to the Ribs, or when ferous humors flow from the head to the Membranes of the Breast, or when wind doth tear the Muscles or Membranes of the Breast, or vapors rising from the Stomach as in Worms.

We have said, that in a true Pleurisie not only the Membrane *Pleura*, but also the internal Muscles are inflamed, because it is impossible but the inflammation of the Membrane should be communicated to the contagious Muscles.

Besides, Others do affirm that the Lungs are inflamed in every Pleurisie, and confirm their Opinion by Authority, Reason and Experience: The Authority is that of *Hippocrates*, lib. de loc. in homine, where he saith, that *Peripneumonia* is, when both parts of the lungs are inflamed: but if onely one part be inflamed, it is a Pleurisie. Also Reason may seem to confirm this, for the signs of a Pleurisie are also the signs of a *Peripneumonia*, namely a Cough, continual Feaver, difficulty of breathing, and spitting of blood.

Also the Prognostick and Cure are the same in both.

They say moreover, that they have found by experience in the opening of those who have died of Pleurisies, that their Lungs appeared always to be inflamed.

It is to be granted that in many the Lungs are affected as well as the *Pleura*, for the defluxion may easily fall upon both, because the lungs are fastned to the upper-part of the *Pleura*: but we must avouch, that often the *Pleura* alone is onely affected and not the lungs; or at least they are so lightly affected, that the Disease cannot be said to be an affect of that part. The Authority of *Hippocrates* in this is cast off by some as false, and contrary to many of his own Assertions, in which he acknowledgeth the *Pleura* only as the part affected, especially in his 1. lib. de morbis, where he often saith, that Choler and Elegm do stick to the side and cause vehement pain. But *Martianus* doth reconcile this, saying, That *Hippocrates* speaks in that place of *Peripneumonia*, which comes of a Defluxion from the Head, a portion whereof falls upon the *Pleura*, and he calls it by the name of a Pleurisie, that he may distinguish that which inflameth one part of the lungs, from that which inflameth both: For the same nature of a Disease being in both the Pleurisie and *Peripneumonia*, makes the likeness of Symptoms in both, being both from Inflammation, and nearly adjoyned,

And though many who have died of Pleurisies have been found to have their lungs affected, it is not to be concluded that it is so in all; for the most vehement Pleurisies which use to cause death, do many times turn into a *Peripneumonia*. But many do witness, and we have found by experience, that in many bodies dead of Pleurisies, the *Pleura* onely hath been found putrified.

It may be questioned, why the *Pleura* rather than other Membranes should be inflamed? But the Answer is from *Hippocrates*, 1. de morb. text. 124. according to the Division of *Salus*, where he saith, that the side is a very weak part, because it is naked from flesh in respect of other parts, and hath nothing to rest upon: therefore when the humors are moved and inflamed, their Defluxion is easily sent thither.

CAUSES. The matter causing a Pleurisie is for the most part cholerick blood which doth easily penetrate a thick Membrane: As *Avicen* speaking of a Pleurisie, saith, except the Humor be thin and cholerick it cannot pierce into the Membrane. Other Humors may also cause this Disease so they have a ferous cholerick humor mixed with them for a Vehicle: I say other humors not Excrementitious but natural, which are contained in the form of blood, and are called either blood it self, or blood that is watrish or melancholy.

But

But you must note, That thin Humors make a true Pleurisie; and thick a Bastard Pleurisie.

Now this blood is carried by the Vessels which nourish the Breast, especially the *Vena Axillaris*, and *Azygos*; and if it offend either in quantity, quality or motion, it is cast upon the Membrane and Muscles adjoining.

DIFF. The Difference of Pleurisies is taken from the part affected, and the Causes.

In respect of the place of the pain, it is divided by *Hip. 2. acut.* into an ascending Pleurisie, namely, when the pain reacheth more to the Throat; and a descending Pleurisie, when it goeth down to the *Hypochondria*. Sometimes it is extended more towards the back, of which *Hip. 3. de Morbis* makes mention; and sometimes it comes more forward.

In respect of the cause and the Humor offending, it is called either Sanguineous, coming of Blood, Cholerick, Flegmatick or Melancholick.

There is also another excellent Difference made by *Hippocrates 1. acut.* where a Pleurisie is divided into a dry and moist Pleurisie. A dry one is that in which there is little or no spitting, not only in the beginning, but continuance of the Disease; of which there are divers causes, as the Crudity of the matter, the thickness and sliminess thereof, the weakness of the faculty, the obstruction of the *Bronchia*, or the vehemency of pain. But a moist Pleurisie is that in which there is abundance of spittle, from the beginning of the disease.

DIAGNOSTICK. The Diagnosis or knowledge of this Disease is by the signs, as saith *Galen*, 5. *de loc. aff.* cap. 8. and elsewhere; who reckoneth Five.

1. A pricking pain of the Side.
2. A continual sharp Feaver.
3. Difficulty of Breathing.
4. A hard Pulse like a Saw.
5. An often troublesome Cough.

A pricking pain is chiefly in the Membranes, and comes from a Cholerick matter, and this pain possessing the side, stretcheth it self into the parts adjacent, one while to the Throat, another while to the *Hypochondria*, by the continuity of the Membrane, which covers the whole Cavity of the Breast, By this sign a *Pleuritis* is distinguished from a *Peripneumonia*, in which there is no pain or very little of the Side, except it be joyned with a Pleurisy.

A continual sharp Feaver hath its original from a Flegmon or Sanguineous tumor in some part near the Breast, and therefore is symptomatical: although sometimes an Essential Feaver be joyned with a Pleurisy, and gives it sometimes a being, for it often happeneth in the beginning of continual Feavers, that the blood boiling in the Veins is expelled by Nature unto some part which is most fit to receive it; as the Sides, and there it breeds an inflammation. The sign of this is, That the Feaver first seizeth upon the Patient, and the second or third day after the pain is in the Side. But when the Feaver is symptomatical, then the pain in the Side comes first, but the Feaver a little after.

Difficulty of breathing doth necessarily follow in this disease, because the parts inflamed cannot sufficiently distend themselves to draw in a great quantity of Air, which is requisite for the cooling of an inflamed heart.

The Pulse is hard, because the Membrane is affected and stretched forth, which also distendeth the Arteries, and they therefore make that difference of Pulse, called *Serratilis*, like a Saw; for when you lay many fingers upon the Arteries of the Pulse, one part seems to be more lifted up than the other, so that it seems to represent a Saw.

A troublesome Cough follows a Pleurisy, because Nature doth continually strive to expel that which is troublesome from the part affected: as also some of the matter sweateth from thence into the Lungs, which moveth the expulsive faculty, whence the Cough cometh.

There is also a spitting of blood as another sign, which is neither in all Pleurisy, nor at all times of the Disease; therefore it is not reckoned as a proper sign. They who say that the Lungs are always affected in a Pleurisie, do affirm that the blood is spit from the Lungs, and they deny that it can pass from the Membrane about the Ribs to the Lungs, because it is very thick; and also the Membrane about the Lungs is of the same nature, and cannot therefore be pierced by that blood which is without the Vessels. But *Galen* doth clearly confute these, 5. *de loc. aff.* cap. 3. where he first shews that the matter contained in the cavity of the Breast may be taken into the Lungs, and be sent upwards, by two clear Examples. The one is of those who have received a wound in the Breast that pierceth into its Cavity, for if an injection of Honey and Wine be made into the wound, and it be presently closed at the orifice, in a little time the injection will be coughed up and spit forth, and the Patient will have the taste of it in his mouth. Another Example is taken from a Fracture of a Bone, when the skin is not broken; which while the *Callus* is growing, and the broken bones begin to glutinate, that blood which flowed to the part affected is carried forth to the skin and goeth through it, so that it moistneth and fouleth all the rowlers and ligatures about the part. *Galen* also shews the manner how blood, matter or the like, being contained in the Cavity of the Breast may be taken through the Lungs,

namely, by the extream outward Orifices of the *Bronchia* or branches of the rough Artery, which are spread through the Lungs, and end in the superficies of them.

Although the orifices of the Vein Arterial, and Artery Venal are also carried to the superficies of the Lungs, yet the orifices of the *Bronchia* are more open and large than they. For by how much greater the Body or Trunk of the rough Artery is than the Trunk of the Venal Artery or Arterial Vein, by so much the greater are its branches than theirs, and its orifice than theirs; because all these Vessels are equally divided and distributed into the whole body of the Lungs. Moreover, the substance of the rough Artery and its *Bronchia* or branches are cartilaginous or grissly, from whence it is that they cannot close together so much as other Vessels; and their orifices are more constantly open, by which they can better receive the matter from the Cavity of the Breast.

But *Galen* teacheth, that the matter contained in the Breast is taken through at the time of breathing, when the Thorax is straightned; for then the Thorax doth press those things that are in the cavity of it, and drive them into the Lungs, so that some part of them at least is carried into the orifice of the *Bronchia*. Neither is the softness of the Lungs, which yield to a compression, and therefore cannot be forced to receive the matter any hinderance. For this softness is the cause why all the matter is not received: yet it is no obstacle but some part thereof may be received in, although the greatest remain in the Cavity by reason of the softness aforesaid. Let us add to this Doctrine of *Galen*, the wonderful providence of Nature, which hath found out ways, not only manifest, but also unknown, and sometimes incomprehensible, by which she useth to expel things hurtful: as we said of the matter in Fractures, which is purged forth by the insensible pores of the Muscles and of the Skin.

A Bastard Pleurisie is distinguished from a true, in that the pain is encreased when the Patient lieth on the contrary side, in a true Pleurisy; for then the part inflamed is pulled, and more distended by its own weight; but in the other, the Muscles external being inflamed, are compressed when the Patient lieth on the same side, and therefore he hath then greater pain.

The times of this disease, are known by these Signs following:

In the beginning of it, all the Symptomes are weaker, the pain and Feaver small, there is a dry Cough, and very little and crude spittle; In the encrease of the Disease, the Feaver and pain encrease, and there is more spittle. In the state or height the symptomes are more vehement, want of rest, dotage, pain of the head; and if the disease will be cured, there is much concocted spittle easily raised. In the declination, the spittle is perfectly concocted, a free spitting, and decay of all symptomes.

The signs of the Causes are generally taken from the temper of the Patient, the time of the year, the Country, the Diet and the like. But especially these things shew that a Pleurisy comes of pure blood, red and bloody spittle, a stretching and pricking pain, the fulness of the Veins, especially about the Forehead and Temples, redness of the whole face, a full pulse, thick and red Urine, sometimes with a blew Crown.

These Signs shew that it comes from Cholerick blood, yellow spittle, a burning Feaver, great thirst, a hard and quick pulse, a more acute pricking pain, great watchings and restlessness, bitterness of the mouth, a thin and very yellow Urine.

These Signs shew that it comes from Flegmatick blood, a white, viscous, or frothy spittle, sweet and slow in coming forth, a remiss Feaver little thirst, much spittle, a less, but heavy pain, more sleep, a little pulse, and not so hard, pale and thick Urine.

These Signs shew that it comes of Melancholick blood, black spittle, tough and slow in coming forth, a less pain and Feaver, a red Urine and dark, a dry Cough, a black and rough tongue, a belly bound.

PROGNOSTICK. The Prognostick is taken first from the remission or vehemency of the symptomes. For if pain, difficulty of breathing, and a Feaver be not great, they signify that the disease is gentle; but if the pain be great, and the Cough, and there is nothing raised up, and if the Feaver be violent with great difficulty of breathing, you must look upon it as a desperate Pleurisy.

A small pulse, quick and hard, foreshew death in a Pleurisy. And *Galen* saith, that none of these have been cited, *Gal. 4. de prasag. expuls. cap. 5.*

An exquisite Pleurisie in which nothing is raised by Cough, and when the spitting after it began is restrained, having still the pain and weight in the Side, is most dangerous. For it signifieth a very crude disease which will either shortly kill, or be long in Cure.

If the spitting begin with the first, or within three days, it signifyeth the disease will be short; but if it begin late, it will be long, *Hip. Aph. 1. Sect. 5.*

Yellow Choler mixed with Flegm or a little blood, appearing in the beginning of the disease with much spittle, is a sign of recovery.

Very bloody spittle is dangerous; for it signifyeth a ruption either of a Vein or of Flesh; from whence we expect suppuration: For it is thought that little blood doth breath through.

White

White, glutinating and round spittle, is evil, for the clamminess comes from the fiery heat which burneth the matter.

Green and rusty spittle is evil, but black worst of all: For it signifies the greatest adustion or extinction of the Natural heat.

A plentiful spitting which doth not abate the pain and other symptoms, is evil: For it signifieth great plenty of matter.

A Pleurisie in old men, women with Child, and in them that are Asthmatical, or have twice or thrice had the same disease, is dangerous.

Whosoever have the disease in the Side called Pleurisie, and are not cleansed of it in fourteen days, have an *Empyema*, or collection of matter, *Aph. 8. Sect. 5.* Others do extend it to the twentieth day.

A *Diarrhoea*, or Loosness coming upon a Pleurisie or *Peripneumonia* is evil, *Aph. 16. Sect. 6.* which we must understand of a Pleurisie, in which there is so great an inflammation that the Liver and Stomach consent therewith, or when the strength is so gone by the disease, that the retentive faculty is almost spent. But if the Pleurisy be not so great, and be in a body full of evil humors, the Flux of the Belly useth then to be healthful, especially if any signs of concoction went before.

A cholerick and plentiful Vomiting in the beginning of a Pleurisy signifieth health to come: For Nature being eased by that Evacuation of Choler, doth more easily overcome the disease.

If a *Peripneumonia* comes from a Pleurisie, 'tis evil, *Aph. 11. Sect. 7.* For it is the translation of the matter to a more noble part.

If the pain in the Pleurisie, and the cholerick spitting go away without reason, the Patient falls mad, *Hip. 3. Prorrhet.* For the Choler is carried into the Head, and then the Urine looks thin and white.

A Pleurisie which followeth an old disease, or is in a body of evil habit, is dangerous.

Thick Bodies used to exercise, do soonest die of Pleurisies and *Peripneumonia's*, as *Hip. in Coac.*

And experience teacheth us, that almost all the Diggers taken with Pleurisies, do die thereof: because such strong Bodies fall not sick, but upon some great cause, and by reason of their thickness they cannot easily sweat, so that the disease cannot break forth.

They who in a Pleurisie have much noise in their Breast from the spittle, and their countenance dejected, with yellowness in their Eyes and mists: in these death is to be expected, *Hip. in Coac.*

They who in Pleurisies have cholerick tongues at the first, are judged in seven days: but they who have not much Choler upon their tongue till the third or fourth day, are judged about the ninth day.

CURE. For the cure of a Pleurisie, first the humor causing it is to be revelled, derived and discussed: and if it cannot wholly be discussed, it must be digested, matured and expectorated: as also the Fever which is commonly essential to a Pleurisie, and not always symptomatical, is to be cured by proper Medicines. All which may be done by the following Remedies.

And first you must (after a Clyster, if the disease be not very violent) open the *Basilica* on the same side: but if it be violent, give the Clyster afterwards.

You must bleed every day till the pain or Fever grow less: nay, sometimes twice in a day, if the Pleurisie be very violent.

Hippocrates in his 2. lib. *de ratione victus in acutis*, Text. 10. gave an excellent rule to posterity most profitable in practice, that blood be let till the colour of it change: For if at the first second time it appear crude, flegmy or watery, it is to be continued every day, sometimes twice a day till it appear red or yellowish. But if it appear red in the beginning, you must bleed so often till it become livid or black, for that will signify, that the last blood came from the part affected, or the neighbour Veins, which is altered by the part inflamed, and of crude is made red, or of red, black or blew by adustion.

Although the observation of that rule bring commonly good success, yet sometimes you must not expect that change of colour, but desist from bleeding; namely, when the strength is little, or the Patient is of a thin habit of body easily dissolved, or the weather very hot. And although blood-letting is excellent in the beginning of the Disease, yet if it be omitted, or done insufficiently, you may open a Vein after the seventh, ninth, or eleventh day, according to the Example of *Hippocrates* who in 3. *Epidem.* opened a Vein for *Anaxion* in the eighth day, either because he was not sent for sooner, or because that it was a most crude Pleurisy, which will scarce concoct till the eleventh day.

But when he expectorath freely, then you must abstain from Phlebotomy, which will stop his spitting, and bring him in danger of his life.

But blood letting is so necessary in the beginning of this Disease, that it must never be omitted, neither in old nor young, nor women with child, in Child-bed, or having their Terms: unto all which, Experience hath taught us, That Phlebotomy is good in this Disease. Yet you must observe some

Rules in bleeding of Women in Child-bed, or having their terms, which you may find hereafter in the Fifteenth Book, and the last Chapter concerning the Cure of Acute diseases in Women that lie in.

From the beginning of the Disease twice or thrice in a day, you must give cooling Juleps; which restrain the heat and boyling of the humor, and stop the defluxion thus made:

Take of Poppy Water four ounces, Syrup of Violets or Poppies one ounce; Sal Prunella one dram. Make a Julep.

After the first Phlebotomy let the side be anointed with this Liniment, covering the part with greazy Wooll sewed into a linnen cloth.

Take of Oyl of Lillies, Camomel and sweet Almonds, of each one ounce; fresh Butter and Hens grease, of each one ounce and an half. Make a Liniment.

Many put Wax to these Liniments, which is not good; because it stoppeth the Pores; but the mucilaginous bodies do not, because they cool and astringe.

In a malignant Pestilential Pleurisie, you may add to your Liniments, Oyl of Scorpions of *Mathiolus*, or a little Treacle.

After the second bleeding, you must apply this Fomentation, made thus:

Take of Althæa Roots and Lillies of each two ounces; the Leaves of Mallows, Violets and Pellitory, of each one handful; Line and Fenugreek seeds, of each one dram: the flowers of Camomil, Melilot, Elder and Violets, of each one pugil. Boyl them together, with which foment the side that is pained in a Hogs Bladder.

After the Fomentation apply the Liniment aforesaid, to which in the progress of the disease, you may add more dissolving Oyls; as of Dill and Flowerdeluce, as also the powder of Flowerdeluce and Saffron. And to the Fomentation add discussing Herbs, as Origan, Calaminth, Hyssop and the discussing seeds.

Many other Topicks are very profitable against Pleurisies, which Authors relate; as these:

First, anoint the part with Oyntment of Marsh-mallows, then lay on the powder of Cummin-seed, or a Colewort-Leaf heated at the fire, and anointed with the same.

Faventius mixeth the Oyntment of *Althæa* with Oyl of sweet Almonds, and after he hath anointed, sprinkles on the powder of Cummin-seeds, and layeth on a Colewort Leaf; and this he commends highly.

Also the Cataplasim following is very profitable:

Take the Residency or Ingredients of the Decoction above mentioned for a Fomentation: beat them in a stone Mortar, adding of the Oyl of sweet Almonds, Lillies and Camomel, of each two ounces: Hens grease one ounce: Barley and Bean-flower, of each as much as is sufficient to make a Cataplasim.

Also a live Hen slit through the Back, and sprinkled with the powder of Flowerdeluce roots, being applied doth very well.

The Paunch of a Sheep laid hot to the part is a very good Anodine; but the Lungs are better.

The Chymical Oyl of Wax being mixt with the Liniments, asswageth pain, and powerfully discusseth the matter.

Hot Bread from the Oven, dipt in fresh Butter, and applied, doth very much dissolve the matter fixed to the side.

After he hath taken twice or thrice of the Julep aforesaid, you may use Pectoral Juleps, thus made:

Take of Barley one Pugil; Liquoris and Raisins stoned, of each one ounce: Jujubes twenty: the four great Cold Seeds, of each three drams; Bugloss and Violet flowers, of each one pugil: boyl them to a pint and a quarter. Dissolve in the straining; Syrup of Violets and Jujubes, of each two ounces. Make a Julep for four Doses to be taken morning and evening.

Or if the Feaver be very sharp, and much watching, you may make the Emulsions following:

Take of Almonds blanchèd, and steeped in cold water, one ounce: the four great cold Seeds, of each half an ounce: Lettuce and white Poppy seeds, of each two drams: beat them in a Marble Mortar, pouring on by degrees the Decoction of Barley and Liquoris one pint and an half: strain it and dissolve in it Syrup of Violets three ounces. Make an Emulsion for three Doses to be taken morning and evening.

Some Practitioners in want of sleep give Narcoticks: as Syrup of Poppies, *Philonium Romanum*, and *Laudanum*, which are dangerous in this disease: for they stop spitting, and astringe and strengthen the Breast. From whence comes oftentimes sudden death.

But this must be understood, of the whole dose of Narcoticks: for given in a very small quantity they do good in a vehement pain, a thin defluxion which causeth a Cough, and in want of sleep. In which cases I have often given one grain of *Laudanum* with good success, and sometimes often.

But

But the use of this is most proper in the beginning of the disease; for then the humor flowing to the part may be restrained, and the encrease of the Disease hindered.

When the Cough is violent, and Nature begins to evacuate by spitting, let the Patient hold often in his mouth Sugar of Roses, Sugar-Candy or Penides, or the Tablets of Diatragacanth frigid, Syrup of Violets and Jujubes. Or this Eclegma following:

Take of Sugar-Candy and Penides, of each one ounce; the Powder of Diatragacanth frigid, two drams; Syrup of Violets and Jujubes, of each as much as will make a Lohoch: which let him take often with a Liguoris stick, or make it of Butter, Honey and Sugar, of each equal parts; the Oyl of Linseed, or of sweet Almonds, being fresh drawn without fire, mixed with Sugar, doth much help the Cough and pain in the Pleurisie, especially if it be drunk in Broth or any other Decoction.

If the spittle be thick, you must mix some attenuating and cutting Medicines, as Syrup of Colts-foot, Liguoris, Oxymel simple, Powder of Diatreos, and the like.

You must take these lying with the Face upward, for so they better go to the Lungs.

As the Disease encreaseth, you may use this restoring Medicine to strengthen.

Take of Conserve of Violets one ounce, Conserve of Borrage flowers, and Bugloss-roots, of each half an ounce; Confection of Alkermes two drams; Powder of Diamargariton frigid, and Diatragacanth frigid; of each one dram; Sugar of Roses as much as all the rest. Make a Composition covered with Gold to be taken often with a Spoon.

Purging is improper in a true Pleurisie, except it be in the declination; and then you may appoint this:

Take of Senna half an ounce, Annis seeds one dram, Bugloss and Maiden-hair, of each half an handful; Liguoris and Raisins stoned, of each three drams: the flowers of Bugloss and Violets, of each one Pugil. Boyl them to two ounces; in the straining, dissolve of Rhubarb infused in Scabious Water with a little yellow Sanders, four scruples: the best Manna and Syrup of Roses, of each one ounce. Make of these a Potion.

In the whole time of the disease, let him take Barley Water for his ordinary drink, made with Liguoris, Poppies and Maidenhair; and let not his drink be actually cold, for it would hurt the Breast. Wine in this disease is poyson, and also sharp things which provoke Coughing, and by their astringency hinder spitting.

In the declination of the disease after purging, and when the Feaver is less, if the pain continue, you may apply to the part Cupping-glasses with Scarrification two days together. They may also be applied before the declination, after often bleeding: and if the pain still encrease and return, you may again let blood, and after Cup with Scarrification.

Zacutus Lusitanus having taken off the Cupping-Glasses, applied six Horseleeches with good success, as he witnessed, *Observ. 104. lib. 1. Praxis Admiranda.*

For the same purpose to discuss the reliques of the matter, having first tried Fomentations and Liniments, you may apply with benefit the Emplaister of Brimstone and Bayberries.

Besides vulgar Medicines, there are some proper and specificall, namely the shavings of a Boars Tusk, the ashes of the Pizzle of a Bull or Deer, the flowers of red Poppies, or Coral prepared.

Quercetan in his Dispensatory commends an Apple made hollow, and one dram of Francincense put therein and roasted, which the Patient must eat, and drink three ounces of *Carduus* water after; then cover himself warm, and sweat. He will have this Medicine used after the third day, and affirmeth that many have been restored therewith.

The Flowers of Box-Tree do so much purge the Blood, that if a dram of them in powder be given with Poppywater, and a Vein opened an hour after, the blood will continue pure.

Horse-dung dissolved in *Carduus* Water and strained, doth powerfully disperse the pain and the humor in the Pleurisie.

White Hen-dung given in a dram of the same Water doth as much.

These Dungs have much Volatile Salt, which is very piercing and discussing.

You may make a Potion of them both thus:

Take of Hemp-seed one ounce: bruise them, then put to them, of the white Dung of a Hen, and of Horse Dung, of each half an ounce: dissolve them in five ounces of Carduus Water: strain them, and drink it.

The blood of a wild Goat given to ten drops with the aforesaid Water, doth powerfully discuss the Pleurisy: in the want whereof, you may give the blood of a tame Goat. But because the strength of him is little, you may give thereof to the quantity of one dram. You must prepare it thus:

Hang up the Goat by the Horns, and bend his hinder Legs backward to his horns, then cut out his Stones, and take the blood in a broad Vessel: dry it in the Sun in Summer, or at other times upon an Oven. It is far different from the Goats Blood in the Shops.

The

The Soot of a Chimney given to a dram is very good, but much rather the Spirit of Soot, described by *Hartman* in his Practice of Physick.

In an Epidemical Pleurisie, Sudorificks are to be given, such as are prescribed in malignant Fevers, which also ought to be made as proper for this Disease as may be.

A Diarrhæa coming upon a Pleurisie is dangerous, therefore you must give Syrup of Myrtles, which doth stay the Diarrhœa, and also expectorate: and this is to be mixed with other Syrups. Let the Belly and Reins be anointed with astringents, as useth to be done in all Diarrhœa's. Give Clysters made of Barley Water, which, as *Galen* saith, doth cool and astringe if it be boyled with red Roses, and also Yelks of Eggs be dissolved in it.

CHAP. III.

Of Peripneumonia, or Inflammation of the Lungs.

Peripneumonia hath the same essence with a Pleurisy, and is distinguished only by the part affected, because that is the Inflammation of the Lungs, and this of the Membrane that compasseth the Ribs. They differ somewhat in the matter, for a Pleurisie comes often of Choler, but Peripneumonia of Flegm: although all humors (as we said of a Pleurisy) may produce this disease, I mean humors which are like blood, and make up the mass of it. For as thick humors do hardly penetrate the thick Membrane called *Pleura*, but thin and cholerick easily: so on the other side, thick flegmatick humors do easily go to their soft and thin substance of the Lungs, and stick close thereto: but thin and Cholerick humors do easily pass by. But this hindreth not, but the Cholerick blood may sometimes cause the Inflammation of the Lungs, as *Hippocrates* 1. de morbis, describeth the *Erysipelas* or Cholerick Tumor of the Lungs, which comes from Cholerick blood thrown into the Lungs from the right Ventricle of the Heart by the Arterial Vein. But an œdematous Inflammation comes from flegmatick blood falling upon the Lungs by way of defluxion from the head. But only excrementitious Flegm, falling as a Catarrh from the Brain, can make a Peripneumonia, because it putrifieth in the Lungs, and attracteth blood, by the means whereof there is an inflammation, and this often happeneth in old Folk. *Mesue* saith, That this Peripneumonia comes rather of Choler, because the Lungs are nourished with Cholerick blood which cometh in great plenty to them by the Arterial Vein. To whom we answer, that fresh, thin and streaming blood made in the right Ventricle of the Heart is carried into the Lungs, which by reason of its quantity, is easily governed by Nature, and is sent by the Venal Artery to the left Ventricle of the Heart, and it seldom is altered from its natural condition, which useth to make a Peripneumonia. But contrarily, a defluxion from the head cutting through the large passages into the *Bronchia* of the Lungs, if it there putrifie, will draw blood unto it, and make a Peripneumonia.

This Peripneumonia is sometimes alone without another disease, sometimes it followeth other diseases, as Quinzy or Pleurisie. *Galen* in Com. 11. Sect. 7. Aphor. teacheth, That a Peripneumonia doth follow a Pleurisie two ways: Either when a Pleurisie is turned into a Peripneumonia, or when an inflammation of the Lungs followeth a Pleurisie. This transpiration is when the former Disease ceaseth, and other comes: but if it comes upon it when it is white, the former remaineth.

CAUSES. Therefore the immediate internal cause of a Peripneumonia is blood, often flegmatick, seldom cholerick, and most seldom Melancholick. Which either comes from the whole body being plethorick, or Cachochemical, that is, full, or of evil habit; or from some part which is replete or distempered.

The external Causes of Peripneumonia and Pleurisie are the same; namely whatsoever defluxion can come to those parts: the chief whereof are, First, great exercise and violent motion of the body, especially after long rest and high feeding. For then the humor abounding from high diet, and kept in long rest, by exercise are dispersed, attenuated and heated, and are sent to the weaker parts, most fit to receive them, among which the Breast and Lungs are chief, because by strong exercise there is caused great and often breathing, and so they become wearied, and the substance of the Lungs being soft and loose, can easily receive the humors coming to them.

Secondly, Among the external Causes, the cold and Northernly Air is reckoned, when it comes suddenly after a Southern and warm: for the pores are opened by warm Air, and the humors are more fluid, which by the cold Air coming after, are compressed, and the humors sent to the weak parts.

Lastly, From *Hip. lib. of Air, Places and Waters*, the drinking of standing Pools and Lakes, begets the Peripneumonia; for saith the Divine Old Man, We observe diseases of the Lungs to be most in Marshy Countreys.

Also

SIGNS. Also the Signs of a *Peripneumonia* do agree with the Signs of a Pleurisy. Two are the same, as a sharp Feaver, and a Cough; which sometimes is dry, sometimes moist, or with more Flegmatick spittle coloured with Choler or Bloud; and in the progress of time, the spittle becomes mattery when the matter of the disease grows ripe, and is concocted by heat, which sometimes comes to pass when the substance of the Lungs is not hurt; for if they ulcerate, a Consumption will follow.

So we may observe, That in fore eyes that are mattery, the humors are converted into Matter when the substance of the Eye is neither suppurated nor ulcerated.

The other Signs differ in respect of the part affected; the difficulty of breathing is greater than in a Pleurisy, by reason of the narrowness of the part inflamed, so that the Patient seems to be choaked, and cannot breath but with the head upright: For the part cannot be compressed by reason of the extension and repletion, or be more dilated, although it be much dilated, yet it takes in but little Air, therefore the respiration is quick and often, with ratling: This is augmented by a Feaver by which the breath is hotter, and the desire of cold Air is greater.

The Pulse is great, faint and soft, by reason of Flegm and looseness of the Lungs: yet there is some hardness by the Choler and bloud: it is unequal from the compression of the Artery near the Heart, and in thick humors most: Sometimes it is intermitting, watery, vermicular, when the Lungs are rotten by too much moisture.

There is a heavy pain that reacheth from the Breast to the Back, sometimes it is between the shoulders, and sometimes under one only Shoulder, and from thence communicated to the Throat and Pap: Especially in a Cough, sometimes they feel no pain till they begin to Cough: sometimes there is also a pricking pain in the side when it is joyned with a Pleurisy as it often happeneth; Although the Membrane that covers the Lungs be of the same nature with the *Pleura*, as *Galen* taught 4. de loc. affect. cap. 5. Yet there is not so great pain in a *Peripneumonia* as in a Pleurisy, for two differences which are laid down by *Galen* in the place afore cited.

The first is, Because the Nerves that go to the Membrane of the Lungs are few and very little; but they which go to the *Pleura* are many and great.

The other is, Because the Breast consists of Bones and Flesh, which will not be stretched, from whence the pain is greater.

But the Lungs are soft and yielding, and therefore their pain is less.

There is redness in the Cheeks, by reason of the hot Vapours which fly into the Head and carry with them the thinner bloud. And this Colour is most in the Cheeks, because their Skin is thinner.

There are besides these Signs, Heaviness, Weakness and a Tossing, with great sense of Heat in the whole Body.

The Tongue is yellow, and then it groweth red; a great thirst, swelling of the Eyes, and of the Veins of the Temples.

There is a Delirium or Doting, when it comes from Choler; and a Coma, when it comes from Flegm.

If the Disease comes of Cholerick bloud, the spittle will be yellow, the heat and thirst greater, more difficulty of breathing with less Heaviness; the Air breathed forth is more hot: the Feaver is very violent, the Pulse swift, the Delirium great, the Water thin, yellow and clear, the age, time of the year, the Country and Diet before, do all attest for Choler.

If Flegm (which is most ordinary) produce the disease, the spittle will be white, viscous and frothy; the Feaver, burning of the Breast, thirst and driness of the Tongue, will be less; the weight of the Breast greater; the Pulse slower and softer; the Age old; Habit of body, time of the year, and the Country, are cold and moist.

If the Disease come from pure bloud, the Spittle will be red, the Urine red and thick, the Face more red; the Veins of the Temple more swollen, with heaviness and distention of the whole body, and other things that declare abundance of bloud.

Lastly, If Melancholy bloud be the cause, the spittle will be black or blewish, the Tongue black, from the beginning dry and rough; there will be also heaviness and great sighing between breathing; and all the signs of Melancholy predominating in the whole body.

PROGNOSTICK. The Prognostick of this disease is thus to be made:

A *Peripneumonia* is more dangerous than a Pleurisy, and for the most part deadly by reason of the necessity of Respiration, and the nearness of the Heart.

Celsus saith, That this kind of Disease hath more danger than Pain; and for the most part killeth.

But strength of body, less vehemency of symptoms, yellow Spittle, not mixed with much bloud, raised in the beginning; a great Flux of bloud at the Nose in the Critical day, or a Flux of the Belly which is cholerick and frothy, or a Flux of the Hemorrhoids or Terms, do shew some hope of recovery.

Imposthumes

Imposthumes about the Ears or inferior parts, being well suppured and kept open, do foretel recovery, as *Hip. in Progn.*

If a *Peripneumonia* be turned into a *Pleurisie*, it is good, though it seldom happens, as *Galen* teacheth. *Comment. Aphar. 11. Sect. 7.* because there is a going from a disease more dangerous, to one less dangerous. And this transmutation is known by a pricking pain of the Side coming thereupon, and by abating the shortness of breath.

But the vehemency of the disease and symptoms do declare a dangerous and deadly *Peripneumonia*, as want of spittle, continual watchings, a *Delirium* or *Coma*, coldness of the extreame parts, rattling with great difficulty of breathing, blewness and crookedness of the Nails.

Moreover, A *Peripneumonia* coming upon a *Pleurisie* is most dangerous, as *Hippocrates* teacheth, *Aph. 11. Sect. 7.* because the translation of a humor from an ignoble part to a more noble, is evil; and the strength being spent by the disease foregoing, cannot endure the force of a new, and worse.

When the Urine is thick in the beginning of a disease, and after before the fourth day it becomes thin, death is at hand, *Hip. in Coacis.*

CURE. The Cure of the *Peripneumonia* is very like that of the *Pleurisie*, and there must be first bleeding as much as the strength will permit, once or twice in a day till the disease abate: for since the Lungs are then full of blood, and draw much from the heart, which is inflamed, you need not fear to let blood thrice, four, five or six times.

But if a *Peripneumonia* follow a *Quinzy* or *Pleurisie*, you may let blood more warily, because the strength is abated by the former disease.

You must let blood from the Basilica Vein of both Arms, if the whole Legs be equally affected, or from either, on that side the pain is, or on which the Patient feels more weight, or from which he supposeth he raiseth most spittle.

You must bleed women in this disease, first in the ankle vein; and after within six hours in the Arm; except it be so desperate that you are constrained at the first to bleed in the Arm: In which case, all the time you bleed, and a little before, you must apply Cupping Glasses to the Thighs.

But after, if the strength will not permit further Phlebotomy, you must apply Cupping Glasses to the Shoulders and Back, both dry and with Scarrification, as much as the Patient can suffer.

Also Emollient and loosening Clysters are good revulsives, but you must not use too strong purging Medicines therein, lest you bring a Flux of the Belly which is most dangerous in this disease.

If a crude Flegmatick humor coming from the Head cause this disease or nourish it, a Vesicatory laid to the hinder part of the Head doth very much good.

In the mean while use the Juleps and Emulsions prescribed in the cure of a *Pleurisie*. Anoint the Breast with Oyl of Violets, sweet Almonds, or with fresh Butter or the like, or with this Liniment:

Take of Oyl of Violets and Water-Lillies, of each one ounce and an half; fresh Butter and Mucilage of Fleabane seeds, of each one ounce; Oyl of Roses half an ounce; the Troches of Camphire one dram. Make a Liniment, Or,

Take of Oyl of Violets three ounces; the Oyl of Pompion seeds and Breast milk, of each one ounce; fresh Butter one ounce and an half. Mix them and make a Liniment.

You may provoke spitting with Syrup of Violets and Jujubes, and the rest prescribed in the Cure of a *Pleurisie*. As the Lohochs and Compositions there mentioned, given with this Caution, In a thin matter give things that thicken, and in a thick matter give things that attenuate.

Let his ordinary drink be Barley Water with Liquoris, as in a *Pleurisie*.

Purging is not good in this Disease, except in the declining of it; and you must make choice of such things then, as were prescribed in the Cure of a *Pleurisie*.

CHAP. IV.

Of Empyema, or matter in the hollow of the Thorax.

Although the word *Empyema* signifie all Suppuration, yet Custom hath prevailed so, that it is taken only for a Collection of matter in the Cavity of the Thorax.

CAUSES. Now there is a three-fold Cause of the gathering of matter between the Lungs and the Thorax.

The first is an Inflammation suppured, which happens in a *Pleurisie* or *Peripneumonia*; and when the Imposthume is broken, the matter falls into the Cavity of the Breast. The same may be in a *Quinzy*, as *Hippocrates* teacheth, *Aph. 1. Sect. 5.* in these words, *Whosoever is freed from an Angina,*

Angina, they have a Disease in the Lungs, and die within seven days; but if they live longer, it comes to Suppuration.

The second is blood falling into the Thorax, where by continuance it must needs come to Suppuration. So *Hypocrates*, Aph. 20. Sect. 6. *If blood be sent into the Belly besides Nature, necessarily it is suppurated.* But this Suppuration is not always true, and properly so called, as *Hypocrates* teacheth, but rather to be called a Corruption, of which there is matter like Quittor produced. This blood may come from a Vein wounded.

The third Cause is Flegm falling from the Head and other parts into the Breast, and there putrefying. So *Hypocrates*, Aph. 38. Sect. 7. *The distillations into the upper Belly are suppurated in twenty days.* *Galen* in his Commentaries, by the upper Belly understands the Breast. But the Flegm there putrefying doth not beget a true Pus or Matter, but something like it; as we observe in flegmatick Tumors, as Atheroma, Steatoma, Mulicris, which are kind of Imposthumes.

DIAGNOSTICK. The Diagnostick signs are two sorts; some declare the Disease to be in the beginning, others, that it's old and confirmed.

Hypocrates layeth down the three Signs of this Suppuration, beginning 2. Progn.

The first is when the Feaver groweth stronger, because the Pleurilie or Peripneumonea is not purged, for while the matter is turning into Pus, the Feaver is increased, *Hyp.* Aph. 47. Sect. 1.

The second is a quaking, which comes when the sharpness of the matter doth twitch the Membranous parts.

The third is weight and sense of heaviness in the part; for the Humor being contained in the Cavity doth weigh heavier than when it is diffused. *Galen* addeth, 4. de loc. aff. cap. 9. Fluctio or routing: For (saith he) if any one is forced to turn in his Bed, and perceive something to flow down at that time, it is no doubt but there is much matter contained there. And you may often hear the Fluctio, unless the thickness or plenty of the matter, which fills the whole Cavity of the Thorax do hinder the Fluctuation. To these you may add difficulty of breathing. For although after the Imposthume is broken, the pain of the side ceaseth, and the Diaphragma and Muscles of the Thorax move more freely; yet because the Lungs are oppressed with matter round about them, so that they cannot move more freely, and some part of the matter is sucked into the substance of the Lungs, from whence it is that the Lungs are so heavy, and the Bronchia is obstructed, thence is short breathing. For the purulent Spittle comes from the filth sent into the Lungs and Bronchia, which shews an Empyema; but this is not always a spitting of matter by reason of its thickness, which keeps it from coming to the Bronchia.

But a long lingering Feaver, partly putrid, partly Hectical, milder in the day and sharper at night, much sweat, especially at night, and a constant troublesom Cough, signifie that the Disease is old and confirmed; as also when the Cheeks grow red, and the Eyes hollow, the Nails crooked, the Legs swell, and Pustules break forth of the Breast by reason that the sharpest part of the matter breaks out of the Skin, these signifie the Disease confirmed.

You may know which side is affected from *Hypocrates*, 2. Progn. Text. 21. *If (saith he) an Empyema be onely in one part, you must turn the Patient, and learn whether he be pained, or hotter in one side than the other; and ask him if he perceives any burden to hang on the side that is upward; and if it be so, in which side soever the weight is, the Suppuration is on the other; as if heat and weight be in both sides, the Pus is continued in the whole Cavity of the Breast.* Also *Avicen* adds a Conjecture which he took from *Hyp.* 3. de morb. Apply (saith he) a linen cloth wet to both sides, and that will be dry soonest which lieth upon the part where the matter is contained. We may lay down another sign from our own Experience, which was not observed by Authors, namely, in the side affected there will be an Oedematous Tumor from a portion of the thinnest matter breathing through the Muscles of the Thorax. And when in suspicion thereof there appears such a Tumor, and blowing up of the skin on either side, you may certainly pronounce that the Empyema is there, and you may safely open the side.

PROGNOSTICK. The chief Prognostick Signs are given by *Hypocrates*, 2 Progn. Text. 63. in these words: *In Suppurations they chiefly escape whom the Feaver left the same day they broke, and they who presently desire Meat, and are freed from thirst, and have small and laudable Excrements: and if the Pus be white and even, and of the same colour, and when it is voided without pain or great coughing. But they die whom the Feaver leaveth not, or to whom seeming to leave them it returns again, and who are thirsty, have no appetite, have a loose Belly, the Pus green and livid, or frothy. They die who have all these signs; but they who have but some of them, some die, and some lie long sick.*

To these we will adjoyn these following Prognosticks:

They who have an Empyema, and by reason of the abundance of matter lift up their whole breast when they breath, are quickly choaked. *Galen.* 4. de loc. aff. cap. 7.

If an Empyema is not spit forth in forty days, it turns into a Consumption, which brings death. *Hyp.* Aph. 15. Sect. 5.

A a

A Sup-

Suppuration on both sides of the Thorax, is more dangerous than in one; also that on the left-side is more dangerous than on the right, by reason of the left Ventricle of the heart, which is more grievously affected with the matter gathered on that side:

Whosoever are burnt or cut for a Suppuration, if the matter commeth forth pure and white, they escape, but if it be bloody, foul and stinking, they die, *Aphor. 44. Sect. 7.*

If the matter flow plentifully by Stool and Urine, and the Patient continue strong, it is a sign of recovery, although this Evacuation is very seldom, yet it is spoken of by *Galen, Aetius, and Paulus*; As also the way declared by *Galen* through which it passeth. 3 *de loc. affect. cap. 4. and com. in Aphor. 30. Sect. 3.* In the first place he speaks thus: *This question doth not a little disturb the followers of Erasistratus, who think that there is nothing but Spirits in the Arteries. But we find no difficulty in it, because we know that the smooth Artery in the Lungs, so much Pus as it receiveth from an Imposthume broken, can carry the same into the left Ventricle of the heart, which after goes to the Reins by the great Artery.* In the last place he saith, That the matter contained in the Lungs doth first come to the Ventricles of the Heart, and then to the great Artery; or by the hollow Vein to the out-side of the Liver, from thence to the in-side, and so to the Guts. From which you may easily see the way by which an Empyema may be purged by Stool and Urine.

If the Patient grow better, and be almost cleansed, and then again raiseth stinking spittle, he dieth of that which remaineth and returneth. *Hyp. in Coac.*

CURE. For the Cure of this Disease; First, If you cannot hinder the Suppuration of the matter in the Thorax, you must further it by convenient Cataplasms. As,

Take of Marsh-mallow-roots three ounces: fat Figs ten: Raisins stoned one ounce: Camomel and Melilot-flowers, of each one Pugil. Boil them all well, then beat them and strain them, then add the Flower of Line, Fenugreek-seed and Wheat, of each one ounce: Oyl of Lillies, sweet Almonds, and fresh Butter and Turpentine, Make a Cataplasma.

Also to help Concoction and Maturation within, you may give this following Apozeme.

Take of Marsh-mallow-roots, and of the greater Comfrey, of each one ounce: Agrimony, Colts-foot, Scabious, and Maiden-hair, of each one handful: the four great Cold Seeds, of each one ounce: Annis-seeds one dram: Liquoris and Raisins of the Sun stoned, of each one ounce: the three Cordial Flowers and Camomel, of each one Pugil. Make a Decoction to one Pint and an half; dissolve in the straining Syrup of Colts-foot, Liquoris and Sugar candy, of each two ounces. Make an Apozeme perfumed with the Powder of Flowerdeluce-root one Dram, for five Mornings Draughts.

This following Eclegma is good for the same purpose:

Take of the Pulp of fat Figs one ounce: fresh Butter two ounces: Oyl of sweet Almonds newly drawn without Fire, one Ounce: Sugar-candy two Ounces: Starch two Drams. Make a Lohoch.

Venice-Turpentine washed with Barley-water given to the quantity of three Drams with the Powder of Liquoris, doth much profit for Maturation, Discussion and Cleansing.

But if the Empyema will not be spit up (as sometimes it will not) you must come to opening of it, which you must do between the fourth and fifth Ribs, beginning to count from below, with many Cautions, which are elegantly set down by many Chyrurgeons, especially by *Hierome, Fabricius ab Aquapendente*, in his Book of Manual Operations. But it is more profitable to open the Imposthume which comes from a Pleurisie before it break, and the Pus flow into the Cavity of the Breast, which is known by the Tumor which is against the place of Suppuration, and by other signs of an Empyema. And then you must not open it below, and between the fourth and fifth Ribs, because if you make an Orifice far from the Imposthume, there will no matter come forth; but you must open it in the middle of the Tumor, first applying a Caustick. But if no Tumor appear, it is hard to open it before the Imposthume be broken.

But if any will try, he must find out the place in which the Patient finds weight, pain, and heat.

And it must be made between two Ribs upon the higher part of the Rib, because there is a Vein and Artery near the Inferiour, which you must observe in the opening of every Epyema. While the matter is taken forth by degrees, let the Patient take a Wound Drink twice a day, which will purge the Blood, cleanse the Ulcer, and hinder putrifaction. As,

Take of Sanicle, Bugle, Scabious, Betony, St. Johnswort, Carduus, Mouseear, Burnet, Periwinkle, Agrimony, Plantane, of each one handful: the Seeds of St. Johnswort, and Carduus Benedictus, of each half a Dram: Cordial Flowers one Pugil. Boil them in Hydromel to a Pint and an half; Take six Ounces every time.

With this same Decoction Injections may be made into the Cavity of the Breast.

For his drink, let him take Hydromel, or Barley-water, or Spring-water with Sugar.

If after the Breast is opened the matter do not flow freely, you must draw it forth with the following Plaister, which doth powerfully draw from all Imposthumes.

Take

Take of Rosin of the Pine-tree that is fresh, clear and sweet, half a pound : Oyl of Bays and Turpentine, of each one Ounce : Gum Elemi two Ounces. First, let the Rosin and the Gum be melted and mixed : then add the Turpentine and the Oyls, and let them boyl a little ; then strain them. Make a Plaster thereof for the part : change it once a day in Winter, and twice in Summer ; cut it in two or three places that the matter may pass through.

Chap. 5. Of the Dropsie in the Breast.

THe Dropsie in the Breast is like to Empyema which comes from a ferous Humor contained in the Cavity of the Breast. The common Practitioners do not describe this Disease, although Hippocrates doth it excellently, 2. lib. of Diseases, under the Title of a Dropsie in the Lungs, thus : There is a Fever and a Cough, quick breathing, the Feet swell, the Nails are contracted, and they suffer as they do in an Empyema; but not so violently and longer ; and if you pour any thing in or apply a Fomentation or Fumigation the matter doth not follow ; and by this you may know that it is not matter but water that is within : and if you try a long time to discover it by your Ear laid to his side, it boyls inward like Vinegar ; after that it goes into the Belly, and then he seems to be recovered : But in progress of time the Belly is inflamed: and that endureth the same, or more : some swell in the Belly, Cods, and Face. Thus Hippocrates.

This Disease seldom hapneth, yet it is more often than it is discovered, for it is not ordinarily known. Many Relations of it are given by Schenkius, by which it appears that he never saw it till their Bodies who died of it were opened by him. Therefore we will describe it exactly that a Physician may not be deceived.

This ferous Humor either may be bred in the Lungs by the proper fault of them, as when it doth not concoct its own nourishment, but turneth it into water, which by degrees is sent to the Cavity of the Breast, or by bladders breaking upon the Lungs, which are mentioned by Hippocrates in his Book of Internal Diseases, and also by others. Or it is sent into the Breast from other parts, as from the Hypochondria especially, when the Liver or the Spleen are distempered with a Schirrus or other Disease by which much water is produced. This watry Humor is either sent by the Veins to the Lungs which are weak, or else from the Cavity of the Abdomen it is carried to the Breast by insensible Transpiration. Now experience teacheth that this ferous Humor may be sent from one belly to another, because the Dropsie of the Breast turns into a Dropsie of the Belly, and a Dropsie of the Belly into the Breast, from whence they are suddenly choaked.

DIAGNOSTICK. The Diagnosis of this Disease (as hath been said) is very hard, for almost all the signs are the same with the signs of other Diseases of the Breast. But a noise of water in the breast is only peculiar to this Disease and to Empyema, which may be heard within, if the body be moved to and fro, or be taken upon a strong mans shoulders and shaken.

But all the signs which we mentioned from Hippocrates taken together, may make a certain Diagnosis : To which you may add this one, as being most evident to shew the Disease, and by which the Dropsie in the breast is onely distinguished from other difficulties of breathing : Namely, when at every first beginning to sleep this difficulty of breathing cometh and hindreth it, and by night increaseth, and towards morning by degrees abateth.

To these you may add sometimes a pain of one Arm or Shoulder, which comes either from the Humor falling from the Head into the Breast, part whereof falls into the Arm being near, or from the water contained in the breast, and sent to the Arms by the Axillary Veins of Arm-holes, or from the Refrigeration of the Intercoastal Muscles, from which the Nerves are derived to the arms, or from some other sympathy by way of vicinity : For Hippocrates in Coacis observed this Sympathy of the Breast and Arms, If those parts or Lobes of the Lungs which hang towards the right and left side of the Chest be vehemently inflamed, so that they sway or rest upon one side of the Chest or Ribs, the watry matter breaks out on the same side of the Body where the Lungs lean or rest.

PROGNOSTICK. This is a great Disease and hard to be cured, for they who have it, have their natural heat very weak, and their natural strength also, from some great Disease in the bowels ; from whence it comes that when the Humor collected in the breast is evacuated by Medicines (which is very difficult) there comes more in the place of it ; from whence the Disease is not onely nourished but increased ; so that at length by abundance of water they fall into the Dropsie called *Ascites*, yet in the beginning before the bowels are much hurt, it sometimes may be cured.

CURE. For the Cure of this Disease, you must observe two Indications ; namely, That the matter contained in the breast be evacuated, and that the breeding thereof again be hindered.

It is a hard thing to empty the water contained in the breast, because the ways are not open by which it should be brought forth. Therefore Hippocrates doth advise to open the Side, which because we never see practised, and never read in any Author that it was done with good success, we cannot

absolutely approve; and we may speak of it as we have of the opening or tapping for the Dropsie in its proper Chapter.

Therefore it is better to attempt this Evacuation with Medicines that expel Water, for which purpose all those Medicines prescribed by us in the Cure of the Dropsie are good. Where we must observe diligently, That if when the Disease is confirmed, and much serous Humor is gathered in the breast, you give a violent purge, those Humors will be much moved, from whence there will come a great suffocation which will kill the Patient; therefore be wary, and give your Medicine in a less Dose, though oftner, and mix them with strong Openers that purge Urine, that both the passages may be unstopt, and the matter carried to the Uretors.

Among Water purges the Minerals are best, as Mercurius Dulcis, and Mercurius Vitæ so corrected that it may work only downward.

Also Diureticks alone, or Medicines that provoke Urine, often used are good, because they turn away the matter coming to the breast to the bladder, and by way of consequence they bring it also from the breast.

Also Sudorificks are profitable to the carrying away of this serous matter; and we saw a man of sixty years old, who by the use of a sweating drink made of Guajacum and Sassa, taken fifteen days together, and by provoking sweat with the vapor of the Spirit of Wine, was cured.

Cauteries applied to make Issues in the Thighs and Legs, are also good to take Water from the Breast.

You may hinder the breeding of this Water, by amending the faults of those parts which send this matter.

So if the Lungs be in fault you must apply proper Medicines unto them: if the Liver or Spleen be troubled with Distemper, Obstruction, Schirrus, or the like, you must cure them by Medicines taken out of their several Chapters.

But those things which do strengthen the Vital and the Natural Parts will always agree, such as are prescribed in the Cure of weakness, Dropsie, and Flux of the Liver.

Chap. 6. Of Hæmoptysis, or Spitting of Blood.

ALthough usually the Word *Hæmoptysis* doth signifie all manner of Spitting of Blood from what part soever it doth proceed, whether from the Breast, Lungs, Rough Artery, or from the Jaws, Gums, Palate, Uvula, Brain, Stomach, Liver and Spleen. Yet *Galen lib. 1. de cris. cap. 5.* saith, That *Hæmoptysis* properly is taken for that spitting of blood which comes from the Vital parts, as the Breast, Lungs, and rough Artery.

It is a Symptom in the Excretion of those things which are wholly besides Nature.

CAUSES. But since every Symptom depends upon a Disease as its next and immediate Cause; the Cause of this will be either an Organical or a Common Disease. The Organical is twofold, the opening of the Vessels called in Greek *Anastomosis*, and Rarification called *Diapedesis*. Also the Common Disease is twofold, namely the breaking of the same Vessels called *Rexis*, and the Corrosion of them called *Diabrosis*.

The Internal cause immediately producing the Disease is a great quantity of blood.

Blood exceeding in quantity will either break the Veins, or open their Orifices, and so make either a *Rexis* or *Anastomosis*.

The same blood offending in quality, as when it is too hot or too thin, will come forth by way of *Anastomosis*; but because heat will open the Orifices, and the thinness causeth it to flow more easily: Also the same qualities make a *Diapedesis* or Rarification; for heat doth make thin the Tunicles of the Vessels, and the thinness of blood causeth it to flow more easily through the Pores of those Tunicles.

Lastly, The sharpness of the blood doth gnaw the Tunicles of the Veins and exulcerate them, and so cause a *Diabrosis* or Erosion; this also is caused by sharp or salt Humors which distill from the Head, or coming from other parts to the Lungs.

Moreover, the External Causes do concur for the Production of this Disease either mediately or immediately; it is produced immediately by a stroke, fall, wound, or the like; but they produce it mediately which increase blood, heat, and attenuate; as high and hot feeding, stoppage of Terms or Hemorrhoids, too much exercise, great clamour, heat, long staying in the Sun, and many others.

Moreover, External Cold may cause the Ruption of the Vessels, by making their Tunicles harder and not so easily to be extended; but with this must be joyned strong motion, or abundance of Humors.

DIAGNOSTICK. The Diagnosis of this Disease is difficult in respect of the Part from whence it comes: yet *Galen* declareth it in few words, 4. *de loc. affect. cap. 6.* namely, Blood coming

coming from the Gullet and Stomach is put forth by Vomit; when it comes from the Vital parts, by Cough; from the Jaws and Wealand by Hawking; from the Mouth by simple spitting which wants a more clear explication when blood comes from the Head to the inner-parts of the Wealand and the Jaws, it comes forth by Coughing, and so it doth when it comes from the Breast, and therefore it is distinguished by this sign.

Moreover, When blood coming from the Lungs or Breast is brought out by Coughing: there are other necessary signs from which the parts affected may be distinguished.

First therefore when blood comes from the Head, although it sometimes cause Coughing, yet the greatest part thereof is put forth by a Hawking, and there is a tickling in the Palate as in a Catarrh; as also when you look into the Palate it appeareth to be foul and bloody, and it is more confirmed to be from the Head, if at that time the Nose bleed.

When the blood comes from the Lungs, it is distinguished from that which comes from the breast by *Galen* in the place mentioned; for that which comes from the Lungs is froathy, in a greater plenty and without pain; but from the Breast it is black, little, and with pain.

But it may be objected, That blood coming from the breast is carried by the lungs, and by consequence is froathy, because it is mixed with the air taken in, as that which comes immediately from the Lungs.

And *Avicen* saith, That blood from the breast is froathy. I answer, That it is one thing to spit some froath mixed with the blood, and another thing to spit nothing but froath, which only comes from the substance of the Lungs.

Therefore you may observe three degrees of froath; for either it is wholly froathy from the flesh of the Lungs, which it resembleth, for the lungs are but a congealed froath; or it comes from the Vessels of the Lungs and is very froathy; or it is mixed with froath and comes from the breast.

But the most certain sign that it comes from the Lungs is taken from the pain which is fixed and continueth where the solution of continuity is.

And you must observe, That blood is sometimes sent from the Liver, Spleen, Matrix, and other parts into the Lungs, and spit forth; so that the breast is not primarily, but secondarily affected, which thing is hardly to be discovered.

But we may conjecture of it, namely, if any of the aforesaid parts be troubled with pain, inflammation, or any other distemper, and there neither is, nor hath been any other fault in the breast.

You may find out the signs of the causes from what hath been said: For if blood be brought by the Anastomosis of the Veins, there went before some cause that opened the mouth of the Vessels, then blood is thrown forth in a pretty quantity and without pain. But if it come forth by Diapedesis or Rarification, then it is watrish, little, and without spots.

When it breaks forth by Raxis or Eruption, it is very much, if a Repletion went before, or any External Cause that might break the Vessels.

Lastly, If it come by Driabrosis or Corrosion of the Vein, there went before salt and sharp Distillations from the Head; the blood is salt and sharp, and ill-coloured, and some Causes of sharp humors were formerly: In the beginning there is but little blood, but after when the Corrosion is greater, then is much blood spit forth, and at last there is a spitting of matter.

PROGNOSTICK. *Hippocrates* Aphor. 25. Sect. 4. doth lay down the Prognostick of this Disease, as what kind of blood soever is spit out of the Mouth from any part below, it is evil; for every opening of a Vessel which letteth blood come forth so is dangerous, especially in the Lungs, concerning which his *Aphorism* chiefly speaks.

But sometimes such spitting of blood may be without hurt, namely, when Nature by a Critical Motion doth purge the superfluous blood by those ways. And it is observed that Women which have had their Terms stopt without harm at certain times spit blood from their Lungs by the Anastomosis of the Veins.

In respect of the Causes. Diapedesis or Rarification is less dangerous than Anastomosis or Aperition and eruption is most dangerous; for unless it be healed within three or four days there cometh an Inflammation, which being suppurated produceth an Ulcer, from whence cometh a Consumption: Whence *Hippocrates* saith, Aphor. 15, & 16. Sect. 7. That from spitting of blood there followeth spitting of matter, and from spitting of matter a Phthisis or Consumption.

But *Diabrosis* or Corrosion is most dangerous, and *Galen* saith, That it is incurable by reason the Ulcer that followeth it, is incurable.

CURE. The Cure of Hemoptysis or spitting of blood, is wrought by Revulsion of blood from the Lungs by correcting the evil quality thereof, and closing the Vein that is opened by Astringent and Conglutinating means.

First therefore let blood from the Arm on the same side on which you find heaviness or pricking, in a small quantity often, and at a distance for the better Revulsion.

After that, open the Vein in the Foot, and so you will make a Revulsion to a farther distance, and
this

this will be more profitable if the Disease come from obstruction of the Terms. If the Patient be subject to the Hemorrhoids, you must open them with Horse-leeches.

Also apply Cupping Glasses with Scarrification to the Shoulders and Back, or without Scarrification to the Groins and under the Ribs. Rub and bind the extreame parts, and in all the time of the Cure, at some distance apply often those Cupping Glasses to the Hypochondria, or under the Ribs.

And let him take the following Julep thrice every day.

Take of Plantane and Poppy-water, of each two Ounces: Syrup of dried Roses one Ounce: Lapis Prunella one dram. Mix them for a Julep.

Lastly, You must often purge the serous and cholerick Humors which make the blood more thin and fluid with Medicines that have an Astringent Virtue: As,

Take of Rhubarb one Dram: yellow Myrobalans half a Dram: Tamarinds half an Ounce: Infuse them in Plantane-water; strain it and dissolve in it Powder of Rhubarb half a Dram: Syrup of dried Roses one Ounce. Make a Potion.

Then give Medicines that close the Orifices of the Vessels by an Astringent quality, but such as will not retain the blood in the Breast by too much astringition; therefore mix sometimes with them such as dissolve and expectorate the congealed blood which is out of the Vessels.

Of all which these following are the best.

Take of Bole-armeniack, Terra Sigillata, both sorts of Coral, Blood-stone, of each half a Dram: Sugar of Roses half an Ounce; with one White of an Egg well beaten with Rose-water. Make a Lohoch.

Or you may make one more speedily, and more pleasant thus:

Take of the Water of the White of an Egg well beaten two Drams: Sugar of Roses one Ounce: white Starch three Drams. Mix them for a Lohoch. Or,

Take of Conserve of Roses and the greater Comfry, of each one Ounce: Bole-armeniack and Terra Sigillata, of each one Dram: With the Syrup of dried Roses make an Opiate to be often held in the Mouth and swallowed by degrees.

Take of Conserve of dried Roses, Troches of Amber, and of sealed Earth, of each half a Dram: prepared Pearls one Scruple: Sugar of Roses as much as all the rest. Mix them and let him take a spoonful thereof one hour before Meat.

Take of the Juycce of Purslane twelve Ounces, Sugar eight Ounces: boyl them to a Syrup, of which let him often lick.

This is the best for spitting of blood: And if you want Purslane, you may take Plantane.

The Syrup of Comfry according to Fernelius, prescribed by Blanderon, is good for the same.

Take of Yarrow with the white Flower, and yellow Flower, of each two handfuls: Green Robts of Tormentil with the Leaves, if they may be had, otherwise of the dry, one Ounce: the greater Burnet one handful: Conserve of red Roses half a pound: Spring-water sixteen pints: put them in a glassed Pot covered and luted, that the Vapors may not come forth: Then boyl them in Balneo Mariæ sixteen hours; keep the straining in a Glass, and take six Ounces thereof every Morning, Noon, and Night.

Take of the Troches of Amber one Dram: Plantane and Rose-water, of each one Ounce and an Half: Syrup of Myrtles and dried Roses, of each half an Ounce. Mix them for a Julep.

Take of Spirit of Vitriol half a Scruple: Plantane-water four Ounces. Mix them for a Potion.

This presently stops blood coming either by Cough or Vomiting.

Two spoonfuls of Syrup of Coral taken every day, is good against all manner of bleeding. But the Tincture of Coral drawn with Juycce of Lemmons, is more powerful.

Quercetan in his Dispensatory, prescribeth this following Water against spitting of blood, which is very excellent.

Take of the Roots of Snake-weed, Comfry and Tormentil, of each one Ounce: Knot-grass, Yarrow, Veronica, Winter-Green, Sanicle, Shepherds-purse with the Roots, of each one handful: Bramble-tops and Mastick-wood, of each half a handful: Sumach and Myrtle-berries, the Seeds of Plantane, Barberries and white Poppies, of each six Drams: the Flowers of Water-Lillies Guerd, Quinces and red Roses, of each two Pugils. Bruise them and mix them; then steep them four days at the fire in the Juycces of Plantane, Purslane, Sorrel and Agrimony, of each two pints: Then strain them well, and put to them Acacia and Hippocistis, or Conserve of Sloes, of each two Ounces: sealed Earth, Bole-Armeniack, of each half an Ounce: the Electuary of Diatrageanth frigid, two Drams: then macerate them again four days, and distill them. Take two or three spoonfuls of this Water alone, or with some proper Syrup.

The

The Chymical Oyl of Amber doth pierce, astringe, and dry powerfully, if you give two drops thereof in Plantane-water: As *Celapinus* teacheth in his *Speculum Artis Medicinæ*.

Mercurialis in his Consultations doth highly commend the Seeds of white Poppies, or white Henbane to be taken every Morning to the quantity of a Dram, with sugar of Roses and Syrup of Purslane; so you may also use the white Diacodium or Syrup of Poppies prescribed in the Cure of the Phrenzy.

Amatus Lusitanus doth highly commend the Juyce of Nettles, in these words: *They which have vomitted blood, after they have been given over by Physicians, have been cured only by the Juyce of Nettles drunk five or six days fasting, to the quantity of four ounces, and by Nettle-Broth.*

Sanguis Draconis doth wonderfully conglutinate all inward Veins, if you give half a Dram thereof with Plantane-water, or other proper Liquor or Medicine.

The usual Pills to hold under the Tongue, may be made thus:

Take of the Mucilage of Gum-Arabick and Tragacanth, drawn with Plantane-water, of each two Drams: Mummy and Mastick, of each one Dram: Sugar of Roses as much as will make Pills, of which let him hold one continually in his Mouth.

And take this following Powder in his Broths.

Take of Red Coral and prepared Pearl, of each half a Dram: Gum-Arabick and Tragacanth, of each two Drams. Make a Powder.

Or boyl White Poppy-seeds and Sumach tied in a Clout in his Broth.

Narcoticks are good in this case, and you must use them thus;

Take of Syrup of Poppies, Jujubes, and dried Roses, of each one Ounce: Mix them, and take a Spoonful every Night. Or,

Take of Syrup of Poppies and Purslane, of each three Drams: Terra Sigillata half a Dram: Purslane and Plantane-water, of each one Ounce and an half. Make a Potion to be taken at night. Or,

Take of Syrup of Myrtles and Poppies, of each one ounce: Bole-Armeniack half a Dram: mix them to be taken at night.

Sometimes you may give Treacle of four months old, as *Galen* teacheth, §. *Method. Cap. 13.* or *Philonium Romanum*, or *Laudanum*.

Platerus reports, that he cured one only with the Troches of Winter Cherries, with Opium dissolved in Goats-milk, taken some days: and also that he cured a Woman with one Ounce and an half of Manna given in Broth, and with blood-letting, and the use of the Tablets following morning and evening for many days.

Take of the Seeds of white Henbane powdered finely, two Scruples: red Coral half a Dram: Gum Arabick one Scruple: new Violets ten: the Juice of Barberries two Drams: Sugar dissolved in Rose and Plantane-water, two Ounces. Make Tablets.

Trallianus, Lib. 7. Cap. 1. doth rightly commend the Blood-stone, by which he saith that he cured many, giving it to four scruples, with the Juice of Pomegranates or Knot-grass; but to them who bled not much, he gave it with warm Water. But he saith, you must sift it well, give it often that it may better be distributed, and in Wine.

Antony Valerius, Exercit. ad Cap. 27. lib. 1. *Hollerii de Morb. internis*, reports, that he cured when all means failed, by this Powder which he had from *Julius Scaliger*.

Take of Spodium, red Roses, Bole armeniack, Terra Sigillata, and Blood-stone, of each half an ounce: red Coral, Amber and Pearls not perforated, of each two Drams and an half: Gum Arabick and Tragacanth, of each two Drams: the Seeds of Purslane, Mallows, Ribwort, red Roses, burnt Harts-horn, and white Starch burnt, of each three Drams. Make thereof a fine Powder, and give three Drams thereof with Rain-water.

This Powder *Scaliger* borrowed of *Serapio*, who mentioned it in his Book of spitting of Blood, and which *Valescus* also commends. And you may make Tablets thereof with Sugar dissolved in Rose or Plantane-water.

The Electuary of *Halidem* is like it and easier made; which was wont to be famous in Germany, and so commended of *Gesner*, *Erastus*, and *Crato*, thus:

Take of the Seeds of white Poppy and Henbane of each ten drams: Terra Sigillata and red Coral, of each five drams: old Sugar of Roses as much as will make an Electuary. Give hereof one dram morning and evening, after universal Medicines have been given.

But because that spitting is stopped by the use of Astringents, and thence comes difficulty of breathing, you must at times use things that mollifie the breast, and also stop bleeding, such as they which are compounded of Gum-Arabick, Tragacanth, Starch, and Syrup of dried Roses, Quinces, Myrtles, and Jujubes, the Juice of Plantane and Purslane. While you use Astringents, if the belly be bound give a Clyster or Purge that leaves some Astringency.

In the whole time of the Cure, if you suspect that there is any congealed blood in the Breast, you must dissolve it with Oxycrate thus made according to *Galen, 5. Meth.* that it may be pleasant and not provoke Coughing with the Vinegar; for so, it dissolveth the blood and gently bindeth: Let him take six Ounces warm twice or thrice in one day, and if it provoke Coughing, sweeten it with Sugar; but you must use this when the bleeding begins to cease: For this also Amber and Mummy mixed with Glutinators and Astringents is good.

Also for the allaying the heat of the Liver, use often a cooling Epitheme to the right side.

Take of Rose, Plantane, and Succory-water, of each four Ounces: Vinegar of Roses two Ounces: the Powder of the Electuary of the three Sanders one Dram and an half: Camphire one Scruple: Make an Epitheme to be applied warm to the Liver.

After the use of the Epitheme anoint the same part with Oyntment of Roses, or the Cerat of Saunders, with a little Rose-Vinegar.

Anoint also the Reins of the Back wite Oyl of Roses and Water-Lillies washed with Vinegar; adding a little Camphire to allay the heat of the blood in the hollow Vein: but you must beware of things that are too Astringent, lest they drive the blood from the hollow Vein into the Lungs.

It is also very good to wash the Stones with Oxycrate to stop the Flux and allay the heat: for there is a great consent between these parts.

A Bath would also be good to allay the heat of the Bowels; but because they relax and so open the Veins, you must avoid it.

Let him drink Syrup of Myrtles, Purflane and dried Roses; or Sugar of Roses with Barley-water, or with the Water wherein Blood-stone or sealed Earth hath been infused. Or mix Conserve of Roses with the Water, or with the Water wherein Coriander hath been infused, made sharp with the Spirit of Vitriol, or with the Tincture of Roses.

A weak Decoction of Yarrow drunk ordinarily is good against all bleeding.

If a sharp Defluxion from the Head upon the Lungs be the cause of this Disease, besides what hath been said, you may use those Remedies which are prescribed in the Cure of a hot Catarrh.

After the Blood is stopped, to keep it from returning you must first abstain from all things that stir the Humors, as violent exercise, great heat, anger, crying aloud, rich Wines, the Meats mentioned, which are either salt or spiced.

Conserve of dried Roses must be held in the Mouth, especially at bed-time.

Take of Conserve of Roses and of Comfry-roots, of each one Ounce: the Troches of Amber, and sealed Earth, of each half a Dram: red Coral and prepared Pearls of each one Scruple: Sugar of Roses as much as all the rest: Make a Mixture, of which let him take a spoonful sometimes one hour before Meat.

Let him be purged four times in a year, or oftner if occasion be, with the Potion of Rhubarb and Myrobalans above mentioned; to which instead of Syrup alone add one ounce of Manna.

You may with good success take a Scruple of torrifed Rhubarb every morning one hour before Meat, especially if the Blood be serous, as it is commonly in Hæmorrhagies.

Also Rhubarb not torrifed given in the same quantity; for so the blood after the serous watry Humor is carried away will grow thicker: Or, you may give a Dram of Rhubarb once every Week.

There is also a Magistral Syrup to cleanse the blood from thin serous Humors. As,

Take of the Leaves of Bugloss, Fumitory, Hops, Succory, Endive, Agrimony, Plantane, Maiden-hair, of each one handful: the Tops of Asparagus, Vervain, and Eyebright, of each half an handful: the Seeds of Gourds and Melons, of each half an Ounce: Endive and Dodder-seed, of each two Drams: Liquoris scraped, and Raisins, of each half an Ounce: Sweet Prunes twelve: Senna four Ounces: Polypody of the Oak two Ounces: Agarick tied in a thin Clout, six Drams: Mace one Dram: the three Cordial Flowers and red Pease or Pulse, of each one Pugil: boyl these to a pint and an half: dissolve in the straining of the Juice of sweet Apples three Ounces: fine Sugar one pound and a quarter: Make a Syrup boyled well, and scented with yellow Saunders. Then infuse in it one Ounce of Rhubarb beaten and tied in a Clout, let him take an ounce and an half, or two Ounces, with Broth twice in a month.

Make an Issue in the right or left Leg, as the Liver or Spleen are affected.

Lastly, Let him use for a whole Month Asses-milk steeled, for prevention of this Disease.

For his Drink take Water boyled a little with Coriander-seeds, or the Decoction of Barley and Liquoris.

CHAP.

Chap. 7. Of Phthisis, or Consumption.

Although the Word *Phthisis* signifies every Consumption, yet it is most properly taken for that Extenuation of body which cometh after an Ulcer in the Lungs.

For this Extenuation of body comes from a putrid lingering Feaver, which turneth to an Hectick; and this Feaver comes from the Ulcer in the Lungs, from which by reason of their nearness to the Heart, putrid Vapors are continually sent thither and cause the Feaver, which after is dispersed from the Heart into the whole Body: so all the parts being too cold and dry, and receiving the intemperate putrifying heat, do not well concoct their nourishment, but are ill nourished, from whence you may plainly perceive a Consumption of the substance of the whole Body: For that Feaver by reason of its continuance from the perseverance of the Cause turneth Hectick, and it's often joyned with a putrid Feaver, which is known by the Urine, and by the Distemper extraordinary at sometimes; insomuch that in some Consumptions you may observe fits of an intermitting Feaver.

CAUSES. A sharp and corroding Humor either coming from other parts, or breeding in the Lungs, is the immediate Cause of an Ulcer in the Lungs.

First sharp and salt Rheum falls from the Brain, which being violent, easily ulcerateth the Lungs: Sometimes Flegm that is not sharp nor salt will do the same, namely, if it be long in them, and putrifie, and from the putrefaction ariseth an Acrimony, which corroding ulcerateth; yet this putrid flegm in the Lungs doth not always ulcerate, as we may observe in a Catarrh when putrid matter is spet forth, and the Lungs are sound.

But there are two Conditions for the causing of an Ulcer; one in respect of the Matter flowing; another in respect of the Lungs. In respect of the Matter it is required that it should be so disposed; that when it is putrified it begets a sharpness which may cause an Ulcer. In respect of the Lungs, they must be extraordinary tender, and disposed to corruption, which in a word is called a Vicious Constitution of the Lungs, coming from the Parents usually, of which we will speak hereafter.

Now the Humors that exulcerate and putrifie the Lungs, come from the parts adjoyning, as the Pleura, Mediastinum, Diaphragma, rough Artery, and especially from an Inflammation in them, which comes to Suppuration and turns into an Empyema; of which *Hippocrates* speaks, Aphor. 15. Sect. 5. *They who fall from a Pleurisie into an Empyema, if the Empyema break in forty days and come away; are cured; but if not, they fall into a Consumption.*

The Humor is in the Lungs, when from some Vessel broken, corroded, or opened by a wound, the blood flowing doth putrifie; or when an Ulcer is left there from the small Pox.

Sometimes from the evil constitution of the Lungs, evil Humors proceed, which corrupt their substance and cause a Consumption; and this comes commonly from the Parents, from whence a Consumption is reckoned among the hereditary Diseases, of which it is the chief, so that we may observe how many whole Families are taken away with this Disease.

This evil Constitution of the Lungs is not in the first qualities, but hath some malignant and venomous quality, by which it becomes infectious. Although we deny not but a soft and loose substance of the Lungs, and therefore more fit for corruption, doth much conduce to the breeding of this Disease.

This evil Constitution of the Lungs causeth that some fall into Consumptions without a Distillation, Inflammation, or any other evident cause, but onely from the fault of the part that corrupteth its own Nourishment.

Sometimes it comes from a Pustula bred in the Lungs and broken, which by *Hippocrates*, 1. de morbis, is made two-fold.

One by him is called a Crude Pustule, because it never comes to Suppuration, but growing by degrees stops the Passage of the Breath, and at length kills the Patient.

The other is that which comes to Suppuration, and is called the Imposthume of the Lungs, and these come two ways, either by Defluxion, or Congestion; and the Matter gathered is either in a Bag, or without it in the very substance of the part.

The thickness of the Bag often causeth that such an Imposthume is carried many years in the Lungs undiscovered, and without any hurt to the Body. From whence *Hippocrates* saith, Aph. 41. Sect. 6. *They who have an Imposthume in the Body, and feel it not, it is by reason of the thickness of the Matter, or of the place wherein it is that they feel it not.* For this cause many who seemed to be in perfect health have suddenly died by an Imposthume broken within; of which there are examples in *Fernelius*, lib. 5. de morbis, de part. morb. & sympt. c. 10. among which he mentioneth two Physicians who foresaw the danger without signs.

If the Matter which comes from the Imposthume broken flow into the Ventricle of the Heart, the

Sick presently die: but if it come to the Bronchia or passages in the Lungs, it may be spit up; if the Body be strong, and the Matter little in quantity; but commonly there is an Ulcer remaining in the Lungs which causeth a Consumption.

Moreover, there are External Causes, as Contagion, which is the chiefest; for this Disease is so infectious, that we may observe Women to be infected by their Husbands, and Men by their Wives, and all their Children to die of the same; not only from the infection of their Parents Seed, but from the Company of him that was first infected.

And this Contagion is more easily communicated to them that are of kin, whereof it is not safe for a Brother or Sister to enter into the Chamber for the *Miasmata* or Vapors infective, which come from their Lungs and infect the whole air of the Chamber, and being drawn in by others (especially if they are any way disposed to the same Disease) beget the same Disease in their Lungs.

There are other External Causes, especially very hot or cold Air; the hot Air doth melt down the sharp Humors which are contained in the Brain, and sends them to the Lungs. The too cold Air by astringing, compressing and squeezing, doth cause the like Defluxion: but the Air in Autumn is most dangerous, because by its inequality in heat and cold, it causeth sharp and salt Distillations; whence *Hippocrates* saith, *Aph. 10. Sect. 3. Autumn is the worst time for people in Consumptions.* Secondly, Sharp and Salt Meats and Drinks do cause a Consumption, which fills the Head with salt and sharp Vapors. And lastly, All those Internal and External Causes which use to produce spitting of blood, which useth to end in a Consumption, may be said to be Causes thereof.

Among the Antecedent Causes, evil Humors throughout the whole body are accounted the chief, which being moved by External Causes, are sent to the brain, and from thence to the Lungs. Among which you may reckon the suppression of the Terms, Hemorrhoids, or other usual Evacuations, which do cause Catarrhs and Defluxions.

The aforesaid Causes do produce this Disease, especially among those whom *Hippocrates* calleth *Phthirideis*, and *Pterugodeis*, that is, such as have a straight and distressed Breast, a long Neck, and Shoulder-bones sticking forth, who must of necessity fall into this Disease, if they have tender Lungs, of an hereditary inclination thereunto. Also they are inclined to a Consumption who have a weak Head, which is easily filled with superfluous Humors, which are sent to the Organs or Instruments of the Spirits.

DIFFERENCES. There are no true and proper Differences of Consumptions, but such as come from the variety of their Causes. Yet *Hippocrates* doth lay down many kinds which are worth the observing, which must be reduced not to a true Consumption, but to one in general, which is without an Ulcer of the Lungs. And first, *Lib. 6. Epid. Sect. 2. Text. 47.* He speaks of a Consumption which came from a running of the Reins, in his History: *A Satyr called Grypalopex, being twenty five years old, had Nocturnal Pollutions, and daily loss of Seed; who when he came to be thirty years of Age, fell into a Consumption and died.* For by the continual loss of Seed the Nourishment of the Body is taken away, by which the solid parts are consumed and dried.

There is another kind in *Hip. 2. de Morb.* called the Consumption of the Back, which comes from too much Lechery, which destroyeth the whole habit of the Body, and takes away the Nourishment from the solid parts; this happens to new Married Folks who are unsatiable, and is the chiefest of the Consumptions of the Back; for *Hippocrates* lays down four kinds thereof. The first is that mentioned, which comes from Lechery. The second is laid down, *Lib. 2. de inter affect. text. 13.* which comes from too much blood, and nourishment going to the Spinal Marrow, by which the Natural heat and all other Faculties are stifled and destroyed. Now *Hip. 5. Epid.* sheweth that the body may consume by too much blood, in a story concerning one, who when nothing would nourish him, but he still grew leaner, was perfectly cured (when other Medicines failed) by bleeding in both Hands as long as the Veins would discharge. The third kind is in the place mentioned, namely, when the Marrow of the Back is dried, by which the whole body drieth and consumeth. *Hippocrates* mentioneth two Causes of this driness; one is the obstruction of the Veins which go to the back with nourishment; another is the flowing of Choler from the Head upon the Back, which *Hippocrates* sheweth in his Book *De locis in homine*. The fourth is described in the same Book, and it comes from a Distillation upon the Marrow of the Back, in these words: *Moreover, when a Defluxion falls upon the Back, this kind of Consumption cometh with pain in the Loins, and seeming emptiness to the Patient in the Internal parts of the Head.* In the same Book, Numb. 18. he saith thus: *When there is a Defluxion upon the Marrow, there is a secret undiscerned Consumption.* He calls it Secret, because when the body decays, you cannot so easily find out the Cause; he calls it Undiscernable, because you cannot perceive the inconveniencies of the Defluxion at the first. But it ceaseth to be secret and undiscernable, if the Defluxion be not only upon the Marrow of the Back, but also upon the *Os Sacrum* and Hip; for then the Distillation is apparent, and there is pain and loss of Motion, with dejection of Mind. These are more clear in *Hippocrates*, in his Tenth Book *De glandulis*, in these words: *There is another Disease which comes from a Defluxion from the Head by the Veins*
upon

upon the Marrow of the Back, and from thence to the Os Sacrum and Hip, which is a Consumption also which destroyeth, for then the Shoulders and both the Feet are weak, and after the Legs, and they always die of it, though they have been formerly cured. This kind of Consumption is to be observed, because it often happeneth, especially to such who have weak Nerves, which will easily receive the Defluxion.

To this kind you may refer that which comes of want and hunger, which *Galen* mentioneth, *lib. de Marasmo*, when the body decays for want of Nourishment. Now Nourishment is wanting to the solid parts, not only for want of Meat, which the Stomach concocteth and sends to the Liver to make blood for the whole body; but also when the *Chylum* which is sufficiently concocted in the Stomach cannot pass through the Meseraick Veins, by reason of their obstruction; as it hapneth to them who have a Struma, whose Mesentery for the most part is full of Glandules, by which the milky Veins called *Vena Lactea* are compressed, from whence the body grows lean, and they die of a Consumption.

But the solid parts are deprived of the necessary nourishment when salt blood that is not fit for nourishment is gathered into the Veins, which, as *Galen* shews, are incurable, 5. Meth. except by *Epicrasis*, or change of habit. And finally, *Galen*, *lib. de Marasmo*, *decimo Meth.* and in other places, speaks of a Consumption from a manifest or hidden Inflammation, from the Syncope of the Heart or Stomach, and the like, which may be seen in their proper places.

SIGNS. DIAG. The Diagnostick Signs by which you may know a true Consumption, do some of them declare a Consumption beginning; or begun, or confirmed, which are very well set down by *Hip. 1. de Morbis*.

The Signs of a Consumption at hand, are in *Hip.* Book mentioned, Text 9. in these words: *There is also a Suppuration when Flegm flows from the Head upon the Lungs; and first for the most part it flows privately, and causeth a little Cough, and the Spittle to be bitter, and a little heat.*

In this saying there are contained four Signs of an eminent Consumption.

The first Sign is, a Defluxion from the beginning closely conveyed to the Lungs, because then the Matter is little, and because the thinner part of the Humor floweth about the rough Artery, and doth not vex the Lungs, which otherwise would be more disturbed in the beginning, before they are weakened; thence it is called a secret Defluxion, because there is little hurt at the first done thereby.

The second is, When the Humor flowing makes but a small Cough, being at the first but little and thin.

The third Sign is, When the Spittle is more bitter than usually it was, because the Humor that must ulcerate the Lungs must be sweet, sharp or salt; which qualities being altered by a preternatural heat, do turn bitter; for it is known that sweet and salt things over-much boyled, do grow bitter. But in regard that preternatural heat is not very great at the first, the Spittle is but a little bitter.

The fourth Sign is, A little heat, as being feaverish; for when the matter is not much moved, but receiveth putrefaction from the heat of the place, wherein it hath been long contained, the Feaver cannot be very violent, for the putrid matter can many ways be refrigerated; therefore it is no wonder if the Feaver be small in the beginning.

To these Signs of *Hippocrates* we may add an evil formation of the Breast and Youth, which meeting with the aforesaid Signs, must needs declare a Consumption to be at hand.

The evil fashion of the breast is when it is narrow, and the Shoulder-blades stick up like wings, when the fore-part of the breast is narrow, & the hinder-part broad, for then the breast is both small and evil proportioned. The straitness of the breast shews want of natural heat, and the evil proportion shews its weakness: For if the natural heat were much and vigorous, the breast would have thereby been extended. But such and so great is this disposition that *Hippocrates* calls it a Natural Consumption, coming from a principle in Nature. Wherefore they who are thus made must of necessity fall into a Consumption, except some other Disease take them off. Which by the way is observable, for if they have any acute Disease who are thus inclined, they seldom escape, because the natural heat is weak and little, and therefore will easily be overcome by a strong Disease. Therefore the most wary Physicians in such kind of natures and habits do use to prognostick rather death and danger, than health or recovery, when they fall into any Disease.

In them who are inclinable to this Disease, Youth is most dangerous, according to *Hippocrates*, *Aph. 9. Sect. 5.* especially from eighteen to thirty five years, in which time there is much blood for to break the Vessels; as also it is then thin and sharp, more proper to open and corrode the Vessels. In Children the Catarrh is made slow with much moisture: In old Men it is allayed with Cold, but in the middle age for the reasons aforesaid, it doth often extulcerate.

Moreover, in Youth many Distempers come by Diet, by which many ill humors are produced and the blood infected; as also by reason of violent exercise, as running, wrestling, leaping, fencing, and going in the Sun: also a Vein may be broken in the Lungs which may produce a Consumption.

The Signs of a Consumption begun are set down by *Hippocrates* in his Book of Diseases before mentioned, Text. 10. in these words: *In progress of time the Lungs are exasperated and ulcerated within by the Catarrh putrefying there, whereby the Breast seems pondrous; and there is a pain before and behind, and there is more sharp heat in the Body; and the Lungs by reason of their heat draw moisture from the whole body, and especially from the Head, which also is made hot from that body, and spitteth forth thick matter.*

In these words there are Six Signs contained of a Consumption begun.

The first Sign is, That the Lungs are exasperated in progress of time, that is, the Cough is more violent; for the Disease increasing, the Distillation is stronger, and the Lungs are pierced therewith, and provoked to cough forth that which hurteth them, which Cough doth not only come from the matter flowing down, but from that which flowed formerly; for being not coughed up it groweth foul by long continuance, by which means the Lungs are more forced to expulsion.

The second Sign is, The weight of the Breast which comes from the matter gathered into the Lungs; for albeit the Lungs of themselves do feel little or nothing, yet because they are tied to the Breast by Membranes, they perceive a weight when they are burdened.

The third Sign is, A sharp pain before and behind; for the matter contained in the Lungs doth with its evil quality offend them, as well as with its quantity and putrefaction, by which the Membranes are pricked, which cause great pain, for the pain in the Membranes is always pricking. Now this pain is perceived before and behind; because these Membranes are joyned before to the Sternum, and behind to the Back; and the cause of this pain is from a great Cough, called by *Hippocrates*, A malignant or cruel Cough.

The fourth Sign is, When sharp heat falls into the body, and there followeth a violent Feaver; for when through progress of time the matter putrefieth more, it is probable that the Feaver will be greater; for although the matter from the beginning do only putrefie in the Lungs, yet by reason of the Suppuration made in the Breast with an Ulcer, the filth is communicated to the Humors contained in the Veins: from which come divers sorts of putrid Feavers, and these differ from that Feaver which comes only from the Ulcer in the Lungs, through the filthy Vapors which are carried from them into the Heart, which turns to an Heetick; and therefore in a Consumption there is a Heetick Feaver often joyned with a putrid.

The fifth Sign is, When a great quantity of Flegm falls from the Head to the Lungs; which *Hippocrates* confirms, when he shews the Cause of that great Defluxion, namely, The Lungs by their Heat drawing Flegm from the whole body. Hence it is that the Humors contained in the whole body are the matter of a continual and great Flux which doth so trouble men in Consumptions. The Lungs by the filth which they have contracted, grow hot; by which heat, Flegm is drawn from the brain, which the brain fetcheth from the whole body: And this is one of the principal Causes of the extenuation of the whole body; for all the Humors good and bad are carried to those parts, and so the whole body decayeth.

The sixth Sign is, Spitting of thick rotten Flegm; for when the matter putrefieth and there is an Ulcer, Quittor or Filth must needs come from thence, and therefore the Spittle is mattery: but it is between thick and thin; for after that it hath by long continuance in the Lungs grown thick, it is made thinner by the addition of that which breaks from the Ulcer, and so it becomes moderate, which *Hippocrates* calls *Subcrassum* or thickish.

To these mentioned Signs of *Hippocrates*, you may add this as most certain, namely, The Extenuating the body with a lingring and constant Feaver. For besides the putrid Feaver above mentioned which come and go by fits, and grow from the Humors which putrefie in the Veins: there is also always present a lingring daily Feaver coming from the vapors sent from the Ulcer to the heart, which corrupteth the nourishment of the whole body, and makes it dry and hot, from whence the body must needs grow extenuated.

To these you may add Sweating at Night, with which men in Consumptions are often troubled as soon as they begin to sleep; for by sleep the heat is drawn in which increaseth the Inflammation of the Lungs, and the heat inwardly increased, causeth abundance of vapors which are thickened in the skin, and turned into sweat.

Moreover, there is a continual rigour which comes from the sharpness of the matter which pricketh the Membranes.

And lastly, you may add sweetness of Spittle, which useth to come when it begins to suppurate, which is the original of saltness.

Hippocrates shews also the Signs of a Consumption confirmed in his 11. Text. of the Book above mentioned, in these words: *The longer this Disease lasteth, the more absolute matter will be spit, and the Feaver be the sharper, the Cough more frequent and strong, the body will more consume, and yet the body is disturbed downward from Flegm, and this comes from the Brain, when any man comes to this he must perish.*

In these words, we may observe that there are five Signs of a Consumption confirmed.

The first is, The Spittle being more mattery, or rather matter it self.

The second is, A strong Feaver and sharp, more putrefying, and the Ulcer more foul.

The third is, An often and violent Cough more than formerly; often because of the great provocation and little evacuation, therefore nature laboureth to do that at divers times which she cannot do at once: and it is a stronger Cough, not only because the greater sharpness of the water doth more violently stir up the expulsive faculty, but also because of the wearing away of the solid parts, the breast is made more hollow; hence comes a hoarse and sounding Cough, as from a hollow place.

The fourth Sign is, Pining and want of Appetite, which makes them leaner; now the want of Appetite comes from the Distillation which doth not only fall upon the spiritual Members, but also upon the Natural, especially the Stomach, whose mouth is thence weakened to the loss of Appetite; as also from the putrid Vapors sent thither either from the Feaver or the Ulcer.

The last Sign is, A loose Belly which comes from Flegm falling from the Head, by which in time the Stomach and Guts are weakened, and the retentive faculty destroyed; and this kills the Patient, as we will shew more at large in the Prognosticks.

To these Signs of *Hippocrates* we may add some other.

The first is, A great extenuation of the whole body, so that all the Musculous flesh is consumed; and the bones appear only covered with skin; and hence it is that the Nails are crooked, because the flesh which was in the tops of the Fingers to hold up the Nails is consumed.

To this you may add difficulty of Breathing, both because the Faculty is weak; as also because the Bronchia of the Lungs are stoppt with putrid matter; as also because the part is for the most part putrefied and consumed, and therefore cannot take in sufficient air to cool the heart; so that what the Lungs cannot do by one breathing, it must do by often.

And lastly, We may add that in a confirmed Consumption that is desperate, the Hair falls off, the Cheeks wax blew, except it be after Meat, and then the Vapors sent up make the red Lice breed in abundance, and the feet swell.

Neither need we so many Signs, for if any ordinary man, saith *Aretus*, shall see a man pale, weak, and coughing, and very lean, he will conclude him to be in a Consumption.

Yet we must observe diligently, That sometimes a violent Catarrh falling upon the Lungs will resemble a Consumption, so that filth like matter shall be spit forth, and thence may a Feaver come through putrefaction and extenuation of body: but they who are so, may easily be cured by diligence in means, therefore let us distinguish this rightly from a Consumption, which is chiefly done by discerning between putrid Flegm and Matter. Thus,

Matter is of a dun colour, and less white than Flegm; sometimes of divers colours, and being put into hot Water it sinketh and dissolveth; but Flegm swims at the top and sticks together by reason of its sliminess, and will not dissolve.

But if some of the Spittle dissolve and the rest not, it is made of Flegm and Matter, which often hapneth.

PROGNOSTICK. As for the Prognostick, it is very hard to cure a new Ulcer in the Lungs; but it is impossible to cure an old, because it is opened by the continual motion of the Lungs and by coughing, so that it will not be united; as also the force of the Medicine is gone before it can come at it, and the lost substance of the Lungs cannot be repaired.

Moreover, an Ulcer, Spitting, Feaver, and leanness require contrary Remedies, for those things which dry the Ulcer, do hinder Spittle, increase the Feaver and Leanness; and moist things which are good against the Feaver and Leanness do make the Ulcer more foul.

Sometimes the Ulcer seems cured, and there is a Scab upon it, but with the least motion it falls off and the Disease returns.

A Consumption which comes from a small Ulcer of short continuance, although it be difficult, yet is not incurable if proper Medicines be timely used: and they who have gathered Observations mention many so cured; now there is most hope when the Patient is strong, the Spittle white, even, of one colour and easily raised; if the Humor falling from the Head pass through the Nose, and if thereupon the Feaver abate, if the Appetite be good, and there be no thirst, and if the belly be bound and in good order, if the Patient have a good habit of body, young, and have his breast large & hairy.

They whose Spittle stinketh or have loose bellies, or cannot spit, are near death, as *Hippocrates* teacheth, 1. Prog. & Aph. 11, & 12. Sect. 5. and Aph. 16. Sect. 7.

A Consumption coming upon an acute Disease doth kill speedily, but if it come from other Causes it is Chronical, and lasteth many years. And *Avicenna* saith, that he knew a Woman that lived twenty three years in a Consumption. And *Mathew de Gradi* saith, That another Woman which was always about the Fire, lived in a Consumption twenty eight years.

The Cure of this Disease, as is said, is for the most part impossible, if the Disease is old; but if it be new, it may sometimes be affected, and the easier when it is but coming upon them who are disposed

Posed thereto by an hereditary disposition, but are not yet fallen into it. Therefore we shall first lay down a Prophylactick of preservative, and then shew how to cure the Disease.

Therefore for the amending of the evil disposition in a Consumption, use a cooling Diet, and moist, and all such things as correct the blood, and make it mild, and correct its saltness and sharpness; as the Waters of sweet Baths, the use of Milk, and the like; as also China-roots boyled in small beer; but the Decoction of the Saunders is the best, which is not only good in a Consumption at hand, or begun, but also in salt and thin Distillations, and in old bleeding from thence. The Decoction of Guajacum doth Wonders upon the same account with the former, either given in distilled Waters with a little white or red Wine, as the Disease will bear it. Now the Decoction of Guajacum and of Saunders are made both alike, both for the first and second Drink, and given the same way. To these you may add change of Air, which is good both to prevent and cure. And lastly, those Remedies are good which we will lay down for the Cure of the Disease confirmed, to be used first.

CURE. Now the whole Cure consisteth in the cleansing and glutinating of the Ulcer, by taking away the Causes that produce and nourish it, by opposing the Heetick Fever, and restraining of the Consumption.

First therefore, because an ill habit of body may increase the Ulcer of the Lungs, you must use gentle Purges, at divers distances as long as the body is not very low. And these must be made of Manna, Rhubarb, Cassia, or Syrup of Roses, thus:

Take of Barley half a Pugil: Liguoris scraped and Raisins stoned, of each three Drams: Fijubes four: the flowers of Bugloss and Violets, of each half a Pugil: boyl them to three Ounces. In the straining dissolve Rhubarb infused in Scabious-water with yellow Saunders four Scruples: Manna one Ounce: Syrup of Roses half an Ounce. Make a Potion.

Or give two Ounces of Manna with Chicken or ordinary Broth.

Or make a Bolus of Cassia one Ounce, and one Scruple of the Powder of Liguoris.

In the beginning you may give stronger Purges for to draw down the salt and sharp Catarrh which is the chief cause of the Ulcer, such as are prescribed in a hot Catarrh.

Also before the body be too lean, at the first you may let blood to allay the Fever and the Acrimony of the Humor.

But in the beginning of the Cure you must stay and divert the Catarrh from the Breast, otherwise all other things will be in vain. And all those things which were prescribed for the Cure of a hot Catarrh are good in this case.

Besides a Seton to the Neck is very good. And *Fabricius Hildanus* reports that he cured many by this way.

At length you must come to the Cure of the Ulcer, for which give things that cleanse, knit, and expectorate. Many there are of this nature; but these following are the best.

Milk doth hit all intentions for Cure: It cleanseth with its serous parts, it conglutinateth with its coagulating part, and nourisheth and refresheth with its unctious part. But there are divers kinds of Milk, and Womans-milk is the best, because it is more agreeable to our natures, especially if it be sucked from the breast. *Platerus* affirms that he knew many cured by the use thereof; and that one of them did not only recover, but grew so strong, that lest his Nurse should want Milk for him, he got her with Child again.

But because many will not indure that sort, Asses-milk is commended, which because it is very full of Whey, doth easily pierce into Veins, and excellently cleanse the Ulcer: The next to this is Goats-milk. Let the Ass be fed with Plantane, Vine-leaves, Brambles, Polygonon, Brats, Barley, and Rye. Let him drink it new milked warm, therefore let the Ass be brought near the Chamber, and be warmed into a warm Vessel. First let him take it in a small quantity three or four Ounces, that his Stomach may be used to it, increasing the quantity by degrees to eight or ten Ounces, or a Pint, and lest it should grow sour or curdle in the Stomach, and that it may agree better with the Lungs, put Sugar of Roses to it, one ounce thereof to eight of Milk: let him not sleep after his Milk immediately, but walk gently about the Chamber: let him not eat before the Milk be concocted, and he find a stomach that it may be more effectual. You must not give it in a strong Fever, or when there is a pain in the Head, or swelling in the Hypochondria or a cholerick Flux, according to *Hippocrates* Aphor. 64. Sect. 5.

Commonly it is taken only once in a day, but it is better twice, and best if the Patient live only upon it. For besides that it doth work more powerfully in a great quantity, there is a great profit by not mixing it with broth and other meats, for they will easily putrefie. If therefore the Disease be very desperate, give Milk after purging every six hours with *Manna Christi* of Pearl and Coral. And lest strength should fail, let him intermix a restoring distilled Water.

Sugar of Roses is very profitable, as also the Conserve; by use whereof, *Avicen* reports that he cured a Woman of a desperate Consumption, so that she was not only found but very fat afterwards.

Mesue

Mesue also witnesseth that many have been recovered by the same, and he directeth that the Conserve of Roses be new, not above a year old, taken in a great quantity, and often, with Medicines, Meat, and Drink, and also by it self at any hour. But first give Cleanfers, because it will otherwise astringe and retain the excrementitious Matter in the Lungs. But when breath begins to fail, and the Patient cannot raise Flegm, let him take expectorating things, as Syrup of Hylopp and Coltsfoot, and other Lohochs. And if heat arise from drying too much, give Syrup of Violets, Jujubes, the Mucilage of Fleabane and Quinces, and the like.

Montanus, *Valeriola*, and *Forestus*, say, That they have seen some cured by taking Sugar of Roses in great quantities. An Apothecary whom I knew in a Consumption made a great quantity of Sugar of Roses for himself, and eat it constantly, by which he was cured.

An Infusion of Yarrow, Tormentil, Burnet, and Conserve of Roses made in *Balneo Mariae* is very good, as it is described in the Chapter of Spitting of Blood, if it be used twenty days together.

The Decoction of Bugle in Mutton-broth, doth excellent against a Consumption and inward Ulcers, it doth a little gently loosen the Belly against the Nature of all the *Consolida*.

Trallianus lib. 7. cap. 1. boasts that he cured many with Blood-stone. The preparation and use whereof we have shewed in Spitting of Blood.

The Syrup of the Juice of Ground Ivy is commended by *Quercetan* thus made:

Take of the Juice of Ground Ivy two pound and an half; let it be digested in *Balneo Mariae*. To this Juice well refined, put Sugar of Roses one pound; Penides four ounces. Boyl them to a Syrup to be taken now and then a Spoonful.

He also addeth the flower of Brimstone to it to make it into a Lohoch, of which he gives four times in a day; and he boasteth that he hath therewith cured many.

The Syrup of the flowers of St. Johns-wort made by infusion in *Balneo Mariae*; is very good in this Disease, as also for all inward Ulcers.

The Syrup of Comfrey is excellent, for it cleanseth, healeth and strengthneth by astringing; as also Comfrey-roots boyled in broth.

It is affirmed that many have been cured by this Hydromel.

Take of China-roots sliced, six Ounces: Colts-foot-roots three Ounces: Burdock and Avens-roots, of each three Ounces: Elicampagne-roots two Ounces: Lungwort-leaves, and Scabious-leaves and Roots, both the *Veronicaes*, *Ulmaria*, and Herb Two-pence, of each two handfals: all the Capillar Herbs, of each one handful: the tops of Bugle, Betony, Cowslip, flowers and red *Veronica*, of each four Pugils: Ground Ivy-leaves and Roots three handfals: Jujubes, Dates, Sebestens, and Raisins stoned, of each one Ounce and an half: Spanish Liquoris one Ounce and an half. Let them all being well sliced boyl in thirty two Pints of Spring-water, till half be consumed with a little gentle fire: add to the Liquor being strained, of the best Honey four pound. Boyl it again and skim it; then strain it through an Hippocras Bag, putting thereto half an Ounce of Cinnamon, six drams of Coriander-seeds: Annis and Sweet Fennel-seeds, of each three Drams: put the Liquor in a large Vessel, and let it work in the Sun; for so it will be done in forty days, otherwise it will be longer: but you must keep the Vessel always full and open, that it may froth over: therefore you must make more Hydromel than the Vessel will contain; and if the Disease require it you may use it fresh before it worketh till you make another in the Vessel; and you may make this quantity twice or thrice at once, because it must be taken divers months together. Let him take a good draught thereof twice in a day.

This following Syrup is made more easily, and hath great virtue.

Take of the Juice of Ground-Ivy, *Veronica* and *Carduus Benedictus* refined, of each eight Ounces: in which boyl gently Maiden-hair, Polirice, Scabious, and Lettuce, of each half a handful. Dissolve in the strained Liquor one pound and an half of white Sugar. Make a Syrup well boyled, adding in the end three Drams of the Extract of Juniper; Juice of Liquoris and the Extract of *Carduus*, of each four Scruples. Let the Patient take one spoonful an hour before Dinner, and another before Supper, and another at Bed-time.

Cardanus saith, That he cured many Consumptions with this course following: namely, by giving no other nourishment than Barley-broth made without flesh, and Water with Sugar, and every morning four Ounces of the Concoction of the Tails and Legs of Cray-fish made in Barley-water with two drams of Sugar.

Arcens, *Ingraffius*, *Eracastorius*, and *Erastus*, say with admiration, That they have cured many Consumptions by the use only of Guajacum for a long time continued; yet this in respect of the Antecedent Cause, which is a hot and sharp Humor, seems to be an Enemy.

Avenzoar reports, that his Grandfather cured a Consumption with well leavened Bread, and Sallet Oyl, and also that he did the same.

This Powder following is highly commended by *Valescus de Taranta*, and it is reported to be invented by *Haly Abbas*, and he saith, that he cured one with it. And *Forestus* saith, that he cured his Brother with the same.

Take

Take of white Poppy-seeds ten Drams : Gum-Arabick, Starch, and Gum-Tragacant, of each three Drams : Purslane-seeds and Mallow-seeds, of each five Drams : Pompion, Melons, Cucumbers, Courds and Quince-seeds, of each six Drams : Spodium and Juycce of Liquoris, of each three drams : Penide; the weight of all the rest : make a Powder : give every morning two Drams thereof with the Syrup of Poppies or Fijubes. Let him also take it in Barley, Cream, or Almond-milk, and with other Meats.

Cappivaccus and Claudius do approve of Oyl of Vitriol to dry the Ulcer, giving two or three drops with Rosewater or Juycce of Plantane, with a little Sugar.

Crollius also commends the Elixir Proprietatis which is made of the Spirit of Sulphur, with the Spirit of Wine, Myrrh, Aloes, and Saffron.

The Chymists do highly commend the Medicines made of Brimstone, as the Flower, Milk, and Balsom thereof, as you may read in their Books. You may use them thus very well.

Take of the Flower of Brimstone, and Powder of Frankincense, of each one Scruple : put them into a hollow Apple, then roast it, and let the Patient eat it with Sugar every morning for eight or ten days together. Or,

Take of Conserve of old Roses, Diamargariton frigid, and Diapenidion, of each one Ounce : Flower of Brimstone three Drams : make it up with clarified Honey, of which let him take the quantity of an Hazel-nut twice or thrice in a day. Or,

Take of Flos Sulphuris three Drams : Sugar dissolved in Rosewater three Ounces : make Lozenges, which let him hold in his Mouth often.

Take of Lac Sulphuris half a Dram : Magistery of Pearl and Coral, of each half a Scruple : the Emulsion of Melon seeds made with Coltsfoot or Veronica-water, two Ounces : the Julep of Roses six Drams : Cinnamon-water, and Manus Christi with Pearl, of each two Drams. Mix them, and let him take two or three spoonfuls every morning.

Some Chymists commend Antimonium Diaphoreticum well calcined, with thrice as much Salt-peter, so that all the vomiting quality be gone, which must be given every day in Lozenges made with Sugar of Roses, or mixed with Conserve of Roses, or with the Medicines above mentioned.

The Balsam of Peru is good to heal Ulcers in the Lungs, if you give one drop made into a Pill with Sugar every day.

The Powder of Burnet one Dram given every day in Broth, is esteemed excellent.

Ruffi Pills are commended by some taken to one Scruple every day, but made as followeth they do Wonders.

Take of the Mass of Ruffi Pills one Ounce : Antimonium Diaphoreticum, and Gum of Guajacum, of each half an Ounce. Make a Mass with the Balsom of Peru : of this let him take one Scruple every day for one month.

The Syrup of Coral, and Jelly of Quinces are good for the same.

Rodericus Fonseca commends the Decoction of yellow Saunders for a good Medicine against Defluxions upon the Lungs, which he prepareth thus :

Take of Succory and Sorrel-water, of each four Pints : yellow Saunder sliced three Ounces. Infuse them one day, then boyl them in Balneo Maria in a close Vessel three hours. Take three Ounces of this every morning in Beer for forty days together.

Also all the Medicines which we mentioned for the Cure of spitting blood, are here very good.

Fumigations may be well used to dry the Ulcer of the Lungs very well, and they must be often taken in at the Mouth and Nose. You may make them thus :

Take of the Gum of Ivy one Dram and an half : Frankincense one Dram : Myrrh half a Dram : Amber one Scruple : Benjamin and Storax, of each half a Dram : Hypocistis two Scruples : Coriander-seeds, red Roses, and red Saunders, of each one Scruple. Powder them, and mix them with the Mucilage of Gum Tragacanth ; make Troches and cast them upon the Coals.

Or, Make plain Fumes of Frankincense, Myrrh, Mastick, and Benjamin, always in the Chamber, that he may take in the dry and sweet scent of them.

You may make a stronger Fumigation, but it is not to be used but in strong bodies.

Thus ;

Take of Gum Anime, or Gum of Guajacum, two Drams ; Tobacco half an Ounce ; dry Coltsfoot one Ounce ; Hyssop, white Horehound, Rosemary and Orpiment, of each three Drams. Make a Powder ; put a little thereof into a Tobacco Pipe, take of it twice a day fasting, and half an hour after a draught of this Decoction.

Take of China and Sarfa, of each half an Ounce ; Scabious, Coltsfoot, and Ground Ivy, Ulmaria, Maiden-hair, and Avena Leaves and Roots, of each one handful : whole Barley one Pugil : Liquoris scraped, and Currans, of each one Ounce. Boyl them to two Pints, and put to it being strained four Ounces of Sugar of Roses ; let him take half a pint twice in a day as aforesaid.

For the Rich People you may use a moist Fumigation made of the Decoction of Herbs, which is a good

a good way to carry the strength of them directly to the Lungs: You may use all such Herbs as are proper for the Lungs, and to cure Ulcers. Take this following for an Example:

Take of Green Colts-foot eight handfulls: Hyssop two handfulls: bruise them, and put them in a Pot with a little water, lute it close, then set it into the Oven when the Bread is half baked, and then take it out with the Bread, and put a Funnel into a hole made at the top, and so take in the smoak through the mouth at the Lungs, and put it out at the Nose, and it wonderfully provokes spitting.

You must also morning and evening use a cooling Liniment to the Breast. As,

Take of Gum Tragacanth and Arabick, of each one dram, infuse them in Rose-water a day and a night; put then thereto of Oyl of Violets one ounce and an half; fresh Butter half an ounce; Sal-Prunella two drams: Camphire one scruple; Breast-milk as much as will serve: mix them in a Mortar to an Oyntment.

To repair a Consumption, or to prevent or hinder it besides Restoring Diets, which are principally made of Barley, Almonds, Pine-Nuts, Rice, Nuts, and the like, which Authors declare; Milk commended at first is very good, and a Bath of hot Water of Barley and Almonds bruised: but this is not good in a Catarrh, nor while there is a putrid Feaver, nor when the Lungs are full of Excrements.

Let his Drink be Water and Sugar, Barley-water and Liquoris; an Infusion of Liquoris, a thin Hydromel, or a weak decoction of China.

The End of the Seventh Book.

T H E

THE
EIGHTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Heart.

The Preface.

THE Heart hath many Diseases, Similary, Organick, and Common: but because few will submit to the Physician, in regard of the Nobleness of the Part, which will not endure grievous Diseases, but a man is suddenly gone, and there is no time for Physick: We who intend to bring all our Labours into Practice, will lay down only three Diseases of the Heart, which are usual, and require many Medicines; and we shall bring them into three Chapters. The first shall be of Swooning; the second of Palpitation of the Heart; And the third of weakness.

Chap. I. Of Syncope, or Swooning.

Syncope is defined by *Galen*, 12. Meth. c. 5. to be a sudden failing of all the strength; For although the heart only suffer, and the Vital Spirits are only intercepted; yet when it fails, the rest must suffer, because they have a continual and necessary influence from it.

It is called a sudden failing of all the strength, that it may be distinguished from other Diseases, in which the strength goes by degrees, till death come; nor is the Doctrine of *Avicen* against, it *Fen.* 1. *Lib.* 3. *Traet.* 2. *cap.* 2. where he propounds the Sign of a Syncope that comes by degrees; for although the Causes that dissolve the Spirits do sometimes work by degrees, yet when they grow great, they make a sudden Syncope; and therefore *Avicen* rather propounded the Signs that go before a Syncope, than those that accompany it.

Moreover, This definition may seem to agree with an Apoplexy, in which there is a sudden failing of all the strength; but in an Apoplexy there is strength in the Heart, and the Pulse is generally great and full. And also there is great hinderance of breath, with snorting; but in a Syncope the breath is no ways stopped.

The

The question is, Why, when the Action of the heart ceaseth, doth the Action of the brain also cease, since the Animal Spirit is made of the Vital by way of Concoction, and must therefore stay some time in the Brain, although the Vital do not constantly come to it? We answer, That the brain as all other parts, for the perfecting of its actions, doth always stand in need of adventitious heat, which is brought to it by the vital spirits, and therefore when the vital spirits come not, neither doth heat come from the brain to perform its functions.

There are other Diseases very like to Syncope, differing only in degrees from it, namely, *Eclipsis*, *Leipothymia* and *Asphyxia*: *Eclipsis*, is a light fainting: *Leipothymia*, or *Leipopsychia*, or *Apopsychia*, is a very strong and great fainting: *Syncope* is the greatest, which if it go so far that the Pulse in the whole body ceaseth to beat, it is called *Asphyxia*, which is next unto death.

The word *Syncope* was not used by *Hippocrates*, and the Ancient *Greeks*; but they call'd this Disease *Leipothymia*, *Lipopsychia* and *Asphyxia*. But it was invented a little before *Galen's* time, and used for the greatest; so *Galen*, 1. *ad Glauc. cap. 14.* saith, *Leipothymia* is an imperfect *Syncope*, and goes before it.

By what hath been said, it appears, that the part affected is the Heart, where the Vital Spirits are all made; by whose influence the natural heat and spirits in every part are made to act: therefore when that ceaseth by stoppage of the Influx of the Vital Spirits, it is necessary that the strength of all parts should fail, and their actions cease.

CAUSES. The immediate Cause of this Disease, is the Defect of the Vital Spirits, not wholly, for then sudden death would come; but so great, that Nature is constrained (lest the strength of the Heart should totally fail) to fetch the Spirits from the other parts to the Heart, by which means the parts lose their Functions.

Now this defect of Spirits comes four ways: either because they are naturally few; or because they are dissipated and spent; or because they are preternaturally altered or corrupted; or lastly because they are suffocated and destroyed. They are few by fault of the faculty making, or matter from which they are made. The Faculty is hurt either by a Disease proper to the Heart, or by consent from another part.

The proper Diseases of the Heart which are the chief, are great distempers which overthrow the Natural temper, or destroy the substance of the parts, or of the Natural heat; as Swooning, Feavers sharp and malignant, *Syntactica* or *Colliquantes*, or fainting, pestilential, hecical, or *Marasmodies*, which consume; to this come organical Diseases, as too much constriction and dilatation, and constant solutions, which come to the Ventricles of the Heart.

The Faculty may be hurt by consent from other parts which have great sympathy with the heart, as the Brain and Liver, and sometimes from the mouth of the Stomach, by reason of its nearness and exquisite sense, from whence a Syncope is divided into a heart and stomach Syncope. The *Cardiaca* or Heart Syncope, is when the Heart is principally affected; but the *Stomachica*, or Stomach Syncope is that which comes by consent from the Stomach. Sometimes it comes from the Mother, by filthy vapors sent from thence to the heart, from whence comes the Suffocation of the Matrix, Apnoea, or want of breath and Hysterical Syncopes, as those Vapors do assault the Lungs, Diaphragma, or the Heart.

The fault is in the Matter, when the Air or blood is defective or corrupted; from whence the Vital Spirits are generated. There is a defect of Air, when the respiration and Transpiration is hindered; but the defect of Blood is when Nutrition is hindered; there is a corruption of both, when their qualities are changed: so when the Air is infected in the time of Pestilence, it begets *Leipothymia* and *Syncope*, as also stinking vapors, and sweet also do the same with some Women; and the blood is corrupted from evil Meats.

Too great Evacuation, whether sensible or insensible do disperse the Spirits. The sensible are chiefly of blood, from the Mouth, Nose, Womb, Belly, Hemorrhoids, Phlebotomy, & great Wounds; & next of other humors, which though they are Excrementitious, yet because of their great Evacuation, the Spirits are much dispersed, and cause a Syncope. These humors are discharged by vomit, stool, urine, sweat, the opening of a great imposthume, especially if it be inward, as an Empyema; or outward, as in a Dropsie when the Navel is tapped.

The insensible Evacuations are by the Rarification of the Skin, and by the acrimony and thinness of the Humors, immoderate heat, hot Baths or Houses, great Labours. Also long watching and fasting, lechery, great anger, and joy, long and violent sickness to dissipate the Spirits: as also great pain of the heart, stomach, guts, reins, ears, teeth, and of all nervous parts.

An evil disposition of the Bowels doth alter and corrupt the Spirits, and whatsoever doth procure a malignant quality which is adverse to the heart, as air, stinks, venomous and pestilential taken in by the breath, or bred in the body from putrefaction of humors: as also poyson taken in, or applied outward, or sent to the heart by biting of venomous Creatures.

Lastly, The vehement returning of blood and spirits to the Heart, and an abundance of evil Va-

ports gathered about the heart and the parts adjacent, and too much cold and thick blood gathered about the heart and its veins, arteries, and parts adjacent, do suffocate and destroy the Spirits.

We lately saw a Noble Lady, a Virgin, which from her Infancy was so subject to this Disease, that with every light passion of the mind she was taken therewith, taken with a violent Syncope which ushered death in by a sudden return of blood and spirits to her heart; for when she should have been married to a fine young man which loved her dearly, and her Parents, Friends and Kindred were solemnly met about it, they gave her a Pen to write her hand to the Contract; but she having not fully written her name, fell down dead upon the ground: hence we easily conjecture, that there was a great and sudden retraction of the Blood and Spirits to the Heart by a vehement passion of the mind which choaked the natural heat, and the Spirits therein, of which she died suddenly.

Petrus Salinus Diversus saw (as he reporteth, *Lib. de aff. part. cap. 4.*) a Girl of fourteen years old fell into a Syncope from abundance of cold and thick blood gathered about her heart and the great vessels; for having for a whole day a heaviness of head with giddiness and disturbance, she died the next day after suddenly: after being opened, the blood appeared so congealed in the great Artery and *Vena Cava* or hollow Vein, that taking it by the end, you might draw it out like a Sword from a Scabbard.

Wherefore we judged, That the sudden death came from the interception and stopping of the Veins by congealed Blood.

This happeneth seldom, for you shall seldom see Blood in dead Bodies so congealed, for the veins have such a property to retain blood, that even after death they keep it thin, though without them it groweth always thick.

But *Salinus* gives the Reason of this Congealation, by comparing it with blood without the Vessels, which as soon as it is cold, is congealed; and the sooner from the coldness, thickness and sliminess of the Melancholick or Phlegmatick humor therein contained.

Something like to this may befall blood constrained in the Veins, which abounding with vicious juice thick and cold, doth so fill the greater Veins, that it stops the spirits, and so extinguisheth them; and then the blood grows cold and thick, from those humors which otherwise would have been thin.

The *Spagyrics* refer this to a congealing Spirit, made of a peculiar and extraordinary mixture of humors, which since it seldom happeneth, the disease is very rare; And truly a simple Refrigeration cannot cause that concretion, for then in dead bodies, especially in Winter, the blood would always be thick in the Veins, but we find it always thin: but we may suppose that this congealing Spirit is like that which causeth a Catalepsis or Congelation, which makes the parts inflexible.

The Chymists do acknowledg such kind of Congealing Spirits to be in many Creatures, Vegetables and Minerals, such as are reported to be raised out of the Earth, in some Histories of Men and Beasts who have been congealed by filthy vapors coming from Earth-quakes or Dens, so that their bodies became presently stiff. And *Cardanus* saith, That such Spirits are in Thunder-bolts, in his History of the eight Mowers, who sleeping under an Oak, were struck stiff, and remained as at first, the one seeming to Eat, the other to reach the Pot, and the other to Drink.

DIAGNOSTICK. The Signs to know this Disease by, either is from the Subject which is more capable to receive it, or from the Fit either coming or present, or from the Causes that produce it.

The Subjects which are most fit to receive a Syncope are men, who by some natural debility or weakness from some Disease, became faint-hearted. Women rather than Men, especially in their Terms, or with Child. As also they who have fine Constitutions, subject to the Jaundice, Spleen, or Melancholly.

These things signifie that a Syncope is coming to them who are subject to it; Anxiety and sudden disturbance of mind, heaviness in the head, giddiness, an apprehension of divers colours, green and yellow, a sudden and often change of the colour in the face, and of the beating of the Pulse.

When Leipothymy is present, the same signs are, but greater; and there is often a cold sweat, as also the sick complain of their faintness.

But these signs shew a Syncope, a sudden failing of all strength, a slow pulse, low, and at length stopping, a pale and blewish face, coldness of all the body, especially externally; a cold sweat especially in the Temples, Neck and Breast; from whence the Disease is named.

The Signs of the Causes are commonly manifest, for Feavers malignant, acute, syncopal or fainting, cause a proper Syncope or swooning, are easily known: as also those external Causes which make a sudden Syncope, may be plainly seen; as Anger extraordinary and Joy, a sudden Fright, stinking smells, great bleeding, and other large Evacuations, long watchings and fasting, much lechery and grievous pain.

These things do signifie that the humors and the body are thin, a sharp nose, hollow eyes, temples fallen; and the gnawing of the mouth of the Stomach, trouble of mind, pricking, heat and great pain do shew abundance of Choller.

When

When there is abundance of crude humors, you may know by the enlarging of the body, swelling about the breast, a pale colour, black and blew, a small, obscure and unequal Pulse.

A swooning by way of Sympathy from other parts, is known by the signs of those parts affected; so that if it come from the stomach, that hath been distempered with loathing, vomiting, gnawing, the Mouth hath been bitter and dry, and the like. The same Judgment is to be taken in other parts; but if you see no sign of any other part affected, you may conclude that it comes principally from the Heart.

Moreover, A Syncope is distinguished from other Diseases, by its proper signs. From an Epilepsy, because that hath a Convulsion, but a Syncope not: From an Apoplexy, because in that the breath is stopt, and there is often snorting, and the Pulse is much abated, except when Death is at hand; but in a Syncope the Pulse is almost gone, and the breath is free. It is distinguished from the Mother, for in that the breathing parts are most affected, so that the Patient is almost strangled, but the Pulse is not much altered, nor the colour of the face, but keeps its natural complexion, and sometimes is higher coloured; but in a Syncope breath is not stopt, but the Pulse is almost gone, and the face is pale. But sometimes a Syncope is joyned with the Suffocation of the Mother, and then the Pulse is not perceived.

PROGNOSTICK. The Prognostick of this Disease is first taken from *Hippocrates*, Aph. 41. Sect. 2. *They who often and violently faint without a manifest cause, do die suddenly.* For it is said, A great Syncope doth quite take away the strength from the Heart.

A Syncope from which a man is not recovered by Rose Water thrown in his face, and Wine given to drink with neezing-powder put into the Nose, is deadly.

When one is raised from a Syncope, health is not to be promised; for if his Pulse return not, but his colour be wan, and he still be cold, he will quickly relapse, in which is danger.

That Syncope which comes from immoderate evacuations, fear, sorrow, or some evident cause, is of less danger than that which comes from an Internal Cause.

CURE. As for the Cure, because it comes from divers Causes, it must be various.

But of what cause soever it come, in the time of the Fit these are good, Lying upon the back, throwing of cold Water in the Face, provoking to neez, putting of strong Wine, Cinnamon, or Imperial Water, Aqua vitæ, Cœlestis, and the like into the Mouth, holding of hot bread to the Nose, loud calling and shaking, stopping of the Nostrils, wringing of the Fingers, pulling of the Hair, rubbing, binding and cupping.

But in respect of the Causes that are divers, you must vary the Cure thus:

If it come from want of Meat, he will be cured with strong Wine, and a Toast or Sop; also with nourishing Broths, and restoring distilled Waters among other things, a dish of Eggs with Sugar, Wine and Cinnamon described in the following Chapter.

If it come from thinness of the Humors by which the Spirits do easily fly away, give him sweet things, and meats of good Juice, and thickning; let the Pores of the Skin be stopt with Oyl of Roses and let the Patient stay in a cold place.

If it come from the Mother, you must give Medicines for that.

If it come from some evil quality, give Cordials and Antidotes, such as are prescribed in malignant Fevers.

If from Poyson, give things to expel it: First a Vomit, and then Treacle; and then if he feel burning or gnawing in the Guts, let him take Milk or Butter, or fat Broth, or cooling Cordial Potions.

If it come from immoderate Evacuation, let the Patient be refreshed with Scents, Meat, Drink, Sleep and Rest.

If from too great loss of Blood, lay him upon his Bed with his Head backwards, dash his face with cold Water, give him a little Wine with cold Water.

If it come of too much Purgings, give him new Treacle, or old if you cannot get new, with two grains of Opium dissolved in Wine, or three grains of Laudanum which is better. And let the Belly be anointed all over with this following Oyl.

Take of Oyl of Myrtles and Quinces, of each one ounce and an half: Oyl of Wormwood one ounce; with a little Rose Vinegar, mix them and anoint often.

Give a Clyster of steeled Milk with three Yelks of Eggs, and two drams of Philonium Romanum.

Use Frictions of the Arms and upper parts, give him a Sop in Wine, or Wine alone.

And lastly, Every Evacuation, whether it be of blood from the Nose, or Womb, or other parts, or of humors by Vomit or Stool, must be stopped with their proper Medicines prescribed in their several Chapters.

That Syncope which comes from too much sweat, is cured by Medicines that restrain sweat; as with cold, or Rose water alone, or with a little Vinegar sprinkled upon the Face and Hands. Al-

to let the Air be cooled with the same Water and with Fanning. Apply cold Epithems to the heart made of Rose, Sorrel, and Borrage Water, with Powder of Diamargariton frigid, with a little Wine to make it pierce.

You must also give often cooling Juleps made of Syrup of Sorrel, Violets, and Apples, of Lemmons with cooling matters, and Lapis Prunellæ. Let the Pores be closed with anointing the Skin with Oyl of Roses, Myrtles of Mastick. Let him abstain from Wine; let him not be rubbed, but let him move often gently, being lightly covered.

Let his Bed be perfumed with this Powder following :

Take of the flowers of Water-Lillies, Red Roses, of each three ounces : the best Labdanum, half an ounce : Storax two drams : Myrtles, and grains of Sumach, of each two ounces. Make a Powder.

If it come from suffocation of the Spirits, you must call them forth by Frictions, Ligatures, Cupping-glasses, and the like. And if this Suffocation came of Repletion, you must bleed plentifully, but by degrees.

If it comes from Terror and fear, you must also bleed, lest it cause an Obstruction or Inflammation.

CHAP. II.

Of the Palpitation, or beating of the Heart.

AS in Syncope the motion of the Heart is diminished, so in this Disease it is depraved. It is wrongly stiled by some a trembling of the Heart, when trembling is a passion of the Animal and Voluntary Motion, and is not proper to any parts, but such as have voluntary motion.

Galen in his Book of Trembling, Palpitation and Convulsion, saith, That Palpitation comes only from the Disease that is from the Cause which lifteth up, and depresseth the part, without any help of the Faculty; but trembling comes partly from the Faculty, partly from the Disease. Hence it is that many using the word Palpitation indifferently to any part, think it is in the Heart, as in the Skin and Muscles, in which it comes from wind driven violently thither; for if the Heart be moved as a Bladder by water or wind, they suppose that to be a Palpitation. But the reason is different; for the Skin and Muscles cannot naturally dilate and contract themselves, but by Diseases. But the Heart hath a natural Faculty to contract and dilate it self, therefore a Palpitation cannot be without its motion. And they do in vain muster up *Galen's* Reasons so thought by them, to prove that the Palpitation of the Heart comes not by Nature, but by a Disease, or cause of a Disease. For *Galen* in all those places speaks of no other Palpitation than that which is in the skin and other external parts, and not of the Palpitation of the Heart, which is of another nature; and *Galen* 2. de *symp. caus. cap.* 2. saith, that the Palpitation of the Heart and Arteries is different from that of the other parts.

Therefore the Palpitation of the Heart is an immoderate and preternatural shaking of the part, with a great Diastole or dilatation, and a vehement Systole or contraction, which sometimes is so great, that as *Fernelius* observes, it hath often broken the Ribs adjoining, and sometimes displaced them which are over the Paps; and sometimes it hath so dilated an Artery forth into an Aneurism as big as ones Fist, in which you might both see and feel the Pulsation.

This immoderate shaking of the Heart comes from the Pulsative Faculty provoked.

But here may be objected, That in Feavers all these things are found, for this is an immoderate Systole and Diastole, by the provocation of the Faculty through some troublesome matter, or by increase of heat in the Heart.

To this we answer, That the motion of the Heart in Feavers is distinguished from Palpitation, only by its degrees; and the depraved motion of the Heart when it is vehement, is called Palpitation; but if it be not vehement, it is called a quick, great and swift Pulse, and is referred to the differences of Pulses.

CAUSES. Now the efficient Causes of this Palpitation may be referred to three Heads. Either it is somewhat which troubleth and pricketh, or necessity of Refrigeration, or defect of Spirits; which two later may be referred to the increase of Custom.

The molesting Cause is most usual, so that many Authors knew no other, the others are rare, and that is either a Vapor or Wind which troubleth the Heart either in quantity or quality, or both. The quality is either manifest or occult.

A Vapor troublesome in a manifest quality, is either in the Heart and its parts adjoining; or it is sent from other parts; and this suddenly getting to the innermost parts of the Heart, doth stir up the Expulsive Faculty, which being naturally very strong, ariseth powerfully with all its force to expel the Enemy.

In the Heart, and thereabout, especially in the Pericardium, are gathered sometimes cold and thick Humors, which send up vapors to the Ventricles of the Heart, which cause Palpitation.

But from more remote parts, vapors and wind are sent to the Ventricles of the Heart; as from the Stomach, Spleen, Mother, and other parts of the lower belly.

Many times a Vapor that troubles the Heart by an occult quality, ariseth in malignant Feavers, Plague, and after Poyson, and sometimes from Worms putrefied, and the Terms stopped from corrupt seed, or other putrid matter, which do much stir up the Expulsive Faculty thereof.

Divers Humors do molest the Heart, either with their quantity or quality; so too much blood oppressing the Veins, Arteries, and Ventricles of the Heart, so that they cannot move freely, makes a Palpitation by hindering motion, which that the Faculty may oppose, it moveth more violently. So Water in the Pericardium, being in great quantity, doth compress the substance of the Heart and its Ventricle, so that they cannot freely dilate themselves. The same do Humors flowing in abundance to the Heart, as it happens sometimes in Wounds, Fear and Terror.

Humors offending in quality hurt the Heart, if they be venomous, putrid, corrupt, sharp, or too hot, especially burnt Choller coming to the Heart, and provoking its expulsion.

Also Tumors, though seldom, cause this Disease; as Inflammation of the Heart, Imposthumes, or Swelling in the Arteries of the Lungs near the Heart; which *Galen* saith besel *Antipater* the Physician, 4. de loc. aff. by which, after an unequal Pulse, he fell into a Palpitation and an Asthma, and so died: so *Dodonæus* reports, That he found a Callus in the great Artery next to the Heart, which caused a Palpitation for many years. Also Tumors in the Pericardium, whether they be without humors and scirrhus, or without humors in them, as the Hydatides, or watery Pustules and little stones; bones and pieces of flesh are sometimes growing in the Heart, which cause Palpitation. So *Platerus* reports, that in one who had a long Palpitation, and died thereof, there was found a Bone in his Heart. But *Schenkius* reports, That in a Priest (who was from his youth to the age of forty two) troubled with a Palpitation, there was found in the bottom of his Heart an Excrecence of flesh which weighed eight drams, and resembled another Heart.

The second Cause of Palpitation is necessity of refrigeration, which is, when there is a preternatural heat in the Heart, by which the Spirits are inflamed within; and therefore the motion of the Heart and Arteries are increased, that what is spent may be restored, and the heat cooled; and this comes sometime from an internal cause, which is rare, but oftner of an external, as anger, vehement exercise, and the like. As *Platerus* observed in a young man, who being hot and angry at Tennis, fell into a Palpitation of the heart, and so died.

The third Cause, is the defect of Spirits which comes by hunger, watching, anger, joy, fear, shame, and great Diseases, and other Causes which do suddenly dissipate the Spirits, which defect the heart labouring to repair, that it may beget more quick and plentiful, and send them into the whole Body sooner, it doth enlarge its motion, and make it quicker.

You must observe for conclusion, that it is more ordinary to see a Palpitation which comes by consent from other parts, than from the Heart it self; for it hath a consent with all parts by the Veins and Arteries, by which vapors, wind and humors are sent. Which all shall be shewed in the Diagnosis following.

DIAGNOSTICK. The Diagnosis or knowledg of this Disease is directed either to the Disease, or the Causes which produce it.

The Disease is subject to sense; it may be felt with the hands, sometimes seen and heard; for the Artery may be seen to leap especially in the Jugular. And *Forestus* saith, It may be heard, by an example of a young man, that they who passed by might hear it by laying their Ear to the Window.

Also the Causes are distinguished by their Signs: A hot distemper is known by the greatness of the Pulse and swiftness, by a Feaver and heat of the Breast, by great and often breathing, and desire of cold things.

If the Palpitation come of Wind it quickly comes and goes, and is presently raised by little motion, and the breath is difficult, with a trembling sometimes at the knees, mists in the Eyes, noise in the Ears, and sometimes pain of some part, which quickly is gone; but you must gather the nature and quality of the Vapor by the signs of the humor which aboundeth in any part, because vapors do always arise from humors.

If the Palpitation come from humors in the heart, the Disease doth not come so suddenly, and continueth longer, and you may know what kind of humor it is by the signs of the humor which abounds throughout the whole body. And especially if it be from blood, from which it most often proceedeth; and this is known by a divers and unequal Pulse, sometimes great, sometimes small, slow and swift, to which the breathing answereth in proportion, the Patients heart seemeth to be bound and oppressed, as appears by the exceeding heat, distension of the Veins, redness of Face, the time being Spring, the Age, Region and Diet causing blood to abound.

That

That which comes by consent from other parts, is known by the proper Signs of the parts affected, so we know that it is from the stomach, when there is want of appetite, loathing, vomiting of base Humors, and gnawing at the stomach. A troublesome breathing about the Pancreas or Spleen, or any other Disease of the Spleen, sheweth that the matter lurketh there, from whence the vapors fly to the Heart; so suppression of the Terms, and Hysterical Fits, declare that it comes from the Womb.

The Water abounding in the Pericardium is harder to be known, but we may conjecture, if the Pulse be weak and faint, and the Patient bemoaneth himself, that his heart as it were is sometimes in Water, and is suffocated, and if it be constant, and he incline to an Atrophy or Hætick.

If malignant humors cause it, there will be great change in the Pulse, a loss of strength, sometimes fainting, and other signs of malignity.

If it come from a Tumor, there is remarkable variety in the Pulse, and the motion of the heart is different from the natural, very unequal and inordinate; and if the Humor be hot, there will be great inflammation in the body, great thirst, difficulty of breathing and fainting will follow with death: but if the Tumor be hard, and in the Pericardium, the Disease is constant, and the Patient decays by degrees, without any manifest cause: if flesh, or any more solid thing grow to the heart, there will be a continual Palpitation from the beginning of the Disease to the end of life.

Lastly, You may know when it comes by want of Spirits by the precedent causes, which destroyed the Spirits, and by the quick and small Pulse, and when it comes from the least labour or motion. Sometimes the like befalls them that are well from walking or other motion, with a change of Pulse and a resembling Palpitation.

PROGNOSTICK. The Prognostick is to be taken thus: It is dangerous from the hinderance of the motion of the Heart, by which life is preserved, and it brings Synopes and Death: For it is a true Observation of *Galen*, Com. Aph. 41. Sect. 2. and 3. de loc. aff. cap. 2. All that youth, or in declining age, are troubled with the Palpitation of the Heart very much, die before they are old; for the often Palpitation is a sign that the Vital faculty was very weak.

A Palpitation by propriety is worse than by consent, and sometimes deadly. And that which is of an internal is worse than that which comes of an external Cause, unless it be from Poyson, or some great wound.

If it comes from a Tumor, or solution of Unity, it is incurable.

CURE. The Cure is various, according to the variety of the Causes; and first that which comes from a peculiar distemper of the Heart and Pericardium, is incurable; therefore we must look only at the Cure of that which comes by consent, which depends upon the divers Diseases of the parts, whose Cure must be sought in their proper Chapters.

But besides those Remedies which take away the Cause, you must use those which assuage the Symptomes, by refreshing the heart, and strengthening it, and which discuss the vapors which arise from melancholy, or crude or waterish Humors; as Cordial Juleps, Opiates, Epithems, and Perfumes, which are prescribed in weakness, and these that follow.

Take of Conserve of Balm, Rosemary-flowers, Borrage-flowers, and Clove-gilly-flowers, of each one Ounce: Confection of Alkermes and old Treacle, of each one Dram: The Powder of Diamber, and Dimoschi dulcis, of each one Scruple: with Syrup of Citron Barks make an Opiate, which let him take often.

Take of Bugloss, Rose, and Orange-flower Water, of each two Ounces: the Syrup of Clove-gilly-flowers, one ounce and an half: Cinnamon-water half an ounce: the Spirit of Roses two drams: Confection of Alkermes one dram: mix them, and give two spoonfuls now and then.

This following Liquor which imitateth the Juyce of Hearts described in the following Chapter, is good.

Take of Hogs or Sheeps Hearts three: Cinnamon and Cloves, of each one dram: Lettuce and Sorrel seed, of each one dram and an half: white Wine two ounces: Borrage, Scabious, and Rosewater, of each one ounce and an half: Confection of Alkermes one dram: boyl them all between two Dishes, and let him take two spoonfuls of the Liquor morning and evening.

Take of red Roses and Rosemary-flowers, of each two drams: Lavender flowers one dram: Angelica seeds, Citron peels, Cloves, Cinnamon and Mace, of each half a dram: Saffron one Scruple: Musk and Amber-greece, of each six grains: Make a Bag with red Silk, and Sprinkle it with Rose-water and white Wine, and apply it warm to the Heart.

Take of Oyntment of Roses half an ounce: Oyl of Cinnamon and Cloves, of each six drops: Musk and Amber-greece, of each four grains: Mix it for a Liniment for the Heart.

Purging Clysters and Carminative to expel Wind are often to be given.

But in the Fit, it is best to open a Vein: And *Galen* witnesseth, 5 de loc. aff. cap. 2. That he never did it without profit.

Some

Some apply Cupping-glasses without Scarification to the Breast, which they say are excellent to discuss Wind there contained. Others to the *Hypochondria*, when the Matter of the Disease is there.

But *Zacutus Lusitanus* applied a Cupping-glass with Scarification to the heart with wonderful success, as you may read in *Prax. Admir. Obs.* 133. lib. 1.

Others commend true Rhapontick given to two scruples in Wine, or Wine wherein the same hath been steeped.

Chap. 3. Of Weakness.

ALthough Weakness of strength doth generally comprehend the hinderance of all Actions Animal, Vital, and Natural; yet more particularly it comprehends the Vital, which are known by a weak Pulse: yet this weakness useth to be found in all great Diseases, in which Nature doth yield, or with difficulty resist the Cause.

Therefore as in Palpitation the Action of the Heart, that is Pulsion, is depraved; so in Weakness it is diminished.

Which is the same with a Syncope, but it differs in this, In a Syncope it is so little that it is hardly perceived; but in weakness the Pulse is manifest and not so little.

In this also the Animal Faculty is always offended; whence comes weak motion without hurt of the Brain, Nerves or Muscles; but from the defect of Vital Spirits which are not so sufficiently sent to the Head that they may be made Animal.

CAUSES. The immediate Cause of Weakness is defect of the natural heat and spirits from which the life and strength of the parts do depend.

And this Defect is in every part from the Defect of Vital Spirits, and heat flowing from the Heart.

Now the Vital Spirits are defective, either because they are not bred in many; or because they are dissipated after they are bred or corrupted, or suffocated, as we said in a Syncope; where there is this difference, That in a Syncope the Causes of defect of Spirits do suddenly produce their effect; but in Weakness they operate by degrees. And therefore in Syncope and Leipothymia all the vital spirits, almost, do suddenly fail, but in this there are fewer than ought to be communicated to every part.

Moreover, When the natural heat wants not only adventitious heat, but also radical moisture to feed upon; if this moisture be wanting and diminished, the natural heat must be less, and the strength abated.

Now the Causes which hinder the Spirits from being generated, or maketh them disperse themselves, or corrupt, or suffocate them, are propounded in the Treatise of a Syncope.

DIAGNOSTICK. The Diagnosis of this Disease needs no explication, because it is manifest, and the Patients do complain of their Weakness. But the Signs of the Causes were propounded in the Syncope.

PROGNOSTICK. The Prognostick depends upon the various disposition of Causes, for as they are greater or less, there is more or less danger.

CURE. The Cure of this Disease is to be directed to two things, To the taking away of the Cause, and the restauration of the Heart and vital Spirits.

The causes are almost all great Diseases, in which either Nature yields to, or resisteth with difficulty, therefore the taking away of the Cause belongs to the Cure of almost all Diseases: which you must take from their proper Chapters.

But the strengthening of the Heart, and restoring of the vital spirits are to be here declared; sometimes to be preferred before the Cure of the Cause, when death seems to be at hand: but we must always take heed lest when we increase the strength, we increase the Cause of the Disease: And therefore in a hot Disease you must use more temperate Cordials; but in a cold Disease those that are more hot.

First then mix Cordials in his nourishment, as *Confectio Alkermes*, or *Confectio de Hyacintho* in Broths, or with pleasant Wine or Cinnamon Water, if there be great weakness.

Boyl also between two dishes a piece of a Leg of Mutton, after the Skin and Fat is taken off, and after that let the Patient drink the Broth, being strained, at one draught. Or,

Take the Flesh of a Capon after the Skin and Fat is taken away, cut it in pieces, and put it in a glassed Pot well luted, and set it in *Balneo Mariæ* to boyl for five hours, then let the Patient take two or three spoonfuls of the Liquor in all his Broths.

Or you may make a distilled Water thus :

Take a Capon or an Hen, after the skin is taken off and the fat, cut it in pieces ; then pour upon it Water of Bugloss, Borrage, Sorrel, Roses and Orange Flowers, of each half a pound ; the Powder of three Saunders, Aromaticum Rosatum and Cinnamon, of each half an ounce ; yellow Saunders one ounce, Lemmons sliced, three ; distil them according to Art, which must be given every hour by the spoonful.

The Juyce of Legs of Mutton only is of much use.

Half roast a Leg of Mutton, and slash it upon the Spit ; take the Juyce and boyl it a little in the dish, and give it either alone, or with broth, or with yelks of eggs.

Valeriola doth much commend the Juyce taken out of Sheeps Hearts. And Zacutus Lusitanus confirms it by his experience, saying, That he with this only Medicine a month continued, cured a rich man, who often swooned through weakness of the Vital Faculty, and resolution of the Blood and Spirits, when many other Medicines had been used in vain.

The Juyce is thus taken forth :

Slit the Heart of a Sheep or Goat in the middle, then wash it well, and last wash it with Rose water ; then cut it in slices and put it into a glassed Vessel with a few Cloves, and no other Liquor. And after the Pot is well luted, put it into the Oven after it is drawn, till the Juyce come forth. Give this to the Patient to drink.

The Italians use Caudles of the yelks of Eggs, Wine, Sugar, and Cinnamon, which is very restorative.

Zacutus Lusitanus makes a fine dish of twenty yelks of Eggs ; as you may see in the 107 Observation, Lib. 2. of his Admirable Practice.

You may make Cordial Juleps thus :

Take of the Water of Bugloss, Roses and Orange Flowers, of each one ounce ; Syrup of Apples and Lemmons, of each half an ounce ; Confectio Alkermes one dram, Cinnamon Water two drams. Make a Julep.

Or make this following mixture :

Take of white Sugar two Ounces, moisten it well with the best Cinnamon Water ; then put to it as much Spirit of Vitriol as is sufficient to make it sharp ; then add of the Essence of Cinnamon four drops ; the Essence of Mace, Nutmegs and Annis seeds, of each three drops ; the Essence of Cloves two drops. Mix them, and take it either by it self, or in Broth.

You may also make a restoring Opiate thus :

Take of Conserve of Roses, Bugloss, Borrage, and Clove-gilly-flowers, of each one ounce ; Citron Barks, and Nutmegs candied, of each three drams ; one candied Myrobalan, Confectio Alkermes half an ounce, the Spirit of Roses and Essence of Citrons, of each half a dram ; the Essence of Cinnamon six drops : With the Syrup of Apples make an Opiate ; take it often.

This Water following is excellent.

Take of the Jelly of Harts-horn drawn with white Wine four pints ; the Blood of a Lamb and a Calf cleansed with the hand from all fibres, of each two pints ; Muschadel, Canary and Malaga Wine, of each three pints ; of Calfs Hearts cut in pieces four ; Crumbs of new white Bread dipped in Milk two pound and an half ; the Juyce of Balm one pint and an half ; Rose and Orange Flower Water, of each one pint ; great Citrons sliced three, Cinnamon four ounces, Mace one ounce. Put them in a large glass-still, and still them in Balneo Mariæ.

You may make a most excellent and precious Cordial Water after this manner :

Take of Amber greece two drams, Musk two scruples, Lignum Aloes one dram and an half, the white part of Benjamin three drams : after they are bruised and mixed, put them into Spirit of Wine, and setting them upon a gentle fire, draw out the Tincture fully, and then filter off the Liquor, and draw off half the Spirit with an Alembick upon the Ashes with a very gentle fire ; keep the Liquor close stopped in a Glass, with a Cork waxed over, and a Bladder ; of which you may give two, three, or four drops, or in Juleps, or in this following Syrup.

Take of Cinnamon Water four ounces, the best Rose and Orange Flower Water, of each six ounces : Mix them and dissolve therein as much Sugar-Candy as you can, and make it into a Syrup without fire ; with a spoonful whereof, mix four drops of the aforesaid Cordial Liquor.

Of the Ingredients remaining from the former Liquor, with as much of Damask Roses, and four times as much Benjamin, you may make Cakes to perfume the Chamber.

Apply both Liquid and Solid Epithems to the Heart, and young Pidgeons slit and sprinkled with Cordial Powders.

Apply

Apply to the Stomach bags of Spices dipped in Wine. Let the Stones and privy Members be so-
mented with Confection of Alkermes dissolved in Wine.

Let the Arteries of the Temples, Hands and Feet be touched with *Confectio Alkermes*, adding a
little Cinnamon Water.

Apply this following to the Nose.

Take of the Leaves of Balm, Basil and Marjerom, of each two drams; Citron peels, yellow Saunders
and Cloves, of each one dram; Saffron half a scruple, Amber-greece six grains, Musk four grains:
tie them in a Clout, and dip them in Rose and Cinnamon Water, and smell thereto often.

Or make a Balsom to anoint the Nostrils with the Chymical Oyls aforesaid of Nutmeg, Cinnamon
and Cloves, with a little Wax.

The End of the Eighth Book.

THE

THE
NINTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Stomach.

The Preface.

AS there are divers Actions of the Stomach, so there are divers Hinderances of those Actions, which cause variety of Diseases: For this Part being to concoct Meat, and make the Chyles for the performance thereof, first it is constrained to desire Meat and Drink by the Appetite, which may be diminished, abolished, or depraved. When it is abolished, it is called Anorexia, and Apositia: When it is diminished, it is called Inappetentia, and Loathing. But when it is depraved, it is called Dogs-hunger, or Pica, or Malacia. Too great desire of Drink is called Sitis Morbosa. These Diseases mentioned do concern the attractive Faculty; they which concern Concoction, as it is diminished, abolished or depraved, are comprehended under the name only of Concoction hindered: If the Retentive and Expulsive Faculties be hurt, it consists in Vomitting and Hiccoughs. There are divers kinds of Vomittings according to the divers Condition and Nature of the Matter vomited forth. And because the Stomach is of exquisite sense of Feeling by reason of the Famous Nerve it hath from the sixth Conjugation; it is therefore as other sensible parts subject to pains; and it hath sometimes Tumors (as other parts) and Inflammations, Imposthumes and Ulcers. That therefore we may in this Book explain all the ordinary Diseases of the Stomach, we will comprehend it in Eleven Chapters. The first, Of Inappetentia, or Loathing of Meat. The Second, Of Fames Canina, or Dogs Appetite. The Third, Of Pica and Malacia, or Green-sickness. The Fourth, Of Sitis Morbosa, or diseased Thirst. The Fifth, Of Concoction hindered or hurt. The Sixth, Of Hiccoughs. The Seventh, Of Vomiting. The Eighth, Of Vomiting Blood. The Ninth, Of the Disease called Cholera. The Tenth, Of Pain in the Stomach. The Eleventh, Of its Inflammation, Imposthume and Ulcer.

CHAP.

CHAP. I.

Of Want of Appetite, or Loathing of Meat.

In *Nappetentia*, and Loathing, is either from the abolished or diminished Action of the Stomach: When it is abolished it is called *Anorexia* and *Apositia*; but when it is diminished it is called *Dysorexia*, but by Custom *Anorexia*, and *Apositia* are used for both.

CAUSES. The Causes of this Disease are divers, which that we may bring into order, let us consider the Natural Causes of hunger or Appetite: These are called by *Galen* (*lib. 1. de symp. caus. cap. 7.*) Symptoms; and are Five: The first whereof is emptiness of the parts. The second is the Natural Appetite of those parts so emptied. The third is the sucking and attraction of the *Meseraick* Veins in the Stomach and Guts. The fourth is the sense of their sucking in the Stomach. The fifth is the Animal Appetite which cometh from the Nerve in the mouth of the Stomach which comes from the Brain, and is endued with great sense and feeling. As also the *Melancholick* Humor which comes from the Spleen to the mouth of the Stomach, which with its sharpness gnaws the inmost Tunicle of the Stomach, and is like sawce to stir up Appetite; which that it may be natural, it is necessary that all those Causes be in order; for if there be any fault in either, then there is a hurt or hinderance of Appetite.

Therefore the first Cause which is Emptiness of Parts, if it be wanting there is no attraction made by them from other parts and the Stomach, and so there is no Appetite: now this emptiness is wanting either when the parts are filled with plenty of crude juyces, by reason of gluttony or drunkenness, or for want of exercise, or usual evacuations, or when there is so much fat that it is sufficient to nourish the parts. Also the great stoppage of the Pores of the Skin, doth hinder the emptiness of the parts; or great weakness of the natural heat, so that it can disperse none or but little of the substance of the parts: or the calling of that heat to the concoction of the matter of a Disease whereby the nourishment of parts is neglected, as in Feavers.

The second Cause is Natural Appetite, and the attraction of nourishment to the Stomach; and this is depraved when the parts though empty, will not draw by the Veins, by reason they have lost their strength, but languish and forget their duty; as hapneth in acute, malignant, pestilential, synteck, and hecick Feavers: And in immoderate Evacuations; as in the Flux of the Liver, Womb, Hemorrhoids, Bleeding at the Nose, great Sweat, much Lechery, long Fasting, and the like.

The third Cause is the Attraction of the Stomach by the *Meseraick* Veins, which useth to be depraved by stoppage of those Veins, by which means the empty parts cannot attract their Chylus, nor make the mouth of the stomach sensible: so we may perceive Children troubled with Struma, to consume by a long Flux of Chyle, by reason all the *Mesentery* is full of Glandules which stop its Veins, and hinder the passage of the Chyle to the Liver, by which means it is sent half concocted forth by siege, and the parts are deprived of their necessary nourishment.

The fourth and fifth Causes, which are sense of sucking, and Animal Appetite, do require a good disposition in the stomach, brain, and nerves: Therefore whatsoever can alter their dispositions, may also destroy Appetite; so every great distemper of the belly, especially if it be hot and dry, doth hinder Appetite. Great heat by dispersing the moist substance of the stomach, doth take away Appetite; as also great cold not only positive as when the bowels are so cold that they are stupified by Air, Water, Frost, Snow, and the like; but also privative, when the native heat is spent, which *Galen* calls *Narcosis* or *Stupefaction*, as by long bleeding, Feavers and the like, by which the strength of the stomach and other parts is consumed. Evil also and corrupt Humors, whether hot or cold, do cause want of appetite: The hot are cholerick, adust, putrid, or virulent, whether they are bred in the stomach for want of concoction, or brought from other infirm parts.

The Cold Humors are, flegmy and slimy, gathered in the stomach by evil Concoction, or coming from the whole body, as in them who by often vomiting bring the corruption of other parts into the stomach.

Or from the Brain by Catarrhs in which the stomach useth to be troubled with Flegm: The suppression of the Terms and Hemorrhoids, also by choaking and smothering the natural heat, do also diminish the Appetite.

Moreover, the distemper of the Brain and Nerves cause that the sucking is not felt in the stomach in them who have lost or depraved the Animal Faculty; therefore they are sick in mind, as in an *Apoplexy*, *Lethargy*, *Phrenzy*, *Madness*, and the like; as also in a *Palsie* by reason of the Obstruction of the Nerve of the sixth Conjugation which comes to the stomach, or by reason of the *stupefaction* thereof, by the use of cold and *Narcotick* things.

DIAG.

DIAGNOSTICK. The knowledge of this Disease is manifest, for the Patient will complain of his want of Appetite, and loathing of Meat. But the Signs of the Causes are partly manifest, and partly to be discovered by Art.

And first, they which cause the want of emptiness, are known by former high feeding, repletion want of exercise, or evacuation, long sleep, and other causes of crude Juices; as also if the Body be full, and the Veins swoln. Also the thickness of the Skin signifieth the same, for that hinders the dispersing of the nourishment, as also some great disease in some particular part, by which there is a dispersing of the Natural heat in the whole body, so that it is so weak that it cannot concoct the nourishment brought to the parts, and cause hunger.

The signs of the second Cause are manifest, namely acute, malignant, pestilential and syntectick Feavers, strong evacuations, and other Causes, by which there is a great decay of natural heat in the parts, so that they cannot attract necessary nourishment.

The signs of the third Cause are obstructions, whose signs are known in the Diseases of the Liver, Spleen and Mesentery.

The signs of the fourth and fifth Cause, need a more curious search: And first, heat in the Præcordia, especially in the stomach, thirst, driness, and bitterness of the tongue and jaws, and a Feaver, do signifie a hot distemper of the stomach, and abundance of Choler. And if this hot humor do flow from other parts, the disease of that part will shew it, as inflammation of the Liver, or other part. But if no other part seem to suffer, you must conjecture that the fault is in the stomach, or that evil Meats have been received.

To these are joyned Cardialgia, Heart-scalding, Nausea or loathing, Vomiting and Purging, the Nature of which Humors are known by what is sent forth. A cold Distemper and much Flegm is known by cooling Causes aforegoing, or such as disperse the natural heat, and extinguish it, as also from the sense of weight in the stomach, from sharp belching, or from a slimy thick humor sent out of the Mouth, or by Stool.

The same is signified by a long Catarrh, and a Disease in some part which may send Flegm or Melancholy to the stomach, as of the Spleen, Womb, or the like. Also the Distempers of the Brain and Nerves are to be known by their proper signs.

PROGNOSTICK. As a good Appetite is good in all Diseases, as *Hip. Aph. 33. Sect. 2.* says, To be right in mind, and to be willing to take that which is brought, is good. So want of Appetite useth to be an evil sign. For it signifieth a great digression from the natural state; and it comes, as *Galen* teacheth, *Com. in 3. Epid.* either from evil Humors in the mouth of the stomach, or from the loss of the faculty, whose duty it was to be sensible of the want of nourishment, and consequently to desire it. So *Hip. in 1. Epid.* saith concerning men in Consumptions that died in the time of an Epidemical Disease, they always abhorred Meat and drink. And so *Galen*, *Comment in 3. Epid.* saith, that he hath seen many in a Plague time which could take no sustenance, and died. But some who were stronger, and took courage, and did eat, recovered. So in *Hip. 3. Epid. Sect. 1.* *Aph. 32. Her. mocrates*, who died the twenty seventh day *abhorred meat all the time, and in the last days could not fast.* And *sect. 2. of the same Book, Agr. 6.* *Euriana* is her daughter, who abhorred meat all the while, and drunk nothing worth speaking of, died twelve days after.

But we must observe, That loathing of meat is bad if it come from the destruction of the Natural heat; but it is not so dangerous if it come from abundance of evil humors, and Cacochymia, as you may see in *Hip. 7. Epid.* by the Son of *Cleomis*, who without a Feaver abhorred meat for two months, through abundance of crude and viscid Flegm, which at last he vomited up. So in the beginning of Diseases, and especially of Feavers, want of Appetite is not so dangerous, because then nature being busie about the concocting of filthy humors, is called from her usual desire of meat. But after, when the Feaver is appeased, and the humors that caused the Disease being spent, she returns to her old custome.

In Children, want of Appetite is worse than in others, because their substance is moist, easily dissipated, and requires more use of nourishment to restore them.

In Men recovered of a Disease, loathing threatneth a relapse, by reason the reliques of the Disease cause it.

In a continual disease, loathing and sincere dejections are evil, *Hip. Aph. 6. Sect. 7.* Loathing is an evil sign in long diseases; but they who are like to escape, have the contrary, that is, a good appetite. But sincere dejections coming do cause a worse Prognostick, because *Hippocrates* understands by sincere dejections, such as have no humidity mixed with them, when the humor alone without any water, is cast forth, whether Choller or Melancholy; for these stools do shew that all the natural humidity is burnt up by the heat of the Feaver.

In long diseases of the Guts, loathing of meat is evil, and with a Feaver worse; *Hip. Aph. 3. Sect. 6.* when there are deep and putrid Ulcers in a Dysentery, the Stomach suffering with the Guts

doth not well concoct, which offence arising higher, affects the mouth of the stomach with loathing. There are some in Dysenteries, who abhor meat from the beginning of the Disease, by reason of the evil humors which come from the Liver; for the superfluous part of them comes to the mouth of the stomach, which is not always dangerous. But in long Diseases when it is so, there is either a putrefaction about the Ulcer, or a great Inflammation, both which are desperate.

CURE. The Cure of this Disease, if it come from the distemper of other parts, must be by the Cure of it. But if it come only from a fault in the stomach, it is to be reduced to a hot or cold distemper joyned with Matter.

A hot distemper is to be cured first by purging of Choler gentle and often. And this may be made of Rhubarb, Myrobalans, Tamarinds, Syrup of Roses, or of Succory with Rhubarb: or if the Patient be subject to vomiting, you must give him a gentle one.

The same Humor is to be altered with Juleps or cooling Broths, in which you must not omit the Spirit of Vitriol or Sulphur; because all sharp things do not only allay Choler, but provoke an Appetite. Hence it is that we use all Sallets in Summer to provoke Appetite.

Or you may alter and purge this Humor at once with a convenient Apozeme, to which, for the stomach add half a handful of Sea Wormwood, and half an ounce of Citron Myrobalans.

After purging, Marmalad of Quinces is good to strengthen the stomach, or the Syrup mixed with Syrup of Wormwood, the Lozenges of Diamargariton frigid, or Triafantaloon, or Diarrhodon abbatis, if there be a suspicion of obstruction. Or this Opiate:

Take of candied Lettuce, and Gourds of each one ounce; Conserve of Sorrel, Roses, Succory and Bugloss, of each half an ounce; red Saunders, Coral and Pearl prepared, of each half a dram; the Troches of Spodium and Sorrel Seeds, of each one scruple. With Syrup of Lemmons make an Opiate, of which let him take the quantity of a small Nut morning and evening, drinking after a little Wine and Water.

Anoint the Stomach outwardly with this Oyntment:

Take of Oyl of Roses, Myrtles, and Quinces washed with Vinegar of Roses, of each two ounces: all the Saunders, red Coral, Coriander seed prepared, and red Roses, of each one dram; Grana Kermes and Spodium, of each half a dram; white Wax as much as is sufficient. Make a Liniment, with which anoint the Stomach with your warm hand only twice or thrice in a day, putting in a little Rose Vinegar at the same time.

Or lay on a Rose Cake sprinkled with Rose Vinegar, or steeped therein, which you must remove before it groweth hot.

Lastly, In the continuance of the Disease a Bath is good twice or thrice used, by which many are brought to their former appetites.

Vinegar, and all sharp things are good with their Meat.

A loathing cometh from a cold distemper, when flegmy melancholick humors are gathered into the stomach, and hinder its office; or being drawn from all other parts of the body, as in them who using to vomit, draw the impurity of other parts of the Stomach, or from the Brain, Spleen, and Mother, and other parts.

In the Cure hereof, you must first look at the distemper of the parts from whence they come, which must be amended with Remedies laid down in their proper Chapters.

Then you must apply Medicines to the Stomach by evacuations of the humor offending, and strengthening the parts.

Evacuation may be made by vomit or stool.

By vomit, If the Patient be Nauseous, and easie to vomit, with Medicines for that purpose.

But if the humors be thick, and fastned upon the Tonicles of the stomach, and the Patient is not used to vomit, they must be purged, especially with Pills, because they stay longest in the stomach; as Galen sheweth, cap. 7. lib. 4. de sanit. tuenda. who exceedingly commends Pills of Hiera: which may be given to two scruples or a dram in the morning two hours before meat: and you may make them fresh, thus:

Take of the best Aloes washed with the Juice of Wormwood one ounce: Agarick trochiscated two drams: the Powder of Rhubarb sprinkled with white Wine one dram: Nutmeg and Spiknard of each half a dram: Salt of Tartar, Mastich, and Cinnamon, of each one scruple. With Syrup of Wormwood make a mass of Pills: of a dram whereof make six Pills gilded. Let him take them in the morning if you will purge much; or give half a dram two hours before dinner twice or thrice in a week. They may be quickned with Diagridium, if you will have them stronger.

If you fear the Liver is too hot, you may mix cool things; as red Roses, Saunders, Diamargariton, and make up the mass with compound Syrup of Succory.

Strong Pills are not good, because they will draw humors from other parts of the stomach.

If he cannot swallow Pills, you must give him Hiera to drink with a convenient Liquor. Or,

If a Potion shall be unpleasant, make an infusion of Senna, Myrobalans, Rhubarb, and Agarick in Worm-

Wormwood Wine, or the Stomach Decoction, dissolving in it a little of the Electuary of Citrons solutive, if you will make a stronger.

If this Disease comes from flow, slimy Flegm, before Purging you must dissolve it with Honey of Roses, and Oxytel, with Syrup of Hyssop and the like, with a cutting and cleansing Decoction.

Or this following Apozeme will do both :

Take of the Roots of common *Acorus*, *Cypress*, and *Calamus Aromaticus*, of each one ounce : dried Citron peels and *Sassa*, of each six drams : Wormwood, Mints, Marjerom, Germaner and Chamapitys, or Ground-pine, of each one handful : Citron and Annis-seeds, of each two drams : Senna two ounces : Carthamus-seeds bruised one ounce : Agarick trochiscated three drams : Dodder of Thyme, or Epithimum Flowers, Sage, Rosemary and Lavender, of each one Pugil : boyl them to a pint and an half : in which dissolve of the Syrup of Wormwood and candied Citron peels, of each two ounces : make a cleer Apozeme, and scent it with a little Cinnamon and Powder of *Aromaticum Rosatum* for four mornings draughts : in the first and last whereof you may dissolve for the better Purging three drams of the Solutive Electuary of Citrons, with one Scruple of the Powder of Rhubarb.

The use of Turpentine is good, because it cleanseth all the Bowels ; especially if you make it into Pills with Rhubarb.

It is not good to let blood in this Disease, except the liver be very hot.

After sufficient Purging you must come to strengthening, both internally and externally : Thus,

Take of Syrup of Wormwood one ounce : Let him drink it fasting many mornings ; or Wormwood Wine.

Take Conserve of Mints, Citron Peels candied, and candied Nutmegs, of each half an ounce : one candied Myrobalan : of Confectio Alkermes three drams : the inward Skins of Hens Maws powdered two drams : Cinnamon and *Aromaticum Rosatum*, of each one dram : with Syrup of Mints make an Opiate : or candy them with Sugar of Roses : use it in the morning, drinking after it a little Wine.

Salt of Wormwood is good to be put to the aforesaid Medicines, or Oyl of Mints Chymical.

Or, Salt of Wormwood with Orange Peels, or either of them to half a Dram in Wine, or Broth.

This following Syrup is most excellent.

Take of the Syrup of Quinces, and Citron Barks candied, of each two ounces : Cinnamon Water one ounce : Oyl of Sulphur twelve drops. Mix them to be taken now and then a spoonful.

Claret Water is usual, and it is made thus :

Take of Cinnamon grossly powdered two ounces : steep them in one pint of *Aqua-Vitæ* in a Glass : in another glass put six ounces of Sugar with half a pint of Rose water : let these Glasses stand two or three days, every day shaking them often : then mix them both together and strain them by filtration ; keep the Liquor in a Glass close stoppt, and let the Patient take a spoonful or two fasting.

In Paris the Syrup of Wormwood made by *Pena* is highly esteemed ; made thus :

Take half a pound of candied Citron Barks sliced ; boyl them in equal parts of the Waters of Succory and Agrimony, make a strong expression, and put to it the Juyce of Quinces, and Wormwood water, of each half a pint : in which infuse for four days four ounces of *Schœnanth* in a close Vessel well glassed and set upon the Embers : dissolve in the straining as much Sugar as is needful : then boyl them to a Syrup, in which when it is hot dissolve one dram of *Ambergreece* : keep it in a close Glass.

Cinnamon Water alone is excellent good in a cold Stomach, or with other Medicines ; as Syrup of Wormwood, Mints or Coral : to which you may also put *Ambergreece*.

The Syrup of Cinnamon made with *Aqua-Vitæ*, according to *Quercitanus* Dispensatory, is no less powerful.

And Cinnamon Water distilled with Juyce of Quinces.

And also the Spirit of Mastich made thus :

Take three ounces of Mastich, one ounce of Galangal, half a pint of Spirit of Wine, digest them and distil them.

The Elixir *Proprietatis*, described by *Crollius*, is good, if you give twelve or fifteen drops in Wine they wonderfully strengthen the stomach.

You may make Tablets for the same purpose thus :

Take of the Pulp of Rinds of fresh Oranges, and *Aromaticum Rosatum*, of each two drams : white Sugar dissolved in Orange flower Water four ounces. Make Lozenges.

Tablets

Tablets of *Aromaticum Rosatum*, *Opiata Solomonis*, and old Treacle are good for the same.

A Decoction of *Guajacum* or *Saxapbras* taken many days together with a little sweating, or without in weak people, is good in this Disease, being of long continuance.

Also Sulphurous and Nitrous Baths, as our *Bellilucana* being taken in great quantity many days, do powerfully cleanse the Stomach and Guts from all slimy filth.

Take of *Agrimony*, *Centaury* the less, and common *Wormwood*, of each half an handful: boyl them to half a pint, and add one ounce of Sugar, drink it, either in a cold or hot cause.

Hartman exceedingly commends the use of *Zedoary* in these words: The often use of *Zedoary* doth so strengthen the Stomach, as nothing more, therefore we may commend it, having tried it often, and never missed; you must eat it often.

Costus commends hot Wine thus: Hot Wine drunk ordinarily, doth amend the imbecillity of the Stomach; it is usually observed, that they who have been continually vexed with Wind and pain from an evil Concoction when they have begun to drink warm drink have been cured, and lived after a long time more comfortably.

You must give him Wine in Water, wherein *Coriander* hath been boyled, for his ordinary drink.

But observe, That if a hot distemper of the Liver meet with that cold stomach, as often it doth, you must give hot Medicines warily, and rather those that are temperate.

Zechius commends this Bolus following, in these words: That the Stomach may be warmed gently, and not dried, you can use no Medicine inwardly more powerfully.

Take of washed *Turpentine* two drams: Powder of *Mastic* half a dram: *Aromaticum Rosatum* half a scruple: Make a Bolus to be taken two hours before Meat.

This digestive Powder is usual to help Concoction.

Take of *Coriander* seeds prepared half an ounce; sweet *Fennel* seed and *Annis* seed, of each two drams; *Cinnamon* and *Cloves*, of each half a dram; Sugar twice as much as the rest: Make a Powder, of which let him take one spoonful every meal.

The Balsom of *Peru* is good, if you give a few drops in Wine one hour before Meat.

Or in form of a Pill, one or two drops in Sugar for many days.

There are some ordinary Medicines for this, *Hippocras* Wine, a Decoction of *Annis*, *Coriander* and *Cinnamon* mixed with Sugar for ordinary drink.

The Dukes Powder, commonly so called, made of two parts of Sugar and one of *Cinnamon*, to sprinkle upon all Meats.

A Salt to be eaten with Meat, made of *Coriander*, *Annis* seeds, long *Pepper*, *Galangal* and *Nutmeg*, mixed with an equal proportion of common Salt.

Some Grains of *Pepper* whole or beaten, taken fasting.

Acorns stuck with *Cloves* and *Cinnamon*, and candied with Sugar, *Citron* and *Orange* peels candied together. *Annis* seeds, *Fennel*, *Coriander* and *Cinnamon* infrosted with Sugar, all these Men may use as they please.

Citron peels are more pleasant than the rest, but because it will grow so dry, that it will hardly be chewed; we are often constrained to make it up in a Mortar with *Rose Water*, in the form of an Opiate.

Candied *Myrobalans* and *Nutmeg* may be used for the same, and be made up as the former, though they are so apt to grow hard.

The Essences of *Annis*, *Cinnamon*, *Citron* peels, *Nutmegs* and *Olives*, are excellent to strengthen the stomach, and they must be used as before in the Diseases of the Heart.

Of Meats, They which are salt do most provoke Appetite, and sharp things in a small quantity, and mixed with other things, lest they cool the stomach.

Outwardly apply Liniments, Fomentations, and Emplaisters, thus made:

Take of *Cypress* Roots, *Galangal*, *Flower-de-luce*, and dried *Citron* peels, of each two ounces: *Mints*, *Hyssop*, *Sage*, *Rosemary* and *Marjeron*, of each one handful; *Annis* seeds, *Barberries*, *Nutmegs*, *Cloves* and *Cinnamon*, of each three drams: the flowers of *Stoechas*, *Schoenanth*, and *Rosemary*, of each one pugil; slice those that must be sliced, and bruise those that must be bruised, according to art, and put them into two Bags with holes pricked through, and steep them in strong Wine, and lay them warm to the Stomach one after another.

Take of the Oyl of *Wormwood*, *Mints* and *Spike*, of each half an ounce; Oyl of *Nutmegs* two drams; Wood of *Aloes*, *Mace* and *Cinnamon*, of each one scruple: With a little Wax make a Liniment, which will be better, if you add six drops of Oyl of *Cloves*, and of *Musk* and *Ambergreece*, of each eight grains.

Also there is a Liniment of Oyl of *Nutmegs*, Balsom of *Peru*, or of Oyl of *Wormwood*, *Mastic*, and Balsom of *Peru*.

Take of the Emplaister of Mastich one ounce; Aromaticum Rosatum one dram: Oyl of Nutmegs as much as is fit to make a Plaister like a Buckler for the Stomach.

Crato doth wonderfully commend this following Plaister:

Take of Labdanum two ounces: Wax four ounces: Oyl of Nutmegs three drams. Make an Emplaister.

Galen adviseth (7 Meth.) not to keep these Plaisters long upon the part, for at length they will dissolve the heat.

Many Practitioners do not only apply these Remedies before to the Cartilage called *Xiphoides*, like a Sword, but also behind upon the thirteenth *Vertebra*, because the proper Orifice of the Stomach inclineth backward; but the thickness of the *Vertebra* is such, and of the Muscles under them, that the strength of the Medicine cannot pierce through the Stomach.

Take of Galangal and Calamus Aromaticus, of each three drams: Mastich and Cloves, of each two drams: one Nutmeg; dried Citron peels half an ounce: Annis seeds one dram and an half. Make a Bag of these being bruised, and put into red silk pricked through, and into Muskified Cotton, to be worn always upon the Stomach.

The Skin of a Vultur dressed and worn upon the Stomach is commended for the same; in want of which, a Harts-Skin, or a piece of Scarlet may be used.

Chap. 2. Of Dogs Appetite, called Fames Canina.

HAVING in the former Chapter spoken of Appetite diminished and abolished, now we shall speak of it depraved. And this is done two ways: When it is either offended in quantity or quality. It offends in quantity, when nourishment is required in a greater quantity than Nature would; and this is called *Boulimia*, or Dogs Appetite. It offends in quality, when things are required which are evil or are not food, and this is called *Pica* or *Kitta*. Of the first we shall speak in this Chapter, of the last in the Chapter following.

The word *Boulimia* comes *apo to bou kai limon*, because the Particle *bou* put to the other words, increase the signification, as if it were compared to the greatness of an Ox. It is also called *Phagedaina*, which word is given to Ulcers which eat the flesh and enlarge, and therefore called *Ulcerata Phagedaina*, that is, spreading Ulcers. Now it is called *Fames Canina*, or Dogs Appetite, because they who have it are as hungry as Dogs.

But you may observe, that these two words, *Boulimia* and *Fames Canina*, are sometimes confounded, and used for the same thing; and sometimes distinguished, so that it is called *Fames Canina*, when after much feeding, they vomit like Dogs. But some purge rather than vomit, when Nature throweth down that which it cannot concoct. In *Boulimia*, vomit doth not follow, but sometimes *Leipothymia*. There are some who feed unsatiably, and yet vomit not nor purge, but concoct all; and if they have not presently more, are sick. As *Sennertus* reports of a Scholar, who was black coloured, who eat not only in the day, but night, and digested it without vomiting; he could not be satisfied with delicate Meats, but required gross; and therefore would eat no Bakers Bread, but such as the Country people made, and would eat as many raw Parsnips in a Summer morning as could be bought for six pence, without damage.

Hence it appears, that this Disease is a Symptom of an Action depraved, in respect of quantity, which action being increased is called Dog-like, or an Appetite beyond Natural measure. The part affected is chiefly the Mouth of the Stomach. The cause containing is sense of sucking, and vehement pulling, which stirs up the Appetite.

CAUSES. Galen, 2. de symp. caus. cap. 7. reduceth the immediate causes of this Disease to two Heads, in these words: Evil Appetites exceeding in quantity, which are called by some *Caninae*, are then; when either some evil sharp Juice biteth the Stomach, or when the whole body immoderately concocting, wants nourishment; for evil Juice which is cold biteth like the Natural sucking, and produceth appetite by the resemblance of Nature. The immediate cause of a preternatural Appetite, according to Galen, is first a vicious humor and cold, sticking to the Stomach. Secondly, want of Food by overmuch concoction.

Evil Humors sticking to the Stomach, cause immoderate Appetite, because they by their too much coldness, sharpness and sourness, do constringe, wrinkle, and pull the mouth of the Stomach, and so make a sense of feeling like a natural sucking, and beget a false Appetite.

This Humor is either four flegm staying long in the Stomach, or many times Melancholy sent from the Spleen into the Stomach, which in a natural state, and a moderate quantity and quality begets a moderate and preternatural Appetite; but if it be preternatural and exceed, it makes the Appetite too great.

CAUSES.

The want of Food, by reason whereof the Veins do continually suck from the Stomach, either it comes from too great evacuation by bleeding, purging, vomiting, sweating, and the like; or from too great a Consumption of the alimentary substance, by reason of the immoderate heat of the parts, or the thinness of the humors and body, and looseness of the pores, watchings, baths, immoderate exercise, much venery; all which do dissolve the substance, making humidity: and by these emptiness being caused, and want of food, the meat is carried from the stomach sooner than it ought.

Also this *Fames Canina*, or Dogs Appetite, may come from worms which devour the Chylus: as *Trallianus* reports, lib. 7. cap. 4. of a Woman in this disease, which voided a Worm twelve cubits long by the use of Hiera, and was cured.

The Hermetical Physicians do lay down another cause of this wonderful Appetite; namely, a certain dissolving spirit begot in the body, which by an inhærent property doth so readily consume whatsoever meat is taken, that it doth not allow nature a lawful and necessary bound of nourishment. This they call a hungry, devouring, salt, sharp, vitriol Spirit: For they say, as from divers salts, vitriol, nitre, common salt, and salt Armeniack, with the like, *Aqua fortis* is made by Chymistry, which will dissolve the hardest Stones, or Metals, into Liquor in a short time: so that Gold, which will not be dissolved in a month by a strong fire, in a quarter of an hour will be dissolved in *Aqua Regia*, and be turned into a Liquor of the same colour.

This Doctrine is diligently to be examined; for as the digestion of the stomach in its natural condition hath something to be admired by the curious Searchers into Nature: so the same being made preternatural, hath something to be wondred at.

This is wonderful in the Natural digestion of the Belly, that the hardest Meats are digested therein, and in three or four hours space, are turned into a Chylous Liquor, so thin that it may be strained through the narrowest branches of the *Vena lactea*: and that Dogs do turn the hardest Bones into the same Liquor, is not to be attributed to a stronger concocting heat; because Meat in a Pot, although the fire be never so hot, cannot in twenty four hours, or many days be converted into the same. The Galenists hold, that this comes from the faculty of the stomach, which faculty works not without an Instrument: because if there is an *Idiosyncrasia*, or a certain proportion of the first qualities, as is commonly reported, its chief action must be from heat: for cold, moisture or dryness, do nothing to that great dissolving of food: and heat, as it is said, hath not that power. Therefore the *Idiosyncrasia* is somewhat more unknown, and not to be expressed. Let us therefore search after it in the Macrocosm, or greater World, of which there is a great Analogy or Resemblance in the little World. And therefore the more witty Hermets say, that there is a great Spirit or acid liquor sent from the Spleen into the Stomach, which dissolveth the solid nourishment, and shortly converteth it into Chylous Liquor, and that is the principal Instrument of digestion. And some conjecture, that this may be made, because Birds who digest the hardest nourishment have a Spleen round about their Maw; for the flesh which is found about their stomachs, is like the substance of a Spleen; from whence there is a more noble use of the Spleen than what is allowed by the Ancients, who said, that it was only for the purging of the grosser sort of blood; because according to this opinion it serveth for concoction of meat. Therefore if the Spirit or sharp Liquor which comes from the Spleen when it is in its natural condition, makes a natural and moderate digestion: the same spirit being altered from its natural condition and defiled, or made sharper or more dissolving, it will sooner dissolve solid nourishment; and when they are so dissolved and thrown from the stomach, it will make a new immoderate Appetite. We do not conclude that this new Doctrine is certain and undoubted, but we only shew it, that solid wits may examine it. And we will talk of it again when we speak of the Causes of the hinderance of Concoction.

DIAGNOSTICK. The signs by which this Disease are known are manifest; for it will appear to them that eat, and to the standers by, that the Appetite is depraved, which causeth such devouring of Meat, which afterwards is thrown up by vomit, and then it is *Fames Canina*; and if vomits follow not, then there is fainting, with coolness of the extreame parts, and this is called *Boulimia*.

The signs of the Causes may be found by the Antecedents, Concomitants and Consequents. These are the signs of a cold distemper, and of sharp humors in the Stomach, belching, and sharp vomiting, crude dejections or stools, want of thirst, and external Causes of refrigeration afore-going. If it come from defect of nourishment, the Patient is lean, and there are causes present or fore-going of dissolving of the Humidity; and lastly, the signs of Worms shall be spoken of in their proper Chapter.

PROGNOSTICK. The Prognostick of this Disease is thus: If it come only from External Causes, it is not dangerous if they be presently taken away. And if it come from Worms, there is little danger, for when they are taken away, the Disease is cured.

But it is very dangerous, if it follow great evacuations and meltings of the body; especially if after meat, when the belly is yet full, there come a fainting; for when that which should most help, becomes unprofitable, it signifies a great distemper of the Stomach.

So a Dog-appetite continuing with Vomiting and great Purging, is dangerous, for it useth to end in an evil habit, dropfie, lethargy, consumption, and the like.

CURE. As for the Cure, because *Fames Canina* for the most part takes its Original from Melancholick and Flegmatick Humors fastned in the mouth of the Stomach; therefore Medicines must principally be directed to them; such as do empty and change the Humors, and also strengthen the part affected.

You must evacuate by Vomit or Stool with Medicines prescribed in the Cure of Want of Appetite from a cold cause: for although these diseases are contrary, yet they come from the same humors, different in the degrees of coldness, and second qualities, and such as diversly affect the Stomach.

Also the Remedies there prescribed to heat the Stomach, and strengthen it both internally and externally, are excellent, because they not only correct the cold distemper, but dry and cause thirst; and thirst coming, hunger is diminished.

Moreover, Wine plentifully taken, asswageth hunger, according to *Hippocrates*, Aph. 21. Sect. 2. And especially the Spirit of Wine, or *Aqua-vitæ*.

They do properly stay hunger; which do much moisten the Stomach, relax it, and assuage the sharpness of humors. As all fat things and Oyls, as *Villanovanus* reports, That one thus diseased did eat a hot Loaf dipp'd in Oyl; and a Woman drank the melted Suet of an Ox with as much warm Oyl at twice, and both did so disdain Meat, that they eat nothing in five days, and were cured.

Narcotick Medicines by dulling the too exquisite sense of the stomach, do lessen this Disease; and new Treacle is most usual for it, because besides its stupifying quality, it doth correct the malignity of the humors, which is some cause thereof.

But because these are to be used but seldom, and not without urgent necessity, sometimes you may use old Treacle, for the reason aforesaid, as also to strengthen.

Five or six grains of Amber-greece taken in a rear Egg, doth not only strengthen the stomach, but by a special quality cureth this Disease.

CHAP. III.

Of *Pica* and *Malacia*.

Pica and *Malacia* are a depraved Appetite; by which, evil, unprofitable and hurtful things are desired.

It is called *Kitta* or *Pica*, from the Bird called a Pye, either in regard of the variety of colours, or because it eateth lumps of Earth; for Women in this Disease use to eat Earth and Chalk, and the like: It is called *Malacia* by *Pliny*, for these Women through weakness of mind and tenderness want that right and natural Appetite.

CAUSES. This Disease comes of evil corrupt Humors, which are gathered into the stomach by reason of its hurt Concoction, or else sent from other parts.

Flegmatick and Melancholick People are most disposed for the production of these humors, especially Women, to whom this Disease seems proper and peculiar: although sometimes Boys and Men (though seldom) have the same. Eating of evil Diet doth cause this, want of any natural evacuation, especially of the Terms, Sadness, Distemper of the Liver and Spleen, Obstructions and Weakness, divers Diseases of the Womb, and the like.

These vitious humors according to the divers degrees of distempers and other dispositions have a divers nature, from whence comes divers appetites of evil things. For since some humors are crude and unconcocted, others burnt and adust; some require sour things, sharp, bitter, and very cold, so that they are delighted with the continual use of unripe Fruits, Vinegar, Juyce of Lemmons, Pomegranates and Oranges, cold Water, Snow, Ice, and the like. Others desire Earthy, dry and burnt things, as Cloves, Cinnamon, Nutmegs, and other Spices, Salt-Ashes, Chalk, and the like.

This Disease is common to Women in the *Chlorosis*, or Green-sickness; to Women great with Child, and such as have their Terms stopped; which staying in the Body corrupt, and ascending do infect the stomach, from whence its Actions are depraved, and chiefly the Appetite is taken from its natural Condition.

Boys are sometimes troubled herewith, and especially if they are born of a Woman that hath the *Chlorosis*: Nor are Men altogether free from it, although it happen seldom; and they are especially troubled therewith who are Melancholick, have Obstructions, or want their usual Flux of the Hemorrhoids.

It is disputed much among Authors, whether a depraved Appetite require those things which are like to the Preternatural State or Distemper of the Stomach, or those that are contrary? *Galen* raised

raised the first dispute, cap. 9. *artis parva*, where he teacheth, That the Stomach being distempered, doth desire Contraries, and in its natural state and temper it desireth things like to it self. Which Doctrine Avicen followeth, *Fen. 13. lib. 3. tract. 2. cap. 10.* speaking thus, When there is an evil humor gathered in the stomach, different in quality from its own nature, then it doth require things contrary to it; therefore some desire Clay, Coals, Earth, Loam, Chalk, and the like, by reason of the quality that is in them, to dry up and cut that which is contrary to the quality of the Humors. But they who are in health desire judiciously rather things like, than contraries; for since fancy is much employed in stirring up of Appetite, and is much stirred up from the disposition of the Body; it is probable that the humor predominating should move the fancy to desire things like unto it: For as Cholerick Men both in time of health and sickness do dream of Fire and Anger, and Flegmatick Men of Snow, Ice, and Waters; the apprehension of which things proceeds from the humors predominating in the Body: So when the seat of Appetite, the mouth of the Stomach, is affected by foul humors there long continuing, they do imprint their Similitudes in the fancy which stirs up the Appetite to desire things like, though never so contrary to reason, which is now overcome by force of imagination.

Moreover, if things contrary to the disease, or its cause were desired by the continual use thereof, the Disease would be cured; daily experience confirmeth this.

By which we are taught. That Virgins in the Green-sickness, and Women with Child, do for the most part desire those things which are agreeable to their present distemper and evil habit, so that they who have Salt and Aduft Humors long for Coals, Salt, Spices, and the like; but they who have Melancholy or Salt Flegm predominating, desire Vinegar, green Fruits, and the like.

As for the Authority of *Galen*, some wholly reject it; saying, that if it were true, that diseased dispositions should desire their contraries, all sick men, of evil habit, would desire meat of good nourishment; which is not true, for we often see that sick men desire evil meats, and refuse good; and we see that bodies inflamed, whether they are in a preternatural state, as in Feavers; or in a natural, as by violent exercise require cooling.

Some desire to reconcile this Opinion of *Galen's*, saying, That in this *Pica* the distemper upon the Stomach is habitual and connatural, and therefore doth cause an Appetite like to a natural, which is for things like it; which may be thus explained, When we say that every natural temper doth require the like, and every preternatural the contrary, the last is to be understood of distempers which come without overflowing moisture, for they which are with much moisture when it is sucked up by the Tunicles of the stomach, do rather desire things like the moisture with which they are wet, because the humor which now pierceth all the Tunicles, although it be noxious, yet it is not troublesome. On the contrary, when the humor only possesseth part only of the stomach, or is only in the bottom, the stomach desires the contrary to that which is offensive unto it: but if it possess the whole Stomach, and be soaked into its Tunicles, then the natural faculty is destroyed and so changed, that it doth not desire any thing but what is like to the humor so soaked in, and so it may be rightly said, that the humor was become as it were connatural.

Platerus and *Sennertus* do easily free themselves from these difficulties, by flying to an occult quality, and they take an occasion from hence, if the Patients so affected should require things like to the cause of the Disease, then by the plentiful use of them, the Disease would be exceedingly increased, but we see that they will devour Chalk, Clay, Coals, and the like trash, and not receive the least hurt thereby, by which men that are sound would be almost killed.

Moreover, They say that Women with Child will often void salt and four humors, and yet not require salt or four things, but the contrary. And lastly, they affirm constantly, that there is no agreement of Coals, Chalk, raw Flesh, and the like with the Humors. And therefore they say, That they must not rest in manifest qualities, and that the Cause of this Symptom and wonderful Appetite cannot be taken from them, but they must fly to some occult quality not to be explained.

Yet *Sennertus* confesseth, That it is probable that this Appetite depraved, should proceed rather from a like than a contrary quality: but what that quality is, cannot be explained, because the things which are desired have no agreement with the humors either sweet, salt or four in manifest qualities.

We may Reconcile all these thus:

The desire of Trash is stirred up by humors of the like nature and temper, but these humors besides their native temper have a certain peculiar fault from corruption, which since it cannot be well explained, it may be called an Occult Quality.

DIAGNOSTICK. The Knowledge of this Disease is easie, for the Patient can relate it; it is manifest, that the part affected is the mouth of the Stomach, for that is the seat of Appetite. The Cause also may be found out by conjecture from the supposed desire of things like. For if they desire

fire Coals, Salt, and the like, we may gather that the Disease depends upon Salt and burnt humors, which will more clearly appear, if any of those humors be cast forth by vomit or stool, if there be sharp belchings or salt, a tast bitter, sour, or salt.

PROGNOSTICK. This Disease is Chronical, of continuance, but not very dangerous, if the Body by Nature or Art may be brought to its old condition, which is not very difficult. For in time the humor offending may be sent forth by vomiting naturally, or by Medicines; and the Terms of Hæmorrhoids stopt, which causeth this disease first, may in time be discharged; which if neglected, and Nature sink under the burden, great Diseases follow. For when the first Concoction is hurt, it is necessary, that the second and third be corrupted, from whence come great Obstructions, evil habits, and dropsies. Or if the humor be carried in greater plenty to the stomach, and partake of greater Malignity, sometimes it produceth violent Cardialgiaes, or Heart Diseases; from whence fainting, swooning, and sometimes death doth follow.

If Women in this Disease begin to abstain from trash, and to eat good meat with less disdain, it is a most certain sign of health at hand.

Women with Child use to be freed of this Disease about the fourth month, because then the Child is grown greater, and so consumeth more of the humors, and the Mother hath sent it forth by often vomitings; but if it last longer, 'tis dangerous; for it signifies that the evil disposition of the stomach hath taken deep root, which will hardly be pluckt up.

It is better for people in this Disease to desire sharp and sour things; it is worse, if they desire things contrary to nature, as *Avicen* teacheth, *Fen. 13. lib. 2. tract. 2. cap. 20.* for it signifies a greater distance from the natural state, which is harder to be cured.

CURE. The Cure of this Disease is divers, according to the variety of the Bodies affected.

In Women with Child, few Medicines are to be used, by reason of the unfitness of the subject, and danger of miscarriage, but you may give them gentle things, and such as were prescribed in the Cure of Want of Appetite, to cleanse and strengthen the stomach. Nor must you omit blood-letting, which done sparingly and often, is of great consequence.

But in Virgins sick of the *Chlorosis*, or Green-sickness, this Disease is cured with the same Remedies which shall be prescribed for the cure of *Chlorosis* in its proper place.

But for the *Pica* which is in men, which is very seldom, because it comes from Obstructions of the Liver and Spleen, you may use those things which shall be prescribed for the Cure of them.

CHAP. IV.

Of the Thirsty Disease, called Sitis Morbosa.

THE Appetite of Drink or Thirst may be three ways hurt, as that of Meat; by diminishing, abolishing and depraving; it is diminished many times by a sweet insipid humor, which moistneth the Tunicle of the Stomach, or from too much moisture in the whole body, from whence it is, that the parts do not draw the drink from the Stomach. It is abolished by acute Diseases through the interception of the sense, when the Mind is sick, or because the natural faculty is decayed by the extinction of the natural heat: from whence *Hip.* saith, *It is evil not to thirst, when a cause of thirst is taken*: and since thirst diminished doth depend upon the same cause, from which want of Appetite is produced, and thirst abolished, is only in acute Diseases, we shall not speak here of them particularly. But we will only speak of thirst depraved, as being most usual: and this is to be divided two ways, as also hunger depraved. The one requiring divers kinds of drinks, the other great quantities and often. That which desireth filthy drink is to be referred to *Pica*, as when they desire Vinegar, Lemmons, and salt Water: It remains that we speak of thirst increased, which is an usual Symptome when the Appetite offends in the quantity of Liquor, and much drink is desired.

CAUSES. The immediate Cause is want of moist nourishment, and dryness of the stomach, and of other parts which make the stomach sensible of their wants.

This dryness and want of moisture useth to come from all such things which can consume the dewy moisture of the Stomach and the whole Body, and dry it up, and they are hot and dry. The dry do principally suck up the humor, and the hot things secondarily.

Also this Disease is either by Propriety, or by Sympathy. It is by Propriety, when the innate moisture of the stomach is altered and drawn forth by an unequal distemper, dry or hot, or both; sometimes by a simple distemper, but often by that distemper which is joyned with matter; as a salt, sharp or filthy humor fixed in the mouth of the stomach, or contained in its cavity. But that which is by Sympathy, comes by consent from the whole body, or some part whose Veins having lost their moisture, do suck from the stomach; as it is in Feavers, Inflammations of the Liver, Lungs, and other parts, as also in hot and dry distempers, especially of the Reins, as you may see in a *Diabetes*, or involuntary

voluntary pissing, which is called by the name of *Dipsacus*, by reason of the great thirst which accompanieth it.

The outward Causes are all such as extraordinarily heat or dry, as very hot and dry Air, long continuance in the Sun, or at the Fire, use of salt Meats, sharp and spiced, much use of old rich Wine, great watchings, too much evacuation, especially by purging.

The Hermetical Physicians say, That immoderate preternatural thirst comes from some thirsty Spirits which are bred of sulphurous excrements, which will not be satisfied with simple cooling and moistning, but with other Spirits like unto themselves; as we see in Feavers, that a strong thirst is little allayed with much Water, which with sharp Spirits of Vitriol, Sulphur, Salt, and the like, will be satisfied with a less quantity of Water.

DIAGNOSTICK. The knowledg is easie, for the Patients will complain. But the Causes are known by their proper Signs; as a hot and dry distemper cleaving to the Stomach and other parts; as also sharp, salt and bitter humors, some whereof are sometimes cast forth, or they have their tastes in their Mouths, if the humors are in the Stomach; but if thirst come by consent from other parts, the Signs of those Diseases will be manifest.

PROGNOSTICK. That thirst which comes from External Causes is safest, for that is quenched presently with drink. But that which comes from Internal Causes, is more or less dangerous, according to their Differences.

That thirst which comes with Feavers, and other Diseases easie to cure, endeth with them. But if it come from great and dangerous Diseases, it is very dangerous; as in a Dropsie in which thirst is not slack'd, but rather increased with drink.

CURE. The Cure of this Disease is often in Feavers, and Inflammations of some parts; which is described sufficiently in our Method of the Cure of Feavers, Sect. 2. Cap. 2.

But if thirst be contracted by immoderate Evacuations, causing a dry distemper of the Stomach, and other Causes, the Cure is by suppressing those Evacuations, and by restoring the empty parts with moist Medicines.

Therefore first, having ordered a restoring Diet, as in a Heetick Feaver, Consumption and Marasmus. Two Remedies prescribed by *Galen* are the best, 7. Meth. namely, Milk and Baths. Although *Hippocrates*, Aph. 64. Sect. 5. forbids Milk to thirsty people, that is to be understood of those who thirst from abundance of Choler and putrid humors, in whom Milk is easily putrefied; not of those who thirst from driness and consumption. We shewed the use of Milk in the Cure of a Consumption.

Let the Bath be made of the Decoction of *Althæa* Roots and Lilly Roots, with Mallows and Violet Leaves, and of a Decoction of the Head, Feet and Guts of Sheep, or melt with fresh Butter, or Oyl in warm Water, to be changed often.

Going out of the Bath, let the Loins, Back and Stomach be anointed with Oyl of Violets, the Marrow of a Veal Bone, and the like; with which let as much Breast or Goats Milk be mingled, as they will receive.

Let the Patient in the mean while use restoring Syrups and Lozenges, and other Remedies, which shall be laid down in the Cure of an Heetick Feaver.

This following Opiate is excellent:

Take of *Eryngus* Roots candied, and Conserve of Bugloss, of each two ounces: Conserve of Violets and Borrage flowers, of each one ounce; Confectio *Alkermes* half an ounce: Diapenedion newly prepared without the Species two drams: With Syrup of sweet Apples make an Opiate, of which let him take the quantity of a Chesnut at the time of thirst, drinking after it a little Borrage Water.

Chap. 5. Of the hurt Concoction of the Stomach.

DIFFERENCES.

THE Concoction of the Stomach called *Chylosis*, as of all other parts, is hurt three ways, either by diminishing, abolishing or depraving. This Concoction diminished is called *Bradypepsia*, the abolished *Apepsia*, the depraved is called *Dyspepsia*: all which differences are commended in this one word *Crudity*. Now this *Crudity* is twofold; either nidorous, stinking and acidous, or sharp. The nidorous *Crudity* is when the nourishment is turned into a stinking burnt Matter, as when the stink of Eggs, or rotten Fish, or fried Oyl, is smelt by belching, which happens often in hot Cholerick Bodies. But a sharp four *Crudity* is, when Meat turns sour, and the belchings are four, and this comes from a cold distemper. To these you may add a third difference of *Crudities*, when by reason of a weak heat the Matter is imperfectly concocted, and is turned into flegm without sourness.

CAUSES. The Causes that hinder Concoction in the Stomach, may be brought into three Heads; namely,

namely, fault in the Organ, Object, and things External and Internal.

The fault in the Organ comprehendeth all Diseases in the Stomach; whether they be Similar, or Organical, or Common, all which may overthrow its actions, but distemper is commonly the cause of hurt-Concoction; for since Concoction is made by a moderate heat according to Nature, if at any time it want its due moderation, the Concoction is hurt. So a cold distemper of the stomach which diminisheth the heat, if it be gentle, it only weakneth the Concoction, and make a Bradypepsia or slow Concoction. If the cold distemper be greater, it abolisheth Concoction, and makes Apepsia. But a hot distemper doth deprave Concoction, and make a Dysepsia, which is a difficult Concoction. These Distempers are sometimes simple, and in such who have naturally a weak stomach, and small Natural heat; or have a sharp and burning heat, but they are commonly with matter. Hence in Hypochondriack Melancholy, much flegm and fermentation of a black humor use to cause Crudities, Winds, Swellings, Rumbings, and four Belchings.

The fault of the Object, that is, the nourishment, which is the proper Object of the Stomach, comes many ways, when it offendeth in Substance, Quantity, Quality, Time or Order of being taken.

Nourishment is vitious in respect of its substance, when it is too hard and difficult to be concocted, as Deers flesh, Hares flesh, especially if old, and made hard with Salt or Smoak, Bread full of Bran, Mushrooms, Roots, Pulse, and the like, which are all called Dyspepta.

Meats offend in quantity, when too much is taken at once, and therefore cannot be overcome by the heat: hence come Crudities, which are most usual amongst them who surfeit themselves. If there be less eaten than is required, it may seem to be Crude, because too little Meat will be burnt and dried in a Cholerick Stomach.

Meats offend in quality which are too cold and moist, and windy, or they which are too hot, whereby the thinner part of the Chyle is burnt, and turned into nidorous vapors.

To this may be reduced the Art of Cookery, and Sawce-making; for the divers ways of roasting, boyling, and making of Sawce, do alter the disposition of Meat, by which means they become more easie or hard of Concoction.

The time and order of eating being preposterous, may also spoil the Concoction; as if any one should omit his usual time of eating, and fall to it at Midnight, or a little before he goes to sleep fill his Stomach; or if after taking of solid and astringent things, as Cheese, Pears, Quinces, and the like, they take liquid things which do soon corrupt.

Also external things may spoil the Concoction, if they be immoderate: so too cold Air by dulling the natural heat, if it be weak or too hot, by dissipating the heat may hinder Concoction; as also immoderate exercise, especially after Meat, by drawing the natural heat forth from the stomach to the external parts, and so dispersing it extraordinarily; as also by throwing the Chylus yet imperfect into the Guts. The stoppage of the Belly and other extremities, or an immoderate flux, great watchings, sleep in the day time, great passions of the mind, especially sadness, and deep study presently after meat, and the like, do not a little hinder the action of the Stomach.

Besides the Causes mentioned, the Hermeticks of late time mention one less usual, and not noted by the Ancients, which also is not plainly demonstrated by them; but it is confirmed by some conjectures, not to be contemned; of which we made mention in the explaining of the Causes of *Fames Canina*. First therefore they affirm, That the Natural Concoction of the stomach is not made by heat only; but that quick melting of solid Meats by which it is converted into Chylus, is from another cause; since experience teacheth, that Meat boyling in a Pot at a strong fire many days, will never be dissolved: and bones in a Dogs Stomach are quickly dissolved, and turned into Chylous Liquor; and in the bellies of Fishes which have no actual heat, all that is brought in is dissolved and concocted the same way. Therefore they lay down the principal cause of this dissolving to be a certain Spirit or sharp Liquor sent from the Spleen into the Stomach, which hath great power to dissolve. And they take this Opinion from *Galen*, by whom it is confirmed, that a Melancholick Humor sent from the Spleen into the Stomach, doth cause Appetite, and that either by astringing or wrinkling the inner Tunicle of the Stomach, or pulling of it by its sharpness, which may be opposed; for if it do it by astringing, then all astringent things would do the same; and if by pulling, sharp things rather than four would provoke Appetite. Therefore they think it more profitable, that that humor should stir up Appetite by accident, by causing want of nourishment, by dissolving of that which comes in. And therefore they allow a more noble use of the Spleen than ever the Ancients thought of, namely, to be a chief Instrument to serve the Stomach in Concoction. This may be conjectured from Birds, which dissolve the hardest Seeds, & have a spleen round about the stomach or maw, that it may more powerfully inspire that dissolving Spirit, or communicate unto it four Liquor. And *Helmont* from his own experience saith, that that four Spirit is very strong in Birds; for he relates, that when he was a Boy and kept a Sparrow, he gave it his Tongue, which the Sparrow catching with his Bill, desired to

swal-

swallow; and that touching the Throat of the Sparrow with the tip of his tongue, he found it exceeding sharp. The dissolving Spirit inherent in the Gizzards of Birds is proved from Physical Practice, in which the Gizzards of Hens for to help Concoction are usually prescribed in digestive Powders, and it is credible that they produce that effect by helping the dissolution of the meat; and the same are prescribed in the Stone, and they do much dissolve them; and that is more manifestly declared in that from the Gizzards of Birds, there is a salt taken which is excellent to dissolve the stone; out of which salt, being in great plenty in their gizzards, Nature being wise and provident, knows how to draw a spirit in a living creature, by help whereof with the natural heat she may dissolve solid nourishment: and it is ordinarily seen, that there is a spirit made of dissolving salt, as of Vitriol, Nitre, Armoniack, and common Salt, which is more powerful to dissolve.

Therefore the Spirit or sharp Liquor which is sent from the Spleen into the Stomach while it is in its natural state makes a laudable concoction; but if it be changed it overthrows the actions of the stomach as aforesaid, from these Positions, That a Dog-Appetite was stirred up, when that Spirit or acid Liquor is too active and powerful to dissolve: So on the other side, if the dissolving power be too weak, or be defective, there followeth a diminished or abolished concoction. Hence *Helmont* saith, That the 1. Aph. of *Hip. Sect. 6.* which is this; In long raging of the Guts, if sour belchings arise, which are not formerly, it is a good sign; is thus to be interpreted, because that sour belching signifieth that that fermentation which was lost by the disease begins to return.

Let us hold up this new Doctrine by our own Experiment; for in the year past, 1648, we had a great Flegmatick and Melancholick Flux for four Months, and were brought thereby to extreme lean-ness, by reason all our nourishment turned into a Flegmatick and slimy substance, from the debility of the Stomach which could not well concoct the same, after many Medicines used all along that time, the chief part whereof profited little or nothing, at length by the often use of very sharp Vinegar in a few days we were perfectly cured of that violent disease; by the force of which Vinegar we may conjecture that the natural sourness which was almost lost was much restored; we used this vinegar at our meat with hard Eggs, which being cut in peices we dipped therein, and for some days we continued the use thereof in all our meats. And we manifestly perceived, that if the vinegar was not very sharp it did our stomach little good.

DIAGNOSTICK. The Knowledge or Diagnosis of this Disease, according to the differences of hurt concoction, is divers. And first, *Apepsia* and *Bradypepsia* are known by the same signs, only differing in degrees; and these signs are sour belchings, vomiting or purging forth of Food either not, or but half concocted; some causes of refrigeration went before, there is a weight, extension and Inflammation in the stomach, inconvenience by taking cold things; thin urin, waterish and pale; sometimes thick and red from that impure and filthy juyce which by reason of the imperfection of the first concoction could not be separated from the Chylus, but being sent to the Reins with the serous humor, makes the urine foul, such as useth to be voided by melancholick and Scorbutick persons.

See the Explication of this Urine more at large in *Sennertus, lib. 3. pract. med. part. 8. Sect. 2. cap. 7.* but these shew Concoction depraved, or *Dyspepsia*, Nidorous stinking belchings, the like tast or stink in the mouth, sense of thirst and heat, inconvenience by hot things.

If the stomach is affected principally, there will be proper signs of its disease; but if by consent, this sympathy is to be found out from the proper signs of the part affected; but if the symptom depend upon the fault of external causes or of the object, it will appear by the relation of the Patient and those that stand by, from the present or foregoing Constitution of the same.

PROGNOSTICK. The Prognostick is thus made; The fault of Concoction which comes from external causes is easily helped, by taking away those causes, and by ordering a good diet.

Concoction hurt is more easily cured when it comes of humors which are brought from other parts into the Stomach, than when it is only from the Stomach: for if those humors are purged before they fasten any disease in the Stomach, concoction is restored.

The Abolished Concoction of the Stomach is worst of all, because the whole nourishment of the body is frustrated, from whence comes most deadly diseases, as *Lientery*, *Dropsie*, *Atrophy*, and the like.

The Concoction diminished brings its inconveniences, as *Cholick*, *Cachexy*, or evil Habit, and sometimes divers sorts of *Dropsies*.

The Concoction depraved is the cause of many Evils; of *Obstructions*, *Scabs*, *Feavers*, and the like
CURE. The Cure is wrought by taking away causes external, antecedent, and conjunct, which do cause, encrease and preserve this disease.

And first observe if the humors be brought from other parts into the Stomach, and in this case they must first be evacuated and repelled, the disease of the part sending to those humors to be amended, and the stomach strengthened, the cures of the diseases of other parts must be taken from their proper Chapters; But the strengthening of the Stomach may be taken from the cure of the *Want of Appetite*.

But the Hurt which comes to the Concoction from the proper fault of the stomach, that chiefly takes its beginning from cold or hot humors; and therefore requires the same Cure which was propounded for want of Appetite coming of the same Causes, which we will not repeat.

Lastly, If the proper cause of the Hermeticks afore-mentioned be worth observing, you must look it; first correcting the Evil state of the Liver, and then restoring the Spirits dissolving, with some acid substance; of which kind is Spirit of Sulphur, Vitriol, Salt, juyce of Lemons, Pomegranates, Oranges, and Vinegar.

Chap. 6. Of Singultus, or Hiccough.

Singultus or Hiccough, is a depraved motion of the Stomach, by which it desires to expel something that is hurtful.

It is distinguished from vomiting, because that which is so sent forth, is contained in the Cavity of the Stomach, and it is wholly turned to throw it out; But in *Singultus* the matter offending is fixed in the Tunicles of the Stomach, therefore it doth contract itself, and shakes its fibres, or exclude it. And that we may comprehend loathing also in this definition, we say that the expulsive motion of the Stomach is three ways; For either Nature would sometimes rise to expel, and cannot; or it is not sufficiently raised to this motion, and then it is *Nausea* or loathing; sometimes it riseth and expelleth, and then it is Vomiting. Or lastly, it riseth to expel, and cannot, and that is *Singultus*.

This is a Convulsive motion, not a Convulsion, which is only in the Muscles, and parts given to voluntary motion.

CAUSES. The immediate causes of *Singultus* are propounded by *Hip. Aph. 39. Sect. 6.* that is, Emptiness and Repletion, as of a Convulsion. But *Galen* and *Avicen* add a third cause, namely, a provocation by sharp matter. Some labour to bring the matter provoking to a kind of repletion, that they may excuse *Hippocrates*. But when the matter is plain, we need not confound and darken the evidences of things for Authors words; for what is more clear, than that *Singultus* comes from the expulsive Faculty provoked? Therefore whatsoever can provoke is the immediate cause of *Singultus* or Hiccough. But humors and vapors offending either in quantity or quality may provoke the Stomach to expulsion, and so repletion and acrimony are two distinct causes. But it is not easie to shew how emptiness makes a *Singultus*: For since its Essence is in defect, none will say that Nature riseth to expel a defect; but rather will be moved to refresh and repair it, and so it doth rather move the Attractive than the Expulsive Faculty. But if *Singultus* follow great Evacuations, as in sharp Feavers, and malignant, and purging with Hellebore, it is not simply to be attributed to the Evacuation, but rather to a malignant quality in the Stomach, coming from the disease, or some Medicine taken.

The Matter causing *Singultus*, is either gathered in the Stomach, or sent from the Liver, Spleen, Guts or other parts, or from the whole body. So sharp nourishment, or sharp medicines, or sharp humors, or gnawing worms contained in the Stomach, cause a *Singultus* by propriety; but inflammation of the parts adjacent by water or vapors sent to the Stomach, make it by consent: as also because the Tumor, especially when the Liver is inflamed, doth compress the Stomach, by which the expulsive Faculty is continually provoked. Finally, Humors may be brought from the whole body, or sharp humors to the Stomach in the diseases of the whole body, as appears in sharp and malignant Feavers.

DIAGNOSTICK. The Diagnosis or knowledge of this disease is manifest of it self. But the signs of the cause are thus to be distinguished, so that if it be by propriety, the disease is more lasting, and there will appear signs of the humors contained in the Stomach, and the disease is asswaged by vomit. The Humor contained in the Stomach is known by vomit, belching, tast in the mouth, and by other signs. And finally, if it come from a disease in any other part, you may take the signs thereof from their proper Chapters.

PROGNOSTICK. As to the Prognostick; *Singultus* that comes from any principal cause, as Meat, Drink or Cold, is not dangerous; as also that which goes before a Crisis by Vomit, and then other signs must be healthful.

If any have the Hiccough in a great Fever, the disease is very dangerous, *Hip. in Coacis*. For it comes from sharp humors, and malignant, which pull the Tunicle of the Stomach inwardly, and force its expulsive Faculty. And *Vallesius* saith, That he never knew any extenuated persons taken with a hot and malignant Fever, who had a *Singultus*, to escape. So it is in *Hippoc. 3. Epid. Sect. 2. Agr. 12.* A Woman living in the Market, had many Hiccoughs upon the twelfth day, and died the Fourteenth day of her sickness. Also *Platerus* observed, that a *Singultus* coming upon the burning Feavers, and continuing, is for the most part a fore-runner of death, and the same is deadly in a *Dysentery* or bloody Flux.

After

After Vomiting, *Singultus* and redness of the Eyes is evil, *Hip. Aph. 3. Sect. 7.* These two signs coming after vomiting in acute diseases, and continuing any time, therefore are said to be deadly, because they declare an Inflammation of the Brain or Stomach; which inflammation is not only the cause of Hiccoughs and redness of Eyes, but also of vomiting. For if Vomiting come from sharp Humors that gnaw the mouth of the Stomach, and its Tunicles, when those humors are thrown out by vomit, the *Singultus* & Vomiting would cease, nor would any sharp vapour be sent to the eyes, which should make them red. But when vomiting doth not only not profit, but also brings after it Hiccoughs and redness of the Eyes; it is most certain that these three, namely, Vomiting, Hiccoughs and redness of the Eyes, do come from the Inflammation of the Brain or Stomach: for the Brain being inflamed, doth through abundance of blood send it to the eyes, & into their extream Tunicles, whence comes redness; to which also the Stomach consenting by the nerves of the sixth Conjugation, is easily from the inflammation of the Brain brought to Vomit and Hiccough. Also the stomach inflamed by a concurrence of hot blood to the Eyes by reason of the great consent between those parts, brings vomit, Hiccoughs and redness of the Eyes, which the beginnings of Suffocations do demonstrate, and the appearance of things before the eyes which are in the stomach disordered: whence *Hippocrates* in his Book *de locis in homine*, affirms, That the Eyes are chiefly hurt by vomiting.

Singultus from Inflammation of the Liver is hurtful, *Hip. Aph. 17. Sect. 7.* which comes then, as *Galen* shews in his comment upon that Aphorism, when the Inflammation is greater and worse, for then it is so great in the Liver that it lieth upon the stomach, and brings the *Singultus*: nay, sometimes by conflux of Matter, there is sometimes an Inflammation or *Erysipelas* in the Stomach: or else there comes gnawing from the same being sucked into the Tunicles of the Stomach.

CURE. The Cure of this Disease is directed to the Causes, which as I said, do either produce it by way of Sympathy or Propriety. The Causes which produce it by Sympathy, are the diseases of other parts, which being cured, this is cured, although these Medicines are to be administered then, which are good to allay the Symptom, which shall be afterwards declared.

This Disease by Propriety comes of Flegm, Wind, Choler, or some sharp or malignant Humor.

That which comes from Flegm in the Tunicles of the Stomach is cured by Medicines which cut the humor, cleanse and purge it, and by strengtheners of the part, such as were prescribed for the cure of Want of Appetite coming of a cold cause. To which we may add these following, as more proper to this Disease.

Take of Castor one dram, the Juice of Mints four ounces; Mix them, let the Patient take one Spoonful or two every fit: and you may anoint the Stomach with the same Medicine warm twice or thrice in a day.

He may take Vinegar of Squills often to cut and dissolve the Matter contained in the Tunicles of the Stomach; or instead thereof, Oxymel of Squills.

Cloves held often in the Mouth do not a little profit.

Also the Elixir *Proprietatis* of *Crollius*, is very profitable:

Take of Dill seeds two or three drams; boyl them a litle in eight ounces of the best Wine: of which let the Patient take one ounce first and last. Let the same seed be put into a cloth, and often smelled to.

When the Disease is violent, these Pills following are very good:

Take of Castor and Myrrh, of each three drams: Sal gem, half an ounce, Diagridium and Mastich, of each one dram: Agarick newly trochiscated three drams: Aloes as much as all the rest: Make them with Juice of Mints into a Mass, of one dram whereof make six Pills guilded. Let him take two or three in the morning twice in a week, two hours before Meat.

Plainer Pills, and almost as good, may be made of Hiera with Oxymel, of which you may give a dram.

In the days between the taking of Pills, give this Powder:

Take of Dill seeds half an ounce, Zedoary, Lignum Aloes, Nutmegs, Cloves, and Powder of Diambr, of each one dram. Let him take two scruples in a morning with a little sweet Wine, or put to them three ounces of common Salt, and let him eat it with all his Vitals.

Apply this Cataplasme following to the Stomach:

Take of Roots of Aristolochium, or long Birth-wort, Flower-de-luce, Bay-berries, dried Leaves of Rue and Mints, of each three drams; Castor and Myrrh, of each two drams; Cloves and Hypocistis, of each one dram. Make a Cataplasme with Honey of Rosemary.

At length, when the disease is stubborn, you must use the Decoction of Guajacum and Baths of Brimstone as the best Medicines.

That which comes from Wind is cured by the same Medicines, adding thereto things to expel wind.

Apply also Cupping-glasses to the Region of the Stomach, which miraculously do presently abate, and take away the windy diseases of the stomach.

That which comes from a sharp cholerick Humor, besides those Remedies which were prescribed in Want of Appetite coming of a cold distemper, most proper also to this disease, must be cured by Phlebotomy (if there be Plethory or fulness) by vomiting and gentle purging every third day, thus made:

Take of the Powder of Rhubarb, sprinkled with Endive Water, half an ounce: the pulp of Tamarinds two drams, the seeds of Endive and Purslane, and of Spodium, of each one dram: yellow Saunders and Diagridium, of each half a dram; with Syrup of Lemmons make a Mass of Pills of half a dram; whereof make four or five Pills to be given in the morning as aforesaid.

Upon other days let him take Conserve of Roses and Borrage, mixed with a little Triasantalon, or the Opiate mentioned in the Cure of Want of Appetite.

Emulsions often used, made of the cold Seeds, do powerfully assuage the sharpness of the humor; or in a disease not very hot, the Milk of sweet Almonds.

Syrup of Apples, with Syrup of Quinces is to be given in a Spoon.

He must take Broth often.

And must drink cold or warm Water or Ptilans often.

The Oyl of sweet Almonds doth assuage the sharpness of the Humors.

Let the Stomach be fomented with a Sponge dipt in Rose water.

Take of the Cerat of Saunders and Oyntment of Roses, of each one ounce; Mastich half an ounce, Citron peels and pulp of Quinces, of each one dram: with Juice of Houfleeke and a little Turpentine. Make two Emplaisters, of which lay one to the fore-part, another to the hinder-part of the Stomach.

Anoint the Region of the Liver with Cooling Oyntments, because the Humors use to flow from thence to the Stomach.

If you suspect any infection, you must give Treacle and other Antidotes, and anoynt the Stomach with the Oyl of Scorpions according to *Matthiolus*.

These Medicines following are good against the Hiccough of what cause soever.

First, Expel the Humor offending by vomit, if the Patient can well endure it; and repeat it, if the Disease abate; and give stronger, if necessity requires.

As *Platerus* sheweth in his Practice, of which he gives an Example in his Observations, in these words; A Chirurgion being sick began to Hiccough day and night, so that he could neither sleep, speak well, or take meat: at last being thus weak and nothing profiting him, when he was in an agony, we gave him not without fear, but at his own intreaty, a strong Chymical Vomit at hand, by which he vomited abundance of Choler green and black, and so was cured.

If the Patient abhor Vomits, purge him.

But prepare the Humors first, or before you repeat it with cutting and cleansing means, after use these following.

Apply Cupping-glasses to the Back against the Stomach, or before.

Bind the Stomach that it may not be dilated.

Use Ligatures to the remote parts.

Take Annis-seeds, for they say that doth specifically cure.

And give often Clysters to draw the humors from the Stomach.

Apply young Creatures to the Stomach.

And take Vinegar of Squills in a Spoon.

Neefing doth shake off the Matter which is compacted in the Tunicles of the Stomach; as *Chrysimachus* the Physician in *Plato* cured *Aristophanes* by Neefing, when he could not be cured by holding his breath, and gargling of cold Water.

Galen 8. de comp. med. sec. loc. mentions the Medicine of *Asclepiades*, of which he examineth every Simple, and approveth them as if it had all faculties fit for this intention; namely, To discuss and evacuate the matter hurtful by stool and urine, to strengthen the Stomach: And lastly, To mitigate sharpness.

The Composition is thus:

Take of Costus or Galangal, Saffron, Spicknard, Roses, Mastich, of each four scruples: Asarabacca and Aloes, of each two scruples: Opium one scruple, with the Juice of Eleabane: make them into little Balls or Cakes, and let him take one of a scruple in weight every morning.

In imitation of that you may quicklier prepare Pills for one Dose, of one dram of Aloes, two or three grains of Laudanum: And if you will purge more, give three or four grains of Diagridium.

Duretus

Duretus testifieth what excellent force Aloes hath in this Disease, in these words, *Many when they have been almost dead with the Hiccough, have been cured with Purging five days together with Hiera, after they have voided black glutinous humors.*

Platerus reports in his Observations, that he cured a Boy of ten years old, that was troubled night and day for eight days together with the Hiccough, with the Water of green Nuts, distilled with Rhadish first macerated in Vinegar, which he gave as a Vomit; and though he vomited not, yet he was eased; and taking a draught thereof at night, was presently cured.

Forrestus reports, That he cured one with one draught of the Decoction of Dill-seeds, Carva, Purslane, and white Poppy-seeds, made in small Ale.

Claudius doth highly commend *Diaphœnicum* with *Philonium Romanum*, when the Cause and the Symptom are very violent.

Lastly, Narcoticks only do alone cure this when all other things fail, by stupefying of the sense of the part which is too exquisite.

Chap. 8. Of Nausea, and Vomiting.

Nausea and Vomiting differ only in degrees, and both are the Motion of the Stomach, by which it either expelleth or labours to expel things contained therein; therefore *Nausea* is a desire to vomit with trouble, and only sending and pewking forth a thin waterish humor by Salivation: whatsoever troubles the stomach either in quantity or quality useth to stir that up, when it cannot be avoided by reason of the weakness of the stomach, or the strength of the upper Orifice, or thicknels of the Matter or sliminess.

But Vomiting, which is called in Greek *Emetis*, or *Emesia*, is a depraved motion of the Stomach, which shaketh it, by which the Expulsive Faculty is stirred up by contraction of the Fibres of the lower part, and loosning those in the superior, doth sensibly with a violent motion throw upward the Matter contained therein, which is troublesom unto it; it is called a depraved Motion, both in respect of the Object troubling it, as also in respect of the Motion it self, which is from the bottom of the stomach to the mouth of it, turning it, when the natural motion of the stomach is compulsive towards the Guts and *Pylorus*.

DIFFERENCES. The Differences of Vomitings are taken from their Causes, which are either External or Internal; therefore it is divided first into Natural and Artificial; the Natural again is either without a Disease, or in the Disease; from whence ariseth a three-fold Difference, one is called Periodical, another Critical, and another Symptomatical.

Periodical is that which without a Disease is used for preservation often, from whence we read in *Hippocrates*, That the Ancients did vomit twice every month, either at distance, or together.

And there are many in our times, who use either every Month, or Week, or Day to Vomit Choler or Flegm; by which they are preserved from many Diseases: and this is not properly a Symptom, because there is no disease present; but it is rather to be termed a Motion of Nature.

Critical Vomiting often happens in Diseases, and by that the Matter of the Disease, if preparation be first made, is wholly evacuated; either all, by which it is cured; or in part, by which it is diminished.

Symptomatical Vomiting comes from Nature provoked and weakned, and without ease to the Patient, because it is not enough, or it is nourished continually with the Matter that maketh the Disease.

Other Differences of Vomitings are taken from the things vomited, for they are either nourishable or excrementitious, the first is of Meat, Chylus, or pure or mixed Blood; the latter is of Flegm, Choler, Melancholy, Water, Matter, and the like.

CAUSES. Artificial Vomiting generally is whatsoever is from an External Cause; The External Causes are chiefly Strokes, Falls, Compression of the lower Belly, Southerly Weather, or infectious Ayr, Poysonous Breath, Stinking Smells, violent Exercise, Riding, Sayling at Sea, especially in a Southerly Wind, beholding or conceiving of some filthy thing. And the like External Causes which provoke Nature, or move the Humors; but especially things taken in have great force, not only Vomits called *Emetica*, and Poysons which we distaste; but also nourishments either hurtful in their Nature, or hated peculiarly of some; as in *Hippocrates*, who speaks of one who with eating of Mushrooms or Toadstools, died vomiting. The same hapned to a Courier of *Antoninus* the Emperour, who eating much Mouldy Cheese died vomiting. The Quality of Food will do the same if it be Fat or Oily, as also a preposterous order in eating, when moistning and loosning things

things are eat after astringents, and also too much food taken, though never so good, as appears in Gluttons; for then Nature being over-charged, desires to throw out what she cannot concoct, to which she is also stirred up by the evil quality which is brought to those Meats by corruption or evil concoction.

The internal Causes are either Antecedent or Conjunct.

The Antecedent Causes either come from the whole Body, or from some proper peculiar part into the Stomach. They come from the whole Body in a Plethory, evil habit or Cachexy, Feavers, and other Diseases of the whole Body. The humors are often derived from some peculiar part into the Stomach in the Inflammation of the Liver, Spleen, or other Obstructions of the Mesentery, from the Terms stopped, or Hemorrhoids, from a Catarrh, or the like. To this you may add the evil Conformation of the *Porus Cholidochus* when it is not placed in the *Duodenum*, but into the Stomach, whence they are called *Picrocholi Ana*, who are often troubled with Cholerick Vomits; by reason of this evil Conformation. Also this vomiting cometh by the Peristaltick Motion of the Guts, when they are stopped in the Cholick, and the humors cannot well get forth, but come upwards; also Worms coming up into the Stomach from the Guts, & pulling the inward Tunicle thereof, do cause vomiting. And lastly, An Imposthume broken in the Spleen, Mesentery, and other parts of the *Abdomen*, useth to cause a vomiting of Matter.

The Conjunct Causes of Vomiting are them before mentioned, when they come to the Stomach; for while they were in other, they were Antecedent Causes. These are especially divers Humors, some bred in the Stomach, especially Flegm, of which there is often much in the Stomach, by Crudities, and want of concoction when the stomach is weak and turns it into Flegm. So also is there sometimes green Choler in the Stomach bred of corrupt humors, as *Galen* teacheth, *Com. in 2. Progn.* and this clearly appears in sucking Infants, who through corruption of Milk in their stomach use to avoid green stools like Leeks or Verdegrees.

This green Choler which comes from corrupt nourishment in the stomach, is not the same with that which cometh from yellow Choler by Adustion and Torrefaction.

SIGNS. The Signs of Vomiting are manifest; But the Causes as they are divers, so they have divers Signs.

First then, If Vomiting come from a fault in the Stomach, there are signs of that part being affected, as loathing of Meat, heaviness, extension, swelling in the Region of the Stomach, slow and hard Concoction, sour and stinking belchings, and other signs that shew the distemper of that part. So if it come from a common and organical disease in the stomach, as a Tumor or Ulcer, the signs of these diseases will discover themselves. But if vomiting come by sympathy from the whole body or other parts, there will appear some disease of the whole body or some part.

The whole body is affected in Feavers, evil Habit, Jaundies, Atrophy or want of nourishment. But the principal parts from which the humors are sent more frequently to the stomach, are the Brain, Liver, Guts, and Womb.

If the humors flow from the Brain to the Stomach, there will appear signs of distillations, frothy and flegmy vomiting, and a great loathing at Meat time.

If the Humor come from the Liver, it is commonly Choler: and vomiting before Meat, is worse than after: and there appears some disease in the Liver, as pain or tumor.

If the Matter come from the Guts, either there will be Cholick or Iliack Passion, or the signs of Worms.

Lastly, If it come from the Womb, there is conception, suppression of Terms, or other Symptoms.

We may also know by some signs whether the humor be contained in the cavity of the stomach, or stick to the Tunicles thereof. For if it be in the cavity it is easily cast forth, and there is stretching in the stomach, and trouble after Meat, which will not cease till the humors are sent out by vomit, which are for the most part thrown out alone, and the Meat retained. But if the humors stick to the Tunicles, vomiting is chiefly after Meat, and the Meat is cast forth without the humors, but when there is no Meat, there is a loathing, and that which is cast forth, is thick and slimy, and with great straining.

The external Causes are known by relation of the Patient, as if he hath eat or drunk too much, or received a stroke, or eat any evil thing.

The signs of vomiting to come are shewed by *Galen*, *lib. 3. de crif. cap. ult.* as head-ach, dark giddiness, trembling of the lower Lip, gnawing at the Mouth of the Stomach, often and much spitting.

PROGNOSTICK. You must take the Prognostick thus:

Vomiting from Choler and Flegm, which is neither very thick, nor very much, and which hath both those Humors exquisitely mingled, is good. For it is commendable in substance, quantity and quality. For of all excrementitious Humors, Flegm and Choler are the mildest: if then they

be

be vomited well mixed, and in a moderate quantity and consistence, it hath all the Laudaable conditions.

Cholerick and Flegmatick Vomiting on a critical day are very good: For not only mixed are good, but vomiting of one single, if it cause the disease. So in Cholerick Feavers, when Choler comes forth critically, or Flegm in Flegmatick Feavers, the disease is at an end, or at least there is great hopes of recovery.

A vomiting naturally after a long Flux of the Belly cures the disease, *Aph. 15. Sect. 6.* for there is a revulsion of the Matter to the contrary part. And this shews that Nature is refreshed, and gets strength; For as the Physitian ought to labour for the retraction of those things that flow to any part. So Nature, when she begins to prevail, makes a repulsion to the humor, which flows to the part affected, that the part may be refreshed and strengthened.

Little and violent vomiting in a sharp Feaver is evil; for it is not good to void sparingly in a Crisis; for it signifieth one of these two things, either abundance of Matter which Nature cannot bear, but must send some of it forth; or the weakness of Nature, which striveth in vain to send forth that which is superfluous.

Vomiting of divers colours are evil, it signifieth divers humors lurking in the body, and therefore Nature will be more put to it with divers enemies; for if it be troublesome to Nature to contend with divers nourishments, how much more dangerous is it to strive to concoct and tame divers preternatural humors, especially in acute diseases, in which there is but short time to fight, which should be long, that there might be more hope of Nature being a Conqueror.

Green vomiting like Leeks, Verdegreefe, as also blew, black or stinking, is deadly; For it signifieth that there is abundance of Choler of those colours. And all these kinds of Choler use to produce malignant and deadly diseases. And if there be a stink, it shews a great corruption of humors, with which Nature cannot long consist.

In acute Feavers, vomiting without mixture of humors is evil, according to *Hip. 1. Prorrhēt.* For a pure Humor is not only crude, but incapable of concoction, because it excludeth not only the act, but the power of concoction. *Hippocrates* calls every humor that is without mixture, and every excrement that is hot and crude, *Acrimon*, because it is bred either by the defect of some part, or by reason of the watery serous matter is exhausted by the heat of a Feaver. Therefore in sharp Feavers it shews that there is a great inward Inflammation, and for the most part such as Nature cannot conquer.

CURE. As for the Cure; if Vomiting come from a disease in some other part, it needs no other Medicines than those which are agreeable to the disease from whence it comes.

But if it come from Cholerick, Flegmatick or Melancholick humors which stimulate and provoke the Stomach, either by their quantity or quality, you must throw out those humors by Vomitive Medicines.

But if they be thick and glutinous, or clammy, they are to be cut and cleaned, as we shewed in the Cure of *Want of Appetite.*

The best Vomit in this case, is that which is indifferent gentle, and not too weak, as warm Oyl; nor must you give strong ones made of Antimony, which draw violently from remote parts. But such as do cleanse and dissolve the glutinous humors, as *Gylla Theophrasti*, or white Vitriol prepared; but Salt of Vitriol brought to a high redness by Calcination, is the stronger.

If Vomits are unpleasant, you must take away the matter with often Clysters and gentle Purgations with Rhubarb in them, which astringeth and strengtheneth afterwards.

In Cholerick vomiting, these Pills following may be prescribed;

Take of Aloes washed with Rose Water three drams, the powder of Rhubarb sprinkled with Borrage Water one dram; Mastich. red Sanders, and Coral prepared, of each one scruple; With Syrup of Roses Solutive make a mass of Pills, of which take half a dram, or a dram every other day till the Vomiting be ceased. Or,

Take of Rhubarb powdered one dram; yellow Myrobalans one scruple; Spodium, or burnt Ivory and Harts-horn shaved, of each six grains. Make a powder, and give it twice in a Week, in a little Broth.

Or make a Bolus of *Hiera Picra*, or three drams of *Diacatholicon*; with one dram of powdered Rhubarb.

In a most violent vomiting give three Grains of Laudanum, with two scruples and an half of *Cochiæ* Pills the less, the vomit will be stayed, and five hours after they will work downwards. There is a good quantity of Purging Pills in this Receipt, because *Laudanum* doth astringe, and therefore it must be given with Medicines made of *Diagridium* and *Coloquintida*. And if the Medicine do not come away, you must give a sharp Clyster.

After

After sufficient Purging, you must strengthen the Stomach with Syrup of Quinces, four Pomegranates, old Conserve of Roses, or Comfrey Roots, Conserve of Quinces; or this following Julep, if it be very Cholerick and vehement:

Take of the juyce of fower Pomegranates six ounces: the juyce of Mints clarified two ounces, Sorrel Water one pint, white Sugar half a pound, make a Julep, in which while it is clarifying boyl gently in a clout of yellow Saunders, red Roses and Spodium, of each one dram: Let him take four ounces first and last.

Take of Terra Sigillata, or sealed Earth, Bole-Armenick, red Coral, prepared Pearl, Purslain, and Sorrel seed, of each one dram: shavings of Harts-horn, and of dried Mints, of each one scruple; red Roses half a pugil; Make a Powder to be taken in Broth, or the like: or in a spoonful of Chalybate Water. Or,

Make Tablets thereof with Sugar dissolved in Plantane Water, or an Opiate with Syrup of Quinces, Conserve of Roses, or Comfrey Roots.

Some few grains of the best Mastich, taken in the Morning is good to stay Vomiting.

Three Grains also of Balsom of Peru taken in a rear Egg, or in Sugar like a pill, do it better.

Also a Decoction of Beans or Pease, after the first water is cast away, with a little Vinegar, is much commended.

And the crude Juyce of Quinces, taken two or three spoonfuls at a time, doth Wonders.

Camphire often smelt to, or taken with a little Rose water, and a little powder of *Diamoscum* is good for the same.

The Spirit of Vitriol mixed with Plantane or Spring Water, to make it sharp, doth also powerfully stay Vomiting.

If it be very violent, make the water sharper with Spirit of Vitriol; or given in Sack or rich Wine; if you want Spirit of Vitriol, use the strongest Vinegar without mixture, one spoonful or two at a time.

One scruple of Salt of Wormwood, mixed with a spoonful of the Juyce of Lemmons, is a most excellent Medicine; especially in those Vomitings which happen in malignant Feavers.

If the Patient grow very weak with vomiting, give him Laudanum with Conserve of Quinces, or syrup of dried Roses; and then apply a Cupping-glass to the Stomach, and a Cataplasim of Leven, Powder of Wormwood, Orange Peels, made up with juyce of Mints.

Apply also outwardly a Fomentation to the Region of the Stomach, a new sponge dipt in Rose water and Rose Vinegar; or let the Sponge boyl in strong Vinegar, and apply it hot to the Stomach.

Or make a Fomentation of the Decoction of the Roots of Snake-weed, Plantane-leaves, Purslain, Mints, Bramble tops, and Willow-tops, and then anoint it with this Oyntment;

Take of Acacia, Hypocistis, Grains of Sumach and Myrtle, of each two drams; Mastich and Grains of Kermes, of each one dram; Oyl of Myrtles two ounces, Wax as much as is sufficient; make an Ointment. Or apply this following Cataplasim:

Take of Quinces boyled in Rose-water and Vinegar, or Marmalade thereof well beaten, three ounces: the powder of Mastich, Grains of Kermes, Myrtle Berries and Plantane seed, of each two drams. With the Juyce of Mints or Quinces, or Syrup of Wormwood, make a Cataplasim.

Or steep a Crust of Bread in Rose-Vinegar, and sprinkle it with this Powder following.

Take of red Roses and Pomegranate flowers, and Coriander seeds prepared, of each one dram and an half; Mastich, red Coral, Sorrel seed, Spodium, of each half a dram; yellow Sanders one scruple: mix them into a Powder.

Or, Apply this following Emplaister;

Take of Mastich Plaister one ounce, the powder of Myrtles, and Bistort-Roots, of each half a dram; with the Oyl of Mastich, make an Emplaister in the form of a Buckler.

If the Vomiting be very violent, and bring a Fever Symptomatical, and the Body very full; it is good sometimes to let blood to prevent Inflammation which may be in the internal parts by reason of the violent straining; and this must be done warily, and but a little, lest the strength be abated.

Moreover, It is good to apply Cupping-Glasses to the Back and Navel, and to rub and bind the extreame parts.

You may bind about the Neck Linnen Clothes dipt in Oxycrate to repel the humors; putting of the hands into cold Water, doth stay all kinds of vomiting.

And lastly, When other things avail not, use Narcoticks which do very quickly stop all Evacuations.

In a Flegmatick vomiting (if it will not be staid with the aforesaid Vomits) give Pills of Hiera, with Rhubarb and Agarick, or other fit Purges.

Then come to strengtheners for the Stomach, such as were prescribed for the cure of *Want of Appetite*: To which add this following;

Take of Conserve of Roses and Comfrey Roots, of each one ounce; Confection of Hyacinth three drams; the Powder of Diambra and Aromaticum Rosatum, of each half a dram; Troches of Spodinm, Terra Sigillata, and Grana Kermes, of each one scruple; With Syrup of Quinces make an Opiate.

The Spirit of Vitriol with Wormwood Water, or Juyce of Mints, doth mightily stay Vomiting, and strengthen the Stomach.

Or one or two spoonfuls of *Aqua Imperialis* given after vomiting, if the Stomach be very cold.

Apply these things following outwardly;

Take of Wormwood, Mints and Balm, of each three handfuls; boyl them in a sufficient quantity of Vinegar and Wine, to the consumption of the third part: make a Fomentation for the Stomach.

After apply the Plaster afore-mentioned, or the Cataplasm of Quinces, using the Powder of Nutmegs and Cloves, instead of Myrtles and Plantane. Or,

Take of Wormwood and green Mints, of each one pound; a Toast dipt in Rose water weighing half a pound; the pulp of Quinces, or Marmalad of the same, two ounces; Mastich half an ounce, Mace and Nutmegs, of each two drams; beat them all well together with Oyl of Quinces, and make an Emplaster.

Or make a Cataplasm of Quinces boyled in strong Vinegar, and then beaten with a little Mustard-seed, and Powder of Cloves.

Or- Apply a Toast dipped in strong Wine and Juyce of Mints, and sprinkled with powder of Nutmeg, Cloves, Frankincense, Mastich, and Grains of Kermes.

Villanovanus much commends sharp Leven, which he applieth to the stomach twice or thrice, being steeped in strong Vinegar and Juyce of Mints: this doth most certainly stop Vomiting after convenient Evacuations and Revulsions.

In a long Vomiting where the Stomach is very weak, you must use strong Astringents made thus:

Take of the Roots of Snakeweed and Tormentil, Pomegranate peels and flowers, and Hypocistis, of each two drams; Leaves of Mints, and dried Wormwood, of each half an handful; Sumach and Myrtle berries, of each one dram; red Roses one pugil; Cinnamon, Cloves and Mastich, of each half an ounce; green Galls, and Cypress Nuts, of each two drams: boyl them in Iron Water and red Wine, in which dissolve a little Musk, for sweet things do much assuage Vomiting, of which let the Patient take two ounces every morning, and foment his stomach with the same.

Alter the Fomentation apply some Plaister or Cataplasm, made as aforesaid.

CHAP. VIII. Of Vomiting Blood.

THis Disease is a casting forth of Blood from the Stomach by the Mouth; and as all other bleeding, it comes from the Veins either by *Anastomosis*, or opening of them by *Diapedesis*, or Rarification, by *Rixis* breaking, or by *Diabrosis* corroding, which diseases of the Veins were shewed in the Cure of Spitting of Blood, called *Hemoptysis*.

CAUSES. The Causes also are the same.

And first the conjunct Cause; Excess of Blood in Quantity or Quality.

Blood offending in Quantity will break or open the mouths of the Veins, and so come *Rixis* or *Anastomosis*, which happeneth in full bodies.

If it offend in Quality, as when it is too hot or thin, it may cause an *Anastomosis*, because heat doth open the Orifices, and thinness makes it flow easily through: The same Qualities may cause a *Diapedesis*; for heat doth make thin the Tunicles of the Vessels, and thinness causeth the blood to pass through their Pores.

Lastly, Sharpness gnaweth and Ulcerateth the Tunicles of the Veins, and so produceth a *Diabrosis*.

The Antecedent Causes are the same with the Conjunct, but they differ in place; for when blood offending either in quantity or quality, doth immediately open the Veins; it is called a Conjunct Cause; and the same being contained in the Veins, is called an Antecedent Cause.

The parts sending, of which the chief are, the Head, Liver, Spleen, and Womb, are antecedent Causes.

Oftentimes blood is carried from the Head to the Stomach by the Palate and Gullet, or *Oesophagus*: and also a violent Catarrh of sharp and salt Flegm doth corrode the Stomach, and open the Veins thereof.

It is carried from the Liver and Spleen by the veins that go to the Stomach from the Womb, when blood by the stoppage of the Terms, runs back and opens the veins of the Stomach, so that some Women have had their Terms by vomiting blood constantly at the time.

Vomiting of blood comes ofner from the Liver and Spleen, than from other parts, and from the Spleen than the Liver, because it doth more consent with the stomach. For it is evident by Anatomy, that the great branch of the Gate-Vein or *Porta* goeth to the Spleen, from which many Veins are sent to the stomach both above and below; and these are so great, that being distended with wind or blood, they are as thick as the middle finger: this we have observed in Dissection. Moreover, the *Vas breve* being wide, as in a natural state, it doth continually send Melancholy into the stomach; so being in a Preternatural state, it may send great plenty of blood. But observe here, that in this case, that blood is voided by stool as well as vomit, both because a part thereof which went to the Stomach is sent downwards, and also because the Meseraick veins are open, and send blood into the Guts, which by its long passage through the Guts groweth black, and comes forth like Tarr.

The external causes are, all things that can wound or bruise, as also great heat which causeth boyl-ing of the blood; hence it is that young men to the age of thirty five, are very subject to vomit blood, and other bleeding, as also great cold by too much striction may endanger to break the Veins; the same doth unseasonable Motion and Labour, unusual Exercise, great hollowing, and the like, which move the blood violently in the veins.

And finally, All the Causes of Blood-spitting aforementioned. For blood being violently moved either in the Veins or Arteries, whether from an external or internal cause, goes soonest to that part which is weakest, and most fit to receive it; and therefore if the Stomach or the Veins going thither are so disposed, there will be vomiting of blood rather than any other way of bleeding.

DIAGNOSTICK. The Diagnostick of this disease lieth chiefly in the discovery of the part from which the blood comes.

If from the Stomach, the situation of the part, and the constant pain and heaviness thereof will demonstrate, and there is less blood, for the veins of the stomach are smal, and it comes with loathing, and there is a biting when they swallow, as also sometimes it comes forth mixed with meat, flegm or Choler.

If it come from the Head, there will be tickling about the Jaws and Palate; and some blood will be blown out of the Nose with Snot; there went before it some Head-ach or heaviness, which after bleeding ceaseth.

If from the Liver or Spleen there is more plenty of blood, and sometimes a Tumor or dolor in the part. From the Liver the blood is red and frothy, from the Spleen it is thick and black. Also blood from the Liver goes most downwards, because it commonly goes from thence to the Guts through the Meseraick, and must ascend from them into the stomach to cause vomiting, but it doth easier descend. Contrarily, that which comes from the Spleen is rather by Vomit, because the Veins from the Spleen to the stomach are shorter and narrower.

Lastly, If from the suppression of the Terms, you may know it from the Woman, and it will come at those times, which will be more probable, if there be no disease in any other part.

PROGNOSTICK. As for the Prognostick: Vomiting of blood, of what cause soever, is dangerous: for it either threatneth death suddenly: or if it stay in the stomach and putrifie, it breeds faintings, swoonings and suffocations.

Vomiting of blood from suppression of the Terms, is less dangerous than that from the Liver or Spleen: for when they are brought down it is usually cured, as *Hippocrates* taught, *Aph. 34. Sect. 5.* in these words: *When a Woman vomiteth blood, if her Courses break down, she is cured.* And in this case only, the opening of the inferiour Veins doth provoke the Terms, especially if she take something besides for that purpose.

They who after vomiting of blood fall into the Dropsie called *Ascites*, do die thereof. *Dodonæus* doth testifie that he never knew any that escaped: And Experience teacheth, That a Dropsie from any kind of bleeding is deadly: for it comes from a great dissipation of Natural heat, which cannot be repaired.

CURE. For the Cure of this disease, use Medicines which revel the blood from the Stomach, and correct its distempers and open the veins with astringents and glutinatives. To which add those things which concern the part chiefly affected, from whence the blood is sent into the stomach according to the divers Nature, and Disease of the part.

And because Diet is of chiefest concernment in this disease, let us shew some Rules thereof.

Let

Let his Nourishment be commonly Astringent and Emplastick, and cold both actually and potentially, as Barley, Almonds, Rice, Panadoes, Jellies, and especially Starch made without Chalk, and boiled in Milk, which is good also in spitting of Blood: to all these you may add some Pomegranates or Vinegar of Roses. Also hard Eggs steeped in Vinegar are good; Bread-crumbs steeped in cold water and Chicken Broth, with Sorrel, Purslain, Plantane, and unripe Grapes; the feet and hips of Sheep, Kids and Calves, boyled to a Jelly; for the first course, let him take that which is astringent, as a Quince, or four Apple or Pear roasted in the Embers, Marmalet of Quinces, or Jelly of sharp Cherries, Medlars or Services.

Let him abstain from all sharp, salt, peppered and fried Meats, as also from things that breed much Blood, except he grow weak, and then you may give him them sparingly. He must be but little nourished, for the less Blood is bred, the Disease will be the less, and the empty parts by their attraction will stay the Flux.

Let him drink little, only a little Iron water with a little juyce of Pomegranates. He must drink no Wine except it be thick and sharp, which we call *Tortium*, and it must be when there is no Fever.

Let the Air be cool, without Wind, Sun, or Moon-shine; let him sleep little, and not in the day; for although all Fluxes are said to be stopped by sleep, yet this by long keeping the heat in the Center may be increased. Let his belly be loose, and he kept free from passions.

After his Diet is thus ordered, we must go on to Chyrurgery and Medicine.

And first take away little blood often, for the greater Revulsion; and that out of the Liver Vein called *Basilica*, in the right Arm, if it come from the Liver, in the left, if from the Spleen; or from the Aule vein, if from stoppage of the Terms.

Use Frictions and Ligatures to the extreame parts, and give cleansing Clysters.

Apply Cupping-glasses to the Buttocks, Thighs and Loyns, and to the *Hypochondria*.

Give half a scruple of Camphire with four ounces of Oxycrate or Plantane water. Which *Rondeletius* commends in his Counsels for excellent.

If you suspect there is congealed blood, give him a glass of Vinegar and Water, or Oxycrate, for it easily dissolveth blood, and sends it from the veins of the Stomach, and shuts them up.

And foment the Stomach cold with the same.

When Vomiting ceaseth, to astringe the veins, use these following:

Take of the white of an Egg, Rose-water and Vinegar, of each one dram and a half, beat them well, then add two drams of Chalk. Let the Patient take now and then a spoonful. Or,

Take of prepared Coral, Terra Sigillata, Bole-armenick, Blood-stone, and Troches of Amber, of each one dram; Plantane-water and syrup of Myrtles, of each two ounces; mix them for to be used as the former, or the powder in Broths. Or,

Take of the juyce of Plantane four ounces; give it cold morning and evening. Galen saith, There is nothing better for to stop any kind of Bloody Flux.

The juyce of Purslain and Polygamon or Knot-grass taken with Sugar, is very good for the same.

Take of Plantane and Purslane water, of each one ounce and an half; the Syrup of Myrtles half an ounce, the Syrup of Poppies two or three drams, Sal Prunella one dram. Mix them for a Julep often to be repeated. Or make a Julep of the Decoction of the said Herbs.

Take of old Conserve of Roses, and of Comfrey Roots, of each one ounce; of Cydoniatum half an ounce; one candied Myrobalan; Troches of Carabe, and Terra Lemnia, of each two drams; Coral prepared, and Crocus Martis, of each one dram. With the syrup of dried Roses make an Opiate to be taken often.

The Troches of Carabe do not only astringe, but dissolve congealed blood, therefore use them often.

The Syrup of Coral is good; but the Tincture drawn newly with the juyce of Lemmons is better.

When blood is vomited violently, and will not be cured by what hath been said, so that death threatneth, you must give Narcoticks either at the Mouth, or by Clysters.

Anoint the Stomach without with Oyl of Roses and Myrtles washed in Vinegar, and after sprinkle on the powder of Coral, Bole-armenick, and Terra Sigillata.

Or anoint with this:

Take of the Juyce of Plantane and Knot-grass, of each one ounce and an half, Vinegar of Roses one ounce, Oyl Olive six Ounces: Boyl them till the Juyces are consumed; then add of Sanguis Draconis, Mastich, Pomegranate peels, and Myrtles, of each two drams; Camphire one scruple; as much red Wax as will serve to make an Oynment.

Let him drink ordinary water, wherein Iron hath been quenched, with Syrup of Quinces, and Spirit of Vitriol; also make all his Broths of Iron Water.

Let his *Hypochondria* and Loins be fomented with the Decoction of Plantane and Purslain made in Oxycrate.

Let his hands be put into cold Water, for so all Vomiting is stayed.

Afterwards use the Oyntment of *Galen*, called *Refrigerans*, washed in Vinegar, to the same parts.

After sufficient Phlebotomy, you must appoint an often and gentle Purge to take away the cause, and destroy the Disease, by which the blood will be purged from waterish and cholerick Humors which produce this Disease.

These kinds of Purges, given by a wise Physician, do miracles; as we have learnt by Experience.

They must be made of Rhubarb, Myrobalans, Tamarinds, and *Tryphera Persica*; which Medicines do all astringe with their purging, and do no ways stir the Humors, so that you need not fear they will provoke vomiting of blood; you may give them in form of a Bolus with Syrup of Myrtles, or of dried Roses; or in form of a Potion, with the Decoction of Succory, Sorrel, Purslain, or the like.

In time of Purging, which may continue three or four days in a small Dose, at night you may give the aforesaid Opiate or Syrup of Coral, or some of the aforementioned Astringent and strengthening Medicines.

Finally, To prevent, you may give for a long time once in a Week, one dram of the Powder of Rhubarb, or the Magistral Syrup prescribed for to prevent spitting of blood; as also almost all other Medicines laid down in the Cure and Prevention of that, are very good here.

CHAP. IX.

Of the Disease called Cholera.

THIS Disease is a violent sending forth both by Stool and Vomiting, corrupt, sharp and cholerick Humours.

DIFFERENCES.

It is called *Cholera*, *apo tes Choles* from Choler, as *Galen* shews from the Opinion of the *Gnidian* Physicians, 2. meth. c. 2. that it comes from yellow Choler and evil humors like it which is sent upwards and downwards. But *Alexander Trallianus*, lib. 7. c. 14. will not have this Name to be derived from a Cholerick humour, because Choler is not always vomited, but also oftentimes a serous and flegmatick Humour; but it comes rather *Apo toon Chola stool* from the Intestines, which were called *Cholados* by the Ancients, because these Humors come from the Intestines and Entrails: yet the first Etymology is more to be approved, because it is used not only by *Galen*, but by *Hippocrates* 7. epid. text. 19. by *Celsus*, lib. 4. cap. 11. and *Aurelianus*, lib. 3. acut. cap. 19. And although a Cholerick humour is not always sent forth, yet one like Choler, sharp, biting and corrupt, is always voided.

Some say the Stomach is the part affected, others the Guts, others both; but we must be of *Galen's* mind, who saith, *de symp. caus. cap. 2.* The part which is principally affected is the Stomach, whose expulsive Faculty is vehemently stirred up, so that it expels the noxious humors at both Orifices. But there is no doubt but the Gullet and Guts are secondarily affected.

Therefore this Affect is a symptom of the expulsive Faculty being hurt, and vehemently stirred up, for it cannot depend upon the retentive Faculty debilitated, for then the humors flow by degrees, as in *Lienteria* and *Cœliaca Passio*: but we must confess that the Disease is more violent if the Retentive Faculty being weak do not resist the expulsive.

Moreover, The Concoction is hurt also, by which evil humors are bred in the Stomach which stir up the expulsive Faculty; but this is an Antecedent Cause, *Hip. 4. de victus ratione in acutis, textu 104.* lays down two kinds of Choler, the one moist, and the other dry; the moist is that which hitherto hath been declared, and which is meant only in this definition, as being the more usual: but the dry is more rare, and it comes from a windy spirit going from the Stomach and Guts, and griping those parts through which it passeth.

These Winds are produced either from the fiery heat of the Stomach corrupting the Meat, and making it stink, or from windy rank Meats and Onions, Radishes, and the like. *Sennertus* addeth another cause, borrowed from the Hermetical Doctrine, namely, salt humors, and adust in the *Hypochondria*, which grow hot by the mixture of another humor: For (saith he) as Salts and the Spirits of Salts mixed with sharp Spirits, make abundance of flatuous Spirits, as appears by the mixing of Oyl of Vitriol and *Aqua fortis*, with Salt of Tartar: So doth it fall out in Mans Body, by the Commixtion of a Salt and Adust Humor with other Spirits, there are many windy Spirits produced.

CAUSES. The immediate Cause of this Disease, is a Cholerick, Burnt, Sharp, Salt, or

or rotten humor in the Stomach, Guts, Spleen, Mesentery, or Pancreas, or some nourishment of evil quality, some strong deadly Medicine, or poyson taken. *Hip. 7. Epid. Text. 90.* doth reckon up almost all the causes of those evil humors, in these words; *Choleric Evacuations upwards and downwards, come from eating too much flesh, especially Swines flesh not roasted. Also for meats not formerly used, from drunkenness with old Wine and sweet, from Pine-kernels, Locusts, rotten Nuts, and from the use of Garlic, Leeks, Onions, especially from boiled Lettuce, Coleworts, and the like crude things; also from Tarts, and sweet meats, Honey meats, Fruits soon perishing, especially from Cucumbers, Pompions; and these Evacuations happen most in Summer, for then they are easily corrupt, and are indigested.*

It is worth the observation from whence so many Choleric Humors should come, which in this Disease are sent forth by Vomit and Stool: It is usually answered, that they come from the Mesentery, and the places adjacent, and sometimes from the whole body, which though it be probable, yet we may say, that humors corrupted in the Stomach, and parts near thereto, do infect other humors with their malignity, and that Nature is constrained to send to the Stomach and Guts, as venomous Medicines, *Antimony, Colocynthida, Elaterium*, and the like, by corrupting of the good humors, do make an *Hypercarthasis*, or over purging.

SIGNS DIAG. The signs of this Disease, are an often and plentiful sending forth of Choleric, sharp, and other corrupt humors by vomiting and stool, a gnawing of the Stomach and Guts, a swelling with wind, pains, thirst, with much heat and disturbance; great Nauseousness and loathing, which is somewhat appeased with cold drink, but presently is cast forth with hot. The Pulse is sometimes small and unequal; sometimes with great sweating, and Convulsion of the Thighs and Arms, swooning, coldness of extrem parts, and other grievous symptoms.

The Causes of this Disease are easily known.

And first, The external are known by relation of the Patient; and those that stand by. If he have taken too much, or food of an evil quality, or poyson, or some violent Medicine.

The internal Causes are known by the quality of those humors which are sent forth. We conjecture it comes from the fault of the Stomach, if other parts are not distempered, and when there is a continual loathing, gnawing, and pain of the Stomach, the matter is sent forth green; but if it be bred in the Veins, there is commonly a malignant Fever adjoyned.

PROGNOSTICK. You must make your Prognosticks thus:

If it be very violent, it brings commonly sudden death. If it come from some evil Food, it is less dangerous; for when that is sent forth, the Disease ceaseth.

By how much the greater the symptoms are, as Swooning, Convulsion, and coldness of the extrem parts, by so much the nearer at hand is death.

Hippocrates in Coac. sheweth, that this is sometimes Critical to Fevers called *Lipyræ*, which can no other ways be cured (as he saith) but by a great casting forth of Choler both upwards and downwards; and these Crises or Judgments happen seldom, and ought to be suspected, because they have not the conditions of a good and Health-bringing Crisis.

If vomiting begin to cease, and the wan and deadly colour of the Face to be restored, there is hope of Health.

CURE. In the Cure of this Disease, in the beginning thereof, some evacuation may be allowed while the evil and corrupt humors do flow forth. And you must help it forward with drinking warm water with Syrup of Vinegar, or with a great deal of thin Chicken Broth; which if it provoke not Vomit, will allay the sharpness of the humors. Or you may evacuate them with Rhubarb brought into a Pill with Syrup of Wormwood, and with cleansing Clysters.

Also fat mollifying Clysters are to be given, made of Milk, Oyl of Roses, fresh Butter washed with Rose-water, or made of Chicken Broth, or Veal Broth with Yelks of Eggs; with which, as the disease shall require, you may mix Narcoticks.

Also Clysters of Oxycrate are good, or made of the Decoction of Lettuce, Plantane, with a little Vinegar, Syrup of Water-Lillies, and Yelks of Eggs.

Also you must qualifie the humors sharpness with internal Medicines; as with the Decoction of Purslane and Plantane with Syrup of Quinces, and dried Roses with *Lapis Prunella*, if there be heat and thirst.

And you must stop Vomiting with those things both internal and external, which were prescribed in the cure of Choleric vomiting, *Chap. 7.*

Among which, the Narcoticks are best, and especially new Treacle, which given in the quantity of a dram, doth presently stop those violent Evacuations, *Laudanum* doth the same, if you give four grains thereof.

If there be great weakness (as often happeneth) it is not safe to give the whole dose of *Laudanum*, but it is better to give one or two grains, and to give it once or twice in a day, as necessity urgeth: for so the force of the humors will be restrained, and Nature will have time to tame and concoct them.

After

After vomiting and purging are stayed by the Medicines aforesaid, and the strength is restored by Cordial means, the Patient seemeth to be past danger; which doth not only sometimes deceive the standers by, but also the Physicians themselves: for after a day or two of rest and intermission, the symptoms return more strong and violent, and destroy the Patient who was made weak by their former encounter; which danger you must prevent, not only with Restauratives, and things that take away the heat of the Humors, as before-mentioned, which must be continued after they are appeased; but especially with Blood-letting, which doth reveal the burnt and boyling blood, and greatly assuage it; and you must do it twice or thrice, if the strength be not impaired by the first, but rather seem to be refreshed. Some Practitioners in the time of the fit, when strength is decayed, adventure to open a Vein, because they say the strength is oppressed. But it cannot then be done without danger; and sometimes the Patient presently after dieth, to their shame. For though we acknowledge that there is an oppression of the strength by reason of the superfluous humor, which is contained in the Veins, being an Enemy to Nature; yet it cannot be denied, but it is greatly decayed by those grievous vomits and stools. It is better therefore first to allay the violence of the humors, and after the symptoms are asswaged to open a vein.

And because in this Disease the strength quickly fails by strong evacuations, you must be very careful in the restoring of it by that way which is shewed in the Cure of weakness in the eighth Book, and the third Chapter.

CHAP. X.

Of Pain in the Stomach, called Dolor Ventriculi.

IT is a sad and troublesome sence in that part, from some things that gnaw and stretch it till it break, or be wounded.

In the Stomach you must consider three parts, which much differ one from the other, namely, its upper Orifice, and its lower, called *Pylorus*, and the rest of its Body which maketh up the whole Cavity.

The upper Orifice is of exquisite sence, by reason of the great Nerve which it hath from the sixth Conjugation, and therefore pain therein is very sharp, and makes the Heart which is the most noble part, and near unto it sensible of the same; from whence it is called *Cardialgia* and *Cardiogmos*; for there is such a near consent between the mouth of the Stomach, and the Heart, that the Ancients called it by the name of the Heart, *Cardia*.

But if the Members of the Cavity, or the *Pylorus* be pained, it is called simply *Dolor Ventriculi*, and sometimes *Colica Ventriculi*, especially when it comes of wind.

CAUSES. The immediate Cause of this pain is solution of Continuity by things sharp and distending, and they are chiefly Humors, or Wind, and sometimes Worms gnawing the Tunicles.

Sharp and malignant Humors, as green Choler or black, salt Flegm, corrupt Matter sent into the Stomach from an Imposthume broken in the Liver or Breast, and all other sharp Humors which may cause pain.

Also sharp vapors coming from those Humors use to cause this pain.

The wind contained in the Cavity of the Stomach, doth cause swelling and painful distension, especially if it be restrained within its Tunicles, which makes a very stubborn Disease, and cannot easily be sent out.

The Disease both of the Stomach it self, and of the parts adjoyning, use to breed this pain, as any great distemper either hot or cold, and especially an Inflammation, and sometimes a Scirrhus or other hard Tumor which maketh a heavy pain; as also Wounds and Ulcers of the same part, and swellings in parts adjoyning by the wind or other ways, cause this pain by compression of the Stomach.

Now these Humors and Winds which cause pain in the Stomach, either come from the whole body, or some parts thereof. From the whole Body, in Feavers, or when the Body is filled with evil Humors. And from other parts, especially the Liver, Spleen and Brain; from the Liver there comes Choler; from the Spleen, Melancholy; and from the Head, salt Flegm.

Also, this pain may arise from extraordinary causes not usual, as *Skenkins* observes from stones bred in the Stomach, *lib. 3. Observat.* And *Fabricius Hildanus*, *Observ. 33. lib.* reports, that a Woman had a piece of Rind of rusty Bacon two years in her Stomach, wherewith she was continually pained, and which after by taking a Vomit, she threw up, and was cured.

The external causes of this Disease, are Meats either evil qualified, or of sharp nourishment, which of themselves produce it, or things apt to breed Wind, or things taken in too great quantity, which putrifie and turn sharp; or things that are too hot, and breed much choler: As also strong, sharp, deadly

deadly Medicines, either taken in too great a quantity, or not sufficiently corrected, and poyson.

DIAGNOSTICK. The Diagnostick Signs are from the part affected, and the cause.

And first, when the pain is under the Cartilage of *Ensiformis* or *Xiphoids*, it shews that the upper Orifice of the stomach is affected; but that it is a true *Cardialgia* in the mouth of the stomach, you may know more certainly when there is a most sharp pain from the exquisite sence of the part with such trouble and disturbance that the Patient cannot stay in a place, or in one posture, but often swoonds and fainteth by consent and sympathy of the heart with the stomach, not only by nearness to it, but also by reason of the dissipation of the spirits by the pain. Sometimes the Brain consents; by reason of the famous Nerve which is in the stomach, and the sharp vapors which are directly sent into the head from thence, from whence come *Cephalagia*, *Hemicrania*, *Vertigo* and *Epilepsis*.

In other parts of the stomach there are great pains, but they have not so great symptoms, and therefore they are like the Cholick, differing only in place.

The Causes also are known by their proper signs. The most manifest are taken from the Excrements; for if Choler, Flegm, Wind, Worms, are voided at the Mouth or Belly, it is easie to conjecture that the disease depends upon these Causes. But if no Humors be discharged we may know when Choler, Flegm or Wind abounds by their proper signs; and the signs of Worms are to be taken out of their proper Chapter: As also the proper diseases both of the stomach and parts adjoyning which produce this Disease, are known by their proper signs. The knowledg of the Humor causing this pain, is also taken from the time of its coming, encrease and cessation. Some are troubled most violently before meat, and this shews that Choler is predominant, which is stirred in time of emptiness, and drawn to the stomach, and made more sharp. Some are pained presently after meat, because the raw biting Humors, which before were quiet and fixed to the Tunicles of the Stomach, are moved when Meat is taken, or they which were in the bottom of the Stomach, are raised up, and disturb the mouth of the stomach. Others are pained in time of Concoction, because sharp gnawing vapors arise from the Matter, causing the Disease from the heat encreased in the stomach in time of Concoction. Others are pained four or five hours after meat, because it is corrupted by evil concoction, and so gnaweth the stomach. Some are worst after sleep, and that comes from a Catarrh from the head in the time of sleeping, which being heaped up in the stomach, produceth pain afterwards. Sometimes the pain is appeased after meat, because the sharpness of the Humors is qualified by the sweetness of the meat.

PROGNOSTICK. As for the Prognostick, it is most certain that *Cardialgia* is more dangerous than any other disease of the stomach by reason of the exquisite sence of the mouth of the stomach, and its great consent with the principle parts.

The danger is more or less, according to the malignity of the Cause, and the vehemency of the symptoms.

A continual acute Feaver joyned with a great pain of the stomach, threatneth great danger; as *Hippocrates* saith, *Aph. 65. Sect. 3. In Feavers, if there be great heat about the Stomach, and Cardiacos, it is evil*, for it signifieth that there is a great Inflammation of the stomach, or abundance of bad humors contained therein.

The pain of the Stomach coming from Worms or Wind, is commonly least dangerous, because the Cause is not so bad, and not fixed of the part. But sometimes from Worms gnawing in the stomach, great symptoms happen, of which the Patient suddenly dieth.

So when the distemper which begets wind, is stubborn and habitual, it is not without danger, for it turneth to a dry dropsie; *Hippocrates, Aphor. 11. Sect. 4. In a Cardialgia, coldness of the extrem parts signifieth death at hand.*

CURE. The Cure of this Disease is to be varied according to the diversity of the Causes. If it come from the Diseases of other parts, you must cure them. But if the cause in the stomach alone, the pain comes either from wind, or sharp humors and Cholerick, or from inflammation; Imposthume, or Ulcer. That which comes from Wind is to be cured by Medicines that discuss and evacuate that flatulent Matter, as also the flegm from whence it comes.

And first you must give a gentle Emollient Laxative Clyster, and presently after another Carminative, that is, expelling Wind, and discussing, of the decoction of Origan, Calamints, Pennyroyal, Rue, the lesser Centaury, Annis-seeds, Fennel-seeds, Carrots, and Cummin-seeds, and the like: In which dissolve *Benedicta Laxativa*, Oyl of Dill, Rue, and Hony of Rosemary.

If the pain continue, you must make a Clyster of equal parts of Sack, or Hippocras, Oyl of Rue, or of Nuts with two ounces of *Aqua Vita*.

Or make a Clyster of white Wine with Oyl of Juniper, or eight drops of the Chymical Oyl of Cinamon or Cloves, which doth Miracles.

Then foment the Stomach with this:

Take of Cypress Roots, Galangal, *Calamus Aromaticus*, of each one ounce; Mints, Origan, Pennyroyal, Marjerom, Hyssop, Sage, of each one handful, Annis, Fennel, Caraway, and Carrot seeds, and Bay-

Bay-berries, of each half an ounce; Chamomel, Melilot, Rosemary and Lavender flowers, of each one pugil; beat them, and slice them; and put them into two bags, and boyl them in Sack; then squeeze them, and apply them one after another to the Stomach, and all the Belly.

When the matter is not so cold, this Fomentation following may be prepared, which is highly commended by *Forestus*, because it hath presently cured when other things failed.

Take of *Althæa* Roots half an ounce; red Roses, Chamomel Flowers and tops of Wormwood, of each one handful; boyl them in common Water, and Chamomel Water, to one pint and an half, adding in the end a little Rhenish Wine, Rose Water and Vinegar. Make a Fomentation.

After Fomentation, anoint with Oyl of Rue and Dill mixed with *Aqua-vita*, and a little Chymical Oyl of Sage or Cloves.

After the anointing, apply a Plaster of Bay-berries, or instead thereof a Cataplasm of Hony and Cummin-seed.

While these are doing, if there be loathing, you may provoke vomiting gently, or give a Purge against Flegm.

After Purging give Oyl of bitter Almonds newly drawn, mixed with white Wine, or Hippocras mixed with *Aqua Claretæ*, or Cinnamon Water.

This following Julep is most admirable to assuage pain, discuss Wind, and strengthen the Stomach:

Take of Wormwood, Centaury the less and Agrimony, of each half a handful; boyl them to five ounces, and add to it being strained, one ounce of Sugar. Let him take it two mornings together.

Amatus Lusitanus commends highly the distilled Water of Chamomel flowers, as a most excellent Remedy to assuage the pains of the Stomach and Entrails, of which you must give three ounces warm. Or in the defect of that, you may make a Decoction of Chamomel flowers, which is so much commended by *Forestus*, who saith that he cured a Merchant with this only Decoction, once only given, of great pain of his stomach, which made him roar; which when he had drunk off, he belched, and fell into a sweat, and all his pain vanished, as by an Inchantment, so that he needed no other help. You may also make a Vomit at the beginning of the disease, which by evacuation may abate the pain, of this Decoction, made with Dill seeds, or Agarick, or the Roots of *Asarabaca*, dissolving therein, Oxymel, Syrup of Vinegar, or of Roses Solutive.

Galen teacheth, That a Cupping-glass applied to the stomach doth presently take away pain. But you must use this Caution, That no crude humor, or very little, lie in the stomach, otherwise the pain will be encreased.

Also you may with good success apply Bread hot from the Oven, cut in the middle, either by it self, or sprinkled with Spices.

Lastly, if the pain continue violent, you must use a Bath of the decoction of mollifying herbs that are hot, which is most safe and powerful, for it takes away the pain by discussing the wind, and sending it forth by the open pores, which it will the better do, if you give some discussing Medicine to the Patient while he is in the Bath; for both internal and external helps concurring, the work will be done.

The Bath must be very hot that the Wind may be better discussed, and the thick Humors melted.

If by reason of the vehement pain, Clysters can neither be given nor retained, you must give a Purge in the Bath, and let him stay therein an hour, or half an hour, till the power of the Medicine touch the Stomach.

Sometimes when the violence of the pain threatneth danger, you must give Narcoticks, which being wisely given, bring wonderful effects.

Some mix Narcoticks with their Purges that the pain may be allayed, and the matter evacuated: such as the Medicine of *Elidæus* commended by *Forestus*, made thus:

Take of *Diaphœnicon* half an ounce; *Philonium Romanum* two scruples; with the Water or Decoction of Chamomel make a Potion.

After the pain is gone, let them who are subject to this disease, be purged once or twice in a moneth to take away the immediate cause of Wind. And let them use strengtheners, such as were prescribed in the Cure of *Concoction hurt*.

The pain which comes of Choler, is to be cured by the evacuation thereof, with a gentle Vomit or Purge, or with frequent Clysters that are emollient, not sharp or hot.

Afterwards, quality the sharpness of the humors with cooling Juleps that thicken, with Emulsions of the great cold Seeds, new Milk, new Oyl of sweet Almonds, yolks of Eggs, and the like.

In the mean while omit not Opiates, and other strengtheners prescribed in the former Cures.

And at last, when need requireth, use Narcoticks.

Apply outwardly a Cataplasm of Bread and Milk, with yolks of Eggs, and Saffron.

Or

Or Bread from the Oven broken in the middle and dipt in Vinegar.

Or foment the part with the Decoction of Chamomel flowers, Violets and Water Lillies, or which is best, put the Patient in a warm Bath, for that is most proper.

After the pain is gone, lest it should return, let the Patient purge twice every moneth, and let the hot distemper of his Belly be corrected with a cooling diet and convenient Remedies.

That pain which comes from Inflammation, Imposthume or Ulcer, may be cured with the Remedies prescribed in the following Chapter.

CHAP. XI.

Of the Inflammation, Ulcer, and Imposthume in the Stomach.

Although all kinds of Tumors may arise in the Stomach as well as other parts, yet we will speak here only of a Phlegmon or Inflammation, which is most usual; the other happen seldom, and may be cured by the same Method with the Tumors of other internal parts.

CAUSES. The Inflammation of the Stomach is a preternatural Tumor coming of Blood which is sent into the substance of the Stomach and its Membranes by the Veins derived from the branches of the *Vena Porta*.

This blood is either pure, and makes a proper Phlegmon, or mixed with Choler, Flegm or Melancholy, and makes a Phlegmon Erysipelatous, Oedomatous, or Schirrous.

The external Causes may be many, all that inflame the blood, as hot Meats, Wine, or all that can drive it to the part; as a blow upon the Belly, especially when it is full; to which you may add things that are very sharp and very hot, as Cantharides sublimate.

DIAGNOSTICK. The Signs of this disease called *Diagnostica*, are a great pain, burden, pricking, distending and beating, reaching to the Back; you may feel a Tumor, and sometimes see it, the Shoulders are drawn downwards, the breathing is difficult, as also swelling and belching, sometimes blood is vomited; there is a most burning Fever, with most grievous symptoms.

If the Inflammation be pure only from blood, it is somewhat gentler; but if it be with Choler called *Erysipilas*, there are grievous symptoms, and the *Febris* called *Lipyras*, in which the exterior parts are cold, and the internal burn, and there is an unquenchable thirst; such a kind of Fever useth to be in an Erypelous Inflammation of the Intestines.

Like to this Inflammation of the Stomach, is that which is in the upper part of the Liver by which the Stomach is covered, or in that part of the Belly which lieth upon it; which is only distinguished by the deadly symptoms, for then the Stomach hath the most desperate.

PROGNOSTICK. From what hath been said is easie to Prognostick and to pronounce this disease to be for the most part deadly.

But that is most dangerous which is over the whole Stomach, or its upper part, or which is like to an Erysipelas.

Galen 3. Prorrh. shews, That much Loathing and Rumbling of the Belly is evil: For it shewss that evil Humors do stick close to the Tunicle of the Stomach, and pull them to provoke Expulsion.

If the Inflammation do not kill, nor is dispersed, it turns to an Imposthume, which is known by the mitigation of the Pain and the Fever, while the Tumor remaineth.

After the Imposthume is broken, there remaineth an Ulcer which is known by voiding of Matter by Vomit and Stool.

But an Ulcer is produced in the Stomach, not only from an Imposthume, but from other Causes which we shall here reckon up, lest we seem defective in Theory.

The Causes of Ulcers in the Stomach, are either Internal or External.

The internal are sharp Humors bred in the Stomach, are sent thither from other parts, as yellow Choler, or black or salt Flegm.

The External are sharp Medicines that Corrode, or Poysons, and Wounds of the Stomach not well cured, which turn into Ulcers; as also the breach of some great Veins which could not well grow together, after much vomiting of Blood.

An Ulcer bred in the Stomach is known chiefly by Matter which is cast forth by Vomit or Stool, to which principal sign there are others to be added: First there is perceived in the belly a pricking pain joyned with burning, especially when any thing is taken that is strong in quality, either sharp, salt or sour, or very cold or hot: there is also no Appetite, stinking belching and a constant lingering Fever.

The Prognostick is always deadly except the Ulcer be very little, and only in the superficies,

and without a Feaver. For the Membranes of the Stomach being ulcerated, being a Spermatick part, will hardly grow together again; the Nourishment will be well concocted in a Stomach ill affected, but will be thrown out before concoction, and so rend the Ulcer. Moreover, Medicines do little good, because cleansers which are required for cure of Ulcers increase pain; and dryers which also are required, are continually hindered by the Meat and Drink, and Chyle, and other Humors which continually are in a weak Stomach.

CURE. The Cure of the aforesaid Diseases, is several.

And first, The Cure of Inflammation is to begin with blood-letting often in both Arms, as the strength will endure. And although by reason of swooning and coldness of the extream parts, the strength seems at first to be impaired; yet because it comes from oppression, it requires evacuation, and therefore blood-letting must not be denied.

Moreover, the opening of the Hemorrhoids, if the Patient be used to that evacuation, doth reveal blood from the Stomach. Also Cupping-Glasses doth dry, and with Scarrification to the Shoulders, Back and Buttocks, with Ligatures and Fractions of the extream parts, and heating of them (because they are usually cold) with hot clothes, and anointing with Oyl of Flowerdeluce and Spike, and other hot things are very good.

We disallow Purges in this case, because they trouble the Humors, and draw them to the part affected.

But *Avicen* commends the decoction of Tamarinds, or half an ounce of Cassia dissolved in Whey or Endive water, if it be given every day to the Seventh day, because they purge not by attraction, but by mollifying, mitigate sharpness, and assuage pain. But it is better in the beginning to abstain from all Purges. After the seventh day is past, when there appear some signs of concoction and declination, you may give a Purge of Rhubarb one dram, with one scruple of red Sanders infused in Borrage water, adding one ounce or two of Syrup of Roses, that the filth which sticketh to the part may be brought forth more powerfully.

In the mean while, you must every day give Emollient, Cooling and Lenitive Clysters, such as these:

Take of chicken Broth, or the decoction of Mallows and Violets, of each one pint; Cassia new drawn one ounce; Oyl of Roses and Violets, of each two ounces; Sugar one ounce and an half: With two yolks of Eggs make a Clyster.

You must give altering and strengthening Medicines at the Mouth, they may be the same which were propounded in the Cure of the pain of the Stomach from a cholerick Humor.

But the Syrup of Water Lillies, and of the Juyce of Purslain, are pacularly good, especially in the beginning, because they supply the place of Repelling Medicines.

Also Emulsions made of the four great cold seeds, and white Poppy-seeds are good, for they assuage pain and heat. As these following Juleps:

Take of Rose Water three ounces, Plantane Water two ounces, the juyce of Sorrel and Pomegranate Wine, one ounce and an half; Sugar of Roses one ounce: Boyl them a little, and strain them. Let him take two ounces twice or thrice in a day.

If the pain be great, you may give the Syrup of Poppy.

Let his Drink be Barley Water with Syrup of Violets taken cold.

In the progress of the Disease, you must mix other Medicines with the aforesaid, which may help to dissolve. To this end you may prescribe these following Juleps.

Take of the Syrup of Water Lillies, Apples, and of the Juyce of Purslain, of each one ounce: Syrup of Sea Wormwood half an ounce; Lettuce, Sorrel and Fennel water, of each three ounces; the Powder of Diamargarion frigid one dram: Make a Julep for three Doses to be taken twice in a day.

To these you may add restoring Opiates, Narcoticks, and the like, all which are to be varied many ways, according to the Judgment and Wisdom of the Physician.

Turpentine washed with Wormwood water, if it be given twice or thrice doth either dissolve or mature the Imposthume of the Stomach.

Let this following Fomentation be applied in the beginning:

Take of Sorrel Root two ounces, Endive, Succory and Mallows, of each one handful; Lettuce and white Poppy seeds, of each three drams; white and red Sanders, of each half a dram; Violets and Water-Lillies, of each one pugil. Make a Decoction, adding a little Rose Vinegar. Let the Stomach be fomented warm therewith.

Or make one with the distilled waters of Lettuce and Water-Lillies, with a little Vinegar and Powder of Triasantal.

After Fomenting, let the part be anointed with Oyl of Roses and Violets mixed, or with this following:

Take of Oyl of Roses one ounce and an half; Oyl of Violets and Rose Vinegar, and of the Juyce

Juyce of Sowthistles, of each half an ounce : Boyl them to the consumption of the Juyces; then add of red Sanders one dram, red Roses half a dram, Lavender and Camphire, of each half a scruple : as much Wax as will make an Oyntment.

Cataplasms in the beginning are not good, because they burden the part with their weight, and by retaining the heat, increase the Inflammation.

In the declination, when the Tumor is resolved, which is chiefly to be desired, you may apply a dissolving Fomentation, made thus :

Take of Flowerdeluce Roots two ounces, the Leaves of Mints, Marjerom, Penroyal, Sea Wormwood, of each one handful; Annis and Fœnugreek seeds, of each two drams : Grains of Kermes one dram : the flowers of Stœchas, Rosemary, Chamomel, of each one pugil : Make a Decoction, adding in the end a little white Wine. With this foment the Stomach.

After fomenting, anoint the part with Oyl of Wormwood, Nutmeg, Spike, and the like; of which you may make an Oyntment with a little Wax and Powder, Orris Root or Cinnamon. But Emplaisters and Cataplasms, because they burden the part with their weight, are not here good.

But if the Tumor tend to Suppuration, foment the part with the Decoction of the Flower of Chamomel and red Roses : Then apply this following Cataplasme :

Take of Althæa Roots two ounces; Brank Ursine and Roses, of each one handful : Boyl them well, and beat them together; then add of Barley-meal, Linseed, Fœnugreek, and Powder of Chamomel, of each half an ounce : white and red Sanders, of each two drams, with Oyl of Roses and Chamomel. With a little Hens Grease make a Cataplasme often to be renewed.

After the Imposthume is broken, let the Ulcer be cleansed with Hydromel, given in a small quantity : To which you may add the Manna of Frankincense, according to Galen's Precept. Or give it with Barley-water with Sugar of Roses in the beginning, in time of heat.

When the Ulcer groweth old, of what cause soever it come either from sharp corroding humors, or burning Medicines or Poyson, Broths of cool Herbs and drying, of Barley, Almonds and Sugar, of Roses, or new Milk with Sugar, and a little Honey, are very good. At length, Chalybate milk and Iron water for ordinary drink, or water wherein a piece of Bole-Armenick or Terra Sigillata hath been steeped, is very excellent. To which you may put a little sharp Wine, if there be but a little heat in the part.

Then give this Apozeme :

Take of Barley one pugil; Scabions, Agrimony, Burnet and Maiden-hair, of each half a handful; Melon seeds two drams; red Roses dried one pugil : make a Decoction to one pint, in which dissolve three ounces of Syrup of dried Roses. Make an Apozeme for four Doses to be repeated often.

Also the Decoction of China is excellent for internal Ulcers, when there is no Feaver, taken twenty days more, sweating gently, for so the Ulcer will be dried by degrees. But if you fear a Consumption, boyl the China Root aforesaid in Chicken Broth, or Pidgeon Broth with the aforesaid Herbs, and Barley made clean.

In an old Ulcer, the drinking of Mineral Waters, either of Vitriol, Iron, or Allum, for a Month together, are very good.

In the whole time of the Disease to keep the Stomach clean, use gentle Purges, as Rhubarb, Tamarinds, Myrobalans, Syrup of Roses, and Diacatholicon taken once in a Week.

Lastly, To heal up the Wound, use these following :

Take of Bole-Armenick, Terra Sigillata, red Coral, and Blood stone wash'd all in Rose-water, of each one dram; Sanguis Draconis, Gum Arabick and Tragacanth, of each half a dram; white Poppy seeds bruised and parched, Hypocistis, Frankincense and Sarcocol, of each one scruple; Sugar of Roses one ounce : Make a Powder, of which take a dram in Plantane Water or Conserve of Roses every day.

Or make an Opiate of the same Powder with Conserve of Comphry and Roses, Syrup of Quinces and Myrtles. Or you may make Troches of the same Powder, with the Mucilage of Fleabane seeds, or Gum Tragacanth. All which the Patient may use by turns, lest he grow weary of the same.

Outwardly, to close the Ulcer, you may apply to the Stomach a Fomentation of the Decoction of Wormwood, Roses, Pomegranate peels, Galls, Pomegranate Flowers, Myrtles, Frankincense, Mastich, or the like. And lastly, Anoint the part with an Astringent Oyntment, or apply an Astringent Emplaister.

The End of the Ninth Book.

THE
TENTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Intestines, or Guts.

THE PREFACE.

THE Perfection of all Nourishment consists in these three Operations, To Ingest, Digest, and Egest; that is, To take in, Concoct, and send forth. The first respects the Appetite; The second the Concoction, and belongs to the Stomach: But the third respects the Intestines, whose Office of Egestion or sending forth being moderate, and according to the Rules of Nature brings great benefit to the whole Body. On the contrary, If it be defective, as in the binding of the Belly, or abound as in divers Fluxes, there arise divers grievous Diseases. Moreover, the retaining of superfluous things doth cause Cholicks, Iliacks, and Hemorrhoids. And finally, putrefaction in the Guts doth not only produce Fluxes, but Worms. That all these may be severally Explained, this Book shall contain Eleven Chapters; The first is of the Cholick: The second of the Iliack Passion: The third of Binding of the Belly; The fourth of Lienteria or Coeliack Diseases: The fifth of Diarrhæa: The sixth of Dysentery: The seventh of Tenesmus: The eighth of the Heptick Flux: The ninth of the Worms: The tenth of the Flux of the Hemorrhoids: The eleventh of the Pain of the Hemorrhoids.

Chap. I. *Of the Cholick.*

THE Cholick takes its Name from the part affected, which is the Gut called Colon; which is long and winding, ordained for receiving the Excrements of almost all the Body; these Excrements retained too long, use to cause this pain.

CAUSES. Therefore the Causes of the Cholick are excrementitious Matter, which by distending, pricking or corroding, can make a Solution of Continuity; and these are either Winds or Humors.

Winds are bred of Crudities, or a cold distemper of the Stomach or Intestines; and if they be not

not sent forth by reason of the hard excrements, or other things that obstruct the Intestines, they are in great plenty shut up in the Guts, especially the *Colon*; and makes a very violent pain.

Also gross humors, cold and flegmatick, being fastened upon the Tunicles of the Guts cause the same pain both by gnawing, if they are sharp or salt; as also by cooling the part, which by consequence must suffer Constriction and Divulsion, as *Galen* speaks of himself, that having had a great Fit of the Cholick did void glassy flegm that was actually cold; and by producing Wind which is easily raised from a gross, slimy, and slow humor, by a weak heat.

Lastly, Cholerick and sharp humors; as also a Melancholly and sour by pricking and twitching the Guts, make these pains: but we may doubt in the action of these Causes how the Cholick should be sometimes more violent, sometimes more remis, since the same matter remaineth in the Intestines. To which doubt we thus answer, That the matter doth sometimes lie quiet, and then it causeth none or very little pain: but sometimes it is moved and stirred up by divers Fermentations which happen among the humors, as in an Epilepsie, the Fits of the Mother, and Agues.

But you must observe diligently, that those winds or humors do not only remain in the Cavity of the Guts, for then were they easily excluded by evacuating, cleansing, and carminative Medicines, but for the most part they are fixed to the very Coats of the Guts, whence it comes that they are not so easily taken off; but they make a long and a stubborn Disease which will not easily be cured. So thick Flegmatick and Melancholick humors do flow by degrees through the Veins of Guts into their substance, and do not presently cause pain; but till they so increase that they provoke Nature to expel them, and so being moved they cause pain; or send out Vapors, which being included in the Tunicles of the Intestines, do stretch and extend them, and finding no passage, cause a long pain. And Choler being after the same manner spread and sucked into the Veins of the Guts and the Tunicles thereof doth stir up sharp pains which use to belong, because the Choler is very hard to be pulled from the substance of the Guts.

There is another kind of cholerick Cholick, which turns into a Palsie, not known to the Ancients, which comes of a cholerick humor, not in the Gut *Colon*, as the former, but suddenly sent into the Membranes of the Abdomen, and it is carried thither from the Cystis, or bladder of Gall, or the Mesentery in the Crisis of continual Feavers, or from great anger, or some other external cause, when by reason of Obstructions it cannot be sent by the common passages, but by a preposterous motion it is presently sent to the aforesaid Membranes of the Abdomen, hence comes a cruel pain like that of the Cholick, which neither by Clysters, Fomentations, or other Medicines can be cured; but continueth many Months, by which means the Body consumeth: sometimes it is like an intermitting Feaver, sometimes and often like a continual lingring Feaver: and at length when the pain begins to cease, there is a Palsie, by reason the humor gets by degrees into the back by the Membranes of the Abdomen: This Palsie doth trouble the upper parts most; but the Thighs and Legs commonly are pained, in some they are wholly resolved and made numb, because the Choler being light flieth to the upper parts: Sometimes it gets into the Brain, and begets Epileptick Convulsions, from whence death commonly ensueth.

There are other causes of the Cholick, but less usual; namely, stones bred in the Guts and knots of Worms which stop them: the Compression of the Guts from Tumors in the adjoining parts, or narrowness by reason of Inflammation, and other Tumors of the Intestines, or Contorsion, or twisting of them by reason of Wind which is the way to the Iliack Passion; sometimes also the matter causing the Cholick is Poysonous and Malignant, and makes a Pestilent Cholick; as *Paulus Aegineta* reports, That a Pestilent Cholick in *Italy* infected most of the Roman Provinces. Finally, all hard Bodies by obstructing and distending the Guts may make a Cholick, as stones bred there, many Cherry-stones swallowed, hard Cheese, and the like: *Platerus* reports, That a certain Governor long labouring of the Cholick with Convulsions, after the use of Clysters; voided a great quantity of hard Cheese which had a long time stuck in his Guts, because before his sickness he had eaten immoderately thereof.

The External Causes are cold Air, which constringe and indurate the Belly; or too hot Air, by which the Excrements grow hard, and lose their moisture; the use of meat and drink not agreeing with the Constitution, as raw Fruits, and binding gross Meats, and hard of digestion, too much rest, and immoderate sleep, unseasonable exercises, immoderate venery, and other external causes which disturb the Concoction of the Stomach.

DIAGNOSTICK. The knowledge of this Disease generally is easie: For the first pain is very sharp, for if it be light it cannot be called a true Cholick from the Opinion of *Galen*, lib. 6. de loc. aff. cap. 2. and it is sometimes moveable, sometimes more in one place than in another: sometimes in the Region of the Liver, sometimes of the Spleen, Stomach, Reins: sometimes above, sometimes beneath the Navel, and oftentimes it is most upon the left side; in which as, *Baubin* first observed, there is a little straightness; for when the Excrements in the upper and widest part of the Colon grow into hard lumps according to its capacity, great, and then by Wind are driven into a straighter part, they must

must needs pass with much pain, in which symptom the Cholick, and the Spleen, and the Stone are not distinguished but by comparison of other signs; for sometimes the pain is as of an Auger-boaring, or a Stick fastened, more fixed in some part. When the Stomach contenteth, there is vomiting of Flegm, Choller that is green, or the like. After Meat the pain is greater, because the Stomach being filled compresseth the Intestines. The Belly for the most part is bound, so that the Patient cannot so much as break wind, and if any thing be voided either naturally or by Art, it is for the most part windy, and like Cow-dung, with water at the top, because it is most Flegm which useth to be so. Sometimes the Belly is so bound, that in the height of pain, purging Medicines that are very strong, will not work.

The Signs of the Causes are thus to be distinguished:

If the pain come of Flegm, it is not so great, unless it be mixed with wind which cannot get forth of the places wherein it is contained: for then the pain is very great; sometimes in one part, as if it were bored through the wimble or stick; sometimes in many, if the wind do remove, the Patient is better for hot, and worse for cold things. He used a Diet formerly which bred flegm, his water is sometimes more crude and white, not always, which deceiveth young unexperienced Physicians, and sometimes in a flegmatick and flatulent Cholick, the Urine will be yellow and reddish, by reason of the extraordinary pain which doth inflame the Spirits and Humors contained in the Veins and Arteries. Which *Avicen* wisely observed, *Fen. 13. Lib. 3. Tract. 3. Cap. 11. Let no man be deceived (saith he) to think by the foulness, inflammation, and redness of the Urine, that therefore the Disease is hot; for that is common to all Urines.*

If the Cholick proceed of wind, there will be a stretching pain, and a swelling of the Belly: the Patient perceiveth a rumbling of the Belly and much wind, and he is better when he breaketh it: he used a Diet to breed it, as unreasonable drinking of cold water, often use of Pease, Rapes, Chestnuts, Sallets, Fruits, and the like. And if the wind be contained in the Cavity of the Guts, the pain is moveable, not in one place; and is sometimes greater. But if it be in the Coats and Tunics of the Guts, the pain is fixed because the wind cannot move, and it is constant because it cannot get forth.

If the Cholick come from a sharp and cholerick humor, it is most grievous, pulling, and pricking, there is heat, thirst, and often a Fever, the Urine is very cholerick. It is worse for hot Meats and Medicines, and better for cold. By sending forth of Choler the disease is diminished, and there went before a Diet breeding Choler.

The pain of other parts under the Navil are easily distinguished from the Cholick, by their proper signs, except the Stone, whose signs are so like with those of the Cholick, that very skilful Physicians have been deceived by them: As *Galen* himself was, as he confesseth 2. *de loc. aff. cap. 5.* when he was troubled with the Cholick he thought that he had the Nephritis, and that a stone was fastened in one of the Ureters till the humor was purged away, and the pain ceased; after which he found it to be the Cholick.

But by these following signs these two Diseases may be plainly distinguished, if they be well observed.

First, The Nephritis, or pain of the Stone, is fixed in the Reins, and comes from thence to the Testicles, according to the length of the Ureter: But the Cholick is moveable, and girts about the middle of the Belly like a girdle.

Secondly, The Cholick increaseth after Meat by reason of the compression of the Intestines from the full Belly: but the Nephritis increaseth not, but rather decreaseth, because some of the Nourishment is carried to the Reins, which doth something assuage the pain.

Thirdly, In the Cholick, the vomiting is more vehement, and the Body is more bound, because the Colon lieth in the bottom of the Stomach, and the Intestines being stretched, or much provoked, do constringe themselves that they may expel what is noxious. But both the symptoms are common to both Diseases, so that you can hardly know their intension and remission, because a strong Nephritick pain may cause a greater vomiting and a striction of the Belly, than a weak Cholick.

Fourthly, In a Cholick there is more ease found after Evacuations than in a Nephritis.

Fifthly, In a Nephritis or the stone, the Urine is first clear and thin; afterwards there is a sediment, and at length sand and little stones are voided. But in the Cholick the Urine is thick from the beginning.

PROGNOSTICK. The Cholick for the most part, if it be gentle and little, and not long, nor in one place constantly, but intermitting and not binding the Belly, is curable, and without danger. But if the pain is very great, and fixed in one place, not intermitting; and if the Belly be bound that nothing can get forth, with great watching, and if vomiting follow, Hiccoughs, doting, and coldness of extrem parts with cold sweats, it is deadly.

A stubborn Cholick coming of sharp and Cholerick Matter degenerateth into other grievous Diseases; as Arthritis, Epilepsie, or Paralysis, which is most usual.

An

An Epidemical Cholick, which is contagious and pestilent, is commonly deadly.

CURE. The Cure of this disease is divers, according to the variety of the Causes.

And first, there is the same cure of a flatulent and pituitous Cholick, which begins with an Emollient Clyster, after which followeth one Carminative and discussing, as was prescribed in the *Dolor Ventriculi*, from the like cause, which must be repeated twice, thrice, or four times in a day, till the pain be gone; and if he go not to stool in one or two Clysters, as sometimes happeneth, you must give a sharp suppository. In one of the aforesaid Clysters, you may do well to add four ounces of the *Aqua Benedicta Rulandi*.

Or two or three drams of Coloquintida boyled in an Emollient and Carminative Decoction.

If Clysters will not give ease, you must not stay too long upon them, but use some gentle Medicine. It hath been observed that when a sick man had taken three Clysters without benefit, that another Physician came and gave but one ounce and an half of Manna, with two ounces of the Oyl of sweet Almonds in the fat broth of a Hen, and cured the Patient. But in a pain that comes from gross Flegm you must give stronger Medicines.

Afterwards, Fomentations, Oyntments, Baths, Emplaisters, and the like, are good, which were declared in the Cure of the *Dolor Ventriculi* of the same cause, to which you may add some specific things, which are fit for this Disease.

Wash the Guts of a Wolf in white Wine, then dry them in an Oven in an Earthen Pot, till they may be powdered. Let the Patient take a dram thereof in white Wine, and he will be presently cured.

Boyl fair Water, and add to it the fourth part of Oyl, and some gross Pepper; let him take three or four spoonfuls as hot as he can endure it, and the pain will be instantly gone.

Take of the best Aloes one dram: Laudanum four grains: Diacrydium six grains: Mix them and make six Pills gilded: Let him take them at a convenient time. They take away the pain after one hour, and then purge out the noxious humor.

Instead of these you may give *Diaphœnicon* and *Philonium Romanum*, as is prescribed in the Cure of the pain of the Stomach, *Hip. Lib. de intern. aff.* propoundeth a Purge of Purslain, and Juyce of Poppies.

Six ounces of Oyl of sweet or bitter Almonds, do assuage pain, and cast the Matter cleaving to the Intestines downwards.

If you mix it with these things following it will be better.

Take of Oyl of sweet Almonds, or Sallet Oyl for poor people, four ounces; Spanish Wine one ounce and an half; Syrup of Poppy one ounce: Mix them for a Potion.

Allo of sweet Almonds mixed with Manna in fat Broth as aforesaid doth ease pain, and evacuate the Matter offending.

One dram of Annis-seeds powdered and given in Wine, doth first assuage, and the second time it is given, quite takes away the pain; applying at the same time a Cataplasm of Turpentine, three ounces laid on with Stuphes sprinkled with Pepper and Sanguis Draconis finely powdered, of each one dram.

Galbanetum Paracelsi is good to discuss the Humor if the whole Belly be anointed therewith. The description is in *Crato* thus:

Take of Gum Elemi, Ivy, Galbanum, Oyl of Bayes, of each equal parts: distil them in Sand with a Retort; keep the Liquors asunder, first the Water, then the clear Oyl, then the thick Oyl like Honey, which you must use first.

Take of Calamus Aromaticus one ounce: Galangal three drams: the outward yellow of the Orange peel four ounces: Cinnamon, Annis, and Fennel seeds, of each three drams, Cummin seeds six drams: Juniper berries green half an ounce: Bay berries three drams. Powder them finely, and infuse them in six pints of the best Spanish Wine in a hot place six days; then distil them in Balneo Mariæ. The Dose is one ounce after Evacuations.

You may with good success apply to the Belly Gum Garagma, and Tacamahacha; but first let a great Cupping-glass be applied to the Navil.

Although you apply not the Plaisters, yet you must not forget to Cup; which as *Galen* saith, doth discuss pain that comes of wind like an Enchantment.

If the disease last long, you may cure it with the decoction of Guajacum continued for many days, Purging sometimes, and giving often Clysters. And if it come of glassy flegm, let Guajacum be boyled in Wine, as *Amatus Lusitanus* used it with good success, *Curat. 32. Cent. 1.*

After the pain is allayed, use an Apozeme to purge flegm for the carrying away of the reliques, or instead thereof, the decoction of an old Cock made with incising, attenuating, and purging things. Or that excellent Julep prescribed in the Cholick of the Stomach.

A Choleric Cholick is cured by Emollient Clysters, and such as temper the acrimony of the Humors.

Let

Let the Belly be Fomented with an Emollient Decoction, which is Anodine ; or which is better make a Bath of the same.

Also Cataplasms made of Barley and Linseed Flower, boyled in Oyl of Chamomel, applied to the bottom of the Belly are good.

As also a cooling Epithem to the Liver, made thus :

Take of the Juice of Endive and Succory, of each half a pint ; the Juice of Lettuce, and Rose Vinegar, of each two ounces : mix them, and make an Epitheme.

Give Juleps of Poppy, Lettuce, Endive and Sorrel Water, with Syrup of Violets, Apples, and Lemmons.

If the Pain be urgent, come to Narcoticks.

When the pain is mitigated, give the infusion and expression of Rhubarb in Succory Water with Syrup of Roses often, till all the filth be evacuated.

If this be too gentle to eradicate the disease, give *Mercurius dulcis* which being sometimes given with some Purging Diagridiats, doth finish the Cure.

They who are not to take *Diagridium*, may take *Mercurius Dulcis* alone made into a Pill with Conserve of Roses, drinking after it the infusion of Senna with Rhubarb, adding a little Manna and Syrup of Roses.

After this you may give your sharp Vitriolated Waters.

When the pain is violent, fly to Baths and Laudanum, to which you may sometimes mix Purgers, but in a great quantity ; because their force will be hindred by the Laudanum.

Galbanetum Paracelsi, although hot, is fit to discuss the Humor if all the Belly be anointed therewith : it is described formerly.

Sometimes Bloud-letting is good where there is fear of a Feaver by the heat of the Bloud : and if the Feaver be begun, do it presently.

Where there is a great thirst, give cold water, as *Galen* teacheth, *lib. 12. meth. cap. 7.* And *Amatus Lusitanus* saith, That he Cured one presently with it. And *Septalus* shews in two Stories in the Seventh Book of his *Practical Animadversions*, That he hath given the same, and taken it with very good success.

For the Cure of that Cholick which turneth into a Palsie, after the Belly is loosed with many Clysters, and the first ways being made open by a Purge, put the Patient into a warm Bath made of an Emollient Decoction, twice, thrice, four or five times in a day, that the sharpness of the humors may be allayed, and the pores of the Membranes opened.

The day after let the Humor be purged with a fit Medicine ; then let him be bathed again, and if his strength will endure it, let him do it every other day, till the humors are purged and the pain gone and the Patient Cured.

In the mean time let the Clysters be continued, especially those made of Milk are best to assuage pain, to which you may put Cassia, Oyl of Violets and Lillies.

Let the Belly be often anointed with Oyl of Chamomel, Dill, sweet Almonds, Lillies, or with fresh Butter.

Then let him use Whey and sharp Waters.

And Lastly, When the disease is of long continuance, you may use those things which were prescribed for the Cure of Hypochondriack Melancholy.

Nor must you omit Phlebotomy from the beginning of the disease before Purging, and it must be often repeated if the bloud be evil, or the pain come of a Catarrh any ways.

Finally, All the Medicines mentioned in Chollerick Cholick may here be applied, which if it avail not, some Physicians use this following Potion, which though it be fordid and not fit for men well educated, yet they say it cureth presently.

Take of Horse-dung one ounce: break it in pieces, and infuse in it one pint of Poppy-Water with eight or ten drops of Spirit of Vitriol: strain it gently, and divide the Liquor into three Doses, for the time of the violent pain.

But if it turn into a Palsie, you must anoint the Spina or Back-bone and the Paralitick parts with a Resolving and a Nerve-Corroborating Balsom if there be no Feaver ; but if there be, bind Wooll dipt in Oyl, or some digesting Oyntment, to the Paralitick parts, taking heed of Cold, by which the humor will be fastened to the part, and the breathing of it hindred.

Galbanetum Paracelsi is best, if it be applied to the parts aforesaid, and the Navel.

CHAP. II. Of the Iliack Passion.

ILEOS, or *Iliack Passion*, took its name (as some say) from the Gut *Ileum*, which chiefly is affected in this Disease; although the other thin and sometimes thick Guts are capable of the same: Or rather from *Eilesthai*, which signifieth to be rowled and girt about; therefore the Latins call it *Volvulus*, or *Convolutus*, because the Guts in this disease seem manifestly to be rowled about, and to be moved upwards: it is also called *Kordapsos*, because the Guts, if you lay your hand on them, seem to be like a stretched or twisted cord.

The Barbarians call it *Miserere mei*, because it is a miserable Disease, and commonly deadly, and therefore needs Divine Commiseration.

The Iliack Passion is a preposterous motion of the Intestines, in which the Belly is always bound; and the Excrements which should be carried downwards, are brought to the Stomach, and cast out by vomiting.

It is known that the Intestines have a natural motion by which the Chylus and Fæces are by degrees carried downwards, which is called *Peristalticus*; this motion is by the Orbicular and transverse Fibres which contract the Intestines, and is compared to the motion of Earth-worms which move the parts of their bodies successively. And this motion is sometimes inverted by preternatural Causes, as when the Fibres of the Intestines which ought to be contracted from above downwards, are contracted upwards; and whatsoever is in the Guts is not sent towards the Belly, but towards the Stomach, and then is this Iliac Passion. We observe something like this in Vomiting; for when the Fibres of the Oesophagus contract themselves from the upper part towards the Stomach, the Meat is swallowed down; but when by an inverted order they contract themselves from the part beneath upwards, there is vomiting. This Peristaltick inverted motion comes from the vehement stirring up of the Expulsive Faculty of the Guts, which when it cannot throw downwards the superfluous Excrementitious matter, doth by a violent motion cast it upwards. This motion is sometimes so violent, that not only Chyle, and Wind, and excrementitious humors, but the Fæces also and Excrements which should be sent out by the Anus are thrown forth by vomiting; so that Clysters and Suppositories also are snatched up and vomited out: So *Matthew de Gradi* reports of a Girl of 12 years old, who in this disease for three days together did not only vomit up Dung and Clysters, but also a long Suppository a short time after it was administered unto her; and when another Suppository was tyed to her Thigh, that was presently broken off, and vomited up with a piece of the thread at it: And when, thirdly, a Suppository was tyed with four strong threads as before, that also was broken off, and vomited up with the part of the threads: And at length when the Mother, as desired by the Physicians to administer another, it was drawn upward with so much violence, that she was constrained suddenly to draw it out lest it should be again vomited up. There are the like stories in Authors, which for brevity sake we omit.

CAUSES. This stirring up of the Expulsive Faculty of the Guts comes from divers Causes: The chief is Obstruction; therefore whatsoever doth so violently obstruct the Guts that nothing can descend, doth beget this disease: for after the Faculty hath long laboured to throw out superfluities the ordinary way, and is frustrate of her intention, desiring to satisfy the necessity of Exclusion, she takes another course, and by a preposterous motion drives them upwards, and vomiteth them out.

The Causes obstructing are hard Dung long retained, gross vapors gathered in abundance into the Guts, and violently distending them; Inflammation, and other great Tumors, which wholly shut up the internal Cavities of the Guts, and the circumvolution of it, so that it is as it were tyed in a knot, which often happeneth in the Hernia or Rupture, and also in the Cholick, after which often follows this *Ileos*, because the Intestines being stretched with wind do rowl together, and sometimes knit a knot.

The more unusual Causes which do provoke the expulsive faculty that are constrained to alter their motion are great Ulcers, or sharp humors which twitch the Guts; for when the Fæces or other humors going downwards, do touch the ulcerated part, they so prick it that the faculty is provoked not to suffer so noxious a thing to pass, but driveth it upwards with violence; which motion the other Intestines stirred up by sympathy, do follow till the noxious Matter goes to the Stomach, which following the same Motion, by the help of the aforesaid faculty, drives it forth by vomit.

SIGNS. The signs of the Iliack Passion are partly common to those of the Cholick, and partly proper.

The common signs are, pain in the Abdomen, swelling and puffing up of the Belly, a bound Belly, loathing of Meat, Nausea, Vomiting, want of Rest, difficulty of Breathing and Pissing.

Those which are proper and peculiar to this Disease, are a sharp pain and most violent, puffing up

and very violent distension, an eminent hard Tumor in the Hypogastrium, a total suppression of feces, so that nothing is voided that way. In progress of the Disease, there is irregular vomiting, first of Choler, then of Flegm, and Chylous Matter, and at length of Dung, or rather of a Matter like it, of corrupt and stinking Meat, for the Fæces are seldom sent upwards; when they are near death, there is abundance of cold sweat, refrigeration of the extreamparts, trembling of the Heart, disturbance and fainting.

Galen in Comment. *Aph.* 10. Sect. 7. affirms, that the proper and inseparable signs of this Disease is not to go to Stool at all. But *Hippocrates* seems to affirm the contrary, *Epid.* Sect. 2. Text. 7. in an History of a Woman thus affected, which dwelt at *Tisamen*, saying there were thin, few, and crude defections. To which difficulty we answer, That in the beginning of the Disease, some Stools may be from the Fæces contained beneath the Gut affected, which by Nature or Art may be excluded before all the Intestines consent and lose their proper and Natural faculty. But when the Disease is confirmed, and the Peristaltick motion of all the Guts is inverted wholly, there is nothing more sent downwards.

The signs of the Causes are these: If *Ileos* come from Inflammation (which often happeneth) the Disease is most acute, and comes quickly to the height, there is an intense Feaver, a most vehement pain, cholerick Vomiting and Flegmatick do soon appear, and Fæces and Dung do presently appear; and other deadly signs before mentioned.

If it come from the Fæces indurated, there went before it a constriction of the Belly for many days, and in the beginning there is no pain, but afterwards there is, the Disease is of longer continuance, nor is so acute as that which comes from Inflammation, neither is the pain so great, nor the Feaver so strong, and sometimes there is none.

If it come from wind or flegm, it followeth for the most part the Cholick: and signs of the Cholick of Flegm and wind went before, which are laid down in the Chapter aforegoing.

As for the Prognostick. Every *Ileos* is dangerous, but one more than another. That is most deadly, in which first there is cholerick, then flegmatick, and after stinking vomiting; and *Galen* 6. de loc. aff. cap. 2. saith none of these escape; but Experience teacheth that some do, as when the Disease comes from retention of the Fæces, or *Hernia Intestinalis*, or Rupture in the Guts.

They who have this Disease with the Strangury, die within seven days, except a Feaver coming, the Urine be more plentifully voided *Hip.* *Aph.* 44. Sect. 6. if the Strangury come of thick and Flegmatick humors which are plentiful in the Veins and Guts, a Feaver coming thereupon, they may be concocted, melted, and attenuated, and pissed forth, by which means the *Ileos* is cured. Although *Galen* in his Comment upon his Aphorism saith that he is ignorant of what *Hippocrates* saith here, and that it cannot be confirmed by Reason and Experience.

If symptoms be remitted, and either Medicines or Meat taken at the mouth, pass through, there is hope of recovery.

CURE. The Cure of this Disease, is to be varied according to the difference of the Causes. And first, if the obstruction comes from the Fæces indurate, or from gross and slimy Flegm, you must use Emollient and Laxative Medicines, both internally and externally.

First then, give Clysters of the Decoction of *Althæa*, Mallows, Violets, Chamomel, and Melilot, with Lin seed and Fœnugreek seed, or of common Oyl to a pint, in which you may dissolve the third part of Butter, or of the Broth of a Sheeps Paunch, in which dissolve Butter, Honey, and Salugem. The which Decoction, if there be wind (as commonly there is) it is good to put Carminatives and Discussers.

After the matter is somewhat mollified with these Clysters, you must give first some gentle Purges, then longer, and last the strongest.

In the mean while you must apply Fomentations and Liniments that are Emollient to the whole Belly, and continue them long. The Paunch of a Gelding warmed in hot water, applied to the Belly, is good; but mollifying Baths are better, especially if they be made of Air only.

Also you may give inwardly the Oyl of sweet Almonds either alone or with white Wine. To which if the pain be great, you may add the Syrup of Poppies, as was shewed in the cure of the Cholick.

And lastly, If there be vehement pain, and much flatus, you may give those other Medicines which are prescribed in the cure of the Cholick, nor omitting Purges, which being opportunely given, take away the cause.

That which comes from Inflammation of the Intestines, is to be cured by often Blood-letting, if strength permit, both in the Arm and Foot, and by applying of Cupping-glasses with Scarrification to the Groins. Also Emollient Clysters and cooling are to be given, made thus:

Take of *Althæa* Roots two ounces: Mallows and Violets, of each one handful: Gourd seeds half an ounce: Lin and Fleabane seeds, of each two drams: Water Lillies and Roses, of each one pugil: Chamomel Flowers half a pugil: make a Decoction, in a pint whereof dissolve two ounces of Oyl of Roses; Cassia one ounce. Make a Clyster, and in progress of time add Oyl of Violets and Chamomel.

The

The aforefaid Emollients muſt be boyled in Oxycrate.

Or give new Milk with a little Sugar, and the white of an Egg, or the Mucilage of Fleabane feeds one ounce, to aſſuage pain.

Or, you may make a Clyſter of oyl of ſweet Almonds, Barley, Cream, ſtrained from the decoction of it, adding a little freſh Butter and Sugar.

A Clyſter may be made of ſimple Oxycrate, and be every day given, which is excellent againſt Inflammation of the Guts.

Anoint with Oyl of Violets, ſweet Almonds, and Chamomel, with Mucilage of Linſeed, Fœnugreek ſeed, and Quinces, with Axungia of Hens and Ducks, and ſweet Butter.

Alſo make a Fomentation of the Decoction of thoſe Simples which were preſcribed for a Clyſter.

Alſo Foment in the beginning with Oxycrate, and after let the Simples aforeſaid be boyled in Oxycrate.

And make a Cataplaſm of the reſidue of thoſe things in the Decoction with Barley Meal Fœnugreek, Linſeed and Butter, with the Axungia's and Oyls aforeſaid.

Alſo a Bath of Warm Water, in which cold and Emollient things have been boyled, is moſt convenient.

After bleeding give two ounces of Oyl of ſweet Almonds to appeaſe pain, and if it be very great, uſe Narcoticks.

If there be no vomiting, you muſt provoke it with a draught of warm water with Oyl of Violets, for ſo the upper parts will be purged, and the Humors will be revelled from the part affected. In the whole time of Cure, you muſt give Juleps and Emulſions preſcribed in the Inflammation of the Stomach.

Let his drink be Barley Water: and in the beginning let him abſtain from all Nouriſhment for twenty four hours, that ſome of the Matter may be conſumed; then give him Chicken Broth. This Diſeaſe is to be attended with diligence, for it is for the moſt part deadly.

The chief buſineſs in the cure is by abſtinency; and this is taken from the example of thoſe that are wounded in the Guts, for they are almoſt ſamished for forty days. Therefore let men in this diſeaſe for four or five days, take only three ſpoonfuls of broth every day, that vomit may be hindred which doth encreaſe the diſeaſe.

Moreover, Food bringeth no comfort to the ſick, for it turneth not to Nouriſhment, but is plainly corrupted, and the Chyle which goes from the Stomach into the Guts, is mingled with the Excrements retained, and encreaſeth vomiting.

He may drink more freely, becauſe it goes more eaſily to the Liver, and may be fit to oppoſe the Diſeaſe, if it be well tempered Oxycrate, and in a ſmall quantity.

Laſtly, it comes ſometimes but ſeldom, from the circumvolution of the Inteſtines; and this either from Wind which tortureth them; or from a *Hernia* called *Interocele*, or Rupture.

That which comes from Wind is cured by the ſame Medicine which cures the flatulent Cholick. But if after long uſe of the Medicines the Belly will not be opened, but all things taken are vomited up, that there is little hope of health, the laſt Remedy muſt be uſed, which *Hippocrates* propounds. 3. *de morbis*, namely, That a pair of Smiths Bellows be applied to the *Anus*, and that they blow into his Belly. Then give an Emollient Clyſter with Troches of Alhandal to bring out the ſæces. This is good not only againſt the *Ileos* from contorſion of the Inteſtines, but in that which comes from a grievous obſtruction, for by dilating the Guts it takes away the obſtruction. *Amatus Luſitanus*, *Curat. ult. Cent.* teſtifieth that he cured one deſperate by this means: as alſo *Epiphanius Ferdinandus* in his *Physical Hiſtories*, *Hiſt.* 74. reports that the ſon of *John Altimar* of Naples, a moſt expert Phyſician, was ready to die of this diſeaſe, and taken as it were from the Graves mouth by this means. But *Aurelian* diſalloweth it, becauſe the wind coming from the Bellows may much hurt with its cold. But this may be avoided if the Bellows be filled with wind by the fire.

Paracelsus alſo propounds another unuſual Medicine, by which he boaſteth that he cured many at deaths door, namely, by drinking three pound of Quickſilver in Water alone, for with its weight it doth untie the Guts, and open, and ſend down the hard excrements; which remedy is commended by others, who ſay that it may be taken without harm.

But we may well fear ſo great a quantity, leſt it extinguiſheth the native heat with its coldneſs, and coagulate the blood in the Veins; therefore in a deſperate caſe it is better to give a leſs quantity. Some give two ounces in a rear Egg, and think good to repeat it if the firſt Doſe do not ſucceed well; but you may ſee in our Obſervations, that one ounce hath done well.

But when the Iliack Paſſion comes from the Guts falling into the Cods all the cure is to place them right, which muſt be done by the gentle hand of a Chirurgeon, long fomenting the part affected, firſt with an Emollient Decoction, and Relaxing Oyls, giving often Emollient and Carminative

Clysters, so placing the Patient that his Head be low, and his Thighs high, for some having been hung by the Heels, were quickly cured.

If the *Hernia* comes with Inflammation of the Intestines, it is cured with a Fomentation of cold water. If Wind stretch the Guts, discuss with a Fomentation of Spirit of Wine. See the Examples of both Cures in our Observations.

CHAP. III. Of Astriction, or binding of the Belly.

BY Astriction of the Belly, we do not understand all kind of Suppression, by which nothing is let forth downwards, as in the *Ileos*. But only a dull and slow dejection, by which the fæces and reliques of meat are seldom, and not according to the quantity of Food thrown forth; therefore they are necessarily indurated, because of their long continuance being dried with heat, and some moisture is always drawn from them by the *Meseraick*, which reach not only the thin, but thick Guts. It is a Symptom of the expulsive faculty diminished, or the retentive increased, and it is the cause of many diseases; therefore the *Excreta* and *Retenta* are reckoned among the six things not Natural, which not keeping the Law of Nature produce divers diseases, so the Belly being bound, sends vapors to the Head, and produceth Catarrhs, and other diseases of the Brain, disturbs the Concoction of the Stomach, and the actions of other parts.

CAUSES. The Causes of this symptom are many: And first, hardness of the fæces and dryness, are not only effects, but also causes of them, because being hard, they are more difficult to be voided, and do less provoke the expulsive faculty. They become dryer and harder chiefly and oftenest from the excessive heat of the Liver, which powerfully draws away all the moisture contained in the Intestines, and leaves the fæces dry. This is also caused by violent motion, especially riding: also by few excrements through want of food, or because they have no acrimony to prick the Intestines; as it happens in cold Meats; and when the Cholera doth not go to the Guts, as we observe in the Jaundies. And lastly, many diseases of the Guts may cause this constriction, as a cold and dry Distemper, Tumors, Obstructions, Numbness of the *Anus*, and Palsie, and many others.

SIGNS. The Signs depend upon the knowledge of the Causes, which must be taken from their proper Fountains.

The hot distemper of the Liver is to be taken out of its proper Chapter. Also Tumors and other Diseases of the Guts have their proper Diagnosis or signs, and so the external Causes, as little meat or coldness thereof, riding, and the like, are known by relation of the Patient.

PROGNOSTICK. As for the Prognostick. The Constriction of the belly is more or less dangerous, according as the Cause is greater or less: For if it come of Inflammation or other Tumor of the Intestines, it is very dangerous; but from other Causes less. It useth to be contumacious and long when it comes from the fæces indurate; and thence come often Cholicks, which return after they have been cured, by reason of the new dryness of the fæces: as also because though the belly seems to have been made sufficiently soluble by purging, and many liquid Excrements are discharged, yet there remains sometimes many hard Excrements in the Guts, which breed new pains, and cannot be taken out but by many Clysters given after purging.

CURE. The Cure of this disease depends upon taking away the Causes, which are to be taken from their proper Chapters: but because it is commonly long, especially when it depends upon a hot distemper of the Liver, and dryness of the Guts: and in the mean time the belly bound brings many inconveniencies. We will speak of its Cure by its self, which is generally done by Emollients and Laxatives, made thus:

Take of *Althæa* or *Marsh-mallow* and *Lilly Roots*, of each two ounces; *Mallows*, *Marsh-mallows*, *Mercury*, *Violets* and *Brank-Ursine*, of each one handful; *Linseed* and *Fœnugreek*, of each half an ounce; *Annis seed* one dram and an half; sweet *Prunes* three pair; *Chamomel* and *Melilot flowers*, of each one pugil: boyl them to a pint and an half. Dissolve in the straining, Oyl of *Lillies* and *Linseed*, of each two ounces; fresh *Butter* one ounce and an half; *Diacatholicon* and *Diaprunes simple*, of each six drams. Make a Clyster to be given as often as need requireth.

Sometimes instead of this use the following:

Take of the Decoction of *Sheeps Entrails* one pint; fresh *Butter* two ounces; *Cassi*, a *Diacatholicon* and *Diaprunes simple*, of each half an ounce; red *Sugar* one ounce. Make a Clyster.

Also twice in a moneth, or thrice, you may give one pint of common Oyl alone for a Clyster.

And because Nature will grow dull by too much use of Clysters, and at length will never officiate that way, but when she is provoked but one, you must endeavour to mollifie the Belly with other means.

For

For this end, sweet Prunes and roasted Apples with Sugar may be taken one hour before dinner, as *Galen* sheweth 2. *de facult. alim. cap. 31*. For if they be taken immediately before dinner, they will not work. Or take Chicken Broth or other Broth, in which have been boyled Beets, Borrage, and some Apples, or one spoonful of Oyl of sweet Almonds newly drawn without fire, with as much Syrup of Maiden-hair; or two spoonfuls of the Syrup following:

Take of the Mucilage of Fleabane seeds, and of Quinces drawn with Mallows Water, one pound and an half; white Sugar one pound. Make a Syrup according to Art.

That the Prunes may work better, let him drink half a glass of *Vinum Lymphatum*, or Wine and Water before, and after he taketh them; fresh Butter taken an hour before Dinner the bigness of a great Nut, and drink Wine and Water, will do the same thing.

Once in a week let him use one of these following Medicines:

Take of Cassia new drawn one ounce, Cream of Tartar one dram: Make a Bolus.

Take of Manna one ounce, or one ounce and an half: Mix it with Broth, and take it in the Morning.

Or,

Take of Oyl of sweet Almonds and Manna, of each one ounce: dissolve them in Broth to be taken two hours before dinner.

Take of Pulp of Cassia two ounces; Tamarinds and Manna, of each one ounce: the powder of Senna half an ounce; Cremor Tartari two drams: With Syrup of Roses solutive make an Opiate. Let him take half an ounce or an ounce.

Or dissolve in the Decoction of Prunes half an ounce, or an ounce of Manna: let him take it one hour before dinner as all the aforesaid, for so they will work better.

Prisans of Succory, Agrimony and Sorrel, cast into Water that begins to warm, and infused one night, either drunk alone, or with Wine, for ordinary Drink doth keep the body loose.

This following Broth doth most certainly loosen the Belly, and keeps it so.

Take of Beets and Mercury, of each one handful: Boyl them in Broth, and take it in one hour before dinner. Or,

Take of Conserve of Damask Roses with Manna and Sugar, of each equal parts, one ounce for a dose.

Lastly, a Bath or Tub with a decoction of Emollient Herbs is very profitable to moisten all the parts natural, and mollifie the Belly.

CHAP. IV.

Of the Lientery, and Coeliack Passion.

Lientery is a kind of Flux of the Belly, in which the meat is quickly sent through the Belly, as it was taken unchanged. But in the *Cœliack Passion* the meat comes forth crude and imperfectly concocted, whence it appears, that the two Diseases differ only in degrees, so that *Lientery* is referred to the act abolished, and *Cœliack Passion* to the act diminished. For although the meat is sent forth, either altogether unconcocted, or imperfectly concocted, yet these diseases are not to be referred to Concoction hurt, but rather to the Retention; for they are either ill concocted, or not at all, because they are quickly sent forth, and are not long enough retained to be concocted. Hence it is collected, That though this disease be reckoned among the diseases of the Guts, yet the Stomach is much affected, and sometimes more than the Intestines. Hence *Galen* 6. *de loc. aff. cap. 2*. saith, That a *Lientery* and *Cœliack Passion* come both by fault of the Stomach and Guts.

CAUSES. Many Causes of these diseases are propounded by Authors; all which we may refer to three Heads: The cold distemper of the Stomach and Liver: The provocation of these same parts: And a great debility of the Retentive Faculty from some deadly disease.

The cold distemper generateth great plenty of flegmatick and glutinous humors, which cover and daub over the wrinkles of the Stomach, so that it cannot retain the food. Hence we may admire why *Galen* 6. *Aph. 1*. doth speak against the old *Greeks*, who called this disease *Lienteriam*, or smoothness of the Intestines therefore, because the internal superficies of the Stomach being made smoother, doth not retain the meat; whereas the Stomach doth not retain the meat till a perfect concoction be made so much by the roughness of the inward coat, as by an innate propriety of astringing. For as we must confess, that the principal cause of retention is the faculty; so also we must acknowledge, that the faculty doth want instruments fitly disposed, without which it cannot act: and therefore since the inward Tunicle of the Stomach is made rough and wrinkled, that the meat may be retained in the Stomach, it is no doubt but if that roughness be taken away while the wrinkles are filled up with Flegm, the retention of the Stomach will be hurt, so that the Food will slip away unconcocted. The like is in the Womb whose inward Tunicle is rough and wrinkled, that it may the better retain the Seed for Conception; but if it be covered with glutinous humors, it doth not retain, and the Seed presently comes forth, whence many Women are barren.

But

But let us note, That if any will strictly examine this word, he shall find that this Symptom is rather to be called the smoothness of the Stomach than of the Intestines: neither doth it comprehend all the sorts, but only that which comes from Flegm, which because it is most usual, the rest have their denomination from it.

The provocation of the Stomach and Guts is by sharp Humors which by twiching those parts stir them to send them forth too soon, as it is in the Bladder, which being pricked by Acrimony, doth often piss: Hence comes the Strangury, *Galen 6. Aph. 1.* saith, That by those sharp humors there is an Ulcerous disposition in the Stomach, as the *Aphtha* or Thrush is in the mouth of Children.

The great imbecility of the Retentive Faculty in great and deadly diseases often causeth a *Lientery*, as you may see in a *Dysentery*, which when nature is conquered degenerateth into a *Lientery*; the Stomach being drawn to consent with the Guts which are grievously affected, and its Faculties being overthrown; so also in Malignant Feavers there happeneth often a *Lientery*, whereby the Broth as soon almost as taken, is cast forth unconcocted; and the same is when poisonous and hurtful things are taken.

There is also another cause different from the former, which peculiarly makes a *Cœliack Passion*, namely, the obstruction of the Meseraick Veins which hinder the passage of the Chylus to the Liver; whence it must needs be cast forth by the Belly, but that this may be, it is necessary that all the Meseraick Veins, or the greatest part of them be stopped, as in Children who have the *Struma* or Kings Evil, whose Mesentery is found full of Glandules, by which the Meseraick Veins are stopped: and these continually have a Chylous and Cœliack Flux: They eat much and grow leaner till they fall into a *Marasmus*.

Ætius and *Celsus*, and many of their followers, do propound another cause of the *Lientery*, namely, a smooth and thick Scar in the Guts remaining after a long *Dysentery*, by which the mouths of the Veins being stopped, the distribution of Nourishment is hindered, and thence comes a *Lientery* which cause we cannot entertain, for then all the Guts should have been ulcerated, and the Scar in them all should stop all the Meseraicks, which is not agreeable to reason: because it is impossible that all the Guts should be ulcerated, and the man not die.

SIGNS.

The chief Signs of these symptoms do appear by what is said, for if crude meat and unchanged descend quickly and often through the Guts, it signifieth a *Lientery*; but if it be somewhat changed and seem like Chylus, it shews a *Cœliack Passion*.

The Signs of the Causes are thus gathered:

If a *Lientery* or *Cœliack Passion* come of a cold distemper and flegmatick humors, there will be sower belchings, the excrements of the Belly are flegmatick, there will be no thirst nor pain: if the Flegm come from the head, as it often doth, the excrements are frothy, and the Flux is greater after sleep; And there are other Causes which alter the head, and other Signs of a Catarrh.

If it come from irritation or provocation, there is sometimes a gnawing in the Stomach, a heat in the *Hypochondria*, there is great thirst, sharp excrements and cholerick.

PROGNOSTICK. As for the Prognostick, Thus,

Lientery and *Cœliack Passion* lasting long is dangerous, because it catcheth away the nourishment from the whole body, from whence comes an Atrophy or a Dropsie; and if it follow great and acute diseases, it useth to be deadly.

CURE. The Cure of this disease is to be altered according to the variety of the Causes that produce it.

And First,

That which cometh from Flegm may be cured of those Remedies which were propounded for the Cure of Want of Appetite coming of a cold Cause; chusing those things which are most Astringent to stay the Flux of the Belly.

Therefore you must begin with Purging of the peccant humor with Medicines made of Aloes, Rhubarb and Myrobalans.

Clysters are here of little force, while the Stomach is chiefly distempered; except an immoderate Flux do require them: and then they must be astringent and strengthening according to the Forms which shall be propounded in the following Cures.

After Purging sufficiently you must strengthen the Stomach with Opiates, Powders, Fomentations, Plasters and other Remedies mentioned in the place above quoted, in which (as I said) you must not omit Astringents, as Mastich, Citron peels, Coriander seeds, Snake-weed Roots, Tormentil, Coral, &c.

And besides others, the Opiate following which is greatly commended by *Amatus Lusitanus* is convenient, by which he saith he cured an Old man, after many other Medicines failed.

Take of Conserve of old Roses six ounces; of the best Treacle six drams; Syrup of Quinces as much as will make an Opiate, of which let him take half an ounce in the morning, not drinking presently after.

That

That which comes of Cholera is to be cured by those Remedies which were laid down against choleric vomiting; as also by those which shall be described in the cure of a choleric Diarrhœa.

That which comes from the imbecillity of the Retentive Faculty in a deadly, or at least dangerous Disease, is to be cured first with Fomentations applied to the Region of the Stomach, thus made:

Take of the Roots of Snakeweed, Tormentil, and dried Citron peels, of each two ounces; the Leaves of Mints, Plantane, and Sea Wormwood, of each one handful; Nutmeg, Cloves and Cinnamon, of each three drams; red Roses four pugils, beat them and cut them according to art, and fill two bags pinked therewith, and steep them in equal parts of Iron Water, and red astringent Wine; or in Wine alone, if there be no great Fever, and let them be applied to the Stomach warm one after another.

Afterwards use this Oyntment, or some Emplaister made of those which are prescribed for Choleric Vomiting.

Also anoint the whole Belly with Oyls, or astringent Liniments.

Give Clysters of Broth in which red Roses have been boiled, dissolving therein Sugar and Yelks of Eggs, and sometimes *Confectio de Hyacinth*, if the Patient be very weak.

And finally, You may give at the Mouth, strengthening and astringent things, as in the Cure of Vomiting before-mentioned; as also those which shall be shewed for the Flux of the Belly.

In a Cœliack Passion the Food is sent forth crude and imperfectly concocted. It only differs from Lientery in degree, and is cured with the same Remedies.

But if the Stools be altogether Chylous, this Disease doth not depend upon the fault of the Stomach, but upon the obstruction of the Meseraick Veins, which is usual, especially in Children. And therefore it is to be cured by Remedies which open obstructions and strengthen the Liver, because that is commonly also weak; but you must use no astringents, lest another kind of Flux should follow. These Medicines are at large set down in the Cure of the Diseases of the Liver.

CHAP. V.

Of Diarrhea.

Diarrhœa is that kind of Flux of the Belly, by which the Excrementitious Humors are sent forth without Blood or Food, and without the Ulceration of the Intestines.

By the Conditions of *Diarrhœa* properly so called, it is distinguished from other kinds of Fluxes because in *Lientery* and *Cœliack Passion*, the Food is cast forth unconcocted, or half concocted; in a *Dysentery* and *Tenasmus*, Blood is mixed with the Excrements, as in the Flux of the Liver, called *Hepaticus*, and in the *Hemorrhoidal Flux*.

DIFFERENCES. Many are the Differences thereof; which that they may be clearly explained, are to be referred to three Heads: The first whereof respects the matter which is voided; the second the place from whence it comes; the third, the manner and efficient cause which produceth the Flux of the Belly.

First, In respect of the matter voided, this Flux is divided into a Choleric, Flegmatick, Melancholick, and Serous or Watery.

Secondly, In respect of the place from whence it comes; either it comes from the whole Body, or some peculiar part, as the Brain, Stomach, Guts, Liver, Spleen, Mesentery, Womb, and other parts.

Thirdly, In respect of the manner and efficient cause; one *Diarrhœa* is Critical, another Symptomatical: one comes from an internal cause, as a distemper or evil disposition of the internal parts; another from an external, as from some Medicine or Poyson.

These Differences are seldom found single, but they are often complicated in one and the same Flux. So a Choleric Flux is from the Liver or the whole Body; a Flegmatick from the Brain or Stomach; a Melancholick from the Spleen, and a Serous from the whole Body.

Also these Differences are complicated from a divers mixture of humors, so that sometimes Cholera, Flegm and Water, are sent forth by the same Flux.

There is another kind of *Diarrhœa* different from the rest, which is called *Syntectice* or *Colliquativa*, coming from the melting away of the substance of the Body and Humors by the violent hot distemper of the solid parts: such as happeneth sometimes in the Inflammation of the Bowels, in a strong burning Fever, Hætick or Pestilential; in which a fat Matter as it were mixed with Oyl or Grease is voided.

Lastly, *Fluxus Stercorosus*, or a Dungy Flux is another kind, in which much liquid Excrement is often voided, which comes from excrementitious Meats corrupted in the Stomach, or a great plenty of Excrements heaped up in the Intestines.

DIAG.

DIAGNOSTICK:

The Knowledg in general is manifest, namely, when more liquid Excrements are voided, and oftner than usually Nature doth allow.

Signs of these Differences which are taken from the matter are manifest to the Senses, namely, Whether they be Flegmatick, Melancholick, Cholerick, or Serous.

The Parts Sending have a more difficult Diagnosis or Way of Knowledg, yet they are thus distinguished.

If the Humors flow from the whole Body, there either is, or hath lately been, a continual Feaver, or some other disease of the whole body, as *Cachexia*, evil Habit, or *Leucophlegmatia*, or white Dropfie; or there hath been over-eating or drinking, and there is no sign of any Disease of any peculiar part.

If it be Critical, it is a benefit to the Patient, and is easily endured; and thence the Disease is either cured, or diminished.

Sometimes there happeneth a Critical *Diarrhœa* without a Disease in some bodies which use to lay up evil humors; and being strong, do throw them forth at times when they abound and burden Nature, as *Galen* taught, 7. meth. Cap. 11. of which *Flux Celsus* maketh mention, lib. 4. cap. 19. in these words, *It is healthful for to go often to the Stool in one day, and in many days together if there be a Feaver, and if it cease before the seventh day; for the Body is purged, and that which inwardly would have hurt, is now sent forth.*

Among Critical Fluxes, the Serous is one; which comes without a Disease aforegoing, in them who have much water in their Veins, and that chiefly in the Harvest time or Autumn: namely, when the night and morning cold of Autumn, finding the passages external and pores of the skin open, by reason of the heat of Summer aforegoing, doth therefore insinuate it self deeper into the body, pressing forth internally the serous humors contained in the Veins, which Nature afterwards being over-burdened with, sends by the Meseraick Veins into the Intestines, and many times into the Ureters.

Hence it is that many in the beginning of Autumn, and in the first cold weather, do make abundance of Urine for many days together.

But if a *Diarrhœa* be symptomatical, it troubles the Patient much, and weakneth him; and the Disease upon which it comes is increased, or at least is in the same state.

This symptomatical Flux in Burning Feavers and Malignant, is often melting; and hence it is known, because the Excrements appear unctious, and the body forthwith becomes lean, and consumed, and almost in a *Marasmus*.

If the *Diarrhœa* comes from the Brain, the Stools are frothy; *Hippocrates* taught Aphor. 30. Sect. 7. which is not always so: For Flegm may flow from the Brain without Wind, which is the only cause of froth: as also Wind may be mixed with Humors that are bred or contained in the Stomach or Intestines, from whence the Excrements may be frothy, though they come not from the Head.

Therefore we must joyn other Signs to this, namely, if the Brain have any manifest Diseases, as a Catarrh, Deafness, Lethargy, Apoplexy, or great Heaviness, Pain or Sleepiness; and if the Flux be more at night than day.

If it come from the fault of the Stomach, there will be the signs of the Concoction of the Stomach hurt; As if the Food be corrupted, and have a sharp and stinking quality, by which the Expulsive Faculty is stirred up to expel them.

Also there will then be the signs of a hot distemper of the Stomach: So, if the Stools be crude and flegmatick, and if Concoction be slow and diminished, we argue that the Concoction of the Stomach is hurt by a cold distemper: and lastly, we know that the fault is in the Stomach, if the Patient did before fill himself with evil Food which would easily corrupt.

The Flux of the Belly comes from the Guts, when they are full of Worms, and then there will be signs of Worms which you may take from their proper Chapters.

If from the Liver, the Stools will be cholerick, because Choler is bred there; and there will be signs of a hot Distemper, Inflammation, Obstruction and Diseases of the Liver.

If from the Spleen, the Stools will be commonly black or blackish, a distension in the left *Hypochondrion*, a heaviness also or pain there, and other signs of the Spleen distempered will appear.

If from the Mesentery, There will be extension, stretching or pain in that part: But humors gathered in the Mesentery, come commonly from the Liver and Spleen.

If from the Womb, there will be stoppage of the Courses, or the symptoms of the Womb affected, which use to be more violent, and the Flux also at that time when the Terms ought to flow.

PROGNOSTICK. The Prognostick of a *Diarrhœa* is made thus :

A Flux of the Belly which is easily endured, and in which the Patient finds refreshment, is good, On the contrary, that which is painful and weakneth, is evil ; The first is to be accounted Critical, the last symptomatical.

When the Liquid Excrements grow thicker, it is good ; For it signifieth that the Faculty worketh well by concocting of evil humors ; which is done by making them thick.

Thin Excrements with pain often voided, are evil ; For they signifie great sharpness of Humors, which do violently pull, stimulate, prick and gnaw the Guts.

Liquid Stools, without feeling when they are voided are evil ; For they either signifie Disturbance of Mind or Doting, or Dissolution of the Natural Heat, which is followed by loss of Sense.

Liquid Stools beginning with an acute Disease, and continuing with the same, is evil ; For it signifies great plenty of Matter, or an evil quality therein, which forceth Nature to so sudden a Flux.

If a strong *Diarrhœa* comes upon him who hath the *Leucophlegmatia*, it causeth recovery, *Hipp. Aph. 29. Sect. 7.* For there is an Evacuation of the Matter which was in the whole body. But this wants a limitation. The *Aphorism* is true, if this flux happen in the beginning of a disease while the strength is good ; otherwise it doth not take away the disease, but the Patient.

If a Woman with Child have a flux of the Belly, she is in danger to miscarry ; *Hip. Aph. 34. Sect. 5.* For the food which should nourish the infant, is for the most part carried away, and the strength is abated ; as also the Ligaments of the Womb are relaxed by a continual flux of Humors thither ; as also the Child and the Womb are infected by the vapor of those Excrements which are continually voided.

Yellow Stools like Yelks of Eggs ; green, like Verdegreece ; livid, black, of divers colours, or very stinking, are evil ; for the reason which we gave in the Chapter of Vomiting.

CURE. As to the Cure ; Since a Symptomatical *Diarrhœa* comes commonly from corrupt Humors, Cholerick, Flegmatick, Melancholick or Serous, and especially from Cholerick, which provoke the expulsive faculty of the Intestines by their sharpness. You must begin the Cure by Evacuation of the Humor offending, which must be done by a Medicine which doth astringe by purging, lest that flux should be encreased by motion of the Humors ; and you may make it thus :

Take of the best *Rhubarb* one dram : *Citrine Myrobalans* half a dram : *Yellow Sanders* half a scruple : Infuse them in *Plantane Water* ; dissolve in the *Liquor strained* half a dram of the Powder of *Rhubarb*, and one ounce of *Syrup of Roses*. Make a Potion.

You may add *Diacatholicon*, or other Medicines, according to the condition of the Humor to be purged.

Also Vomiting is sometimes good, because it Revelleth and Evacuateth the Matter of the Disease.

If there be signs of blood abounding and strength, you must first let blood. And if there be a Fever, you must open a Vein, though there appear no Plethory or fulness.

Before and after Purging, give cleansing Clysters, such as these :

Take of whole *Barley* two pugils : *Bran* and red *Roses*, of each one pugil : *Liquoris* scraped, and *Raisins* whole, of each one ounce ; boyl them to a pint, dissolve in the straining of white Sugar one ounce, Yelks of Eggs two. Make a Clyster.

After the Body is sufficiently emptied, you must give astringents and strengtheners both at the Mouth and by Clysters, as also to the Belly ; the Forms whereof you may take out of the Cure of a *Dysentery*.

Besides, You may conveniently use these that follow :

Take of *Chalybeate Vinegar* one part ; *Chalybeate Water* two parts : the Leaves and Fruit of *Myrtles*, *Quinces*, *Medlars*, *Servises*, of each two handfuls : *Cypress Nuts* six pair, boyl to halves. Foment the Belly warm with the strained *Liquor* often.

Take of Oyl of *Mastich*, *Quinces*, and *Myrtles*, of each one ounce : *Sanguis Draconis*, *Frankincense*, and *Gum Traganth*, of each one dram ; Wax as much as will make an Unguent to anoint after the Fomentation. Or,

Take Crums of toasted Bread infused in *Chalybeate Water*, and *Quinces* roasted in the Embers, or *Marmalade*, of each three ounces ; *Frankincense*, *Mastich*, *Sanguis Draconis*, of each two drams : With *Syrup of Quinces* and *Wormwood*, make a Cataplasma.

Take of *Mastich* two drams : boyl it in three pints of Water for ordinary drink : *Iron Water* is also good : but in a hot Disease, it is good to use the Tincture of *Roses*, or Conserve of *Roses* mixed with Spring Water, or Water wherein Gold hath been quenched, mixed with *Syrup of Quinces*.

Amatus Lusitanus reports of one that was cured of a Cholerick *Diarrhœa*, by taking much cold

Water in the Summer time. We also once prescribed to a Sanguine man, who was troubled with a Cholerick Diarrhœa in the midst of Summer with great thirst, *Sal Prunella* in his ordinary drink, and Juleps made of Lettuce and Purslain Water to be taken thrice in a day, and he was cured in twenty four hours.

If the Humor be very sharp, and adust or burnt, the Patient must be purged sparingly with mild Medicines, otherwise the disease will encrease, and he is to be cooled and moistened; as also to be blounded a little.

In the same case a warm Bath is very good; the Example whereof is in our Observations.

Plantane boyled in Broth is excellent.

And lest a *Diarrhœa* turn into a *Dysentery*, you must give Clysters of Chalybeate Milk, and Emulsions of the cold Seeds, and of white Poppy seeds, to assuage the sharpness of the Humor.

As also this Syrup following:

Take of the Juice of Quinces six ounces: the Juice of Endive and Sorrel, of each three ounces: Sorrel and Plantane seeds, of each two drams: Red Coral one dram: Plantane Water four ounces, boyl them to the consumption of half, strain and press them well: put to it as much Sugar to make a Syrup to be taken two drams first and last.

In all *Diarrhœa's* after universal Medicines, this following Bolus is good:

Take of Conserve of old Roses half an ounce: Candied Quinces one dram: the powder of Tormentil one scruple; With Sugar make a Bolus to be often repeated. Or if the Disease be old, you may make an Opiate of the same, or the like, in a greater quantity to be taken at many times.

Or to astringe more powerfully, give this Powder:

Take of Sanguis Draconis, Frankincense, Mastick, Mummy, Terra Sigillata, Lapis Hematidis, or Bloudstone, Troches of Amber, of each one dram: true Bole three drams: make a Powder, of which give two drams in convenient Liquor.

Rhubarb twice infused, and then twice or thrice washed in Rose Water and dried, is good.

The Lozenges of the three Sanders, with four times the quantity of Rhubarb given twice in a day, the weight of two drams, do take away the Matter, and strengthen the Bowels.

The Leaves of Fleabane laid upon fire, so that the smoak may be taken through a hollow Chair, do stop the flux of the Belly by a special quality. As also if the same Herb be beaten with Vinegar, and applied to the Stomach.

Also the smoak of Mullen taken throw a hollow Chair is excellent; the example of which is in our Observations.

Syrup of Coral is excellent, and much more the Tincture or Magistery of the same.

The Conserve of the wild Rose, or sweet Bryer Rose is good against a Cholerick flux, especially if it be mixed in astringent Opiates.

But when there is danger of weakness through a low and often flux, you may give Laudanum with Mastick and Terra Sigillata.

When it is very violent, a Clyster or Broth and new Treacle is excellent.

Pills of Bdellium taken twice or thrice in a Week, or every other day, are good against all old fluxes.

Good for the same is the often use of Medlars; as *Forestus* confirms by experience, *Obs. 1. Lib. 22.* in words: One that had a constant Flux, and spent all he had upon Physicians, came to me for Counsel, whom I advised to eat Medlars, though green, as many as he could: by which he was speedily cured. As it was with a Zealand Merchant that came to John Spirinchius, a Physician of Lovan, who having been long sick, and of a Dysentery at last, and could not be cured by any, was at length by his advice cured onely with Mallows, and gave the Physician three hundred Crowns for his advice, Thus *Forestus*.

But we must observe that the Body, before the use of Medlars, be cleansed from Excrements.

In an old *Diarrhœa*, the following Medicines are excellent:

Take of the shavings of Ivory three drams: Confection Alkermes one dram; Sugar dissolved in Rose-water four ounces. Make Lozenges.

Take of Crocus Martis six grains: Bezoard Mineral half a scruple: Conserve of Roses two drams: Spirit of Vitriol three drops: Mix them in a Bolus to be given twice in a day, long after and before Meae.

Take of the Juice of Persicaria Maculata, and of the great Housleek, of each three ounces; boyl them till the third part be consumed, and give them in the morning, they do certainly cure any flux, though very old.

Mercurius Diaphoreticus given some days together, twelve grains at a time, taketh away all the impurities of the body, which use to beget fluxes.

The Decoction of Juniper Berries in Wine given three days together, is good; and also one dram of the Powder of Grasshoppers given in White wine. These two help by deriving the Matter of the flux to the Ureters.

The

The Decoction of Juniper is thus made :

Take of Juniper Berries one handfull : red Wine one pint and an half : boyl them to the consumption of two thirds. Let him take the straining three days together.

The water of Brimstone Mines cures an old Diarrhœa, by purging the body, and by strengthening the Stomach. Of which there is an example in our Observations.

If a Diarrhœa come from a Catarrh, you must Physick the Brain, as the part that sends it, with the Medicines prescribed in the Cure of a Catarrh. But if it depend upon the obstruction or weakness of the Liver or Spleen, you must cure them as shall be shewed in their proper places ; and then there is little or no use of Astringents. *Platerus* in the Cure of the Hemorrhoids, saith, that hot blood given as a Clyster, doth wonderfully cure a Flux.

CHAP. VI. Of Dysenteria, or Dysentery.

A Dysentery is an often and bloody looseness of the Belly, with pain and torment depending upon the ulceration of the Intestines.

The word *Dysenteria* is taken commonly among the Ancients for every bloody Flux of the Belly : but strictly and properly it is taken only for the Bloody Flux, which comes from an Ulcer in the Intestines.

DIFFERENCES. *Gal. 3. de sympt. caus. cap. 2.* nameth four kinds of Bloody Fluxes, which he commonly calls Dysenteries.

The first is, when any part of the Body is cut, or when any exercise is omitted, or any bleeding is omitted, as usual bleeding at the Nose or Hemorrhoids, that by reason whereof, the blood abounding is sent by the Meseraick Veins to the Intestines, and so evacuated by the Belly.

The second is, when by reason of the weakness of the Liver, watery blood like that water wherein flesh hath been washed, is voided ; as it is in the Hepatick or Flux of the Liver, of which we shall hereafter speak.

The third is, when melancholick and shining blood is cast forth, which by reason of the long continuance in the Liver or Spleen is burnt, and mixed with melancholy. Shining signifieth burning, because blood which groweth black by cold doth not shine, but loseth that brightness or splendor which it had before.

The fourth Difference is, when the Patient at some short distance voids blood with Humors or Excrements, with which sometimes there is mixed Pus or Matter, and that with pain and torment, by which we may conclude that there is an Ulcer of the Guts. And this is properly called a Dysentery, of which only we here discourse.

CAUSES. The Internal Causes of a Dysentery, are sharp and ulcerating Humors, as yellow Choler, green like Leeks or Verdegreece, and black ; as also salt flegm bred in the Head from great heat, or in the Belly by putrefaction, and so brought to the Intestines, where cleaving a long time, it doth ulcerate.

Here is a great doubt propounded by Authors ; How yellow choler in a short time should cause a Dysentery, when green choler in a long time maketh only a Diarrhœa, which never turneth into a Dysentery, since the green is made of the yellow by aduotion, and hath more sharpness.

Mercatus answereth, That there must be clamminess, by which it may remain long in the Guts to corrode and gnaw them, as well as sharpness. And therefore if yellow Choler be such, it causeth a Dysentery ; on the contrary, if green Choler be more fluid, and stay less while in the Guts, it makes but a simple Diarrhœa.

Sennertus saith, that this answer is probable ; but it doth not satisfie, because oftentimes there are fluxes, in which there is clamminess with sharpness, and yet there is no Dysentery. And contrarywise, oftentimes there is no clamminess in cholerick humors which cause a Dysentery, and therefore he thinks that the humors which produce a Dysentery have a peculiar occult quality, with which the Intestines are offended and ulcerated, as the Lungs are with the Fish Lepus, and the Bladder with Cantharides, and no other part. And he proveth that malignant quality, in that a Dysentery is contagious for the most part, so that the infections which come from the vapors rising from the excrements of those that have a Dysentery, do only infect the guts of them that are infected, & fall not upon other parts. The same happeneth in other Epidemical and infectious diseases, in which the Poyson doth go only to some peculiar parts ; so their Pleurifies, Peripneumonia's or Imposthumes in the Lungs, and Quinzies which are infectious. So the Poyson of a mad Dog doth only infect the Head: This is more clear to be seen in purging Medicines, which have a peculiar virtue to move the humors in the body, and bring them to the guts, which will not only, being taken at the mouth, purge by stool, but laid to the Navel, or taken by vapor at the Nose, it is probable, that they piercing into the Veins and

Arteries by the pores of the skin, and extremities of the Vessels, do stir up motion, and fermentation, or working in the humors, because the bad humors are separated from the good, and by pricking or stimulating of Nature, they are driven to the Intestines by the force of the Medicine, directing the expulsive faculty to those parts. By the same reason, but after another manner do Sudorifics or Sweating Medicines and Diureticks, or such as provoke Urine work; the former forcing the humors to the Skin, the latter to the Bladder. From which we may collect, that the infection of a Dysentery, by what manner or part soever it is admitted into the Body, doth cause a certain fermentation or working in the humors, by giving them a disposition like it self; which being an Enemy to the Guts, doth provoke the flux of the humors to them, by which they are ulcerated; and they being infected with the like disposition, do infect the humors and nourishment; from whence comes a true and proper Dysentery.

It is demanded of divers Authors, What is that snotty and white Matter which is voided in such great plenty in Dysenteries, mixed with blood and other humors? Some think that it is the fat of the Guts; others, that it is that with which the Intestines are lined, for the better passage of the excrements; others, that it is slegm from the Head or other parts; others, that it is Pus or Matter from the Ulcers. But we conclude, that it is nothing else but a preternatural excrement of the Guts; for they being decayed from their Natural Constitution, cannot convert their proper nourishment into their own substance, but by an imperfect way change it into that Matter; which when it is unfit for nourishment of those parts, is expelled forth, and then the parts wanting again nourishment, attracteth or draweth new, which is changed as the former, and there must needs be great encrease thereof, because the part affected continually draweth blood from the Veins, which is changed into this slimy substance, by which it is deceived of its expectation, and therefore again draweth new for its nourishment, which it continually aimeth at, but cannot turn into its own substance, but into this slimy Matter, of which there is so great an encrease. The same thing is done in other parts, and especially in great and profound or deep Ulcers. For the part ulcerated, when by reason of its evil disposition it cannot be well nourished, draws blood continually from the Veins, which is changed into Pus or Quittor, by which means the whole body by degrees consumeth. Nor doth this befall only parts ulcerated, but others that have no Ulcer or Imposthume; so that although the aforesaid Excrement be like Quittor, yet is not true Pus or Quittor; for that comes only from an Ulcer or Imposthume. This chiefly appears in an Ophthalmy or Inflammation of the Eyes, in which when there is no Ulcer or Imposthume, there is a continual Excrement like Quittor, which comes only from the distemper of the part, and the depravation of the Homiösis, or quality by which it makes nourishment like it self. The same befalls men in Asthma or Phisick, and other diseases of the Lungs, for their Lungs being distempered, do ill concoct their own nourishment, but turn it into an Excrement like Quittor, which is expelled by coughing, and yet they have no Ulcer in their Lungs, as many learned Physicians will conclude when they see the Matter.

The External Causes of a Dysentery, are all things that produce sharp and evil humors, or give them (being produced) a disposition to cause a Dysentery. The principal are, sharp Meats, or very subject to putrefaction, as Fruits soon rotten, and all unripe things, Waters that are drunk ordinarily wherein there is Crudity or a Mineral, and Medicines which are deadly qualified, and evil Air, as *Hip. Aph. 11. Sect. 3.* when the Winter is too cold or dry, the Spring too wet, and too full of South winds, then there will be Dysenteries in the Summer. And *Aph. 12. Sect. 3.* If the South wind blow much in Winter, and it rain much; but if it be dry, and the North-wind blow much in the Spring, those Seasons produce Dysenteries.

But the proper distemper of the Air to produce a Dysentery, is known in a contagious or Epidemical Dysentery, which sometimes is more dangerous than others. As also there is an infection in the Excrements of those that have this disease to them that smell them, and if they be cast into the Privy, they infect most of the Family that sit over them.

SIGNS. The signs of a Dysentery are taken out of the definition mentioned, an often bloody Evacuation with pain and torments of the Belly, and sometimes a Fever, watching, thirst, loathing of Meat, and other Signs common to many Diseases.

But it is hard to know whether the thick or thin Guts are ulcerated. Usually if the pain be above the Navil, they say it is in the thin Guts, and if below, in the thick; but this is contrary to reason, because both the thin and thick Guts are carried both to the superior and inferior parts. Therefore this sign is rather to be taken from the quality of the pain and the Excrements. For if the thin Guts are affected there is vehement pain, like pins pricking, because they are more Membranous, and of more exquisite sence. As also they go not to stool presently after the pain, and there is blood in every stool; for because the blood and purulent Matter comes far before it be voided, it is more mixed with the Dung; but if the thick Guts are affected, the pain is less vehement and lasting, there is presently after going to stool, the Blood and Matter swim upon the Excrement, or are very little mixed, and in a great Ulceration there are as it were little pieces of flesh.

The Signs of the Causes are taken especially from the colour of the Excrements, when they are yellow, green, white or black, to which you may add the Signs of humors abounding from the Age, Temperament, time of the year, and course of Life.

PROGNOSTICK. The Prognostick is thus made.

If the thin Guts are ulcerated, there is more danger; for they are more Nervous, and being nearer the Liver, they receive more pure Choler.

Dysenteries coming from black Choler or Melancholy, are deadly; *Hippocrates*, Aph. 24. Sect. 4. because the Ulcer grows Cancerous, which is seldom cured outwardly in the Body. But if this Melancholy comes by Crisis or Judgment, it is not so dangerous. But you must beware lest you take congealed Blood for Melancholy.

A Dysentery from Choler or sharp Diet is easily cured: from salt Flegm it is worse than from Choler, because by reason of the Clamminess, it stays longer in the Guts to ulcerate.

If in long Diseases of the Guts, loathing of Meat is evil, and worse with a Fever: *Hippocrates*, Aph. 3. Sect. 6.

In a Dysentery there be as it were little pieces of Flesh voided, it is deadly, Aphor. 26. Sect. 4. for it signifieth a deep Ulcer which takes away pieces of the Guts.

Much Watching, Stools without mixture of humors, black, stinking, much blood, a Lientery coming after, Hickets, Cholerick Vomits, pain of the Liver, Midriff, great Thirst, do commonly declare that it is deadly.

A Dysentery coming to those which have the Gout, or a disease in the Spleen, is good: *Hippocrates*, 2 Progn. & Aph. 46. Sect. but this is rather a simple Diarrhoea which sends forth the matter of those Diseases.

Old Men and Children die more commonly in this Disease than Men of middle Age, *Hippoc.* 2. Progn. Children because of their tenderness, and their not observing rules; Old Men because their strength is spent, and because there is a great overthrow of their natural state thereby; for they do not easily produce Excrements that are fit to cause a Dysentery.

CURE. The Cure of this Disease is wrought by Medicines that assuage, cleanse and evacuate sharp humors, that consolidate and dry Ulcers, and stop the Flux.

At first you must evacuate the humor offending, lest it do more mischief, and you must purge often; and if you think it not safe to purge every day, or every other day, do it every third or fourth day: Rhubarb is the best for this purpose, either given in substance with Broth, or made into a Potion as in Diarrhoea. Or thus:

Take of Plantane half an handful: Liquoris scraped, and whole Raisins, of each three drams, Red Roses one pugil: Tamarinds six drams: yellow Myrobalans rubb'd with Oyl of sweet Almonds two drams: boyl them to three ounces: Dissolve in the straining Rhubarb infused with Lavender in Plantane Water one dram: Syrup of Quinces one ounce: Make a Potion.

Or,

Take of Tamarinds half an ounce: Citron Myrobalans two drams; boyl them in Barley and Plantane Water, infusing in the straining, of Rhubarb one dram and an half: yellow Saunders half a scruple; to four ounces of the straining add one ounce of the Syrup of Roses solutive: Make a Potion.

The Decoction of Myrobalans made thus, and given in many draughts, is commended of many.

Take of the rinds of Myrobalans Chebs ten drams: Citron Myrobalans five drams: Currans two ounces; boyl them in twenty six Pints of Water, to the Consumption of the third part: strain them, and add ten drams of Sugar, clarify it, and put to it half an ounce of Cinamon.

Penotus commends the following Potion as good against both Dysentery and Diarrhoea.

Take of the Bark of Guajacum beaten two ounces, boyl them to halves in a sufficient quantity of Water, adding of red Roses, Pomegranate Flowers, and Plantane, of each two drams; boyl them for an hour, and then add to the straining of powdered Rhubarb one dram, Diacatholicon three drams: Make a Potion.

Many give parched or torrefied Rhubarb, that the purging Quality may partly be taken away: But *Amatus Lusitanus* takes the second Infusion of Rhubarb, and saith, That in the first Infusion all his sharpness is taken away, and it is better so than parched, for by so doing it is burnt.

The Preparation is thus made:

Take of Rhubarb one dram and an half; infuse it in three ounces of Plantane Water some few hours, strain it, press it gently, and then infuse it again in three ounces of new Plantane Water, and dissolve in the straining half an ounce of Cassia: Make a Potion.

If you desire, by reason of the abundance of crude humors, to purge more, then you may mix Syrup of Roses or Diacatholicon, or other mild things, but beware of strong.

Sometimes

Sometimes a Vomit is very good, if the Patient be inclinable, and the humors stand in the Stomach; for it makes a revulsion of the humors from the part affected. Which *Amatus Lusitanus* wisely mentioned, *Curat.* 44. Cent. 2. in these words: *If the Physician can draw upwards, and cast out by Vomit, a Humor that is cholerick and sharp, flowing to the Guts to make a Dysentery; it would be contrary to the Precepts of Galen, in his Book of Medicinal Art, and Method of Cure, to carry the matter by the Guts which are full of Ulcers. But when the Physician cannot do it, although he ought to try his best skill, he must use Purges, and especially Rhubarb. This Hippocrates taught, Aph. 15. Sect. 6. After a long flux of the Belly, if Vomiting come of it self, the Disease is cured. But Galen in his Comment upon this Aphorism, saith, That this is the example of those things which are done rightly by Nature, which a Physician ought to imitate. And Mercatus confirms the same in these words: Divert the Humors another way by bleeding if thou canst; also Purge and Vomit, especially in Salt Flegm, for thus we have seen old Dysenteries cured.*

Angelus Sala prescribeth this following Vomit in a Dysentery:

Take of Salt of Vitriol half a dram, or a dram: Syrup of Quinces and Betony Water, of each one ounce: Cinnamon Water ten drams: Mix them, and drink it off.

There is a great dissension among Authors concerning Blood-letting in this disease. And it is the Opinion of the wisest, that in a Feaver and Inflammation of the Intestines (which is commonly joyned with an Ulcer) that it ought to be in the beginning of the disease, before the strength be decayed by it; for so there is a revulsion of Blood, and sharp humors flowing to the Guts. And *Valescus de Taranta*, and *Amatus Lusitanus* in an old Dysentery draw Blood. *Valescus* saith, That a very old Man had a Dysentery three Months; I being sent for, when other Physicians opposed it, commanded a Vein to be opened, and he presently amended. And *Amatus* saith thus; That an understanding Physician went to a man, who had a Dysentery thirty days, with a great Feaver, and after the use of divers Medicines was brought very low and lean, his Flux continuing with much Blood, and drew Blood from the Liver-Vein of his right Arm: and observe with what success; Presently, miraculously the blood stopped, though his Flux continued. But by Clysters with Sugar and astringent Medicines, both internal and external, his Belly was bound, and he cured.

In the mean while give many Clysters, first asswaging, mild and cleansing, then glutinous and astringent; and sometimes in one Clyster all together, or most of them.

Mild, gentle, and anodine Clysters that assuage pain, are made of Milk, either alone, or with two or three yolks of Eggs, or with the Mucilage of Fleabane seeds and Quinces, of each four ounces; with Sugar or Honey of Roses one ounce, Goats Suet one ounce, or with Milk wherein Gold, Iron or Flints have been quenched, that the serous part may be consumed, and so it may be more glutinous.

In want of Milk, you may give Almond Milk, or Barley Cream, or Rice Milk, alone or together; as also the Broth of Mutton, Chicken, Capon, or a Sheeps-Head, and mix the former things therewith. It is usual to boyl Roses, and the Herb Horse-tail with a Sheeps-Head. Or this following.

Take of Marsh-mallow Roots one ounce: cleansed Barley, or Rice one pugil: Linseed and Quince seed, of each one ounce; Fleabane seed half a dram; Chamomel Flowers one pugil: Boyl them in Milk or Broth, adding to the Suet and Yolks of Eggs, and other things before-mentioned.

Or you may make it of Milk alone, boyled with Marsh-mallow Roots at the first, to cleanse and assuage the pain.

If the pain be great, you must mix Narcoticks; as *Philonium Persicum*, one or two drams: Pills of Hounds-tongue one or two scruples: Syrup of Poppies one ounce and an half: Laudanum five or six grains in your Clysters.

If there be an Inflammation in the Guts, which may be known by constant pain, and increasing when it is touched, also by a Feaver and driness of the Tongue; let blood again, give Clysters of Rose-water, with Salt of Lead, and foment the Belly with Oxycrate, or Wine and Water.

Also you may give Salt of Lead at the mouth to ten grains, with Conserve of Roses.

Cleansing Clysters are made of Barley Water, Bran, red Roses, Sugar or Honey of Roses.

But for the greater cleansing and glutinating Ulcer, add one dram of Turpentine dissolved with the Yolk of an Egg. When the Ulcer is more foul, you must use greater cleansers, as Beets, Pellitory of the wall in the aforesaid Decoction. The strongest Cleaners are, Centaury, Wormwood, Gentian, Brine or Pickle, from *Galen*, 12. Meth. Cap. 1. and the like, the use of which is now very rare.

Zacutus Lusitanus durst use Arsenick, and yet with good success, as you may see *Obs.* 18. Lib. 2. of his Admirable Practice of Physick.

Some Chymicks use the Oyl of Wax in Clysters one dram, and anoint the Belly with the same.

To glutinate or heal up the Ulcer, first use gentle driers in Clysters, and a little astringent, then such

such as are more drying and binding. Therefore make them first of Chalybeat Milk, in which Roses have been boyled, or of Barley Water, or Water of parched Rice, and red Roses one pugil, adding to both Clysters two Yelks of roasted Eggs, sometimes Hony of Roses; and when you will have it work better, one ounce of the Juyce of Plantane.

To bind and glutinate more, make it thus:

Take of the Root of Comphry and Mullein, of each one ounce: Plantane and Comphry leaves, of each one handful: red Roses and parched Barley, of each one pugil: Myrtles two drams: Make a Decoction in Cistern water: in one pint of the straining, dissolve of Honey of Roses one ounce: one white of an Egg, or one ounce of the Mucilage of Gum Traganth, Goats Suet two ounces: the Juyce of Tarrow and Knotgrass one ounce. Make a Clyster.

Take of Snakeweed Roots or Tormentil, one ounce and an half: Shepherds-purse, Knotgrass, Horstail and Mouseear, of each one handful: Pomegranate flowers, Acorn cups, Cypress Nuts, of each two drams: parched Rice one pugil: make a decoction in Forge water: in a pint of the straining dissolve two ounces of the Juyce of Plantane, and two Yelks of roasted Eggs. Make a Clyster.

Angelus Sala wonderfully commends this following Clyster:

Boyl a Sheeps-head Cloven in two, till the flesh comes from the bones, add to the Broth strained of the tops of St. Johns Wort two or three handfuls: Tormentil Roots grossly bruised two ounces: Infuse them three or four hours upon the Embers. Let the straining be twice or thrice given as a Clyster.

The Juyce of Plantane alone, or with the Milk or Barley Water is good.

Gum Traganth two drams, or the infusion of it in Rose or Plantane water, is good to put in Clysters; or it makes a very good one, if it be mixed with Juyce of Plantane, and Goats Suet instead of Gum Traganth. Or with it you may with profit use Gum Arabick, Frankincense, Mastich and Sarcocol. All which being dissolved in the aforesaid Liquors, do work by glewing, neither do they exasperate the Ulcers as the strong Astringents. Amatus Lusitanus doth much approve Clysters made of them, because they do cover, as with a Plaster, the internal superficies of the Guts against the gnawing of the Matter; he makes them thus:

Take of Barley Water ten ounces: one white of an Egg well beaten: Gum Arabick and Goats grease, of each half an ounce: Oyl of Roses two ounces: Bole-Armeniack and Gum Traganth, of each one dram; mix them for a Clyster.

But lest those Emplaistick Clysters should fasten the sharp Matter, and shut it up by their clamminess, you must use cleansing Clysters also, which must not be long retained; and you must sometimes use cleansing Clysters intermixed with astringent.

In the astringent you may put Acacia, Hypocistis, or conserve of Sloes, Sanguis Draconis, Bloudstone, the Juyce of Maddir taken out with Rose or Plantane Water, Bole-Armeniack, Terra Sigillata, or sealed Earth, the Troches of Amber, and the white Troches of Rhasis to one or two drams. Other Powders are hurtful, because they settle in the Liquor, and provoke that part to pain.

And it is better to infuse the aforesaid Powders in Liquor, or in a Decoction, and to give them strained.

While you give Clysters, you must give at the Mouth Medicines of the same Nature, and that oftener when the upper Guts are ulcerated, to which the Clyster cannot reach.

If there be no Feaver, you may profitably, when you intend to cleanse, give Goats milk; and when you intend to glutinate, Cows milk, both with Sugar of Roses. But Chalybeat milk, that is, Steel infused, doth knit or glutinate better; three ounces thereof with Juyce of Plantane, and Sugar of Roses, of each one ounce, make an excellent Medicine. Or boyl Comphry Roots in Steeled milk.

Or make Bread of the finest Barley with Yelks of Eggs, and set into the Oven after the Bread is drawn: Crum milk and Sugar therewith, till it is as thick as a Pultis: of which let him take five or six spoonfuls twice or thrice in a day.

Veal broth boyled very long doth assuage pain in the Ulcers.

And Cream of Rice doth heal them up.

Lerius reports in his History, That many troubled with Dysenteries, in a long voyage and almost starved, were cured with Rice boyled in Milk with Yelks of Eggs, and Juyce of Ground Ivy.

Also you may boyl Rice in Almond milk, in which Gold hath been quenched.

Cream of Barley with Sugar doth cleanse and cool.

Broth made of Burnet with Butter, given three days together morning and evening, doth much further the Cure, and the more, if the decoction of Burnet at the same time be given for ordinary drink.

The Rinds of two greenish Oranges boyled in eight pints of water for ordinary Drink, doth half the Cure.

Of the Powders of a dead-mans Skul one dram twice or thrice given in Broth, or other convenient Liquor doth quickly cure perfectly.

Two spoonfuls of the Mucilage of Gum Tragacanth drawn with Rose Water or Gum Arabick half a dram, may be dissolved in all his Broths; as also one spoonful of the Gelly of Harts-horn is good.

After the body is well cleansed, give astringent Decoction to compleat the Cure; which must be made of the Roots of Snakeweed, Tormentill, Comphry, Plantane Leaves, Yarrow, Shepherds-Purse, Horse-tail, Mouse-ear, Agrimony, Plantane and Sorrel Seeds, Sumach, Grape-stones, Red Roses, &c. in Cistern Water; dissolving therein the Syrup of Quinces, Myrtles, or of dried Roses, as also sometimes Acacia, Hypocistis, Conserve of Sloes, Bole-Armeniack, Spodium or burnt Ivory.

The Juyce of Quinces boyled to the consistence of a Syrup or Rob, without an addition, given a spoonful or two often, is very profitable.

The like Juyces may be made of Pears, Cornel, or Dog-Tree Berries, and other sharp Fruits.

Take the fat Guts of a Sheep, boyl them till the Liquor come to half a Porringer, then put a little sweet Oyl thereto, and let him drink it; if the Dysentery be not stubborn, it cureth it at the first or second draught.

Oyl and Rose water given in equal parts do the same.

Let two Yelks of hard Eggs, and mixed with Rose water, be taken with Sugar and a little Nutmeg twice or thrice.

The Juyce of Plantane only given three or four ounces at a time, or mixed with other proper things is excellent; and if there be an Inflammation, it allayeth it.

Höllerus saith, That the Juyce of Ground-Ivy taken, hath saved many a mans life.

Juleps of Waters or Decoctions and Astringent Syrups are to be often given.

Syrup of Coral, as also the Tincture and Magistery thereof are very good, which must be taken often in a spoon; or these following:

Take of Syrup of Grapes, Myrtles, and Juyce of Plantane, Quinces, and dried Roses, and Syrup of the Juyce of Purslain, of each one ounce; Mix them for the use aforesaid.

In the end of a Dysentery the Juyce of Wormwood and Mints well putried, and made into a Syrup with Sugar, is very available; for Mints mixed with Wormwood hath great force to strengthen the Stomach.

And if the Dysentery came by eating much Fruit, in the beginning, Syrup of Wormwood with Cinnamon or Treacle water, is excellent, if you at the same time use Fomentations and Emplasters to strengthen the Stomach.

A Quince made hollow, and filled with the shavings of Virgins Wax, roasted under the Embers, given for some few days together, is a most proper Remedy.

Quercetanus makes the same Medicine of *Pomum Curtipendulum* made hollow, and filled with Gum Arabick and wax, of each one dram, then roasted, and after 'tis eaten, let him drink a draught of astringent Decoction.

Others roast a young Pigeon stuf with wax, and give it for a Dinner.

The use of Medlars according to *Forestus*, cures old Dysenteries, lib. 22. Obs. 1, which we mentioned in *Diarrhœa*.

Bruernius, lib. 8. de re cibaria, cap. 12. writes that he was cured of a desperate Dysentery, by eating raw Service-berries, by the advice of an Old Woman.

Nor let us omit the Oak Grape mentioned by *Martin Ruland*, which he saith, Is under the Earth, upon the Roots of an Oak in Spring time, of a binding tast, outwardly like Pulp, inwardly white, and like milk, which dieth in Summer, and turns to a stick; and therefore must be dried in the shade, and powdered in the Spring: He saith, That there is no more excellent powder to stanch blood and Dysenteries than this. Also *Eucelius*, *Banhus*, and *Skenkius* mention the same.

In every Flux of putrid Humors, let the Guts be strengthened with Bread twice baked, first boyled in Vinegar, and then dried; after it is twice or thrice thus prepared, powder it, and thicken Broth therewith.

Also there are many powders for this: As,

Take of Snakeweed and Tormentil Roots, of each one dram: Red Coral and Pearl prepared, of each half a dram: make a Powder to be taken one dram at a time in Broth, or the like: You may make it more Astringent with Red Roses, Myrtles, Pomegranate Flowers, Harts-horn burnt, or Ivory burnt, or Troches of Spodium: Or for more binding, with Sanguis Draconis, Acacia, Galls, Bole-Armeniack, sealed Earth, Bloud-stone: And if you desire to glutinate, also add Fleabane seeds, Starch and Gum Tragacanth.

The Eastern Bole given one dram in Broth doth cure the *Dysentery*, if sufficient purging went before. Or,

Take Powder of *Tragacanth* one dram : *Nutmegs*, *Coral* prepared, of each half a dram : mix them and let it be given twice or thrice with a rear Egg or Broth. Or,

Take of *Gum Arabick* one dram : *Coral* and *Bole* prepared, of each half a dram : mix and use it as the former. Or,

Take of burnt *Harts-horn*, *Bole-Armeniack*, both *Corals*, all the *Sanders* and *Mastich*, of each half a dram : *Frankincense* and *Tragacanth*, of each half a scruple : mix them for a powder, of which take half a dram often.

Foretus doth highly commend the following powder,

Take of *Citrine Myrobalans*, and *Rhubarb* a little parched, of each one scruple : make a Powder for one Dose.

Hercules Caxonia saith, That all new *Dysenteries* are presently and surely Cured by this Powder :

Take of *Cuttle bone* burnt two drams : sponge dipt in *Pitch*, and burnt in a Pot, and of *Egg-shells* the inward skins taken away, of each one dram ; make a Powder. The Dose is one dram in a convenient Liqueur.

The Powder of *Elder-Berries* is by experience approved, it is prescribed by *Quercetanus* in his Dispensatory, and there you may see the use of it.

You may give *Opiates* made after this manner :

Take of *Conserve of old Roses* and *Quinces*, of each one ounce ; *Conserve of Comfry Roots* half an ounce ; *Coral* prepared one dram and an half ; *Crocus Martis*, *Bole Armeniack*, sealed Earth and *Plantane* seeds, of each one dram : *Spodium* two scruples : with Syrup of dried *Roses* or *Myrtles* make an Opiate : of which give the bigness of a *Chestnut* twice or thrice in a day ; Or with an equal weight of *Sugar*, you may make a Compound to be used often.

Myceleta Nicolai is good for the same.

Crato wisely admonisheth, That before the seventh day, before the *Ulcers* of the *Guts* are well cleansed, you give no astringents at the mouth, nor externally, but after the seventh day you may begin with gentle astringents.

Montanus doth wholly forbid them, and useth only Cleansers, Asswagers of pain, and Thickeners ; But when the matter of the Disease is well evacuated, the weakness of the retentive Faculty by which the Flux is nourished, may be well taken away with astringents.

Therefore it will be profitable, after sufficient purging, to give for many days, *Bole*, *Terra Lemnia*, Powder of *Elder-berries*, or other astringents and dryers with *Sugar*, till the Patient be well : but if too much binding seem to hurt, you must purge again, then bind, after purge ; and you must observe that those Earths do avail two ways, namely, by binding, and by opposing the evil quality which is in the Disease : And the Obstruction which is feared by their use, is taken away by *Sugar* mixed with them.

To allay Pain, and heal the Ulcer, this Electuary is best :

Take of the Mucilage of *Quince* seeds, *Comfry Roots*, and *Gum Tragacanth*, all extracted with *Rose Water*, of each one ounce : *Starch* one dram : *Red Coral* two drams ; *Bole Armeniack* prepared one dram : *Pomegranate Flowers* half a dram : *Rob*, or *Conserve of Services*, or *Quinces* two ounces : *Sugar of Roses* one ounce : make it like an Electuary. The Dose is two drams.

Narcoticks, or things that bring rest, given at the mouth, do wonders, for they take away pain, stop the Flux, provoke sleep, and refresh the strength ; but they are better, when they are mixed with astringents and strengtheners. As,

Take of old *Conserve of Roses* two drams : *Laudanum* three grains : *Confectio Alkermes*, half a scruple : Make a Bolus.

In a Malignant and Epidemical, or Common *Dysentery*, Medicines of *Bezoar*, and *Sudorifick* or Sweating Medicines, are powerful ; for it is observed, that by these Remedies, the matter hath been discharged, and the *Dysentery* cured : Therefore observe at first the nature of the Humor ; for if it be malignant, as in a common Epidemical Disease it is, you shall in vain try other Medicines, except at the same time, and in the beginning, you give Antidotes or Cordials. Here you may use all things proper to a malignant Fever : And besides those things that provoke Sweat, as *Bezoar* and *Aqua Theriacalis*, or Treacle water ; *Harts-horn*, sealed Earth, *Bole Armeniack*, *Unicorns-horn*, *Coral*, *Amber*, *Scordium*, *St. Johns Wort*, *Plantane*, *Tormentil*, *Burnet*, and many others, are very good.

Outwardly to the whole belly apply Oyl of *Quinces* and *Roses*, or if you will have a more astringent, Oyl of unripe *Olives*, or put the third part of *Vinegar* to them, and boyl them to the consumption of the *Vinegar* ; If the *Stomach* be affected also, add Oyl of *Mastick* and *Wormwood*.

After anointing, sprinkle the part with some astringent powder made of Myrtles, Pomegranate-peels, Galls, Cypress Nuts, Acorn Cups, Red Roses, Pomegranate flowers, Frankincense and Mastich; to which for the more binding, add Bole Armeniack and Terra Sigillata or Sealed Earth.

Of the same Powder without the Oyls, you may make an Oyntment for the same Use with a little Wax: Or, You may use *Unguentum Comitissa* alone, or with other Oyntments.

The Cataplasm prescribed before for *Diarrhoea*, and this following, if you will bind strongly, may be used:

Take of Bole six drams: Frankincense six ounces: Sanguis Draconis, Mastich and Mummy, of each two drams: make a Powder, which you may apply to the Belly beneath the Navel, if you mix it with Vinegar and the white of an Egg, and lay it upon a Cloth. Or,

Take three ounces of Spiders Webs, and one white of an Egg well beaten: fry them in a pan, and apply them hot to the Navil.

A Cataplasm of Treacle and sealed Earth to the Belly, is good in an Epidemical or contagious Dysentery.

This following Cataplasm to strengthen the Liver is much commended of Solenander in every flux, both of the Liver, called *Hepaticus*, and in a Dysentery and old *Diarrhoea*. Nor must you fear Astringents (saith he) because they are tempered with things to strengthen the Liver.

Take of Liver-wort and Schœnanth, of each one handful: Indian Spike half a pugil: Mastich and Mace, of each half an ounce: Lignum Aloes three drams: Myrobalans, Chebs and Emblicks parched, of each one ounce: Bole, sealed Earth and Bloud-stone, of each six drams: Coriander seeds prepared one ounce and an half: Spodium or burnt Ivory two drams: Roses one ounce: the Species of three Sanders without Camphire half an ounce: Rust of Iron prepared one ounce: Barley flower two ounces: Oyl of Mastich and Myrtles of each as much as is sufficient: make an Emplaster to cover the whole Belly, from the Cartilage called *Enliformis* or *Xiphoids*, to the *Os Pectinis*, or the Bone at the bottom of the Belly.

You may also make a Fomentation for the whole Belly of a Decoction of astringent things made in Iron Water with a little red Wine and Vinegar. Or,

Take of red Roses two handfuls: Wormwood and Mints, of each one handful: Nutmeg and Cypress Roots, Mastich and Galangal, of each one dram: With a Linen Cloth make a bag as big as the Belly, which being warmed in red Wine or Vinegar, may be laid upon the Belly. Or,

Take of Wormwood, Mints, Plantane, Oak Leaves, and tops of Brambles, Horstail and Knotgrass, of each one handful: Chamomel flowers two pugils: red Roses half a handful: Myrtles one dram: Seeds of Sumach, Plantane and Coriander, of each six drams: Nutmegs three: make a Decoction in steeled Water, and red Wine for to foment the Belly.

Rulandus doth apply a Bag of Bran boyled in Vinegar.

If the pain be great, apply a linen cloth wet in steeled Milk that is warm.

But if Fomentations will not Cure, you may use Waters to sit in called *Incessus*. These are commended by Mathew de Gradi, Savanarola and Jachinus, who saith, that they are a great secret for the Cure of Children, for by their actual heat they do drive the humors somewhat towards the Skin, and by their astringent quality stop the flux. But you must not use them if the body be very full of evil Humors, or if the Dysentery be malignant, and joyned with a Feaver. They are made of Oak buds, green Cypress Berries, green Pine nuts, or Leaves, Barks, and other such like boyled in Water, of the aforesaid Decoctions for Fomentations.

You may make Fumigations that the Patient may receive the vapor of them through a hollow Chair.

Especially a Decoction made of Mullen and Fume thereof received, is commended in this Disease and also for a *Diarrhoea*.

Faventius commends a Fumigation made of Turpentine cast upon a hot Iron taken up into the Body twice in a day.

And he commends also this Fomentation:

Take of Balm one pound: Mullein one handful: Put them in a long bag: boyl it well in red Wine, and strong Vinegar, and apply it to the Fundament.

Rulandus useth a Decoction of Acorns in Vinegar for a Fomentation.

And Faventius propoundeth this following Lotion as a secret to stop the Dysentery:

Take of the drops of Iron, and filings of Steel, both prepared in Vinegar, of each one pound: then boyl them in two pints of very strong Vinegar to the consumption of half. Let the Patient put his feet and his hands half an hour every morning and evening therein.

In a long disease, and when there are Ulcers in the Guts, Quick-silver is good, if it be mixed with Oynt-

Oyntment of Roses, and the Belly anointed therewith. As also the Clysters afore-mentioned for filthy Ulcers.

At the same time you may give Milk and Syrup of Myrtles.

Also one dram of true Balsom given in water, doth wonderfully heal all inward Ulcers.

For asswaging pain, apply the Caul of a new killed Sheep to the Belly, and bind it on, especially to Children, and repeat it often.

If the Liver, Stomach or Brain cause this Flux, you must use proper Medicines to them, always making choice of those that do astringe and strengthen.

For his ordinary drink, give him Spring water with Conserve of Roses, the Tincture of Roses, a Decoction of Oaken Leaves, or water wherein *Terra Sigillata* is infused, or wherein red hot Gold hath been quenched with Syrup of Quinces, Myrtles, or dried Roses. Or when there is no Feaver, use a weak Decoction of Mastich with the Syrups aforesaid. According to *Crato's* Judgment, you must not use any Chalybeat or steeled drink; for it doth not astringe, as commonly they suppose, but troubleth the Belly. Others commend the Decoction of Gramen or Dogs Tooth, because it is good to dry and divert by Urine.

Lastly, 'Tis worth the observation which *Aetius* speaks, *Lib. 3. cap. 8.* and *Paulus, Lib. 1. cap. 35.* That old Fluxes are dried up by Venery. Which *Hippocrates*, said formerly, 7. *Epid.* in the end; *Excessive Venery doth cure fluxes of the Belly.* *Amatus Lusitanus* learned this Truth by Experience, *Curat. 41. Cent. 2.* One troubled with a Dysentery (saith he) very violently, was married, and the first night he lay with his Wife was cured.

Let this be added for a Conclusion, which is related in the Cure of Diarrhœa out of *Platerus* in his Cure of the Flux of the Hemorrhoids; Hot Blood of either Man or Beast given in a Clyster, doth wonderfully stop and cure the Flux.

CHAP. VII. Of Tenasmus.

Tenasmus is a continual desire to go to Stool, and voiding of nothing but slime or bloody Matter.

CAUSES. The immediate cause of this Disease, is an Ulcer in the streight Gut called *Intestinum rectum*; from which, Quittar or filthy Matter continually floweth, and stirreth up the Expulsive Faculty, by which means there is a continual desire of going to stool. Moreover, there is voided a slimy Matter mixed with blood, from the depravation of the *Homoiosis* (or quality that converts things into its likeness) of the ulcerated part, because it cannot well concoct its proper nourishment, and make it like it self, but turns it into another slimy substance; as we shewed more at large in Dysenteries, and other Ulcers of the Guts.

But in regard we said in the Chapter of Dysentery, that all the Intestines might be ulcerated in that disease; thence it seems to follow, that the Ulcers of the straight Gut called *Rectum* belong to a Dysentery. Yet Custom hath so prevailed, that when the *Rectum* is only hurt it is called by the name of Tenasmus: And because when other Guts are affected, if the *Rectum* suffer, there is also Tenasmus or needing, although the disease be then called a Dysentery; therefore Dysentery and Tenasmus are of the same Nature, and have the same Cause, and differ only in respect of the part affected. And therefore we need not repeat the Causes, because they are the same with those that produce a Dysentery.

DIAGNOSTICK. For the knowledg of this disease, there is no more required but to distinguish it from a Dysentery, which you may learn from the definition. For in a Tenasmus there is a continual meeting; but in a Dysentery it is by fits: besides, in that, after great straining, there is voided only a little slime, bloody or mattery; but in a Dysentery, both Excrements and Humors are continually voided.

The Signs of the Causes are the same with a Dysentery.

PROGNOSTICK. As for the Prognosticks, *Celsus*, lib. 4. cap. 19. saith, that a Tenasmus is easily cured, and that of it self it never kills any; yet *Galen*, 5. *de usu partium*, cap. 4. reckons it among the chiefest diseases of the Belly; and truly it may very well be accounted grievous, in respect of its troublesomeness and long continuance; yet it is not dangerous, except it come of melancholy, for then it tends to a Cancer ulcerated; besides, it brings great inconveniences, as Miscarriage or Abortion to Women. So *Hip. Aph. 27. Sect. 7.* saith, if a Woman with-child have a Tenasmus, she will miscarry. For the continual straining at stool doth much disturb the Womb, which is so near to the straight Gut. Besides, the same Muscles which serve to throw out the Excrements, are employed for delivery; therefore when they daily compress the lower Belly, they cause Abortion. Lastly, the Ulcers of the *Rectum Intestinum* being near the *Anus* or Fundament, if they continue long, turn to an incurable Fistula.

CURE. The Cure of a Tenasmus little differs from the Cure of a Dysentery. And therefore first, the sharp humors that come from the Liver and other parts, are to be purged with Medicines that leave an astringent quality, as chiefly Rhubarb, which must be so often given, till the humor seem to be spent.

If there be an Inflammation (which is chiefly known by a Fever) or if much blood; you must open a Vein. And in case it continue after bleeding, and cause a strangury or difficulty of Urine (as it often doth) it is very good to open the Hemorrhoids with Horse-leeches.

Also you must use asswaging Clysters when there is much pain; and cleansing, glutinating and astringent, according as the Ulcer requireth; the forms whereof are to be found in the cure of Dysentery.

But in the use of Clysters, observe first, that you give them often, and in a small quantity, only half a pint, because they will be hardly kept any time, by reason of the continual needing. And the pipe must be warily conveyed in, lest the pain be increased.

And you must diligently apply Fomentations, Injections or Baths to sit in, Fumigations, Suppositories and Ointments.

You may make a Fomentation thus:

Take of Mullein and Wormwood of each six handfuls: boyl them in new Milk, and put them into two bags, which apply to the Anus and whole Belly one after another very warm. Or,

Take of Camomel Flowers and Roses, of each one handful: red Wine two pints: Infuse them two hours upon hot Embers. Foment the Fundament as hot as can be suffered with four times doubled cloths: After let the Patient sit upon a sponge dipped and strained from the same Liqueur.

Or, Fill two Bags with Barley Bran, and boyl them in Vinegar: Let the Patient sit one while upon one, another while upon another, as hot as he can.

If he void much blood, make the Fomentation thus:

Take of Mullein Leaves and Roots two handfuls: Red Roses one pugil: Pomegranate peels and Galls, of each half an ounce, boyl them in two parts of Iron Water, and one of red Wine for a Fomentation; which you may make stronger, if you add half an ounce of Allium.

Injections, or Baths to sit in to assuage Pain are made of Emollients boyled in Water, or Broth of Sheeps Head and Feet, to which you may add Violets, Nightshade, Gourds and Melons sliced, but for healing of Ulcers you must make them of Astringents aforementioned.

Fumigations are good to dry the Ulcer, made of Frankincense burnt, or the Decoction of Savin made in Oxycrate, or other things mentioned in the Cure of a Dysentery, the Fume whereof must be taken sitting in a hollow Chair. But this following is commended by Forestus.

Take of Mastich one dram, Frankincense one scruple; Myrtles one dram and an half: Red Roses two scruples: make a Powder for a Fumigation.

Suppositories are good in this disease, they must be gentle and mild, lest they exasperate the part which is so sensible: They are fitly made of Goats Suet cut into the form of a Suppository; for they appease the pain, and heal the Ulcer: but they will be better against pain, if you mix the seed finely powdered of Poppies or Henbane, and tie them in a knot in Paper like a Suppository: But far best, if you instead of these things put three drops of the Oyl pressed out of these Seeds to every Suppository: or one grain of Opium dissolved in half a scruple of Oyl of sweet Almonds.

The Ulcer will be sooner healed, if you first dissolve the Suet, either alone, or with white Starch, Gum Tragacanth beaten, and first steeped in Plantane Water, or else with some Narcoticks: Or thus,

Take of Gum Tragacanth as much as is sufficient, Sprinkle it with Plantane Water, that it may only swell and dissolve; then add as much of the Mucilage of Fleabane seeds, or Quince seeds, and mix them with the white of an Egg roasted; then with melted Wax make them into a Suppository: You may also add Narcoticks: as likewise to Cure the Ulcer better, the powders of Ceruse, Tutty, Bole, Pomegranate Flowers, and the like, which dry without Acrimony and sharpness: And these must be very finely powdered and sifted, lest the part be exasperated.

You may apply Oyls and Ointments as in a Dysentery, to the Belly and Fundament: As Ointment of Roses, Populeon, or of the Mucilage of the whites of Eggs, Oyl of Roses, and the like, to take away Pain and Inflammation: and other things that shall be mentioned in the Chapter of Hemorrhoids, or to Cure the Ulcer, the white Ointment of Rhasis or Pompholygos, melted in Hydromel, or in Honey and Water.

Lastly, In a more desperate condition, use Narcoticks both inwardly and outwardly; but three or four grains of Laudanum is best given with Mastich and Terra Sigillata, or mixed in a Clyster made of a Decoction of the Flowers of Camomel.

CHAP. VIII.

Of Fluxus Hepaticus, or Flux of the Liver.

A Flux of the Liver is that in which ferous and bloody humors like water wherein flesh hath been washed, are voided.

CAUSES. This Disease is produced from the Liver, being weak, and out of tune; by reason whereof it cannot breed good blood, but turneth the Chylous matter into thin and ferous blood, which because it is not fit to nourish, is sent by Nature into the Intestines, from whence comes this Flux of the Liver.

This weakness and disorder may come from any distemper: For by the excess of any of the first qualities, the Native heat, and its power to make blood, is dejected. Yet this hath a doubt rising from Experience, because we see often, that great distempers of the Liver, and excess in the first qualities do produce other diseases, and not this. And again, this Flux is many times without the excess of the first qualities. That therefore the nature of this disease may be declared, we must say with wise *Verandens* my Master, there is something more than an ordinary distemper for producing of this disease. And it is occult or hidden, consuming the radical moisture in the Liver, which also destroyeth the Natural heat.

This evil disposition, and occult distemper may come by burning and swooning Feavers, by a hot distemper of the Bowels, which melteth the Oily substance, by occult corruption, and corruption of humors, by a great coldness from Flegm and Melancholy abounding, which doth oppress and corrupt the natural heat; and it may come by outward Causes, as great draughts of cold water, Snow or Ice, extraordinary eating of raw Sallets, Poyson and Medicines that purge too vehemently. By drinking of too much new Wine, salt, sharp and prepared Meats, and strong things which parch the substance of the Liver. To these you may add all other Causes, which by too much cooling or heating do dissolve the strength and tone or order of the Liver.

Hitherto is declared a true and proper flux of the Liver which hath this sign, there are liquid and ferous stools, like washings of flesh, from the weakness of the Liver, which cannot sanguifie or make blood well, or from a malignant distemper which spoileth the natural heat and moisture.

There is also a Bastard-flux of the Liver, which comes of a simple distemper, without any fault of the radical moisture; by which distemper the faculty is not hurt, but the work hindered; so that instead of pure blood, there comes impure and corrupt, or good turns into evil, when in a true flux of the Liver there is never any good blood in the Liver.

The blood is corrupted, either by the mixture of Choler or Melancholy, or some other impure Matter, or from its too long staying in the Liver, and the parts adjacent, by which it is made thicker, or burnt, or rotten; or from the fault of the Spleen, which doth not suck away the drossie blood; and in this Bastard-flux, sometimes thick, sometimes black blood is voided, and sometimes blood is mixed with humors of divers colours.

SIGNS. The signs of this disease may be gathered from what hath been said. For in a true Flux there appear moist stools, like washings of flesh, which are not in other Bloody-fluxes, if in a Dysentery at any time, it is seldom, and then there is Choler, Flegm, and excrements of divers colours voided: and in a Dysentery there is pain and torment of the Belly, but in this none.

The Signs of the Causes are known by their proper Characters: For if the weakness of the Liver come from a hot distemper, there went a burning and consuming Feaver before, or there is green vomits or stools, thirst, and a Feaver, foulness of Body, and want of Appetite and stinking evacuations; but if it come from a cold cause, the stools are less stinking, neither is there thirst or consumption; the whole Body is colder and blewish.

Sometimes there comes a Feaver from the putrefaction of humors, which changeth the said symptoms; but you must examine the Causes foregoing, which will declare both distempers. Also in this cold distemper the Patients desire much strong Wine.

A moist and dry distemper are known by the contrary effects. A moist causeth more and oftner stools, very thin; but a dry, little and thicker stools, but there is also a great thirst.

Lastly, The External Causes are known by the relation of the Patient, and those that are with him.

A Bastard-flux of the Liver hath almost all signs of a Dysentery, only there is no pain of the Belly, nor pieces of flesh in the stools as in a Dysentery.

PROGNOSTICK. The Prognostick of this disease useth to be evil and deadly; for when a principal part is very ill, by consumption of the radical moisture, whose reparation is scarce to be hoped for, we can expect for the most part nothing but destruction, especially when the disease comes of heat.

When

When this disease comes in Feavers, there presently follows a melting of the Body, and great putrefaction, which presently kills the party: For in malignant and pestilent Feavers, the danger is increased according to the evil condition of the Cause. But when this disease comes of a cold distemper, it useth to last longer, and turn into an incurable Dropsie.

Lastly, A Bastard-flux of the Liver, although it be dangerous, yet is it less than a true, because it comes only from a simple distemper and evil disposition of the Humors, the tone and strength of the Liver remaining sound, and may be cured by taking away the Causes that defile the Blood.

CURE. The Cure of this disease is wrought by Medicines that strengthen the Liver, correct its distemper, and stay the Flux. And because it comes oftneft of a hot distemper, therefore we will first speak of the Cure of that distemper, because it comes seldom of a cold Cause, and is to be cured as a Dropsie.

First therefore (although Evacuations seem to be needless, by reason of the greatness of the Flux) you may give Rhubarb either alone, or with Myrobalans, as in the Cure of the Dysentery, because it doth strengthen the Liver, and the rather if you find any filth in the stools; for many Patients have been cured by only one scruple of Rhubarb given many days together in Conserve of Roses.

Clysters are here of little worth, because the Liver is affected; yet sometimes you may give one of Chalybeat or steeld Milk, or of a gentle astringent Decoction, lest the Guts should be too much relaxed.

But you may make Juleps to strengthen the Liver, and correct its distemper, thus:

Take of Succory, Graminis, (or Dogs Teeth) and Sorrel Roots, of each one ounce: Endive, Succory, Plantane and Dodder, of each one handful: Sea-wormwood half a handful; red Sanders one dram and an half; the shavings of Ivory and Spodium, of each two scruples: Coriander seeds prepared one dram: red Roses one pugil: boyl them to one pint and an half; dissolve in the straining Syrup of Quinces, and simple Syrup of Vinegar, of each two ounces: Make a Julep for four Doses to be taken morning and evening. Or,

Take of Plantane Water four ounces: Syrup of dried Roses one ounce: Spirit of Vitriol as much as will make it moderately sharp, make a Julep to be repeated often.

He may also take of these Syrups following often in a spoon:

Take of Syrup of Myrtles, Quinces, and dried Roses, of each one ounce: the Syrup of Succory simple or compound with Rhubarb, one ounce and an half: Mix them.

There is an excellent Syrup made of the Tincture of Roses, made in Rose-water, and with Sugar of Roses brought into a Syrup.

Also this following Powder given to the quantity of half a dram, or a dram once or twice in a day in a rear Egg, Broth, or other fit Liquor may be used with profit.

Take of Plantane and Sorrel seeds, of each one dram: Endive, Purslane, Dodder and Coriander seeds, of each one scruple: red Roses, and Troches of Spodium, Gum Tragacanth torrifed, of each half a dram: the inward skins of Hens Gizzards dried, half a scruple: Make a very fine Powder.

Or the Lozenges made of the three Sanders, with a double quantity of Rhubarb given to two drams at a time are good to strengthen the Liver; as also this following Opiate:

Take of Conserve of Succory Roots one ounce: Conserve of old Roses half an ounce: the pulp of Currans six drams: Crocus Martis one dram: prepared Coral, shavings of Ivory and Hartshorn, of each one scruple: with the Syrup of dried Roses make an Opiate, adding half a scruple of Spirit of Vitriol, of which let him take the bigness of a Chesnut three hours before meat. You may add the Liver of a Wolf prepared, which is a specifical proper Medicine according to divers Authors.

Raisins of the Sun, because they are good for the Liver, are commended in this disease, therefore you may eat them in great plenty with their stones; which that they may be better taken, may be beaten first in a Marble Mortar.

Or make a Rob or Syrup of Raisins, boiling them in red Wine, if it be not too hot, and then straining out the Juyce, and boiling it again till it is thick: which you may use alone, or in form of an Opiate, with these following.

Take of Currans half a pound, boyl them to the thicknes of a Pultis in old Wine; pass them through a sieve, and mix with the straining, candied Citron peels half an ounce: the powder of the three Sanders and Diamargariton frigid, of each one dram: Coral prepared, and red Roses of each four scruples: the Liver of a Wolf prepared three drams: Make an Opiate.

The Syrup of Coral is very excellent to strengthen the Liver, and stay the Flux thereof; but the Tincture thereof is far better: As also the Extract or Magistery given in Plantane Water.

The Juyce of young Nettle-tops given either by it self to two ounces, or with Water and Vinegar every morning for three days together, stops the Flux, and purifieth the corrupt blood.

But

But because in this disease the Body is much consumed, a restoring distilled Water that will also stay a flux, either must be give often by it self, or with other Drinks.

Take a fat Capon, and a Partridge, and pulling off the Feathers and the Guts out, fill their Bellies with Succory, Agrimony and Snails, of each one handful: Conserve of Roses three ounces: Plantane and Coriander seeds prepared, of each two drams: Citron Myrobalans one dram: Blond-wort half a handful: the Troches of Amber and Spodium, of each four scruples: the Powder of the Electuary de Gemmis (or precious Stones) the three Sanders, and Diamargariton frigid, of each one dram: Sprinkle them all with astringent Wine, and putting them into the bellies of the Fowls: boyl them in a close Vessel in four pints of Water, till half be consumed: then put them all in a Glass Limbeck with three ounces of good Wine; distil them in Balneo Mariæ for the use afore said.

For Drink, let the Patient take the Tincture of Roses, or the Decoction of Succory and Dogstooth, with Syrup of Quinces, and some few drops of Spirit of Vitriol.

Things made of Barley, Almonds and Rice, are best in Meats.

Outwardly to his Belly apply those things which were prescribed in the Cure of a Dysentery, with some things for the Liver, as Wormwood, Roses, all the Sanders, Spodium or burnt Ivory, &c. Which anointings of the Belly must reach to the Region of the Liver.

You may also apply the following Epitheme to the Liver:

Take of Endive and Succory, of each one handful: Dodder, and both sorts of Wormwood, of each half a handful: red Roses one pugil: red Sanders one dram and an half: Spodium two scruples: boyl them to one pint and an half, and dissolve in the straining two ounces of Rose Vinegar: boyl them again gently, and make an Epitheme.

Let the same part be anointed with the following Oyntment:

Take of Cerat of Sanders two ounces: Oyl of Quinces and of Wormwood, of each three drams: Mix them for a Liniment.

Lastly, If the Patient be troubled for want of sleep, as is usual, because this kind of flux is most in the night, you must use Narcoticks, such as were propounded for the former fluxes.

CHAP. IX.

Of the Worms.

ALthough Worms breed in divers parts of the Body, yet because they are more usual in the Guts than in other parts, therefore we will speak only of those.

By some it is questioned, to what kind of Disease that is preternatural, the Worms are to be referred? But we can take away all occasion of doubting, by saying, that after a divers consideration they may refer to all kinds of Diseases; for as they prick and pull the Guts, or obstruct them, and produce other diseases, they may be said to be causes of diseases. But as they are substances added to those which ought naturally to be contained in the Guts, they are reckoned by Galen in the number of those diseases which are in the number encreased wholly against Nature, as the stone also. And lastly, as they are sent preternaturally by the Belly or the Mouth, they are to be referred to the fault in Excretion, or sending forth.

Galen in his Comment upon the Aphorisms, Aphor. 26. Sect. 3. propounds three kinds of Worms: The round Worms, which are often bred in the Guts, and get often up into the Stomach; the Ascarides, or little worms like small threads, which use to lie in the inferior part of the thick Intestines, and over against the Sphincter Muscle; and the broad worms, called Fascia, because they are long and broad like Childrens Swathing bands. This kind is more rare to be seen than the rest, and a Physician shall scarce see them in his practice twice or thrice in a year, yet there are great Controversies among Authors about them; some say, it is one worm only; some that it is made of many united, which they call Cucurbitinos or Gourd worms, and say that they are parts of the Broad worm; others make a fourth kind, containing the Gourd worms; but we do not intend here to shew their Reasons, and several experiences they have so much boasted of, the curious Reader may search for his better satisfaction, Rondoletius, Platerus, Sennertus, and many others.

CAUSES. Moreover, There is a great controversie of the Causes of Worms; some say they come of putrid heat; others from the Natural; others say that both concur for the productions of them.

The first say, that all Insects or Vermine come from corruption, according to Aristotle. The second say, That putrid heat is strong, fiery and destructive, and therefore is not fit to produce a live body. The third say, to reconcile the former, That the Matter is disposed by the putrid heat to generate worms, and the Natural heat doth turn it so prepared into Worms by way of concoction.

But this reconciliation will not hold, because according to the Axiom in Physicks, it is the property of the same thing to dispose of the matter, and bring in the form, and therefore the preparation of the

the Matter, and the introduction of the form, ought to be from the same agent. Besides, worms breed in Carcasses where there is no native heat; we may say that the heat which is putrid, in respect of the matter putrifying, is native in respect of the worms, because the natural and putridinal heat differ but in degree, but divers degrees of heat are required for the generation of divers creatures; and therefore heat which is putrid in respect of us, may be natural in respect of another creature; So the heat which is natural to a Lion, would cause Feavers in us: and by consequence is putrefactive: Many flie to the heat of the Sun, which is the universal Cause of all Generation; but we must always acknowledge a particular cause, from whence the effect is immediately produced, by the Concurrence and Co-operation of the universal cause: but here is a greater difficulty, because it is a common Axiom or Theorem, That nothing can beget a thing more noble than it self; and therefore heat is not the chief agent in breeding of worms, which are the prædicament of substance, and heat is but an accident; and whatsoever is spoken of the Sun, the form of a worm is more noble than the form of the Sun, because it is the form of a living creature; and that of the Sun is *Forma mixta*, or the form of a mixed Body only; This doubt brings us into that large and weighty Disputation of an Equivocal Generation, in the Circuit whereof very excellent Philosophers have writ whole Volumes, to which we send our Reader, and chiefly to *Fortunius Licetus*, his Book of the *Spontaneous Generation of Living Creatures*: Let it suffice in this place, that to say, Many of their Opinions are brought to this. They believe Seeds of many things to be in divers Substances, which according to their divers Changings come to light, even as the matter is more or less disposed by putrifaction, or other alteration to receive this or that form; and the Seed which is more agreeable to that disposition brought into act, and bringeth into the matter a form proper to it self. This Opinion doth not much differ from the old Philosophy, which teacheth, That Forms proceed from the power in the Matter: but they think it safer to hide the Seeds of things in their Matter, which are truly efficient, than to acknowledge only the power of the Matter, which hath no power to be an efficient, for we must find out some efficient with the power of the Matter, which may raise a Form from it, or rather introduce or bring Form unto it.

CAUSES. The Material Cause of worms is commonly sweet Flegm which groweth putrid, by which it gets a disposition to be turned into worms; but we may think it no way necessary, that food which will breed worms, should be first turned into Flegm: For worms may breed of their immediately being putrified, as we see in Flesh, Cheese, Chestnuts, Apples, Pears, Cherries and other Fruits which bring forth worms by being putrified: So it is in our Bodies, especially in Children which are given to Gluttony, and eat the aforesaid things, and take new commonly before the old is Concocted. Hence it is, that they putrifie and breed worms.

But let young Physicians observe this, That sucking Children that eat meat are most troubled with worms, and because their stomachs are not able to digest it, therefore it is corrupted and turned into worms; moreover, Milk is quickly digested in the stomach, and presently sent to the Guts; and if it hath Meat mixed with it, which could not so suddenly be digested, it will be sent into the intestines with the Milk, and therefore corrupt and breed worms. And observe, That Worms never breed of Milk only, so that as often as you consider the disease of an Infant, take notice, Whether it have the worms or no, which Women always proclaim and say all their diseases come from thence, as they ascribe all diseases of Women to the Mother; and the Physician may certainly pronounce that the Child hath not the worms, if it live only upon Milk, and have eat neither Meat nor Broth: *Galen* in his *com. aph. 26. sect. 3.* taught this, saying, That in Children that suck Milk only, no worms do breed; the Reason whereof is not plain. Many say, That in sucking Children the heat is not strong enough to breed worms: and this is confirmed by *Galen* in the place cited, where he saith, That strong Heat is required for the Generation of worms: and thence he saith it comes, that worms are more in Youth than Infancy: which also *Hippocrates* teacheth in the *Aphorism* aforesaid: and which it seems to gain-say in *lib. 4. de morbis*, where he saith, That worms breed in Children before they are born; but these have not stronger heat than they that suck: And *Hippocrates* gives another Reason why children in the Womb should have worms, because their Excrements are retained: but when they are born they do not breed worms, because then their Excrements are not retained. But this will not satisfy, because then oftentimes in children that suck, the excrements are retained, and yet they have no worms while they live only upon Milk; therefore since the aforesaid reasons do not content solid wits, we expect the new thoughts of Wise men touching this matter; and in the mean while, we will briefly declare our Opinion, and leave it to the Judgement of the Learned: we say, then, That Milk putrifying doth grow fowr, and then is unfit for to breed worms, but rather hindreth them; for it is known, that all fowr things do kill worms: Hence it is, that the Juice of Lemons is so ordinarily given against them, and in ordinary drink a little Spirit of *Vitriol* to sharpen, doth wonders.

It is commonly thought, That among the material causes of worms, Sweet things are the chief: which is to be doubted of, because it is confirmed by a common Axiom, That sweet things do easily

turn

turn into Choler, and Choler by its bitterness doth kill worms: but we can easily answer this doubt thus; In Cholerick Bodys, and such as are sharp with heat, sweet things do easily breed Choler, because by over Concoction they grow bitter, as we see daily in artificial concoction: but in other constitutions that are not Cholerick, sweet things do not breed Choler, But rather Flegm, when they are sent too soon from the Stomach into the Guts, and so being crude, and only half concocted, they putrifie, and become a fit matter to breed worms.

But there is yet a difficulty concerning Sugar and Hony, which since they have a substance not subject to putrification; but rather that doth preserve other things from it, cannot breed worms. This Reason convincing, we say that Sugar and Hony will not breed worms, because their substance is corruptible; but being once bred, they do feed and maintain them, because the worms loving sweet things do stir themselves at the approach of Hony and Sugar, and get into the Stomach, where they grow with speed; from whence those symptoms do arise which are proper to worms.

SIGNS. The Signs of worms in the Guts are divers, not all in all people alike. The usual and most ordinary signs are; A stinking breath somewhat fowr (as the Women call it) and stools like Cow dung, of a gray colour like Potters Earth dissolved. Other signs are less usual, as a continual Feaver, which is often in a day more violent from the motion of the worms, with heaviness, cold sweat sometimes and fainting, loathing, vomiting and unquenchable thirst. The Pulse is unequal, the Cheeks are by turns red and blew, the Eyes shine, the Nose itcheth, the Teeth gnash, and sometimes chatter, there is a small dry Cough and much spittle: sometimes there is heaviness of head, and sleepiness; sometimes doting, and Epileptick Convulsions: There is often a pain in the belly, by gnawing, sometimes by inflammation and distension or stretching forth like men in dropsies: sometimes there is starting in the sleep, and some tremble and rise up, and fall asleep again; sometimes all the body pineth, and the Patient hath a Dogs Appetite, insatiable, which is most usual in the flat worms, which eat up all the food. Moreover, If Gourd worms, called *Cucurbitini*, be voided, they are a sign of flat. The *Ascarides* are known by the itching of the *Anus* or Fundament, and the Excrements are many times filled with them.

For a Conclusion, The consuming, putrification, and eating away of the Gums, is to be reckoned among the signs of the worms, which is confirmed by this following Observation: A certain boy was a long time troubled with eating away of his Gums, many Medicines both internally and externally were applied, and all in vain; at length he died: the body being opened, there were found so many worms, that in some places the bowels were eaten through, and many were found in the empty places of his Belly.

PROGNOSTICK. As for the Prognostick: Many worms are worse than few, great than little. Many times they are dangerous, and bring great diseases; as a strong Feaver by fits, swooning, speechlessness, doting; epilepsie, cholick, and dogs appetite.

In the beginning of a disease it is evil for worms to come forth either alive or dead, especially if they come forth alone, and without dung: for when they are alive, and come forth, they signify great crudity, or want of nourishment: but dead, they signify great putrification, by which they are killed.

Worms in the declining of a disease, coming forth with the excrements, signify Health, if concoction appear: for it appears then, that Nature ruleth and mastereth the Excrements.

CURE. The Cure of the worms is by driving them out, because they are wholly against Nature, And this is done by purging Medicines, which kill worms, and evacuate the matter that breedeth them.

Rhubarb is the best, which you may give in a Flux or Feaver. But you must first give things that kill them, or at least that drive them to the inferior intestines by things taken at the mouth, or those things that draw them down by Clysters.

The usual forms whereof are these:

Take of Dogs-tooth and Purslane water, of each one ounce and an half; Syrup of Lemons one ounce, Confectio de Hyacintho one dram, the Powder against Worms one scruple. Make a Potion: Give it presently, and then this Clyster:

Take of whole Barley, Bran, and red Roses, of each one pugil: Liquoris and Raisins scraped and stoned, of each half an ounce: Boil them to half a pint, or three quarters of a pint: Dissolve in it strained, red Sugar one ounce, and one Yolk of an Egg. Make a Clyster.

You may add Cassia or Diacatholicon, if you desire it stronger.

After those Medicines have been given once or twice, give this Potion:

Take of Rhubarb one dram, yellow Sanders half a scruple: Infuse them in Water of Dogs-tooth or Purslain, two or three ounces: strain them, and dissolve in it the powder of Rhubarb, and powder against the Worms, of each one scruple: Syrup of Roses one ounce: Mix them for a Potion.

Or,

Take of the powder of Rhubarb and Coralline, of each half a dram, more or less, according to the age: Dogs-tooth Water two ounces, Syrup of Violets one ounce. Make a Potion.

If the Feaver be not great, two drams of *Hiera Picra* more or less, are to be mixed in a Potion: for by its bitterness it killeth and expelleth Worms excellently.

If these things will not Cure them, use these following:

Take of Dogs-tooth and Sorrel water, of each one ounce; Endive, Succory, Sorrel and Purslane, of each one handful: the tops of St. Johns-wort, Scordium (or Water Germander) and Centaury the less, of each one pugil: Coralline three drams: boyl them to a pint, dissolve in the straining three ounces of Syrup of Lemons. Make a Julep for three or four Doses, to be taken twice in a day.

Take of the Oyntment de Artania (or Sowbread) three ounces: Quick-silver one dram: mix them, and anoint the whole Belly.

Then purge again, and often, till the body be cleansed.

And you may add to the former Decoction, Senna, Agarick, Rhubarb, &c. and give it but once in a day.

Rondeletius highly commends the Eleotuary *Diacarthamum*, as an excellent Remedy to expel Worms, and to purge flegm and corrupted Chyle, of which worms breed, and are nourished; as also he commends the infusion of Agarick in Oxy-mel. Which Remedies are proper, if there be no Feaver.

But because oftentimes the diseases of the worms in some children cannot be cured without much labour and time, there are many Remedies found out by Authors, both internal and external.

Among the Internal, first we will treat of Powders, whereof there are divers Forms in Authors.

The chief are these following; the dose whereof is from one scruple to a dram, according to the age of the Patient in some convenient Liquor.

Take of Worm-seed half an ounce: Coralline three drams: Harts-horn two drams. Make a Powder. Or,

Take of Worm-seeds, Coralline and Harts-horn burnt, of each equal parts. Or,

Take of *Hiera simplex* two drams: Worm-seed, Scordium, the lesser Centaury and Coralline, of each one dram. Make a Powder.

Take of Rhubarb and Agarick, of each one dram: Troches of Alhandal one scruple: *Diagridium* half a scruple, Coralline and burnt Harts-horn, of each half an ounce: Myrrh, Zedory and Tanisie flowers, of each one scruple; Salt of Wormwood and Tartar, of each half a dram. Make a fine Powder.

In the use of these Powders observe that they which are made of hot things, are to be given seldom, and in small quantities to hot Natures, and in Feavers.

Women use to give to Children troubled with the worms, Worm-seed made up with Sugar, or mixed with Hony; which is an excellent Medicine, because the worms desiring sweet things, take in the Hony, and withal the Worm-seed, whereby they are destroyed.

But because Worm-seed is very hot, it may be made temperate by infusing it two hours in Vinegar, and after mixing it with boyled Hony into the form of an Opiate, which *Amatus Lusitanus* doth praise as a principal Medicine against Worms.

Burnt Harts-horn is commended by *Forestus*, given with Raisins, or otherwise, and some have been cured with that alone. But it is chiefly good for them who have the worms, and a flux withal. In which diseases coming together, he commends also the Juyce of Plantane, and the Decoction of Knot-grass given to drink. To which may be added Topicks applied to the Belly, partly astringent, and partly having vertue to kill Worms.

Women do use common Oyl given with Wine, for that Oyl stops the pores of the Worms, and so choak them for want of breath, and Wine kills them by its sharpness. But when there is a Feaver, it is better to give Oyl with the juyce of Lemons or Pomegranates; or which is better, Oyl of bitter Almonds with the said juyces, or Oragne flower water.

Stocheus in his Empirical Medicines commends the oyl that is taken out of a dried Hazel stick, if it be given but a drop or two at a time to a child, or to a youth, three or four in a crum of Bread; For (saith he) it doth immediately kill them, and cast them forth by stool; also by but touching of Worms or Lice out of the body, it killeth them. The best Authors will have this Oyl of Hazel to be the *Oleum Heraclinum*, by which *Martin Ruland* did cure Children of the Worms in a moment, by anointing only their Lips and Navils, as you may see in his Centuries.

But we have found by Experience, that the Oyl of Juniper given but a drop at a time in Broth, to be excellent for Children so troubled, if they have not a Feaver.

But Quick-silver would exceed all, if we durst give it inwardly; which great Doctors say may be done. Some of whom I will mention, so that they who please to try it, may have Authority for it.

Mathiolus in his fourth Epistle to *Stephanus Laureus*, the Emperors Physician, saith, Because Quick-silver (as *Dioscorides* saith) doth no otherwise kill, but by tearing the Guts with its great weight

weight: we fear not that it will do it in a small quantity, especially because its weight and roundness will easily carry it through the Body. Therefore let us not wonder why Brastavolus, that Famous Physician of our Age hath written, that he gave Quick-silver to Children without any inconvenience. And also a Padua Physician used it with good success, but never would tell us the way of giving and preparing of it. And I, though I never gave it, have seen Midwives give a scruple, or half a dram to Women that had hard labour, without inconvenience, and always with good success: Thus Matthiolus.

Fallopins in his Treatise of the French Pox, Cap. 76. If (saith he) Quick-silver be drunk down, it doth not so much as when it is used with an Oyntment; I have seen Women to cause Abortion, take a pound thereof without hurt. I give it to Children for the Worms, and it doth bring no symptom, but only kill the Worms.

Platerus in the Cure of the Worms saith the same; Give a drop or two, or half a scruple of Quick-silver, and it kills the Worms, or makes them crawl out of the Body, and it may be done without hurt, as we shewed elsewhere.

Fabricius Hildanus, in his 71. Observation, Cent. 2. saith of a Woman troubled with the Worms, sent to him by Gilbert Saracenus, thus: Having reckoned up many Medicines, to these (saith he) I added the excellent Medicine of Quick-silver, a dram and an half strained through Leather, and yet she was not freed of them.

John Baptista Zappata, in his Book of Womens Secrets, Chap. 5. tells many famous Stories of the Cure of Worms by Quick-silver, when Aloes and Wormwood would not do it. He shews two ways of giving it.

The first is this:

Take of Quick-silver one dram, but a scruple or two for little Children: Benjamin half a scruple, four or five drops of Aqua-vita: mix them in a glass Mortar with a glass Pestle, then put to it a little Conserve of Roses or Violets for a Bolus, which let the Patient take in the morning by it self, or with a little Bread.

The second way is this:

Take a little coarse Sugar, and three or four drops of Spring Water; mix them in a glass Mortar till they are like Honey: then put to it as much Quick-silver as was aforesaid; mix them together with six or seven drops of Oyl of sweet Almonds, which will keep the Quick-silver from coming again to its body: And with a little Conserve of Roses, make a Bolus.

Barcellus in his Book called the Genial Garden, saith thus. Quick-silver, which some account Poison, is safely given against Worms, and it is accounted so certain a Medicine in Spain, that the Women there give three grains thereof to Children which peck up their Milk. I cured a Widdow which vomited nine days together by reason of Worms, and scarce eat in three days, neither could retain any thing she took; to whom I gave two scruples of Quick-silver, with a little Conserve of Quinces, and she voided downwards above an hundred Worms, and was cured the same day, and went about her business, to the great admiration of her Parents, being formerly weak and lean. I have given it also to others, and with good success always; and I keep continually at home Quick-silver infused in Water, which Water I give to Children for Worms; nor did I ever receive any discredit thereby. Matthiolus used the same, so did Horatius Angenius, and many other Famous Men, who all do extol the benefit of this Medicine. You may give it to Children in substance one scruple, and to Youth two scruples, or a dram. It is mortified and corrected with red Sugar in a glass Mortar, wherein it must be so long stirred that it be invisible; and lest it should return to its former condition, you may add thereto two drops of the Oyl of sweet Almonds. Give it with Sugar of Roses, Violets or Quinces fasting. Thus Barcellus.

Sanctorius in meth. vitand. error. lib. 5. cap. 11. saith, That except we use strong Medicines to kill Worms, as washed Aloes, or a scruple of Quick silver, with a little Turpentine and Aloes made into a small Pill, we do nothing.

They who fear to use Quick-silver crude, may give it prepared, as Mercurius Dulcis, not only thrice, but six times calcined (for by often preparation the malignity of it is abated) with some few grains of Diagridium, to carry it sooner out of the Body, and expel both the Worms, and the Matter of which they breed.

You must enlarge or diminish the quantity, according to the age of the Patient. As for example, to a Boy of eight or ten years old, it may be thus given:

Take of Mercurius Dulcis twelve grains, Diagridium six grains: make a Powder to be given with a roasted Apple and Sugar, or the like.

For ordinary drink, the water made of Quick-silver, which was formerly mentioned, is very profitable; or that in which Quick-silver hath been shaken in a glass half full, for the space of one hour.

Also water wherein melted Tyn hath been often quenched. But if you will rather use

Quick-silver, it is better to let the Water boyl with it, and so it will be stronger.

Also Spring-water made sharp with some few drops of the Spirit of Vitriol or Sulphur, is of no less force. For sharp things do properly kill Worms, and the Water is to be made more or less sharp according to the age of the Party.

The Decoction of Dog-tooth with Coriander-seed prepared, is used vulgarly for ordinary drink mixed with Syrup of Lemons, or of Pomegranates: Or you may put Sugar and a little Vinegar in the Decoction.

While the aforesaid Remedies are used, you must give Clysters often, the whole time of the Disease, first made of sweet things to attract and draw down the Worms, as at first we said: which may be made not only of a Decoction of Liquoris, Raisins and Figs, but also of Chicken-broth and Sugar, and Honey of Roses, or of Milk if there be no Feaver, otherwise it will be easily corrupted.

But if we conjecture that the Worms are already in the thick Guts, because then they can scarcely ascend into the thin Guts, you may give Clysters to kill them, made thus:

Take of Dog-tooth Roots one ounce; Beets, Mallows, Pot Mercury and Purslane, of each half an handful; Coralline one pugil, Coriander seeds prepared and Wormseed, of each two drams: boyl them in a quart of Water; In one pint of the straining, dissolve two ounces of Oyl of Roses, Cassia newly drawn six drams; Hiera Picra two drams, Honey of Violets one ounce: Make a Clyster.

If you will have a stronger.

Take of Gentian Roots one ounce; common Wormwood and Southernwood, of each one handful; the lesser Centaury half a handful; Lupines half an ounce; Wormseed two drams: make a Decoction. In as much of the straining as you think fit, dissolve the Oyl of Wormwood one ounce and an half; Salt one dram and an half: make a Clyster which must be repeated, and in the last that the Worms may be brought forth after they are killed, dissolve of Benedicta Laxativa, and Hiera Picra, of each three drams, or half an ounce.

If there be a Flux of the Belly, give this following Clyster:

Take of Tormentil Roots, and of round Birth-wort, of each one ounce and an half: Pomegranate Peels and Myrobalans, of each one ounce; Pease a small handful, Myrtle-berries one dram; red Roses one pugil: Make a Decoction, dissolve in the straining of Oyl of Mints, or of Wormwood one ounce: make a Clyster.

Outwardly may divers Topicks be applied, not only those that were mentioned, but these following:

Take of Gentian Roots one ounce, Birthwort Roots six drams, Orange Peels one ounce: Coloquintida one dram, burnt Harts-horn two drams, Saffron half a dram: make a Powder, which mix with Oyl of Wormwood, or bitter Almonds, and with a little Wax make an Unguent.

Also common Oyl boiled with the Pulp of Coloquintida is powerful.

Also Oyl of Wormwood and St. John's-wort must be applied to the whole body morning and evening.

Take of Oyl of Wormwood, Mints and bitter Almonds, of each half an ounce: the Juicy of Wormwood and Rue, of each two ounces: Tormentil, white Dittany and Zedoary, of each half a dram: Oxe Gall three drams; Aloes one scruple; Powder them, and with a little Wax make an Oyntment. Or,

Take of Coloquintida six drams, Powder it, and with an Oxe Gaul lay it to the Navil, by which both the Worms are killed, and the Belly kept loose.

Take of Myrrh seven drams, Mastich eight ounces, Aloes eighteen ounces, common Salt one pound: bruise them all, and distil them by a Retort with a gentle Fire, and great diligence; first you will have a Water, then an Oyl; with which if you anoint the Navil of a Child, all putrefaction will be cleansed which is in the Mesentery.

Also you may make a Cataplasm thus.

Take of the Meal of Lupines two ounces; Myrrh and Aloes, of each two drams: Oxe Gaul as much as is fitting; Oyl of Wormwood two ounces: make a Cataplasm for the Belly.

If a looseness hath continued long, apply this following Cataplasm.

Take of Oyl of Quinces and Wormwood, each one ounce; the Juicy of Purslain extracted with Vinegar, one ounce and an half; Pease flour an ounce, Lupine flour half an ounce, red Coral and burnt Harts-horn, of each three drams: mix them together with as much Turpentine as will make a Cataplasm.

A Cataplasm also made of only Hiera Picra, is most powerful.

Sometimes you may use Fomentations, when there is a great stretching and puffing up of the Belly. Made thus:

Take

Take of Wormwood, Southernwood, Tansie, Scordium, Mallows and Violets, of each one handful beaten Lupins half an ounce, Centaury one pugil, boyl them in Vinegar and Water, and foment the whole Belly hot therewith very often.

Finally, For flat Worms and *Ascarides*, or Arse-worms, Clysters made of bitter things are good; to which you may add the purging things aforesaid, while the filth of which they breed be purged away.

CHAP. X.

Of the Immoderate Flux of the Hemorrhoids.

ALthough the moderate flux of the Hæmorrhoids be healthful, and preserveth a man from many and grievous Diseases, as *Hippocrates* taught in *Epidemii*, and in his *Aphorisms*, as from a Pleurisie, Peripneumonia, or Inflammation of the Lungs; Nephritis, or the Stone in the Kidneys; Madness, Melancholy, and innumerable others: Yet the Immoderate Flux is most dangerous, and brings other pernicious Diseases, as weakness of the whole Body, Coolness of the Bowels, and especially of the Liver; an Atrophy or want of nourishment, an evil Habit, and Dropsie by the loss of Natural Heat, by spending too much blood, which is the Treasure of Life, and the Cherisher of the whole Body.

CAUSES. And this Immoderate Flux hath the same Causes which use to provoke other sorts of bleeding; namely, Blood offending in Quantity or Quality. When it offendeth in Quantity, and is brought in great plenty to the Hæmorrhoid Veins, it doth violently dilate them, and open their Orifices, by the strength of the Expulsive Faculty: but sometimes too much blood coming thither, doth oppress the Retentive Faculty.

Hence it comes that she being defective in her duty, there is a great Flux which must be restrained by art.

But while Blood offends in Quality, as sharpness or thinness, it stirs up the Expulsive Faculty to cast forth by those Veins not only the unprofitable but profitable Blood; the blood causing this Flux is made sharper by a mixture of Choler or sharp Water.

DIAGNOSTICK. This Immoderate Flux is known by the loss of strength, and a sense of weakness coming from a long flux, and loss of blood: As also from an evil yellowish colour of the whole body, as if it were the Jaundice.

If the Disease come from quantity of Blood, there went before Causes of increase of blood, and the Patient bears it well in the beginning, and is more chearful; but afterwards the Flux continuing he grows weak and dejected.

But if it comes from sharpness and thinness of the Blood, there went before Causes that breed choler or sharp water, the Body is of a Cholerick Constitution and burnt: the Blood floweth violently, and it is very red, shining, and as it were flaming, when otherwise offending only in Quantity it useth to be black and melancholy.

PROGNOSTICK. The Prognostick is gathered easily from what hath been said, when we reckon up those grievous Diseases which come from this.

CURE. For the Cure: The Blood must be stanch'd, or moderated at least, which must be done by Repulsives, Derivatives, Thickeners and Astringents.

And first, Phlebotomy is a Revulsive Remedy in every Flux of blood, therefore in the Hæmorrhoids thus flowing, draw blood from the Arm; and more plentifully, if there be signs of fulness, and much hath not been lost; otherwise take but a little, and at divers times.

Also Frictions and Ligatures of the superior parts do revel the blood, as also Cupping-Glasses applied to the shoulders, Breasts and Hypochondria, which for the better Revulsion may have Scarification in the shoulders, but they must be often applied to the places aforesaid.

Also a gentle Purge doth derive the Cholerick Humors which make the blood so violent in the Guts; and this must be made of purging things that have an Astringent Quality, as Rhubarb, Myrobalans and Tamarinds, such as were prescribed against vomiting of blood: And *Mercurialis* teacheth, that Tamarinds have an especial power to stop this kind of bleeding, whether they be taken boiled, or in substance.

Also sharp French-prunes, which are somewhat like Tamarinds, being often eaten before Meat, are good; and their use is convenient to keep the body loose: and if these will not suffice, you may add other things which were propounded for the cure of a Belly bound: because by use of Astringents the Belly will be bound, and by straining to discharge the Excrements that are hard, the Veins will be more open, and bleed more.

After-

Afterwards you must use those things that thicken the blood, and astringe the loose Veins, such as were prescribed for vomiting and spitting blood in form of a Julep, Powder, Opiate, and the rest; coming to Narcoticks, as is there said, if great need require.

And besides those Remedies, the Pills of Bdelium are much commended by Authors; which *Rondeletius* rejecteth, because the Apothecaries have not true Bdelium, and use Myrrh instead thereof, which causeth bleeding. But *Solenander* opposeth him, saying by Experience, that he hath found these Pills made of ordinary Bdelium, so clearly to produce their effect, that he will not doubt of the Composition; Except some should think that the Myrrh is made dull by drying things, and astringents that are mixed therewith. To this we may add what *Bauderon* in his Dispensatory, and other Modern Writers say, That we have true Bdelium brought from India at this day, which is hard to be distinguished from Myrrh.

The use of these Pills, is after this manner:

Take of Pills of Bdelium one dram: the Troches of Amber, and Terra Sigillata, of each one scruple: With the Mucilage of Quince seeds extracted with Rose-water, make a mass of Pills, of which let him take a scruple twice a day before Dinner and Supper.

At the same time you must use Topicks made after divers forms.

A Fomentation of Mullein boiled in Smiths Water, or astringent Wine is best; for that Plant is proper for the pain and bleeding of the Hemorrhoids. But you must diligently observe in the use of Fomentations, that they be either cold or moderately hot.

A more compound Decoction may be made thus:

Take of Snakeweed Roots half a pound, Plantane, Mullein, Bramble and Oak-buds, of each two handfuls and an half: Sumach berries, Pomegranate flowers, green Gauls and Pomegranate peels, of each one handful: Myrrh half a dram: red Roses two pugils: Allum one ounce: boyl these in three parts of Forge-water, and one of old red Wine for a Fomentation.

Martin Ruland commends a Fomentation made of two bags, applied hot by times, made of red Cloth, and filled with beaten Acorns and Oak-leaves, and boiled long in strong Vinegar.

Of the Decoction before-mentioned, with a greater quantity of every Simple, you may make a Bath to sit in, which the sick man must use somewhat cold, as is said of a Fomentation.

Unguentum Comitissa is very good, if you anoint the Back and Hemorrhoids therewith; or you make for the present this following:

Take of Oyl of Roses, Olives and Myrrh, of each two ounces: the Juyce of Plantane and Mullein, of each one ounce and an half; red Wine Vinegar one ounce: boyl them till the Juyces are consumed, then add of Bole, Sanguis Draconis, Frankincense, and drops of Iron finely powdered, of each one dram: Wax as much as will make an Unguent.

Rondeletius approves rather of those Oyntments which are made without Oyl, because they are more astringent, and they are thus made:

Take of the Juyce of Plantane, Shepherds-purse and Mullein, of each two ounces: the simple Symp of Vinegar three ounces: boyl them gently, then add Bole, Terra Sigillata, and Snakeweed Roots powdered, of each one dram and an half: Sanguis Draconis one ounce, Ceruss washed two scruples: mix them into the form of a Liniment.

If the Hemorrhoids be ulcerated, you may make this following:

Take of Oyl of Roses two ounces, Frankincense and Aloes, of each one dram: Sarcocol, Sanguis Draconis and Bole, of each half a dram: Spodium and Carabe, of each one scruple; white Starch three drams, Juyce of Plantane one ounce: Make an Unguent.

The Fat of an Eel, which comes out when it is roasted, put to the Oyntments, makes them better by a proper Vertue.

Also you may with profit apply a Cataplasim to the said parts made thus:

Take of Bole, Aloes, Mastick, Frankincense and Sanguis Draconis, of each half an ounce; the stones of Myrobalans and Gauls, of each one dram: mix them with the white of an Egg, and Juyce of Plantane: Make a Cataplasim.

Or the hairs of an Hare burnt, and Spiders webs mixed with the white of an Egg, will make a Cataplasim, which you must apply to the Vein where it is open, if it appears, or put it gently in.

Suppositories are good for this use, because they are put up into the part.

The Form of them is:

Take of Colophony and Frankincense, of each three drams; Bole half an ounce, Ceruse and burnt Lead, of each one dram; Acacia half a dram, powder them finely, and make them into a Suppository with Goats Suet.

Make Injections into the parts by a Syringe of the Juyce of Plantane, and other things mentioned for a Fomentation. The blood of any Creature newly drawn, and injected while it is hot, doth wonderfully restrain any Flux of blood from the Belly.

The

The Lungs of a Sheep being hot and bloody, being fat upon, have great power to stop this Blood.

Also Fumigations made of the Decoctions of the Fomentations aforesaid, are good for the same end. To which you may add those things mentioned in a *Dysentery*. As also this following:

Take of Frankincense, Aloes, Mastich, red Roses, Myrtles and Wormwood, of each half a dram: Troches of Carabe one dram. Make a gross Powder to be cast upon the hot coals, and let the fume thereof be received in a large funnel by a hollow Chair, tying a wooden or silver pipe to the narrow hole, and putting it into the Fundament.

A Fumigation made of Mullein is the best of all.

If you can apply Remedies to the Veins that bleed, it is best therefore that they may appear. And therefore let the Patient be laid upon a Table, and strain as if he were at stool till they appear: using an Instrument if there be need. And then apply the aforementioned Cataplasm of the Hair of an Hare and Spiders Webs, or other very drying Remedies; Bole, Allum, or burnt Vitriol. Also to touch the Vein with Oyl of Vitriol, is good; or in extream danger with *Aqua Fortis*.

Which things, if they prevail not, *Hippocrates* in his Book of Diet, in acute diseases, and of the Hemorrhoids, shews they way of tying, cutting and burning of them; which operation is out of fashion now, as being most painful and perilous. Although *Massaria* saith, that he once saw it, the story whereof will be profitable to be related; for by that you may learn the way of working, and the event. The History is this: *Frederick Corcicus of Vincentia, first had the pain, then the immoderate flux of the Hemorrhoids: And when he had in vain tried many things, went to Padua; where the Physicians by a common consent, concluded that the blood must be stopped. But when many means inwardly and outwardly were in vain used, in the end finding no Remedy, they concluded to try this Manual Operation: But having no fit Chirurgion, they sent for a Neapolitan, who professed this Art, and he cut, tied and burnt the Hemorrhoids of Fabricius thus: First he bound him so, that he could no ways move, then he separates the Hemorrhoids from the Intestines; then with a Needle he passeth thorow, and seweth them, and tieth all about strongly: then cutting off the part of the Vein which is above the sewing, he burns it with a hot Iron. It was a painful Operation from the Ligature, Section and burning: So that Frederick had a Fever, and great pain. But the Chirurgion gave him a few Medicines, by which he was freed both from Fever and pain in a few days, to the admiration of all men there, and recovered from bleeding. But it is not to be omitted, how he being too confident, and neglecting bleeding and purging, which he stood after in need of, keeping no orderly diet; the next year he was taken with a pestilent Fever, and died. From whence we may observe the Precept of Hippocrates, Aph. 12. Sect. 6. That one Hemorrhoid must be kept open. Except the Patient as Aetius observeth, had rather prevent the danger that comes by stopping of it by a good diet, exercise, bleeding and purging.*

But in an ordinary Cure by Medicines, you must consider the Liver and Spleen, because the Meseraick Veins are inserted into them, especially if they be hot or weak. And therefore not unprofitably do we apply Epithems, or cooling and strengthening Oynments, such as were prescribed in the flux of the Liver, and shall more at large be laid down in the hot distemper, and inflammation of those parts. Sometimes the Obstruction of the Bowels and Meseraick Veins do cause this Disease, which are to be taken away for the Cure of the Patient. And we have sometimes done it with Pills of Steel, which are prescribed in the Obstruction of the Liver.

The whole time of Cure, let the Patient drink ordinary Iron Water, or the Decoction of Yarrow.

At the same time, above all things you must rectifie the blood, which is the chief cause of this flux: Therefore if it be sharp and cholerick, it is often to be corrected with the infusion of Rhubarb and Tamarinds. If it be hot and thin, with thickening and cooling Medicines: if watery, with dryers; if much with a slender Diet. For it is vain to think of stopping of the blood, except the original of the evil be first taken away. Which *Solenander* observed Conf. 22. Sect. 4. in this following History. *I remember (saith he) that I had one Ann a Dukes daughter, of a great flux of the Hemorrhoids; and because she was far spent, I took much pains to stop the flux. But when I perceived that the first day after they were stopped, she began to swell about the heart. Being sent for again, the seventh day I opened the Veins again; nor could I safely stop them before I had given gentle Evacuations, and altering and strengthening things for the Liver.*

After you have cured the flux of the Hemorrhoids, you must prevent their return; which is done by a good diet, and bleeding twice or thrice in a year, and with an ordinary Purge of a Magistral Syrup, or other Medicines, with an Issue made in the Leg, and the like; which are to be altered according to the divers dispositions of bodies. Moreover, Mineral Waters of Vitriol, Allum and Iron, are very convenient.

Fonseca commends the Decoction of the Mastick Tree, or the infusion of it in Wine, for a prevention, thus made.

Take

Take of the shavings of Mastick wood two ounces, Infuse them in twelve Pints of Wine twenty four hours in a warm place, then strain it, and drink of it a whole moneth for ordinary drink: for it hath strength to stop the Hemorrhoids, and strengthen the Stomach.

CHAP. XI. Of the Pain of the Hemorrhoids.

THe Hemorrhoid Veins that are in the end of the *Rectum Intestinum*, or streight Gut, sometimes do swell and cause very great pain.

CAUSES. This swelling comes of the same cause with the flux or bleeding of the Hemorrhoids, namely, of blood offending in quantity or quality, which if it findeth not a way, and cannot open the ends of the Veins, there it settleth, and by filling of the Veins causeth a tumor with Inflammation and pain. The principal Cause why blood cannot get out of the Veins, is the thickness of it, because it is Melancholy: for commonly the Hemorrhoid Veins, especially internal, are said to receive Melancholy from the Spleen, and sometimes to purge it forth.

DIFFERENCES. Authors give many differences of Hemorrhoids, from their greatness, number, figure and place; whence some are called great, others little; some more, some less; some are like Grapes, Mulberries, Warts or Bladders; thence termed Uval, Moral, Verrucal or Vesical. Some are External, some Internal.

DIAGNOSTICK. From these things the knowledge of them is easie, for from a Tumor in the outside of the Fundament, from its greatness, colour and consistence, the differences are known. And they are to be distinguished from other diseases which use to be in the Fundament, as *Rhagades*, Clefts; *Condylomata*, Swellings with Inflammation; *Thymi*, Kernels; *Fici*, Piles, and the rest.

Rhagades are certain Ulcers like Clefts in the hands and lips, from vehement cold. They have no likeness with the Hemorrhoids; but we will explain them with the rest, although they are properly to be referred to external diseases, that you may with the knowledge of the Hemorrhoids know all diseases of the Fundament.

Condylomata are certain Tumors of the skin, which being wrinkled, if it swell by Humors, it is called *Condyloma*. It is distinguished from a Hemorrhoid, because a Hemorrhoid is greater, black, and round in a Vein; but this is long, of the same colour, and not in the Veins.

Thymi are carnos swellings, which are not only in the Fundament, but Privities of Men and Women like Warts, and like the flowers of Thyme, from whence they have their name. These are little, white, or reddish, without pain; but the Hemorrhoids are greater, black, for the most part painful.

Fici are fleshy swellings, but greater than *Thymi*: also they are blew and painful, and therefore more like Hemorrhoids; but they are distinguished from them, because they are all flesh; but the Hemorrhoids shew the Veins full, and enlarged at the ends. Moreover, *Fici* for the most part ulcerate, and are malignant, so they are like a Cancer.

Those Caruncles, or pieces of flesh which grow in the Fundament, are like these *Fici*, called *Criste* or *Tuts*, usual in Italy, but unusual among us, because they come from an impure and unnatural Lechery: they look like the Combs of Cocks, and thence they have their name: Because they are nothing like the Hemorrhoids, they need no distinction. But let this be for a Conclusion, all the aforesaid diseases are cured only by Chirurgery, so that a peculiar way is not to be laid down here.

PROGNOSTICK. As for the Prognostick, The swelling Hemorrhoids, they are seldom dangerous: but sometimes so inflamed, that you may fear a Gangrene: or else they extreemly torment the Patient.

Hemorrhoids, if they come to Suppuration, or an Ulcer, oftentimes leave a Fistula, which is many times incurable, by reason of the tenderness of the part, and the great moisture which hindreth the healing of it.

CURE. For the Cure hereof, first let blood in the Arm, and make a revulsion from the part affected. Which being sufficiently done, you may also open the Vein in the Ankle for revulsion.

The same is done by Cupping of the *Hypochondria* or Revulsion, and the Hips for Derivation.

Strong Purges are not good in this case, because they draw the Humors to the part, and increase the Tumor. But you must constantly keep the body open, because hard Excrements, and voided with straining, increase pain. An Infusion of Cassia given morning and evening, is good for this, thus made.

Take of Lettuce, Bugloss tops, Mallows, of each one handful: Liguoris scraped, and Raisins stoned, of each half an ounce: Bugloss, Borrage and Violet flowers, of each one pugil. Boyl them to eight ounces. In the straining infuse Cassia new drawn one ounce: strain it, and clarify it:

it: and then put thereto one ounce of Syrup of Violets. Give it twice a day as aforesaid.

Sometimes to assuage the sharpness of the Humor, you may give the Emulsions of the cold seeds made with the aforesaid Decoction.

In the mean while, divers Topicks are to be used to appease Pain, take away Inflammation, and discuss the Humor. Or Oyl of sweet Almonds newly drawn, and which is better, the Oyl of Peach, Kernels of Gourd Seeds, Poppy or Henbane seeds.

Oyl of Box-tree is best, because it is stupifying: And as it cures all Tooth-ach miraculously, so doth it mitigate all other: and this if you lay but a drop with a little Lint upon the Hemorrhoids; or if you mix it with Lin-seed Oyl in this proportion, that there be half an ounce of that, and one scruple of Oyl of Box.

Quercetan highly commends the oyl of Nuts, in which Sows or Hog-lice have been boyled. You may also boyl Hog lice in common oyl, and it will much assuage pain.

Plain oyl of Eggs, or made in a Leaden Mortar, doth the same.

Divers Liniments and Oyntments may be prescribed for the same: Some whereof do only appease pain, some discuss the Tumor, and dry: others heal the Ulcers. And you may apply them with Lint.

Take one Yelk of an Egg, as much Oyl of Roses or Violets as will make a Liniment: To which if you put Populeon, it will assuage pain better: and when the pain is very violent, you may add a little Opium.

Or,

Take of Hens grease half an ounce, the Pap of an Apple roasted in the Embers one ounce, Saffron half a dram, Populeon half an ounce: With the Yelk of an Egg make a Liniment.

Or,

Take of Oyl of Violets two ounces, Populeon half an ounce; With one whole Egg make an Oyntment: Or let the white of an Egg be beaten with Breast-milk, and applied to the part with clouts dipped therein.

Or,

Take of the Mucilage of Fleabane seeds two ounces, Oyl of Violets three ounces. Make a Liniment.

Or,

Take of the Mucilage of Fleabane and Fennugreek seeds, extracted with Wine, of each two drams; Fresh Butter three ounces: Goats Suet one ounce. Mix them in a Leaden Mortar for a Liniment.

Or Butter alone set in a Leaden Mortar in the Sun till it wax black, is an excellent Medicine.

Also a fresh Pomatum is very Anodine.

Take of the Juice of Purslain and Honey, of each four ounces. Mix them in a Leaden Mortar into the form of a Liniment.

Take of Unguent of Roses two ounces, Quick-silver two drams: Mix them into a Liniment.

Or,

Take of white Diachylon moll fied with the Oyl of Camomel two ounces: Saffron one scruple: Opium three grains. Make an Unguent.

Horskins much commends an oyntment made of wild Flax, with its flowers boyled in Hogsgrease. To which being strained, and a little cooled, you must add the Yelk of an Egg, and apply it to the part with Lint. He saith, that it assuageth these kinds of pains miraculously, and that he had from John Wolf, that famous Physician of Hesse, who refused to discover it to his Prince the Landgrave of Hesse till he promised him every year a fatted Ox.

These Liniments following are good to discuss the Tumor, and assuage pain.

Take Leeks and roast them in a wet cloth in the Embers, and beat them with fresh Butter, and they will take away pain and swelling.

A red Onion doth the same boyled with the Pap of a Lilly, and beaten with oyl of Myrtles.

Take the Oyl of Peach Kernels, and bitter Almonds, of each two ounces; Liquid Storax and Bdelium, of each two drams. Dissolve them in Oleo, and mix them for a Liniment.

The Balsom of Sulphur made of the flour of Brimstone and Spirit of Turpentine, is good to assuage pain and swelling, and to cleanse the Ulcers of those parts. And better, if instead of oyl of Turpentine you use oyl of St. Johns wort, and of Eggs. Also when there is great swelling with Inflammation, you may use oyl of Roses, or of Violets, instead of the oyls aforesaid.

Also Cataplasms are good for the same purpose. Of which the most common for taking away all pains, is that of white Bread and Milk boyled, adding Oyl of Roses, and Yelks of Eggs.

Aquapendens commends a Cataplasim of Plantane, Pellitory of the Wall, and Mallows boyled in Water, and after with Oyl of Roses; to which, when he would have it more drying, he adds Barley Meal, and Millet Meal: And if the pain be great, he makes it of Milk. He commends also the Cataplasim of Leek heads boyled in Common Oyl or Oyl of Myrtles, or made of Pilewort boyled in Water.

Green Elder Leaves boyled to slime in water, and then spread upon a cloth as big as the Palm of your hand, and applied hot to the Patient lying upon his Belly; if it be often renewed for many hours, and the part first anointed with common Oyl, or the Decoction of the same, is very excellent.

The Leaves also of Elder stamped and applied cold, do take away pain the third dressing.

Also Purslain stamped and applied, asswageth pain and swelling, heals the Ulcers, and consumeth proud flesh.

A white Onion roasted in the Embers, and made with fresh Butter into a Cataplasm, doth assuage pain; and discufs the Tumor.

Let Fomentations be applied to the part to take away pain, made of the Decoction of Mullein, Mallows, Holyhocks, Pellitory, Linseed, Fœnugreek seed, Marsh-mallows, Camomel flowers, and Dill boyled in Milk, or in the want of Milk, in Water and Oyl of Tripe Broth.

You may make a Bath with a greater quantity of the same Ingredients.

Cold Water alone, is a good Fomentation, and a Bath also. But in Winter warm it.

Also foment in Rose Water in which Salt of Lead hath been dissolved, especially if the part be inflamed.

To take away swelling, it is good to foment with red Wine wherein Allum is boyled.

Polypody of the Oak and St. Johns Wort boyled in equal parts of Wine and Water, doth sensibly abate the swelling of the Hemorrhoids, if the Decoction be squeezed in by degrees with a sponge, the Water of hot Baths applied with Spunges, or to sit in, are also good.

Aquapendens applieth a Sponge dipped in Thyme water and squeezed, and after bound upon the part; a Fumigation of the aforesaid Decoction while it is hot, or Mullein boyled in Milk with Rye flour, doth also appease pain. Or,

Take of Houseleek two handfuls: boyl them in white Wine, and let the Patient receive the fume through an hollow Chair.

To consume and dry up the Piles, a Fumigation made of the Powder of Darnel, Mullein, Pilewort, cast upon hot Coals, is good, and better if you mix brimstone therewith. Also it is made of Brimstone only, which taken with a Funnel, drieth up the blind Hemorrhoids. Also a Fumigation made of a Fire stone quenched in Vinegar.

And this following Injection is marvelous good for the same, if often used.

Take of Juice of Plantane, and Oyl of Violets, of each four ounces: Natural Balsom half an ounce. Make an Injection into the Anus.

Amatus Lusitanus in the 91 Cure, Cent. 2. doth praise this following Suppository, in these words: A Roman Lady which lived at St. Angelo's Bridge, having her Womb forth, complained also of the pain of the Hemorrhoids: And after we had used many choice Medicines, by which she received no benefit; we gave her a Suppository of Goats Suet and Opium, by which she was cured perfectly. But we washed the part afterwards with strengthening things warm, as ought to be after stupifying Medicines have been applied.

The same *Amatus*, Curat. 6. Cent. 3. commends these following Topicks in these words: A Reverend man was grievously troubled with the Hemorrhoids; and after divers means used by Physicians, was cured by us with this Medicine immediately.

Take an Orange, and make it hollow, and fill it with Oyl of Roses, and of Spike; then roast it and apply it hot, repeated often, it is wonderful.

The Lungs of a Goat are used commonly, applied hot to the part, or some slices made hot between two dishes with a little water to assuage pain.

Both the aforesaid Balsom of Sulphur, and these following Ointments, are good for the Piles ulcerated.

Take of new Oyl of Eggs two ounces: Stir them in a Leaden Mortar, and apply them.

Take four ounces of Oyl of Roses, and one ounce of Cerufs: With half an ounce of Litharge, and six drams of new wax, and four grains of Opium, make an Oyntment. Or,

Take of Frankincense, Myrrh and Saffron, of each one dram: Opium two grains, One Yelk of an Egg, Oyl of Roses, and Mucilage of Fleabane seeds, of each as much as will make an Oyntment.

If they will not easily be dissolved, you must open them after convenient Revulsions, rubbing them with a rough cloth dipped in the Juice of Onions, in which there was dissolved one dram of Aloes: This is *Hartman's Secret*. But they are sooner opened, and with less pain, with a Pen-knife, or Horse-leeches.

Some special things are taken by the Mouth to assuage pain, and consume the Hemorrhoids. The chief are these:

The Decoction of Yarrow taken three days as ordinary drink, and the seed of three Leaved Grass given many days together with the Yelk of an Egg, is also excellent.

The

The Powder of Mullein given in Milk, or otherwise, is much approved against the swelling of the Piles.

The Powder of Yarrow and Tormentil are commended to do the same.

The Juice of Mullein by its self, or mixed with Sugar of Roses or Penides; or made into a Syrup with Sugar, is also excellent.

Finally, Pills of Bdellium taken often, do consume the Piles, and take away the cause of them insensibly.

An Issue made in the Leg, is very good for them who are subject to this Disease.

The End of the Tenth Book.

THE

THE
ELEVENTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Liver.

The Preface.

THe Liver (as other parts) is subject to all kinds of Diseases: For as it is compounded of similiary parts it hath divers distempers; and as it is an Organical part, it is affected with Tumors and stoppages, as also with solution of Continuity, which is Wounds and Ulcers. And although the Dropsie be in the whole Abdomen or Belly, as in the Ascites or Tympanites; or in the whole Body, as in an Anasarca: yet the Original thereof for the most part is from the Liver. We intend here only to shew the chief Diseases which are most ordinary, and we shall comprehend them in six Chapters: The first whereof is concerning the Hot Distemper of the Liver: The second of the Inflammation, Ulcer, and Imposthume of the Liver: The third of Obstruction of the Liver: The fourth of the Jaundice: The fifth of Schirrus; The sixth of the Dropsie.

CHAP. I.

Of the Hot Distemper of the Liver.

MAny Men have a Hot Distemper of their Liver from their Birth; of which here we shall not treat, but only of that Preternatural Disease which manifestly hindereth the actions of the Liver.

DIFFERENCES. This Distemper is either Simple or Compound; either with Matter, or without; but for the most part it hath Matter joyned with it, because a Hot Distemper of the Liver useth to produce Hot and Choleric Humors.

CAUSES. The Causes of this Distemper are hot Weather, immoderate Exercise, much Anger, and other great Passions of the Mind, and especially hot nourishment and Physick, or things spiced, a pure and strong Wine drunken plentifully: To these you may add the heat of the Part adjacent, as in strong Feavers the Liver waxeth hot from the heat of the Heart.

SIGNS.

SIGNS. The Signs of a hot Distemper of the Liver, are loathing of Meat, especially flesh; thirst, binding of the Belly, vehement heat in the whole Body, especially in the palms of the hands and soles of the feet; leanness of the whole body, the Patient is worse for hot things, and better for cold; and if there be plenty of hot Humors, there will sometimes be vomiting and purging of Choler; there is a bitterness in the mouth, and for the most part a Fever.

PROGNOSTICK. As to the Prognostick. A hot distemper of the Liver is not very dangerous, because it is not much contrary to the Constitution of the Liver, but it useth to be the Cause of many Diseases, not only of the Liver, but also of other parts. It is hard of Cure, especially when the Stomach is cold, as often it is; for those things which are given to cool the Liver hurt the Stomach, and enlarge its Distemper.

CURE. The Cure consists altogether in the correction of the Distemper by cooling Medicines, and by the Evacuation of the Cholerick humors which come from the Liver, increasing the Distemper, and that Distemper it, and is the Cause of other Diseases.

And first opening of a Vein doth much cool the Liver, takes away some of the Choler, and opens the Obstructions which comes from Choler; therefore you must open the Liver Vein of the right Arm, and let such a quantity of blood as is agreeable to the fulness and strength of the Patient, either at once, or divers times, according to the greatness of the Disease, and the continuance of it, and that after a Clyster or Laxative Medicine hath been administred.

Then you must give a Medicine which doth gently purge Choler, and repeat it often at distance; or an Apozeme for divers Doses, or the Magistral Syrup, or Syrup of Succory, Compound with a four-fold proportion of Rhubarb which is most convenient, because it doth innocently purge the Cholerick Humors, cooleth the Liver, strengtheneth it, and opens Obstructions.

The Forms of these Medicines are these that follow:

Take of cleansed Senna and Tamarinds, of each half an ounce: Annis seeds one dram, Succory and Sorrel, of each one handful; scraped Liquoris three drams; the three Cordial Flowers, of each half a pugil: boyl them to three ounces, and dissolve in the straining, of Rhubarb infused with a little Lavender Spike in Succory Water, one dram and an half; double Catholicon three drams; Syrup of Roses one ounce: make a Pation, give it in the morning with due custody.

For the finer sort of people you may make Clarified Potions which are lately invented, which are in form of a Julep, but somewhat unpleasant to the taste, and in them there is prescribed a double quantity of Purging Medicines, because the much strength of them is lost in the Clarifying, so that they do seldom work upon strong bodies, especially in a dry Country where the humors are less flowing, and not so obedient to purges; but in most Countries, these kind of Medicines work successfully.

This following is an Example of Clarified Potions.

Take of clean Senna one ounce, Annis seeds one dram, Succory Leaves and Maiden hair, of each one handful, scraped Liquoris half an ounce; boyl them to ten ounces, and infuse in the straining two drams of Rhubarb, Cassia new drawn, and double Catholicon, of each one ounce, bruised Tamarinds half an ounce, Coriander seeds prepared one dram, Syrup of Roses one ounce; strain them, and clarify them according to art: make a Potion.

An Apozeme to purge Choler is thus made:

Take Sorrel, Dogs-tooth, Succory and Dock Roots, of each one ounce: Endive, Succory, Dandelion and Maiden-hair, of each one handful, of the four great cold seeds, of each three drams, scraped Liquoris one ounce, Succory Bugloss and Violet flowers, of each one pugil; clean Senna two drams, Tamarinds one ounce, Mace and Cloves, of each one dram; boyl them to a pint and a quarter: in the straining dissolve half an ounce of Rhubarb infused in the aforesaid Decoction with a little Cinnamon, of Compound Syrup of Succory, and Roses solutive, of each two ounces: make an Apozeme, clarify it, and aromatize it with two drams of yellow Sanders, for four mornings draughts.

A Magistral Syrup may be made of the Ingredients of the former Apozeme, with a treble quantity of Purges, and adding an equal portion of Sugar to the Decoction.

A Syrup of Juices is most used amongst us, and it is of great power in Chronical Diseases, which come from a hot distemper of the Liver, and from yellow and burnt Choler. And it is made thus:

Take of the new made Juices from their Faces, and of Endive, Succory, Sorrel, Fumitory, Burrage and Bugloss, of each three pints: the Juice of sweet Apples newly drawn and purified two pints, fresh Polypody of the Oak half a pound, clean Senna eight ounces, Dodder of Thyme three ounces: Agarick newly trochiscated half an ounce, Mace and Cloves, of each half a dram: infuse them, and boyl them according to art while there remains one pint and an half of the straining, in which dissolve of Rhubarb infused with a little Lavender in the aforesaid Juices, and strained one ounce: white Sugar one pound and an half: make a Syrup well boyled, clarified and aromatized

aromatized with two drams of Triasantalon; keep this Syrup in a Glass, give two ounces at a time, or three, twice or thrice every Month with Chicken-Broth wherein Endive, Succory and Sorrel have been boyled, or Whey.

These things following are excellent to cool the Liver. And first for ordinary Drink, use the common Ptilan made of Barley water and Liquoris, or with Dogs-tooth and Sorrel Roots. Or mix such a Decoction with Syrup of Lemons or Maiden-hair. Or they who are more dainty may take only the simple Spring Water, mixed with the aforesaid Syrups. And if you desire to cool more, you may put as much Spirit of Sulphur or of Vitriol as will make it a little sharp. And when the heat is very vehement, you may give a dram of Lapis Prunellæ therewith. There is also made a most pleasant Drink of Conserve of Roses mixed with Spring water and strained, to which you may add some drops of Spirit of Sulphur or Vitriol to make it sharp and red like Wine.

You may also make a Tincture of Roses thus:

Take of red Roses dried one ounce, warm water three pints, Spirit of Sulphur or Vitriol one dram and an half: Infuse them three or four hours, add to it being strained three quarters of a pound of white Sugar. Keep it for your use.

The Alexandrian Julep for this purpose, is made thus:

Take of Spring Water one pint, Rose Water, Juicy of Lemons, and white Sugar, of each four ounces: Boil them with a gentle fire till they are skimmed.

These two last Remedies are used two ways, either for ordinary Drink, or as a Julep twice or thrice in a day.

Also divers Juleps to cool the Liver use to be prescribed; of which, the Forms following may be Examples.

Take of Sorrel, Succory, Dogs-tooth and Dock-roots, of each one ounce: Endive, Succory, Sorrel and Maiden hair, of each one handful: Succory, Bugloss and Borrage Flowers, of each one pugil; boyl them to a pint. In the straining, dissolve Syrup of Lemmons three ounces: Make a clear Julep for three Doses, to be taken twice in a day. If you will make it cooler, add a little Spirit of Sulphur or Vitriol to every Dose to make it sharp. And to make it colder yet, add a dram of Sal Prunella.

When Herbs are wanting, you may make a Julep of Stilled Waters thus:

Take of Endive, Succory and Sorrel Water, of each three ounces: Syrup of Lemmons and Pomegranates, of each one ounce and an half: Make a Julep for three Doses.

You may also make Juleps that are good and pleasant of Juices: an Example of all which, may be this that followeth:

Take of the Juicy of sweet Apples newly drawn, and taken from the Feces, four ounces; the Juicy of Lemmons three ounces, Rose Water two ounces, the Juicy of Pomegranates one ounce, white Sugar half a pound. Make a Julep for three Doses.

Instead of Juleps, Physick Broth may be made for dainty Folk, of the Herbs aforesaid boyled with a Chicken. To which you may add one dram of Lapis Prunellæ, that it may cool the better; or make it sharp with some drops of Spirit of Vitriol.

Blood of Succory and Germander, brought into a Syrup as followeth, are good to cleanse the Blood, open Obstructions, and cool the Liver.

Take of Succory Water made in Balneo Maria as much as you please, the Leaves of Succory two parts: Germander one part: Steep them together, and digest them in Balneo Maria three days; then strain them, and add to the liquor fresh Succory and Germander, then digest them again three days; then strain them, and let this way of Infusion be repeated eight or ten times. The Liquor will turn red like blood, to which you must put as much Sugar, and make it into a Syrup.

Besides, you may make Opiates and Tablets to cool the Liver, and strengthen it thus:

Take of Conserve of the Flowers of Succory, Violets, Water-Lillies and Bugloss, of each one ounce; the Powder of the three Sanders one dram and an half. With Syrup of Lemmons make an Opiate to be taken often.

Take of the Lozenges of the three Sanders, with a double quantity of Rhubarb four ounces. Let him take every morning two hours before meat, one of the weight of two drams.

Conserve of Hips of the Canker Rose well cleansed, and boiled with Sugar into the Form of a Marmalade, doth powerfully cool the Liver, if the Patient taketh it instead of the former Opiate.

The Tincture of Coral, made with Juicy of Lemmons doth cool and strengthen the Liver, if you give two spoonfuls thereof every day, or twice in a week at the least.

A Bath of warm Water used often, doth more powerfully and profitably cool and moisten the Body then any other Remedy, especially in lean Folk.

Whey is good for the same, if it be used fifteen days or more together. It is made best by boiling

ling the Milk, and pouring in a little Vinegar of Juyce of Lemons, and afterwards straining it.

Amatus Lusitanus prepareth it thus:

Take of Whey one pint, very sharp Syrup of Vinegar three ounces: Mix them, and after a little boyl-
ing, let it be taken as Mineral water twice or thrice, and then walk upon it. The Ancients took five pints
at a time.

Quercetan prepareth it thus:

Take of Whey two pints, Juyce of Lemons two ounces, the new made Juyce of sweet Apples three
ounces. Clarifie them all together at the Fire with the white of an Egg, and put to them a lit-
tle Sugar. When it is strained, take six or eight ounces every morning, for fifteen or twenty days toge-
ther.

And if the Body be lean and consumed, you may give Milk alone, especially if it be of an Ass, for
many days.

The Decoction of China prepared with the Juyce of Lemons, is also good for this purpose, espe-
cially if there be Obstructions. It is made thus:

Take of China Roots sliced one ounce, Spring water six pints, the Juyce of Lemons three ounces:
Steep them twenty four hours, then boyl them till the third part be consumed, then strain them through
a Hippocras Bag, and let him take six ounces thereof morning and evening, and mix it with Wine
when he pleaseth.

Lastly, Mineral waters that have Vitriol, are good, because they open and cool.

If the Disease continue after all this, open the Hemorrhoids with Horse-leeches once or twice in a
Moneth.

And also use outwardly Epithems and cooling Oyntments to the Region of the Liver.

Make Epithems of Sorrel, Succory, Rose or Plantane water, or of Vinegar and Camphire; to
which for the strengthening of the part, add a little powder of the three Sanders.

The Oyntments are, *Galen's* cooling Oyntment and the Cerat of Sanders.

CHAP. II.

Of the Inflammation, Imposthume and Ulcer of the Liver.

THE Inflammation of the Liver, is a hot Tumor arising from blood, which is out of its Vessels, and
sent into the substance thereof.

DIFFERENCES. And as the blood is either pure, or mixed with other Humors, so doth it pro-
duce divers kinds of Tumors. For if it be pure, it makes a true Phlegmon; but if it be mixed with
Choler, Flegm or Melancholy, it produceth an Erysipelous, Oedomatous or Schirrous Phlegmon.
And if the said humors predominate over the blood, there is a Phlegmonious Erysipelas, Oedema
and Schirrus.

There is another difference in respect of the place in which the Inflammation is; it is either in the
gibbous part, or Cavity of the Liver. Which is thus to be understood according to *Galen*, 5. de locis,
aff. cap. 7. An Inflammation cannot be in either part of the Liver distinct, so that the other shall be
free, because the flesh of the Liver is united in all its parts, and therefore when one part suffereth, the
other also suffereth in some measure.

Moreover, That which *Galen* taught, 13. Meth. Cap. 14. is worth observation: When the hollow
part of the Liver is offended, it is necessary that the Inflammation reach to the Veins of the Mesentery,
which come from the Gate-Vein. And experience teacheth, that they who have died of this Inflam-
mation have had, not only an Imposthume of the Liver, but also in the Mesentery.

We must also observe from *Hippocrates*, Aph. 45. Sect. 7. That an Imposthume sometimes is only
in the Membrane which covereth the Liver, and sometimes in the substance or *Parenchyma* of it:
For (saith he) they who have a hot Liver suppurated, if pure white Quittor or Matter flow from thence,
do escape: for it is contained in the Tunicle, but if it be like Lees of Oyl they die. *Galen* in his Comment
saith thus; They who have Matter in the Tunicle of their Liver, and the substance not suffering, do
all escape: but they who are corrupted in the very fleshy substance of the Liver die: and there is good rea-
son to be given why they do.

CAUSES. The immediate Causes of this Disease are too much Blood, or the boyling heat,
thinness and sharpness of the same; or the motion and stirring of it in the Veins; from whence by
the aforesaid Causes, it is easily thrown into those parts which are most fit to receive it. The Li-
ver is most fit to receive blood abounding when it is too hot, or hath any pain, for heat and pain do
attract, or if it have any natural or adventitious weakness; For all parts that are burdened with any
Humor, do disburden themselves upon the weakest. Among these Causes you may reckon the ob-
struction of the Liver, by which the thick Humors are retained, and are inflamed by a Preternatural
heat.

The External Causes may be many, as too much heat of the body from the immoderate exercise, the Sun or Fire : but Meats sharp and spiced, immoderate taking of too much strong Wine, too much Lechery, Fear, a stroak or fall upon the Liver side, also hot Medicines applied without reason thereto ; as *Fabricius Hildanus* reports of one, who having a cold distemper of the Stomach, had Emplasters and hot Oyntments of Pepper, Cardamons, oyl of Cloves, and the like, applied to him, by which means the Inflammation of the Liver was encreased ; for the Liver covereth the stomach, and the Medicines which are applied to the stomach, do first touch the Liver with their Vertue.

Cuppling Glasses applied to the Region of the Liver will do the same, of which *Fabricius Hildanus* brings an Example concerning one who bled at the Nose, to whom he applied great Cupping-Glasses upon the Region of the Liver which stayed the blood ; but a great Inflammation of the Liver followed.

SIGNS. The Signs of this disease are many, according to *Galen* and other Authors which we shall lay down severally, because many errors are committed in the discovery thereof.

The First Sign is, Heaviness in the right Hypochondrion which comes from the repletion and distension of the Liver ; because being of its own nature large and very compact, if it be filled with much Humor, it will grow very heavy : which the Patient apprehends when he turneth from one side to the other.

The Second Sign is Pain, which sometimes is perceived in one place, sometimes in two or three, in the Region of the Liver there is a weighty pain ; sometimes it is very extending in the lower Ribs when the Inflammation reaches to the Ligaments of the Liver which are fastened to the Ribs : sometimes the pain is communicated to the Throat by the continuation of the Membranes, which have consent with the Membrane which covers the Liver.

The Third Sign is a Fever, which is commonly at night, and is more or less sharp according to the Humor offending : for in a Choleric Inflammation it is most burning ; but in a Flegmatick, gentle ; and in a Sanguine Inflammation, moderate between both.

The Fourth Sign is difficulty of Breathing, because the Liver is tyed to the Diaphragma or Midriff, and therefore by its weight forceth it downwards, as also presseth it with greatness and swelling ; so that both ways the free motion of the Diaphragma is hindered.

The aforesaid Signs are Universal or proper to declare the Disease : there are many other equivocal signs, which also do much avail to the knowledge of the Disease ; As a dry Cough, a hard Pulse, unequal, and like a Saw ; the colour of the Tongue first red, and then black ; a great loathing of Meat, unquenchable thirst ; vomiting of Choler, and sometimes of Flegm ; a pale colour of the whole Body tending to the Jaundice, yellowish, red and flaming Urine, which is sharp : when the Patient lieth with his face upwards, he is more at ease than when he lieth on either side ; because when he lieth upon the right side, the Liver is pressed upon by the stomach ; when he lieth upon the left, it is extended by its own weight hanging down ; the Belly is bound, by reason of the Heat which consumeth all the moisture of the Chylous matter. Sometimes it is loose, namely, when a weakness of the Liver is joyned with inflammation ; for then the Excrements are sent forth moist, like the water wherein Flesh hath been washed.

The Signs of the differences are these ; if the Gibbous or Convex part of the Liver be affected, there is a Tumor to be felt in the right Hypochondrion, and it makes the figure of the Liver like a half Moon ; there is great pain in the Breathing, and reacheth to the right side of the Throat, so that it seemeth to be pulled down. There is a great Cough and difficulty of Breathing, and greater weight.

But if the Hollow part of the Liver be affected, the Tumor is not so easily felt ; but because as I have said, one part of the Liver cannot be inflamed, but the other must also suffer ; when the part is touched and pressed down, some pain is perceived.

Moreover, Because this part lieth upon the stomach, there is a greater loathing of Meat, vomiting, thirst, and looseness of the belly, from the food corrupted in the stomach, which is distempered by the nearness of the Liver to it.

The Signs of the Causes are these,

If the Inflammations come from pure blood, there is either a perfect red, or dusky colour in the face ; the Pulse is great, soft and waterish ; the Urine is red and thick ; the Body is full of flesh : there is sweetness in the mouth, the party is young, and hath fed high.

If the Choler predominate, the Face is yellow, the Pulse is swift, hard and unequal, the Urine thin and very yellow, sometimes flaming ; the body is lean and thin, the eyes hollow, the mouth bitter ; there is vomiting of Choler, and Causes that breed Choler went afore.

But because the Inflammation of the Muscles of the *Abdomen* or Belly, is very like the Inflammation of the Liver, therefore we must distinguish them by their proper Signs.

In the Inflammation of the Muscles of the *Abdomen* the skin is so extended that if you lay hold of it, you cannot move it; the Tumors of the streight Muscles are long & over the whole belly comprehending the Navil: and the Inflammation of other Muscles is in the form of them. On the contrary, the Inflammation of the Liver is in the sharp of the part affected; and if you lay hold on the Muscles they yield, and the Tumor is somewhat deeper.

Moreover, the colour of the whole body is of much concernment for the distinguishing of the Diseases; for in the Inflammation of the Muscles it is fresh, and almost in its natural condition; but in the Inflammation of the Liver, it is pale, yellow, and like the Jaundice.

There is a famous Example of this in *Galen*, 5. *de loc. aff. cap. 7.* of one *Stefianus*, who when he was judged by other Physicians to have an Imposthume in the Liver, *Galen* being sent for, at the first view of his face, presently said that there was none, and searching his belly, he found it in the *Abdomen*: He judged upon this ground, Because the Patient had not his face so discolored, as useth to be in the Inflammation and Imposthume of the Liver.

The like Example is in *Valeriola*, *Lib. 4. Obs. Cap. 5.* of a certain Woman which was brought by another Physician to have a Phlegmonous Tumor in the Liver, But saith he, *When she sent for me, I judged it not to be so, but in the Muscles.* And a little after he saith, *When I first came, I touched the place, and I found a long swelling in the right Hypochondria down to the very Navil; the Face was red, fresh, and of a Rosie colour, mixed with white, continuing all the time of the disease in the same state; the Urine was very good both in colour, and respect of things contained: from all which it appeared, that not the Liver, but the Muscles over it were affected; for when the Liver is affected, there is always a discolouring of the face.* For *Galen* saith, that he knew many diseased in their Livers by their colours, *Lib. 5. de loc. aff. cap. 9.* for the colour in such is commonly yellowish, white and inclining sometimes to green.

Moreover, It is troublesome to distinguish a Pleurisie from an Inflammation of the Liver: as you may observe in *Galen*, 5. *de loc. aff. cap. 7.* in his History of *Siculus* the Physician, who was deceived in himself, supposing that he had a Pleurisie: because he had a Feaver, little and frequent breathing, a small Cough, and a pain near the lower Ribs: but *Galen* by his stools, which were like water wherein flesh had been washed, knew that his Liver was inflamed, for such a flux doth shew that the Liver is greatly disordered. But this sign cannot always distinguish a Pleurisie from an Inflammation of the Liver. For as *Galen* teacheth in the place cited, such kind of moist and bloody stools come only when the Liver is inflamed, when it is also very weak, otherwise one sign of the Liver inflamed is (by *Galen*) costiveness. Therefore when the Liver is not weak, you must look for other signs, by which you may distinguish them.

If then the Inflammation be in the *Pleura* towards the right Hypochondria, the pain will be vehement and pricking, the breath more difficult, there will be no change of colour, the Cough will be greater and not dry, but commonly (especially in the increase of the Disease) with bloody spittle, somewhat at least discolored; and lastly, the Pulse will be hard, and like a Saw: But in the Inflammation of the Liver, the pain is less, joyned with heaviness, the colour is yellowish, there is a dry Cough now and then, the Pulse is not so hard; and lastly, there is a Tumor in the right Hypochondrion.

And if the Inflammation be in the Mesentery, the Tumor will appear beneath the Region of the Liver, there will be no change of colour in the Face, the stools will be moist, in which at first there will be thin and unconcocted Matter, afterwards concocted, in those of whom there is hope of recovery.

PROGNOSTICK. The Prognostick of this Disease is thus made:

Every Inflammation of the Liver is very dangerous, and for the most part deadly. And if it doth not kill presently, it ends in a Dropsie, or Atrophy, or Consumption. All the hope of recovery is from the strength, as *Galen* 10. *Meth. Cap. 5.*

An Inflammation of the Gibbous or buncy part of the Liver, is more dangerous than that which is in the hollow part, by reason it is nearer the heart, the Midriff, and hollow Vein.

An Inflammation coming from Choler, is more dangerous than that which cometh of pure blood, because then the Feaver is stronger, and other Symptoms greater.

The Hiccoughs in an Inflammation of the Liver are evil, *Hip. Aph. 17. Sect. 7.* For it shews the increase of the Inflammation, and malignity, which doth by consent disturb the Stomach.

A Loosness joyned with an Inflammation of the Liver is deadly, except the Matter voided be concocted, and the flux be Critical.

If the Inflammation of the Liver cannot be discussed, as it seldom can, and if the Faculty be strong, it turns into an Imposthume; otherwise it turns into a Gangrene or Sphacelus. The Suppuration for the most part will be within twenty days. And this Imposthume is very dangerous, and few escape thereof: But if it be little, and only in one part of the Liver, and the matter white and even which comes forth by Urine or Stool, they escape. Also a Tumor in the Convex, or outward part of the Liver, which appears in the Skin as it were moveable, may be opened with an actual Cautery;

and if the Matter coming forth be pure and white, they escape, for the Matter is contained in the Tunicle; but if it be like Lees of Oyl, they die.

After the Imposthume is broken, if the Patient live, there remains an Ulcer, which is very troublesome to cure; and if it be not superficial, it causeth a Dropsie or *Marasmus*.

Also an Ulcer may be in the Liver from sharp humors that corrode it, especially if they be cholerick, and spread through the substance of the Liver, which putrifying by degrees, get a malignant and venomous quality.

DIAGNOSTICK. The knowledge of this Ulcer, which comes from the sharpness of the humors without Inflammation aforegoing is difficult. But it may be known by some signs, And first, there is an ulcerous pain in the right Hypochondrion, and the Patient waxeth lean; and if it be in the hollow part of the Liver, there are stools with Pus or Matter, and sometimes with blood, and pain of the Guts by reason of sharpness of the humors, like a *Dysentery*, which is distinguished from this disease in this, Because there is a weight and pricking about the Liver. And sometimes Authors have observed that pieces of the Liver have been voided by stool. But if the Ulcer be in the gibbous or outward part, the water is mattery without any distemper of the Reins or Bladder. There is a small Fever in the increase of the disease, which turneth into an Heetick. The colour is yellow, and sometimes there are small pustules which come from the aduotion of humors in the Face. There is a loathing of Meat, and especially of flesh, a stinking breath, and often fainting.

PROGNOSTICK. Concerning the Prognostick: It bringeth a lingering Heetick Fever.

And if the Ulcer be not small, superficial, and cured betimes, it is deadly.

Those Exulcerations of the Liver which follow Inflammations and Imposthumes, are more dangerous than those that rise without them.

CURE. The Cure of the Inflammation of the Liver, is the same with that of the Inflammation of the stomach aforementioned, and chiefly in respect of Phlebotomy. Purges and altering Remedies are to be given in the beginning of the disease.

You must also give often Clysters, such as were prescribed in the Inflammation of the Stomach.

But afterwards, cooling, cleansing, and opening Juleps, such as we described in the Chapter afore-mentioned, bewaring that they be not too sweet, for by sweet things the Liver being inflamed, grows larger, as *Tralian* teacheth, *Lib. 4. cap. 10.*

Let his drink be Decoction of Barley, Dog-tooth, with a little Liqueoris, Syrup of Violets or Maiden hair.

In the Decoction you may add to the former Juleps, the Roots of Smallage and Parsly the Leaves of Agrimony, Maiden hair, &c.

And afterwards Turpentine, washed Agrimony, or Parsly water given twice or thrice, takes away the reliques of the disease.

But if the disease be stubborn, and last long, you must prescribe an Apozeme of opening and loosening things, thus:

Take of the Roots of Smallage and Parsly, of each two ounces: new Polypody of the Oak three ounces: the Leaves of Agrimony, Burnet, Ceterach, Maidenhair of each one handful: Annis, Fennel and Parsly seeds, of each one dram: Chamomel and Violet flowers, of each one pugil: clean Senna one ounce: Boyl them to a pint and a quarter. Dissolve in the straining Rhubarb infused with a little Lavender in Succory water two drams: simple Syrup of Vinegar four ounces. Make an Apozeme for four Doses, to be taken every other day.

Outwardly, many Topicks are good to be used the whole time of the disease. And in the beginning, Epithems, Liniments, and cooling Plaisters, such as stop fluxes, made thus:

Take of Endive, Succory, Sorrel, Plantane and Rose water, of each three ounces: Vinegar of Roses one ounce: the powder of the Electuary of the three Sanders one dram and an half: Camphire half a scruple. Make an Epithem to be applied warm to the Region of the Liver. Or,

Take of the Leaves of both Endive, Succory, Plantane, Bugloss, Burrage and Water-lilly-flowers, of each one handful: Roman Wormwood half a handful: Red Roses two pugils: red and yellow Sanders of each two drams: boyl them to one pint and an half. Dissolve in the straining half a pint of Rose Water, Rose Vinegar one ounce: Camphire one scruple. Make an Epithem.

If you desire to cool more, you may add the Juyces of the aforesaid Herbs.

Take of Oyl of Roses two ounces: Oyl of Wormwood half an Ounce: mix them and wash them with Oxycrate, and anoint the place therewith after the use of the Epithem. Or,

Take of Oyl of Roses, and of Mirtles, of each two ounces: the Juyce of Endive and Succory, of each one ounce: Vinegar half an ounce: boyl them to the consumption of the Juyces: then add the Powder of red Sanders and Roses, of each one dram: as much Wax as will make an Unguent.

Or,

Or you may use the ointment of Roses alone, or Galen's cooling ointment washed with Oxycrate.

In the progress of the Disease, when the Feaver and pain decrease, you must mix Dissolvers with Coolers, either in equal or unequal proportion, as the Disease grows nearer to the state or declination, these must be wisely composed. But that you may know what to make of them, we will shew you some Examples.

Take of Oyl of Roses two ounces; Oyl of Wormwood one ounce; Oyl of Chamomel half an ounce; Powder of the three Sanders one dram; Spicknard half a dram; Wax as much as will make a Liniment.

Take of clean Dates ten; whole Raisins three ounces; boyl them in Oxycrate; then beat them with Chamomel, Melilot, and red Rose Flowers, of each one pugil; Spicknard and Schœnanth, of each one dram; Smallage and Parsley seeds, of each half a dram; Endive and Purslain, of each one dram and an half; Oyl of Wormwood and Roses, of each one ounce; Barley meal two ounces. Make a Cataplasma.

Or you may make one not so hot, thus:

Take of Barley Meal three ounces, red Sanders two ounces, Oyl of Roses three ounces. Mix them with the Decoction of Endive and Succory, for a Cataplasma.

In the Declination, when the Feaver is gone, you must use Dissolvers with Emollients, lest any hardness should remain, and some Astringents to strengthen the part:

Take of Marsh-mallow Roots three ounces, Cypress Roots, and Calamus Aromaticus, of each half an ounce; Mallows, Violets, and Agrimony, of each one handful; both the Wormwoods, of each half a handful; Fœnugreek, Annis, Fennel, and Linseed, of each half an ounce; Chamomel, Melilot, and Dill-flowers, of each one pugil; Spicknard, Schœnanth, and Mastich, of each one dram and an half. Make a Decoction of them, and foment the part affected with it, somewhat hot.

Take of Oyl of Chamomel, Lillies, and sweet Almonds, of each one ounce; Oyl of Wormwood and Spike, of each half an ounce; the Powder of Schœnanth, Rosata Novella, Wormwood, of each one dram; Wax so much as will make a Liniment to be used in the declination of the Disease.

If the hardness of the part continue, it will be good to add the former Liniment, Gum-Ammoniac dissolved in Vinegar. Or this Plaister:

Take the Emplaister of Melilot, and Diachylon with Flower-de-luce, of each one ounce. Mix them, and spread them upon Leather, cut like a half Moon to be laid to the part. Or,

Take of Gum-Ammoniac dissolved in Vinegar one ounce; Labdanum and Mastich, of each two drams; Oyl of Wormwood and Wax, of each as much as will make a Plaister.

If the Inflammation tend to suppuration, which is known by the increase of the Feaver, and the pain, according to Hip. Aph. 7. lib. 2. there is great danger, and few escape in this case. Yet you must further the Suppuration with the aforesaid Emplaisters, which will dissolve the Matter which will be dissolved, and suppurate that which will be suppurated or ripened; as also with mollifying Cataplasms, and you must give inwardly Chicken Broth wherein Mallows, Marsh-mallows, Figs, and Prunes have been boiled.

After the Imposthume is broken, if white Matter flow by Stool or Urin, you must cleanse with Barley water, or Whey with Honey of Roses, or with those Remedies which are prescribed for the cure of the Ulcer of the Stomach. But if the Suppuration tend outwardly, you must open it with a red hot Incision Knife, according to Hippocrates. And if the Matter come forth white and concocted, there is hope of Cure; but if red, filthy and stinking, the Patient is near death.

CHAP. III.

Of the Stoppage, or Obstruction of the Liver.

THe obstruction of the Liver is a Preternatural closing or straightness of the Branches of the Vena Porta, and Cava, that is, of the Gate and hollow Vein, and sometimes of the substance of the Liver, hindering the passage of Natural Humors, and the distribution of the Nourishment, coming from some Matter which filleth their Cavities.

Hence it is that obstruction is an Organical Disease, namely in the way and passage obstructed, which hinders the distribution of blood for the nourishment of the parts. These ways or passages are not only the veins which are dispersed through the whole substance of the Liver, but also the Pores and insensible Passages, with which the whole substance of the Liver, and also of other parts, is very full; which being shut up by a preternatural humor, neither can the heat of the Liver be cooled, nor can the thin vaporous Excrements be evacuated.

The Matter that causeth the Obstructions commonly is a gross Excrement, vicious and clammy, which being not able to pass freely, sticks in the passage, and is more and more thickened by the heat of the part, so that the longer Obstructions continue, the worse they are.

Sometimes plenty of humors cause an Obstruction, as *Galen* sheweth, 16. meth. cap. 2. in these words: *Of Obstructions some come of abundance of humors, and some from the quality, as when they are gross or clammy: Blood-letting is the best Remedy against those which come from plenty, and the use of attenuating things is best against those that come of Quality.*

This Obstruction which comes from plenty of humors, happens chiefly in the Vessels and their Cavities when being too full, they are so distended that they cannot contract themselves for the sending forth of the Matter contained: As we may observe by the Bladder, when it is stretched out by long retention of too much Urin, that it cannot contract it self; from whence there comes a stoppage of Urin, or difficulty of voiding thereof.

Not only humors, but also sometimes many gross vapors, which cannot easily be discussed (because the way is not open as in the Cholick) may be the cause of Obstruction, as *Galen* teacheth, 3. de loc. aff. which causes are very rare, and absolutely denied of some.

The humor which stoppeth with its thickness is chiefly Flegm, which will easily grow gross and clammy. Melancholy is next, which by its coldness, thickness, and drossiness, may cause Obstructions: Also Blood may do the same by its quantity and thickness. And lastly, Choler staying long in the Liver grows thick, and breeds dangerous Obstructions. The Antecedent and Principal Causes, are all things that produce thick and clammy humors, and thick and cloudy Air, Meats of gross Juice, viscous, hard of Concoction, and distribution, astringent, cold, and not fit to be eaten; as Pears, Quinces, Services, Medlars, Mushrooms, Cheese, Pulse, Pease or Beans, Beet and Pork, slimy Fish, and dried in the smoak, Bread not well baked, Rapes, Chestnuts, thick, red, and astringent Wine, and muddy Ale.

Also an evil disposition of the Liver, especially a cold distemper, which may also produce Obstructions from good Juice, as when it doth not well concoct, but turns the meat into a Salt Tartarous and mucilaginous or slimy Matter.

Also the Distemper of the Stomach may be a cause of Obstructions, when it begets too crude a Chyle, which cannot after be well ordered by the Liver, because the fault of the first Concoction is not amended by the second.

SIGNS. The signs of this Disease are to be divided into divers sorts, some signify the kind of the Disease, others the part affected, and others the cause that produce it.

The signs that shew the kind of the Disease are common to all natural parts that are subject to Obstructions: for they shew only Obstruction lying in the lower Belly, and these therefore will serve for the knowledge of the Obstructions of the Spleen, and Mesentery especially.

The Signs shew that there are Obstructions in the said parts.

The Excrements of the Belly being out of their natural condition, especially when they are moist, white, chylous, or bloody; white Urine, thin and watery, and as it were strained, because the thicker parts cannot pass through by reason of the Obstructions, but only the pure water comes through unmixed; and it may be yellow if there be heat.

Difficulty of breathing, especially when the Patient walketh fast, or goes up a hill or pair of stairs, because the parts obstructed do draw the Midriff downwards, and hinder its free motion; the Face is pale; there is leanness and dulness over the whole body; the Pulse is unequal; and lastly, there is such a sense of weight in the Hypochondria as they feel who have been feeding very hard; therefore *Hippocrates*, 4. de victus ratione in acut. calls that heaviness a fulness of the Hypochondria, attributing that Disease to the Hypochondria, which properly belongs to the Stomach; for as often as the Spleen and Liver are filled with evil humors and swell, they are pressed and feel a heaviness, after the least eating of the lightest Meats, as they who have over-gorged themselves. This sign doth so surely declare the Obstruction of the Hypochondria, although there be neither pain nor apparent swelling, that *Prosper Mauritanus* in his Comment upon the aforesaid Book of *Hippocrates*, affirmeth, That he hath concluded that the Bowels were obstructed, before ever he handled the Hypochondria.

The stretching of the right Hypochondrion sheweth the part affected, together with the other signs, and sometimes pain, that is heavy and dull, which increaseth after meat, especially if exercise immediately follow; sometimes a dry Cough; difficulty of Breathing by reason of the nearness of the Diaphragma, and a greater weight of that part than of any other.

The signs of the causes are these if it come from humors, the pain is more heavy, extending and fixed: if from Wind, it is sharper and more moveable: if from cold humors, there is more sense of weight in the right side, the Face is more pale, there is no Fever nor thirst; there was a cold and thick diet without exercise that preceded: if it comes from hot humors, there is less weight, more

more thirst, the Face is yellow by reason of Choler, or red by reason of Blood, there is a Feaver and a pricking pain sometimes, and hot Diet went before.

PROGNOSTICK. The Prognostick of this Disease is to be made thus:

A new Obstruction is easily taken away, an old hardly.

An Obstruction of the Liver, except it be speedily and wholly taken away, useth to bring many Evils; namely, Putrefaction of humors, Feavers, Inflammations, divers Fluxes of the Belly, constant and vehement, because the nourishment cannot pass to the part: the Cholick, Jaundice, evil habit of body, Dropsie, Schirrus, and other infinite Diseases, so that *Avicenna* calls Obstructions the Mother of Diseases.

An Obstruction made by humors, is worse than that which comes of Wind.

That which comes of crude and flegmatick humors, or of Wind, is sometimes cured by a Feaver; because the heat doth discuss the Flatus or Wind, makes Flegm thin, and more apt to flow.

CURE. The Cure of an Obstruction is to be begun with an universal Evacuation of the whole body, by a Potion agreeable to the nature of the Disease: Afterwards if there be signs of Plethory or fulness, and if the body be not very thin, you must draw blood out of the Liver Vein in the right Arm.

Then prescribe this Apozeme:

Take of Smallage, and Parsley, and Fennel Roots, infused a whole night in white Wine, of each one ounce: the Roots of the greater Celandine two ounces: Fearn Roots, Elicampane barks, the Roots of Capers, the inward bark of an Ash, and Tamarisk, of each half an ounce: Wormwood, Agrimony, Maiden hair, Germander, the tops of St. John's Wort, and the lesser Centaury, of each one handful: Smallage, Parsley, Annis, and Fennel seeds, of each half an ounce: Clean Senna, Polypody of the Oak, and the Kernels of Carthamus seeds, of each two ounces: Epithymum, or Dodder of Thyme one ounce: Ginger and Cloves, of each one dram; the flowers of Tamarisk, Marigolds, and red Vetches, of each one pugil: make a Decoction to a pint and a quarter; dissolve in the straining of the Syrup of the Five Roots and of Roses solutive, of each two ounces: make an Apozeme, clarified and aromatized with two drams of Cinnamon for four mornings draughts, adding to every Dose one dram of Cream of Tartar, Salt of Wormwood and Tamarisk, of each half a scruple.

In the last Dose (if the first hath not sufficiently purged) dissolve of the Electuary of Citrons Solutive and Diacarthamum, of each one dram and an half.

Sometimes we put white Wine in the Decoction before-mentioned. Sometimes a little Vinegar, according to the nature of the Patient.

If the Patient be dainty, and will not take an Apozeme, instead thereof you shall give these Broths:

Take of Smallage, Parsley, and Sparagus Roots, of each half an ounce: Agrimony, Hysop, Maiden hair, of each one handful: Crystal of Tartar one dram: boyl them with a Chicken or a neck of Mutton; make Broth for nine days together every morning.

The Crystal of Tartar dissolved in new made Broth and strained is better, for when the Decoction is cold, for the most part it congealeth again, and is separated from it; and when you give it in the Broth, you must stir it about well with a Silver Spoon afore it be taken, or you will leave the greater part in the bottom of the Dish.

Every other day, infuse in his Broth, half an ounce of Senna, and one dram of Annis seeds.

As long as he taketh these Medicines, and after as often as need requires, let the Region of the Liver be fomented every morning one hour before he taketh his Broth, and every evening one hour before Supper, with this following Fomentation:

Take of Marsh-mallow and Briony Roots, of each one ounce and an half: the Roots of Danewort, Cypress, Eryngus, the Barks of the Roots of Capers, and the middle Rind of Tamarisk, of each one ounce: the Leaves of Mallows, Marsh-mallows, Violets, Agrimony, Germander, Mints, and Wormwood, of each one handful: Lin-seed, Fenugreek, and Juniper Berries of each half an ounce: Coriander seeds, and yellow Sanders, of each three drams: Broom, Elder, Chamomel, and Melilot flowers, of each one pugil: boyl them all in two parts of Chalybeate Water, and one of white Wine, added in the end: and when it is strained, add half a pint of Vinegar: Foment the part as aforesaid.

After the Fomentation, let the part be anointed with the following oyntment:

Take of Oyl of Lillies and Capers, of each two ounces: the Juyc of the Roots of Briony and Smallage, of each three ounces: Boyl them till the Juycs are consumed, adding the Oyntment of Marsh-mallows, and Gum-Ammoniack dissolved in Vinegar, and strained, of each one ounce: Carrot-seeds, and Spicknard, of each one dram and an half: yellow Wax as much as will make an Unguent.

Unguent. Use it as aforesaid, adding in the time of anointing, a little Vinegar of Roses.

After the use of these Remedies, this Opiate following is good to wear away the reliques of the obstructions, and recover strength to the part.

Take of Conserve of Wormwood, Maiden hair, and the Flowers of Tamarisk, of each one ounce; the Conserve of Elicampane Roots, and Citron peels candied, of each half an ounce; one candied Myrobalan; candied Nutmegs three drams; Confection of Alkermes two drams; the Powder of Diarrhodon Abbatis, one dram; Salt of Wormwood and Tamarisk, of each two scruples; Saffron one scruple; Ambergreece half a scruple: with the Syrup of Citrons make an Opiate, of which let him take the bigness of a Chesnut every morning two hours before meat, and drinking after it a little Hippocras.

Warm Baths are also very good, in which softening and opening things have been boiled.

If the obstructions are very stubborn, these following Pills are very good.

Take of the best Aloes infused in the Juice of Wormwood very well, half an ounce; Gum-Ammoniack dissolved in Vinegar and strained, three drams; Myrrh dissolved in warm Wine, and strained: two drams; the Power of the three Sanders, and Cristal of Tartar, of each one scruple; Agarick newly made into Troches, and of the best Rhubarb, of each two drams; the Salt of Wormwood and Tamarisk, of each half a dram; Saffron half a scruple; with the Syrup of Roses solutive, make a Mass of Pills, of which let him take half a dram two hours before dinner twice in a week.

Instead of the Apozeme aforesaid, you may make an old Cock Broth, when the obstructions are old and stubborn.

Take of Polypody of the Oak, and Carthamus seeds, of each one ounce and an half; the tops of Thyme and Epithimum, of each one pugil; Annis, Fennel, and Caraway seeds, of each two drams; clean Senna two ounces; Crystal of Tartar half an ounce; beat them, and fill the Belly of an old Cock therewith: boyl them in three parts of Water, and one of white Wine, till the Belly of the Cock fall from the bones. Make Broth, and let the Patient take it four mornings.

Or (which is better) make a Decoction for one draught every day of the fourth part of the Ingredients.

To this Broth you may add Herbs, and opening Roots in a small quantity.

Quercetan commends exceedingly in his Dispensatory, the Compound Powder of the Root of Cuckow-pintle to open obstructions; of which you may give two drams for divers days together, in a convenient Decoction.

But of all Remedies, to take of old obstructions, Medicines made of Tartar, Vitriol, and Steel, are the best.

Of Tartar there is made Crystal, Salt and Spirit, which are to be given in divers forms.

The use of Crystal of Tartar is formerly mentioned in the Apozeme, and Physick Broths made either of a Chicken, or old Cock.

Concerning this Medicine, young Physicians are to be admonished, that it is of more force than it is commonly supposed to be, although we seldom observe it in Practice, by reason of the negligence of Apothecaries, the deceit of false Chymists, and vulgar Distillers, which distil Chymical Medicines to the Apothecaries, of which few are good, but most adulterate.

The negligence of Apothecaries for the most part is, that they had rather buy Crystal of Tartar of such Fellows, than make it themselves (though it be the easiest of all) because they sell it cheaper than they themselves can make it: for those Impostors will sell a pound for seven pence, or eight pence, from which alone the Apothecaries might argue deceit, perceiving that they would be losers in so selling, if it were rightly made.

The deceit lieth here, These Impostors put a little Tartar, and a great deal of Allum into their Decoctions, not because Tartar is sold dearer, but because it yields but a little Crystal; but Allum will run all into Crystal. Hence it is that the Physicians are deceived of their intentions, because Allum is astringent, which is contrary to the opening Faculty which they desire.

Moreover, There is another wrong done to this Medicine, when it is made in a Brass Kettle, which leaves a malignant quality upon the Medicine; for it is a known and vulgar saying among Apothecaries, you must not boil sharp things in Brass Vessels, because they easily pierce, and attract a noxious Tincture from them. But the Crystals of Tartar are most sharp, called by some *Acidum Tartari*, or the sharpness of Tartar.

This Error is often made by Apothecaries; and almost all they who make this Crystal themselves use Brass Vessels, so that I have seen some Tartar look Skie-coloured from the Verdugreece which it hath taken from the Copper. Therefore Physicians shall do conscientiously, honourably, and for the good of their Patients, if they cause their Apothecaries to make Crystal of Tartar themselves, and in Glafs, Iron, or Earthen Vessels glassed.

The Salt of Tartar hath great power to open obstructions, and may well be mixed with Apozem, Opiate,

Opiates, and opening Pills, But the chief use of it is in a loosening Prisan, or Barley Water made of two drams of Senna, infused in eight ounces of cold water, with one scruple, or half a dram of Salt of Tartar, by which the Tincture of the Senna will be powerfully extracted; so that this Prisan shall work better than any ordinary one; and continue many days it takes away all obstructions: we have seen Quartan Agues cured, by the use of it fifteen days together. If you fear the sharpness of the Salt of Tartar, you may correct it with the Spirit of Sulphur, or of Vitriol, putting fifteen drops of Spirit, to half a dram of Salt.

You may find the use of Spirit of Tartar in our Observations for the Cure of the Dropsie, under the Title of a Diuretical Spirit.

Of Vitriol, only the Oyl or Spirit is used in Apozemes, Syrups, and other Forms of Medicines.

This following Syrup, which is good against all Obstructions of the Liver, Mesentery, and Veins. may be for an Example, by which many through continual Feavers falling into evil Habits and Dropsies have been perfectly cured.

Take of the Roots of Smallage, Elicampane, Sparagus, Eringes, of each one ounce: Leaves of Agrimony, Ceterach, Maiden-hair, Dodden, Carduus, of each one handful: the tops of Sea Wormwood and of the lesser Centaury; of each half a handful: Winter-Cherries one ounce; Spring water six pints; boyl them till two pints of the straining remain; in which dissolve of the Juyce of Succory and Burnet refined, of each one pint: the juyce of Fumitory and Hops of each six ounces: Fennel and Parsley juyce, of each three ounces: Vinegar of Squils one pint and an half: white Sugar six pound: make a Syrup, to which add of the Oyl of Vitriol as much as will make it sharp: of which let the Patient take three Spoonfuls before Break fast and as much before Dinner and Supper.

The Natural sharp Baths shew the efficacy of Vitriol, the use whereof is frequent and profitable in all Diseases coming of Obstructions.

But the Spirit of Vitriol mixed with the Salt or Spirit of Tartar, is much commended by the Chymists, and of them they make Tartar Vitriolate, and that rare mixture of Spirit of Vitriol, Tartar and Treacle, which may be mixed with other openers.

Lastly, There are divers Medicines made of Steel both by Galenists and Paracelsians, which plainly opening Obstructions presently, compel all men to use them, even those who reject all Medicines made of Mettals, as enemies to our Natures.

These Medicines of Steel are made either in the Form of Wine, Syrups, Opiates, Pills or Lozenges.

Steeled Wine is made thus:

Take of the Filings of Steel four ounces: Eryngo Roots, and Elicampane, of each one ounce and a half: yellow Sanders one ounce: red Coral and shavings of Ivory, of each six drams: Cloves, Nutmeg and Cinnamon, of each two drams: Flowers of Broom, Rosemary, and Epithimum, of each two pugils: the best white Wine six pints: steep them eight days in Balneo Mariæ, or behind an Oven: then strain them through an Hippocras bag, and let the Patient take two or three ounces every morning two hours before meat for fifteen days, or more, if need require.

Or make it thus:

Take of Steel prepared with Sulphur, one ounce: Elicampane, and the middle rind of Tamarisk, of each half an ounce: Senna three ounces: Epithimum one ounce: Fœcula Brionia, and Cinnamon, of each two drams: Powder of the three Sanders, one dram and an half: Agrimony water, and white Wine, of each one pint: Infuse them three days in Balneo Mariæ. Let him take three or four ounces when it is strained, three hours before meat.

Commonly they use the Infusion of Steel in white Wine, or Claret for ordinary drink, with much Water for two or Three Moneths together.

You may make a Syrup of Steel thus:

Take of Filings of Steel steeped in Vinegar, two ounces: the inward rind of Tamarisk half an ounce: Ceterach half a handful: Cinnamon three drams: Wormwood and Agrimony Water, of each half a pint: white Wine one pint: Infuse them six days in a warm place: add to the straining, Sugar one pound and an half: make a Syrup. Let the Patient take every morning two or three ounces.

For the preparation aforesaid of Steel, you must steep it in Vinegar in the Sun, while the Vinegar is consumed three times, and grind it upon Marble.

This Syrup may be made Purging, and better if you dissolve the Sugar with a pint of water wherein three ounces of Senna, and half an ounce of Rhubarb have been steeped a whole night.

The Powder of Steel is made thus, taken out of Quercetan's Dispensatory.

Take of Filings of Steel, either commonly prepared, or with Sulphur, one ounce: the facula of the Root of Cuckow-pintle one dram and an half: Ambergreece half a dram (for the Poor, a Cordial

Cordial Species will serve instead of Ambergreece) Coral and Pearl prepared, of each two drams: Amber prepared and Cinnamon, of each four scruples; Sugar as much as is sufficient to make a pleasant Powder, of which let him take half a spoonful, or two drams with wine for fifteen days.

Of the same Powder and Sugar dissolved in Turnep Water and Confection of *Alkermes*, may be made very pleasant Lozenges to be taken as the former, Or,

Take of Steel prepared with Brimstone half an ounce: Confection of *Alkermes* two drams: Ambergreece one scruple: Sugar dissolved in Rose Water four ounces; make Lozenges: Let him take two drams every morning.

Instead of the Powder the Extract of Steel may be used, made in white Wine for those who are dainty.

Divers Opiates are made also of Steel; these following are best:

Take of Conserve of the Flowers of Tamarisk and Maiden-hair, of each one ounce and an half: Conserve of the Roots of Elicampane six drams: Steel prepared either with Sulphur or Vinegar one dram: Salt of Tamarisk one dram: Spirit of Vitriol half a scruple: with the Syrup of candied Citrons make an Opiate, of which let him take two or three drams every morning. Or,

Take of the filings of Steel half a pound: white wine one pint and an half: mix them in a Glass, set it to the fire, let it be boyled gently, stirring it up and down, till a scum arise, then take the frothy and fat part of the Steel which is separated by the heat, and put it with Wine into another Glass: do this four times, adding fresh Wine, heating and separating them, set it on a gentle fire, till it be hot and grow thick as Honey, keep it for your use. Or,

Take of Steel so prepared six drams: Parsley and Carrot seeds, the species of *Diacurcuma*, and *Diarrhodon Abbatis*, of each one dram: Cinnamon half a dram: with clarified Honey make an Opiate, of which take three drams or half an ounce every morning. Or,

Take of Steel prepared with Brimstone one ounce: the best Senna, Rhubarb and Agarick, of each two drams: *Diarrhodon Abbatis* one dram: Saffron one scruple: with Syrup of Roses solutive, make an Opiate: of which let him take two drams every morning for fifteen days, three hours after meat.

Pills of Steel are as good as the rest, and they may be made thus:

Take of Steel prepared with Brimstone half an ounce; the best Aloes, Senna, Agarick and Rhubarb, of each one dram; *Diarrhodon Abbatis* half a dram; Saffron half a scruple; with Syrup of Roses solutive make a mass of Pills; of one dram whereof make six guiladed Pills, which give in the morning for fifteen days, three hours afore meat.

To these Pills you may add according to the kind of the disease and the Patients occasion, of Gum Ammoniack, Sagapenum, Opopanax, Myrrh, Gentian, Birth-wort, Massich, Nutmeg, and the like.

In all Medicines made of Steel, this is always to be observed, That Exercise be used after them, as Walking, to make the strength of the Medicine to go into the parts obstructed: This Walking must be for two hours after; after which give a little Broth, in which opening herbs and roots have been boyled.

Besides all these Remedies, the Chymists commend the Mercurial Purges, of *Mercurius dulcis*; especially given with ordinary Pills, or Extracts, because Mercury doth violently penetrate, and open Obstructions.

The Bezoar Mineral is very much commended, and given with *Mercurius dulcis*; You may give it thus made:

Take of Bezoar mineral twelve grains; *Mercurius dulcis* six grains; Conserve of Roses one or two drams; make a Bolus which must be given many days.

If there be an Obstruction of the Liver in a Cholerick body, with a hot and dry distemper of the part, then must you give cooling or temperate Openers, which shall be shewed in the Cure of *Flatus Hypochondriacus*, mentioned among the diseases of the Spleen.

For his ordinary drink let him take water and small Wine wherein Steel hath been infused; Or, a weak Decoction of Tamarisk, Agrimony, Ceterach, Maiden-hair, Burnet, all or some with Wine.

Some commend the Infusion of the Wood against the Stone called *Lignum Nephriticum* for ordinary drink; others the Decoction of Eglantine or Sweet Brier which opens very powerfully, and strengtheneth; and they say that many have been cured of desperate diseases by that alone.

But the infusion of the filings of Steel made in white Wine, or thin red Wine, doth open better mixed with the aforesaid waters, or with ordinary water; for by this Medicine alone many Virgins have been Cured of the Green Sicknes, and this Wine will work better, if they take every morning two ounces of clear Wine, besides the ordinary drink.

Chap. 4. Of the Jaundice.

THe Jaundice is a yellow colour of the whole Body coming of Choler, spread over all the Skin. It is therefore a Symptom of the Quality changed. And now presently, that vulgar difficulty which is controverted by almost all Writers, offers it self; namely, That the yellow colour in the *Cornea* doth immediately hurt the Sight, making all Objects appear yellow. To which (that I may answer in a word, without Circumstances) I say, that it is a disease in the increase of Number; for since the *Cornea* ought to be void of all colour, that it may let the Species of Objects pass through pure and unchanged, if it have any preternatural colour, it hath a disease in the increase of Number, that is, more than what is necessary to the Natural Constitution thereof.

DIFFERENCES. Authors do make two sorts of Jaundice; Yellow and Black. The Black proceeds from the Spleen, and is very rare: therefore here treating only of the diseases of the Liver, we will speak only of the Yellow Jaundice.

CAUSES. The spreading of Choler upon the skin comes from many causes; which may be reduced to three Heads; namely, An evil disposition of the Liver; An Obstruction of the Bag that contains the Gall; and the Malignity of the Cholerick Humor.

The evil disposition of the Liver is divers; as Distemper, Inflammation, Obstruction, Schirrus, and whatsoever may so weaken the part, that Excrementitious Choler cannot be separated from the Blood, but is with it distributed through the whole Body.

The Obstruction of the Bag or Cystis, which contains the Gall, hinders the passage of it into the Guts, whereby it remains in the Liver, and goes from thence with the blood into the whole Body. This Obstruction is either from gross Flegm or Choler abounding, sometimes from little stones which are often bred in the Bag of the Gall; which may also be made narrow in the Passage, by the compression of some part nigh unto it, which is inflamed or Schirrous.

The evil of the Cholerick humor consists either in the great quantity thereof, which cannot be regulated by Nature, or be separated from the Mass of blood, or which so filleth the Bag of the Gall, that it cannot contract it self to expel it; or it consists in evil quality, which by corrupting of the Humors, doth hinder their due Evacuation, or stir up Nature suddenly to cast it forth, as you may observe in a Critical or Symptomatical Jaundice. This corruption happens in continual Cholerick Fevers; as also after Poyson is taken, or from the biting of some venomous Creature, by which the whole blood is turned into Choler.

SIGNS. The Signs of the yellow Jaundice are manifest: namely, a yellow Choler through the whole Body, especially in the White of the Eyes. Also an itching and laziness, bitterness of the Tongue, sometimes Cholerick Vomittings and Hiccoughs.

The signs of the causes are to be taken from their proper Fountains; for if the distemper of the Liver be hot, this Disease comes from Inflammation, Obstruction, Schirrus, or the like: the knowledge of which is to be taken from their proper Chapters.

These things properly shew the Obstruction of the Bag of the Gall, white Excrements, and a belly bound through the want of Choler, which useth to make the Excrements yellow or red, and to stir up the Expulsive Faculty of the Guts like a Clyster. The Urine is very yellow, inclining to red, and if you put a Linen Clout therein, it will die it yellow.

If it come from the malignity of the Cholerick humor, the Excrements of the belly are high coloured, and also the Urine, especially if it follow a putrid Fever, when the Jaundice is a Symptom, and then after the coming of the Jaundice the Fever remains: but if it be critical, the Fever ceaseth, and the Excrements with the Urine are well coloured. The External Causes, as Poyson and venomous bitings may be declared by the Patient, and those about him.

PROGNOSTICK. The Prognostick of the Jaundice is various, according to the variety of Causes.

That is more curable which comes from the Obstruction of the Bag containing the Gall, because its passages are nearer the Guts, and the Matter cleaving thereto is easily sent into them, provided that the Obstruction come not from a stone, which because it cannot be dissolved, renders the disease incurable.

The Jaundice coming from an Inflammation or Schirrus of the Liver, is most dangerous; for one commonly ends in an Imposthume, the other in a Dropsie.

They who in a Fever have the Jaundice before the seventh day, are desperate, *Hip. Aph. 62. Sect. 4.* against which *Aphorism* there is another of *Hippocrates* opposed, which is in *4. de Victus ratione in acutis*, in these words; *In a Cholerick Fever, if the Jaundice come before the seventh day with chilness, the Disease is cured: but if it come without chilness, it is deadly.* There in

Reason for what he saith; for when in the third, fourth and fifth day, the *Crisis* (or ground) of Judgement is healthful, if it be by Sweat, Urine or Stool, why should not a Critical Jaundice fall upon those days? And experience from many allowed Authors do testifie that the Jaundice doth often happen with safety before the seventh day. Now these Authors do interpret the aforesaid *Aphorism* thus; namely, That *Hippocrates* by the seventh day, understands any Critical day, and he mentioneth the seventh as the most noble day, and to be taken for all the rest. But that is a true Critical day of Judgement, afore which a full Concoction of the Matter causing the Feaver did appear.

CURE. The Cure of the Jaundice is by taking away the Causes: For if it come from a hot distemper of the Liver, or a Tumor in that part, you must consult with the Chapters afore-mentioned for the Cure of them.

But that which comes upon acute Feavers, if it be Critical needs no Cure. Yet if it be Symptomatical, the cure of it depends upon the cure of the disease upon which it depends.

That which comes from the Obstruction of the *Cystis* or Bag of the Gall, is cured by taking away of the Obstruction, which may be conveniently done by the Remedies mentioned in the former Chapter. To which you may add these as more proper.

First, take away part of the humor with this following Bolus:

Take of the Electuary of the Juice of Roses, and *Diaprunis solutive*, of each three drams: the Powder of *Rhubarb* one dram: Saffron half a scruple: With Sugar make a Bolus, which you may give once or twice if the Body be of a very ill habit.

As for Phlebotomy, though *Galen* denieth it as unprofitable, yet if you perceive abundance of Blood, it is very good to abate it.

After general Medicines, this following Infusion used six or seven days, doth commonly pluck this Disease up by the Roots, if it be but young:

Take of *Madder-Roots* half an ounce: the greater *Celandine* one handful: the tops of *Sea Wormwood* and of the lesser *Centaury*, of each one pugil: *Cinnamon* half a dram: Saffron half a scruple. Infuse them a whole Night in eight ounces of White-wine, and add to the straining half an ounce of white Sugar. Let him take it in the Morning three hours before Dinner.

Or you may make this Decoction following:

Take of *Celandine Roots* and Leaves one handful: the Leaves and Flowers of *St. Johns Wort*, of each half a handful: the shavings of Ivory and powdered Goose-dung, of each three drams: Saffron half a dram. Put the powder of Goose-dung and the Saffron in a Cloit, and boyl them all in equal parts of White-wine and Wormwood water to one pint: and when it is strained, add one ounce of Sugar. Give it for three Mornings draughts, and repeat it if you think fit.

Quercetan commends for this purpose, the Dung of a Green-Goose that eats Grass in the Spring, and the dried white Dung of an Hen, given for three days to the quantity of half a dram or a dram. And he saith, that the Dung of these Aerial Creatures is full of Nitre and Sulphur, and hath a wonderful faculty to cut, attenuate and dissolve.

Dioscorides commends the Juice of Horehound for this Disease, and since his time, others and especially *Forestus*, who reports that some were onely cured by the use of the Syrup of the Juice of Horehound, when other means failed.

Gesner commends the Nettle-Root thus prepared:

Take of Nettle Roots one pound: Saffron one scruple: Beat them well, and take out their Juice with White-wine, and let the Patient take four ounces every Morning for four or five days, and cover himself to sweat after it.

While inward Medicines are given, let the Region of the Liver be anointed with this following Ointment:

Take of the Juice of Smallage, Parsley and Succory, of each one ounce; White-wine Vinegar half an ounce: the Oyl of Tamarisk two ounces. Boyl them till the Juice and Vinegar be consumed: then add of yellow Sanders and Spicknard, of each one dram: Wax as much as will make a Liniment.

After the Obstructions are taken away, the yellow colour will presently vanish by the strength of Natural heat, which will discuss the Humor from the Skin. But that it may sooner be gone, make a Bath of warm Water, and rub the Body therein, with a Bag of Barley and Bean-Meal.

CHAP. V. Of the Schirrus of the Liver.

THe Schirrus of the Liver is a hard Tumor without pain, bred of a thick Humor, fastned and hardned upon the Liver.

DIFFERENCES. This Schirrus is twofold, Either it is exquisite or perfect, or imperfect. That which is a perfect Schirrus is laid down in the Definition propounded, which is without Pain or Sense.

That which is not exquisite or perfect hath some kind of Pain, and comes from a Matter less hardned; in a word, it is a Schirrus beginning, and not confirmed; but that which is exquisite is confirmed, so that they only differ in Degrees.

CAUSES. A Schirrus breeds in the Liver two ways; either from Defluxion, or Congestion of a thick and glutinous humor upon the part; or from Inflammation, which dissolveth the thin humors, and leaveth the thick.

The Matter of the former is Flegm or Melancholy, either sent from other parts, or bred in the substance of the Liver by an evil Concoction. For the producing of this humor, evil Diet is a main cause, if it be of thick, cold and viscous, or clammy nourishment; as also a flegmatick or melancholick Constitution and a Natural Straightness of the Liver. From whence Galen saith, 13 Meth. That a Schirrus easily breedeth in the Liver, Spleen and Reins. In the Liver, because the passages are narrow, and it is nourished with thick blood. In the Spleen, because it receiveth the thick blood. And lastly, in the Reins, because they are nourished with thick blood.

The causes of the latter Schirrus which followeth other humors, is the immoderate use of dissolving Medicines, or of Repercussives, which by cooling and binding do thicken the Matter, and keep it from dissolving. Besides, the Matter of the Disease, which is properly cold and thick, and will not be dissolved; or the weakness of the part, which cannot help the breathing forth of the humors. And lastly, a cooling and thickning Diet.

SIGNS. The signs of a Schirrus in the Liver, are a hardness in the right Hypochondrion, and that more than in an obstruction, next a heaviness in that part, especially when there is violent breathing, no Fever nor pain, by which it is distinguished from an Inflammation, or there is but little pain, as when the Schirrus is not exquisite or perfect. There is less repose upon the left side, because the Liver being hard and heavy, doth then lie upon the Stomach and burden it: the colour of the Face is pale and greenish, because when the Liver is Schirrus, there is no good blood produced by it. The whole Body also is slain away, because there is neither sanguification, nor distribution of nourishment as it ought to be.

PROGNOSTICK. The Prognostick of this Disease is given by Galen 2. ad Glaucum Cap. 4. in these words: *An insensible Schirrus is incurable, but that which is a little sensible is curable, though with much difficulty.* Also Galen Cap. 5. of the same Book, saith, *We have cured a Schirrus of the Liver often in the beginning of it; but when it hath been of long continuance, neither could I, nor any other that I ever heard of, cure it.*

An old inveterate Schirrus turns to a Dropsie incurable, of which some die sooner than others, if they have a looseness of the Belly therewith of long continuance.

A Schirrus which followeth the Jaundice, or causeth the same, is dangerous. Whence Hippocrates, Aph. 42. Sect. 6. saith, That if the Liver grow hard in them who have the Jaundice, it is an evil sign.

CURE. The Cure of a Schirrus, is first by the taking away of the Antecedent Cause, by the Apozeme which is prescribed in the obstruction of the Liver. To which you may add other Medicines proper to open obstructions.

Afterwards you must discuss the hard Matter with mollifying and opening things. For this end the Steel-pills above-mentioned are excellent, especially if you add thereto Bdelium, Ammoniacum, and Sagapenum.

But if the hardness be very great, you must give these Pills following many days together.

Take of Gum-Ammoniacum dissolved in Vinegar and strained, and again made thick, two drams; Bdelium and Storax, of each four scruples; mix them. Take one dram every other day.

And in the days between, let him use the Opiate, or strengthening and opening Lozenges prescribed in the cure of obstructions.

These following Pills have a wonderful Vertue to soften a Schirrus, and dissolve it.

Take of the best Aloes and Gum-Ammoniack dissolved in Vinegar, strained and again made thick, of each half an ounce: Mercurius Dulcis two drams; Diagridium one dram. With Oxy-

mel of Squills make a Mass of Pills; of which let him take half a Dram four hours before Dinner, for twenty or thirty days together.

Zacutus Lusitanus, *Obs.* 41. *Lib.* 1. *Praxis Admin.* reports, that there was a strong Schirrhus cured by the use of Conserve of Horehound forty days together.

Some Practitioners commend the use of Turpentine thus prepared:

Take of Turpentine washed with White wine one ounce and an half; Sugar half an ounce. Give one dramevery day, or every other day, for it is an opening Medicine that provoketh Urin, and loosneth the Belly.

All the time of Cure, let the Patient take White-wine, or thin Claret steeled, for his ordinary Drink.

Allo the other Preparations of Steel before-mentioned, are very good.

Outwardly you must apply Fomentations, Oyntments and Plaisters, thus made:

Take of Marsh-mallow Roots, Briony and Lilly Roots, of each one ounce; Mallows, Violets, Pellitory of the Wall, Wormwood and Agrimony, of each one handful; Linseed, Fenugreek and Dill-seed, of each half a dram; Camomel, Melilot and Rose-flowers of each one Pugil. Boyl them in three parts of water, and one of White-wine, or in Water and Vinegar. With the straining let the Region of the Liver be fomented every Morning and Evening.

If the Schirrhus be very great, add to the Decoction Flowerdeluce, wild Cucumers, and Dwarf-Elder-Roots, and make the Decoction in Tripe-Broth and White-wine.

Take of Oyl of Lillies, Camomel, Melilot and sweet Almonds, of each one ounce; Oyl of Roses and Wormwood, of each half an ounce; Gum-Ammoniack dissolved in Vinegar three drams; Wax two drams; make a Liniment, with which anoint the part aforesaid after the Fomentation.

If you desire a stronger Liniment,

Take of the Juice of Briony and wild Cucumber, of each two ounces; the Oyl of Capers and Tamarisk, of each three ounces; White-wine one ounce. Boyl them till the Juice and the Wine be consumed, then add two drams of Wormwood in Powder, Gum-Ammoniack dissolved in Vinegar half an ounce: with a little Wax make a Liniment.

Take of the Emplaister de Mucilagibus, one ounce; Melilot half an ounce; Gum-Ammoniack melted in the Juice of Wormwood three drams; soften them with a little Oyl of Wormwood and Lillies, and make a Plaister to be laid on after the Liniment.

The Leaves of Henbane boiled in Vinegar are good to be outwardly applied to the part, made into the form of a Cataplasim or Poultis; with oyl of bitter Almonds.

To these you may add Baths made of softning and digesting things, and of strengthners, such as we prescribed for Fomentations; and let the Patient use them by turns.

And finally, make an Issue in the right Leg, that part of the Matter offending may be that way drawn forth.

Chap. 6. Of the Dropsie.

Differences.

Hippocrates makes two kinds of Dropsies, namely, an Universal, and a Particular. An Universal Dropsie, is that which is in the whole Body, or over the whole Belly. A Particular is that which is only in one part: hence there is a Dropsie of the Head, Breast and Womb; of which here we shall not speak, but only of the Universal.

Galen gives three kinds of this Universal Dropsie, namely, Ascites, Tympanites, and Anasarca, or Leucophlegmatia.

CAUSES. Ascites is a swelling of the Belly, caused of a serous humor; nor doth the Belly only swell, but many times the Feet, Legs, Thighs and Cods. Nay, an Ascites sometimes begins with a swelling in the Feet, which ascends after to the Legs, and so to the Thighs and Belly.

This serous humor, as it is of the nature of water, it is cold; but as it is salt, it hath in it heat, which then is increased by the nearness of the Bowels, and more by the putrefaction which it gathereth by long continuance: hence comes a Fever and Thirst, namely, from the stinking salt Vapors which do infect the mouth of the Stomach.

It falls out sometimes, that this watry humor is not contained in the cavity of the Belly, but in certain Bladders growing to the parts of the lower Belly.

An Example whereof is given by *Schenkius*, *Lib.* 3. *Observation*; and *Mauritius Cordus*, *Com.* 5. in *Hip.* *Lib.* 1. of Diseases in Women. *Galen* supposed (and almost all Physicians, new and old have followed him) That every Dropsie comes of a cold Liver, which cannot sanguifie or make Blood compleatly, but instead thereof much water, Flegm or Wind. Which Opinion, as it is most true in Anasarca, and approved; so in Ascites and Tympanites it is much questioned by many

Modern

Modern Writers, because in the opening of many that died of Dropsies, the Liver hath been found very sound, as is manifest by many relations in those Authors mentioned. Moreover, *Hippocrates* 2 *Prorrh.* wittily affirms, that a Dropsie may come either from the Liver, or from some empty part; by an empty part, he meaneth all that space from the Ribs to the Guts, and the parts contained in it. Also *Hip. 4. de morb. Mulierum*, mentions a Dropsie coming from the Spleen. To which places of *Hippocrates* they usually answer thus; That the Liver is always affected either primarily, or secundarily; so that there is never a Dropsie before there is a hindrance of Sanguification, or breeding of blood. But two Reasons do strongly oppose this Doctrine: The first is from the Experience before-mentioned, namely, That if the Liver ought necessarily to suffer in the producing of a Dropsie, it would never be found free and unknit in the dissection of a dead body. The second is, That if the Liver should breed watry blood, it would be sent into the whole body, as in *Anasarca*; nor can a sufficient reason be given, why that serous humor bred in the Liver should be sent to the Belly, and not to other parts.

As for the cold distemper of the Liver, that is denied by *Trallianus*, *Avicenna*, and others, who affirm, That a Dropsie may arise from a hot distemper of the Liver, and cannot be cured but by cooling means. And this may be maintained by the Authority of *Hippocrates*, in 2. *Progn. A Dropsie* (saith he) *coming after an acute Disease, is evil, for it doth not take away the Feaver.* If therefore a Dropsie may come while the Feaver is, it is clear that there is still a hot distemper. Neither could that ever please me, which is usually spoken by *Galen's* Servants, That the Native heat is dissolved by a hot distemper, and much diminished, and that diminished heat may be called cold. For so in a Hectick Feaver, and other constant Feavers, in which the Natural heat is much diminished, we should always blame a cold distemper, and the symptoms which follow should be imputed to cold, and not to heat: From whence, who doth not perceive that there would arise a great confusion in the searching into the Causes of Symptoms.

Among the late Writers *Carolus Piso*, whom *Sennertus* followed, hath dived most deep into the true Causes of *Ascites*, which he affirms to come from a serous Matter contained in the Meat and Drink, which by reason of some preternatural cause, is stayed too long in the Gate and hollow veins, not sent into the body, as in a Natural state and condition it useth to be, but into the capacity of the Abdomen. This serous humor is retained in the Veins from the whole body, by reason the attractive faculty of the parts to which it should be carried is either hurt or hindred.

Now the chief parts which draw the serous Matter, are the Liver and the Spleen; for they attract the Chylous Matter in which the moisture of meat and drink is contained. As also the Spleen draws drink to it self pure and without mixture; as *Hippocrates* taught, and Experience confirms, that they who drink much after meat, do presently avoid it by Urin; which learned Authors say, Is by reason the Spleen sucks the watry Matter before there is a perfect Concoction made in the Stomach.

The attraction or drawing quality of the Liver and Spleen is lost chiefly by defect and weakness of Natural heat; the Natural heat is debilitated by a cold or hot distemper, or by suffocation.

A cold distemper coming either from too cold a Diet, from loss of too much Blood and Spirits, or any other Cause, doth destroy the Natural heat of the Liver and Spleen, and so hinder their Actions.

A hot distemper doth disperse the Native heat; whence being made weaker, the Liver and the Spleen becomes less active. This comes from Feavers, much Wine, or hot Meats.

Lastly, The Natural heat is weakned by Suffocation, when there is too much blood in the veins, especially if it be foul, as when the Terms or Hemorrhoids are stopt, by which the blood was cleansed formerly, but now by stoppage corrupted.

Also the attraction or drawing vertue of those parts is hindred by obstructions, which hinder the free passage of the serous Matter. So a Dropsie followeth a Schirrhous of the Liver and Spleen, not only because those parts being weakned cannot produce good blood, but especially because they are not able to attract and send to other parts whatsoever is drunk.

Here it may be objected, That in a Dropsie the whole body is nourished by blood bred in the Liver of a Chylous matter which it draweth to its self. We answer, That the Liver doth better attract that which is most familiar unto its self, and most fit to be made blood; but it draweth to it less than is sufficient, by reason of the weakness of the attractive faculty. Hence it is that the body grows lean, because it draws some water along with the Chylus, and leaves the rest in the Meseraick Veins, and the Veins of the lower Belly, which is by degrees carried into the capacity of the Abdomen.

We do not deny that Sanguification or making of blood is hindred in a Dropsie, especially when the distemper is very cold or very hot, or the obstruction or Schirrhous great, for then there cannot be a perfect making of blood. But we deny that that is the next and immediate cause of a Dropsie, but rather an effect thereof, when the water corrupted in the Abdomen doth also corrupt the Bowels that swim therein.

Next

Next to the Liver and Spleen, the Reins do attract the watry Matter which is in the hollow Vein, and free the whole body from the superfluity thereof, so that if at any time they do not their office, there remains much Matter in the Veins, which being sent to the Abdomen do quickly make an Ascites; now the attraction of the Veins may cease for divers Causes, because of a cold Distemper, Tumors, Ulcers, and Obstructions, which will diminish, abolish and intercept their Function.

Lastly, The distribution of water is hindered from some external cause, as when much cold water is drunk, which Nature cannot govern, nor sufficiently distribute into the veins. So *Carolus Pisco* reports of a young man that had a Tertian Ague, and drinking water exceedingly in his Fit fell into an Ascites, from which by the taking of one Lozenge of Diacarthamum he was cured by discharging the water which was in the Abdomen, but if he had continued drinking so much water any longer, he had not been so easily cured, because it would have brought great obstructions and a cold distemper of the Bowels, by reason of loss of natural heat.

But it is questioned of many by what ways that serous Matter should be carried by the veins into the capacity of the Abdomen? to whom we may plainly answer, by saying from *Hippocrates*, that in a living body all things are passing to and fro, so that in time of necessity not only thin and serous Matter, but also that which is very thick may be sent through the insensible passages. So in a Pleurisie, Blood and Matter will pierce through the thick substance of the Pleura and Membrane which covers the Lungs, and be spit forth at the mouth. So in a Fracture of the Leg or Thigh, which happens without hurt to the muscles and skin, the matter which floweth from the broken bone pierceth through the substance of the other parts, and wets the Boulders and Rowlers.

So also in a Dropsie oftentimes a great quantity of water is vented in one day by giving of Quick-silver, which cannot be, except the water contained in the Abdomen doth pass through the Tunics of the Guts.

Nor is the objection of *Fernelius* of any force, when he saith, That Nature had in vain made so many open ways, if the humors can pass through those invisible passages. For we answer, That in an ordinary and natural motion of humors ordained for the nourishment of the whole body, those passages are necessary through which they may easily flow, but in an extraordinary case provident Nature doth find out extraordinary ways by which she may cast out hurtful Matter, or at least send it to a place less dangerous.

Fernelius objects again, That in them who have died by a stoppage of Urin for twenty days together, it was never perceived that any water went through those blind passages. We answer, That Nature doth not always work the same way in preternatural causes, nor send hurtful humors to the same places, but especially to those parts which are more disposed to receive them through weakness.

So in the suppression or stoppage of Urin, the serous humors flow openly through the Veins and Arteries, and fill them, and if it find any part weaker than the rest it falls forcibly upon it: hence it is that some die of the hurt of one or other remarkable part. So nothing hinders (if the parts of the Abdomen in which the Veins and Arteries end) be grown weak, but that the watry humor may be sent into its capacity or hollowness.

Nor is that true which *Fernelius* would infer, namely, That a Dropsie never comes from suppression of Urin, for Reason and Experience teacheth the contrary; as we shewed before in the Discourse of the loss of Attraction in the Reins: but you must observe, that the stoppage of the Urin doth make an increase of water rather in the branches of the hollow vein, than of the Gate-vein, or *Vena-Porta*, by which the watry humor chiefly flows into the capacity of the Abdomen, as appears by what followeth.

Therefore we may answer this Question, by saying, That the water got into the hollow of the Abdomen by the insensible passages, though there are also other manifest ways by which it may pass.

Hippocrates, Aph 55. Sect. 9. hath shewed them, for (saith he) they who have much water about the Liver, if it get into the Omentum or Cells, their Belly will be filled with water, and then they die. The meaning of which Aphorism is (though *Galen* did not plainly see it) that the water from the Liver doth flow into the branches of the *Vena Porta* which go to the Omentum, and when they are filled either by their Tunics made thin by Diapedesis or Rarification, or by the Mouths of the Vessels being opened by Anastomosis, the water gets into the Cavity of the Abdomen. This happens often in the Spleen also, when it draws water in abundance from the Stomach; as appears by many sayings of *Hippocrates*; and in lib. 4. de Morbis, he saith, That water may press from the Spleen to the Omentum or Cell, in these words; *Drink is also carried into the Stomach, which when it is filled the Spleen takes it from thence and sends it to the Veins and the Omentum.* From which we may perceive, that water chiefly gets into the Abdomen, by the veins of the Omentum which are called Epiploicæ and Gastrepiploicæ, although it may pass also through other veins.

Besides

Besides the aforesaid Causes of a Dropsie, which are more ordinary, there are mentioned by Authors some less usual, confirmed by Observation: and these come from the disorder of some peculiar part, not only of the Liver and Spleen, but also the Mesentery, Sweet-bread, Stomach, Guts, Reins, Bladder and Womb, namely, when the *Homiosis*, or faculty to convert Nourishment into themselves is hurt from some great disease, so that their proper Nourishment is corrupted and turned into water. So *Galen*, *Comment. Aph. 55. Sect. 7.* saith, That watry Bladders are sometimes in the out-side of the Liver, which being broken, send water downwards into the Cavity of the *Abdomen*; the increase whereof breeds a Dropsie.

Fennelius supposeth, That the Liver being very dry hath clefts like the parched Earth, and that through them there flows a constant water which fills the Cavity of the *Abdomen*. Others say, that a Dropsie may come from the Guts, if they be perforated, or pierced through, and yet the Patient dieth not presently, but a watry Humor still flows through them into the Cavity. It comes also from the Kidneys, if they be much ulcerated and water flow from them. So *Platerus* reports of one that in a Dropsie had many Ulcers in both Kidneys, from whence both Matter and Water flowed into the Cavity. There is also a Story in *Sennertus*, taken out of *John Heinzius*, of a certain Woman who had a Dropsie from the distemper of the Womb, whose Bowels were all sound, except the Testicles or Stones which were found to be swoln as big as the Head of a new born Child, being blew, hollow, and full of Ulcers, from which there came a ferous Matter which caused the Dropsie.

The Dropsie called *Tympanites*, hath its name from *Tympanum* a Drum, because the *Abdomen* is stretched out like a Drum, and if you strike it with your hand, it sounds like it. This stretching comes from Wind shut up in the Cavity of the *Abdomen*. But sometimes this Wind is in the Cavity of the Guts; which *Platerus* observed, saying, In some that have been thought to die of a *Tympany*, after they were opened, have had no wind coming forth of the Cavity of the Belly: neither did their bellies but their Guts sink, especially the thin Guts, which were so stretched with Wind that they came forth so rowled together, that they could not be again thrust into the Belly.

But we must observe, That the wind which caused a *Tympany* is seldom contained in the Belly alone, but for the most part mixed with Water; as in an *Ascites*, not only Water but Wind also is contained; and both these Dropsies have their name of that which predominateth: if there be more Wind than Water, it is a *Tympany*; but if more Water than Wind, an *Ascites*: but if they be equal, it is between both: so that we may doubt whether that Dropsie be a *Tympany*, or an *Ascites*.

The material cause of Wind is a crude humor and thick, whether it be Flegm or Melancholy, which being stirred and made thin by heat, sends forth thick Vapors which are hard to be dissolved, and these are called *Flatus*.

This crude and thick humor is partly in the Stomach and Guts, but especially between the Membranes of the Midriff and Guts, from whence it is more hard to be moved than from the Cavity of the parts aforesaid. The 11. *Aph. Sect. 6.* of *Hippocrates*, makes this very probable; They who have pains and griping about the Navel and Loyns which cannot be removed, have a dry Dropsy. For because the Mesentery is joyned to the Guts by the fore-part, and to the Loyns by the hinder-part, we may easily perceive, that the pains which reach from the Navel to the Loyns come from the Mesentery. Besides, the greatness of the pain shews that the Cause is deep in the substance of the part, and cannot be removed. For if it were in the Cavity of the Stomach and Guts, it would easily be remedied.

Concerning the Efficient Cause Authors differ; some say it comes from a Cold, some from a hot distemper. They which accuse a cold distemper, they have *Galen* on their side, who says, That Wind is bred of a weak heat. To whom we answer, That heat may be said to be weak in respect of the Matter which cannot be dissolved or dissolved thereby. But this is to be imputed to the Matter, which is rather defective than the heat, which is commonly too great and preternatural. And we must acknowledge with the Learned, That a burnt Melancholick humor is most fit to breed a *Tympany*, which proceedeth from the parching heat of the Bowels, which heat doth stir that Matter, and produceth from it thick Vapors that are hard to be dissolved.

The Dropsie called *Anasarca*, comes of a Flegmatick humor spread through the whole body, and therefore the Body is swoln and white; from whence the Disease is called *Leucophlegmatia*. This Flegm comes from a cold liver, which instead of good blood produceth crude and flegmatick; which when it cannot be turned into the substance of the parts, leaves the crude part that is unfit for Nourishment upon them, and makes them swell; hence comes *Anasarca* or *Leucophlegmatia*.

This Disease beginning is called *Cachexia*, or an evil Habit, and turns into *Leucophlegmatia*, from which it differs but in degree.

The Antecedent causes are all things that cool the Liver too much, and hinder its concoction, as too much cold and moist Diet, the stopping of the Terms or Hemorrhoids, Obstructions, cold Tumors,

more Schirrus and large bleeding, and other great Evacuations, by which the Native Heat is diminished.

SIGNS. The signs of a Dropsie and every sort of it, may be known by what hath been said.

In an *Ascites* you may know that there is water in the *Abdomen* by its greatness, soft swelling, and broad, and if you press the sides you shall easily hear a noise of water, and then the Patient turns from one side to the other, and then the whole Belly lieth as it were on that side: then the Feet and Cods swell, but the higher parts grow less; the Urine is little and thick, sometimes red, because there goes but little water to the Reins and Bladder, and stays long there, by which means it becomes red and thick. In the progress or increase of the Disease there is difficulty of Breathing, by reason of the abundance of water which lieth upon the *Diaphragma* or Midriff, especially when the Patient lieth down, and therefore he is forced to stand or sit most usually. There is a troublesome thirst from the saltness of the humor, with which the Stomach swimmeth. And lastly, there is a constant lingering Feaver from the corruption of the water, which at length doth corrupt all the Bowels swimming therein.

In a *Tympany*, the belly being strook sounds like a Drum; the Bulk of the belly is less burdensome than in an *Ascites*: There were formerly pains about the Navel and Reins, when the Patient lieth with his face upwards, his belly remains hard and stretched forth, nor doth it turn it aside when he turneth himself.

Lastly, In an *Anasarca*, not only the Belly, Thighs and Legs, but also the Hands, Arms, Breast, Face and whole body swell; and wheresoever you thrust your finger upon it, it will pit, and leave an impression. The colour of the Skin is pale and earthy, the flesh soft and loose, the water thin and white, breathing difficultly, and sometimes a lingering Feaver.

PROGNOSTICK. As to the Prognostick: Every Dropsie is dangerous and hard to be cured, and the more hard, by how much the elder, but *Anasarca* is least dangerous; but *Ascites* and *Tympany* are sometimes one more dangerous than another, according to their causes. So if *Ascites* comes from a Schirrus of the Liver, or Ulcer of some internal part, it is more dangerous than a *Tympany*: but if it come of drinking too much water, or new Obstructions, it is less dangerous.

A Dropsie is more easily cured in Servants than in Free-men, in Country-men than in Noble-men: for they will be better constrained to abstain from drink and the like, and be more patient than they who have liberty.

A Dropsie from the hardness of the Spleen is less dangerous, than from the hardness of the Liver, because the Spleen is not so noble a part.

A Dropsie coming upon an acute Disease, is evil; nor will it abate the Feaver, but cause pain and death. *Hyp. 2. Prognost.*

They whose Liver being full of water, discharge it into the *Omentum* or Caul, their Belly is filled with water, and they die, *Hip. Aph. 55. Sect. 7.*

He who hath water between the skin or an *Anasarca*, if that water which is in the Veins flow into the belly, the disease is cured, *Hip. Aph. 14. Sect. 6.* This Aphorism seems contrary to the former. But this contrariety is answered, by saying that *Hippocrates* in the former, by Belly understood the Cavity of the *Abdomen*; but in this, the belly it self; for if the water flow through the belly, the disease is at an end. Which Opinion is more clearly explained by *Hippocrates* in *Coacis*, in these words, *In the beginning of a Dropsie, if there come a Flux of the Belly without want of Concoction or Crudity, it is prevented.* You must mark that it is in the beginning; for if a Flux come upon an old Dropsie, it is not so safe, because commonly there is some fault in the Bowels by continuance, as a Schirrus or corruption of substance, which begets new matter, and death also. Hence *Hip. in Prorrh.* saith, That they who are to be cured of the Dropsie, must be *Eusplanchnous*, that is, those that have sound Bowels, free from the great diseases mentioned. Otherwise, if a flux of the belly happen with a Schirrus or corruption of the Liver, they die presently, as *Galen* shews, 2. *ad Glau. cap. 5.* And *Avicen* saith thus, *Straitness of breath, and flux of the belly, signifie death within three days.*

Little Urine in Dropsies is evil; the less, the worse, because the drink runs into the belly, and not into the Reins. Hence *Hip. in Coac.* saith, *Little and thick Urine, and a Dropsie that is Feaverish, is deadly: but if the quantity of Urine increase, we may hope well.* Which is elegantly laid down by *Celsus*: And then (saith he) there is hope of Health, when they void more Urine than they drink: Therefore it is good every day to measure the Urine and the Drink, and the Belly with a string, especially while Physick is given to see whether it grow less or not; for if it increase notwithstanding the Medicines, it is desperate.

Imposthumes or spots in the Legs of Hydropical men, are deadly. *Hippocrates* confirms this 7. *Epid.* in his History of *Bion* and *Cresphion*; the one whereof died presently after an Imposthume which ran in his left Knee: the other after he had a red and blewish gathering in his right Thigh.

Men

Men that are cured by Medicines for Dropſies, if they fall again into the ſame are deſperate, *Hip. in Coac.* For it ſignifieth that there is ſome incurable fault lurking in the Bowels, which after the water is emptied, reneweth it again.

If the Patient have ſound Bowels and ſtrength, eat his meat, and concoct well, and be not ſick after, breath freely, have no pain, cough or thirſt, and his Tongue grow not rough, ſo much as in his ſleep; if Medicines preſently purge him, and if without Medicines he be bound, and in a Natural order; and if his Urine change according to his Diet, or if he be not faint. If all theſe things be preſent, the Patient is recovered; if ſome of them, there is hopes of amendment; if none, he is deſperate.

In a dry Dropſy, to piſs by drops is evil, *Hip. in Coacis.*

A Tympany in a Melancholick Body is deadly, and Remedies are given in vain.

If in a *Leucophlegmatia*, a ſtrong *Diarrhœa* follow, the diſeaſe is cured, *Hip. Aph. 29. Sect. 7.* but this *Diarrhœa* muſt be at the beginning, or at leaſt before the diſeaſe be old, or the ſtrength of the Party weakned; but if it happen when the Patient is weak, it is dangerous.

CURE. The Cure of the Dropſy conſiſts in the Evacuation of the Matter, whether it be in the whole body, or in the *Abdomen* or Belly; in taking away the Cauſe that produced that Matter, and in ſtrengthening of the Bowels, eſpecially the Liver.

The chief and moſt ordinary Cauſes are, great Obſtructions, and Schirrûs or hard Tumors, the Cure of which diſeaſes is to be taken out of their proper Chapters. But if they will not ſuffice, you muſt uſe theſe following; which are more proper in Dropſies, and vary them according to the variety of Cauſes, and the Bodys ſick.

And firſt, you muſt purge by an uſual opening Apozeme that expels Flegm and Water, made thus:

Take of the Roots of *Eringus*, *Madder*, *Smallage*, *Parsley* and *Elecampane*, of each one ounce; *Valerian*, *Aſarabacca*, *Dwarf-Elder* and *Flowerdeluce* Roots, of each half an ounce; the Bark of the Root of *Capars*, and inward Bark of an *Aſh* and *Tamarisk*, of each ſix drams; the Leaves of *Agrimony*, *Ceterach*, *Maidenhair*, *Germander*, *St. Johns-wort*, *Wormwood* and the leſſer *Centaury*, of each one handful: *Soldanella* or wild *Mercury*, half a handful: the ſeeds of *Carrots*, *Parsley* and *Fennel*, of each half an ounce: ſcraped *Liquoris* and *Raiſins ſtoned*, of each one ounce: clean *Senna* one ounce and an half: *Agarick* tied in a clout three drams: the ſeeds of *Dwarf-Elder* and *Jallap* Roots, of each one dram and an half: *Ginger* and *Cloves*, of each one dram: *Broom*, *Elder* and *Tamarisk*-flowers, of each one pugil. Boyl them in equal parts of ſteeled water and *White-wine* added towards the end to a pint and a quarter. When it is ſtrained, diſſolve therein Syrup of *Succory* with *Rhubarb*, four ounces. Make a clear Apozeme Aromatized with three drams of *Cinnamon*, for four Mornings-draughts.

After Univerſal Purging, let the Patient take this following Powder once a Week;

Take of clean *Senna*, *Gummy Turbith*, *Hermodacts*, *Dwarf-Elder*-ſeeds, *Jallap* and *Mechoacan*, of each one dram: Cream of *Tartar* two drams: *Cambugia* half a dram: the powder of *Diamber*, *Diarrhodon* *Abbatis* and *Fennel*-ſeeds, of each one ſcruple: *Sugar-candy* three drams. Make a powder of them all, of which infuſe two drams, or two drams and an half all night of four ounces of *White-wine*. Let him take the Wine and the Powder in the morning.

The Syrup of *Ramnus ſolutivus*, or *Black-thorn* made of the Juyce of its Fruit, called *Rhem-Berries* with *Sugar*, given one ounce at a time doth wonderfully purge water. It muſt be taken preſently before Dinner.

Or give the Magiſtral ſyrup made of the Decoction of the Apozeme afore-mentioned, the Doſe of Purgers being increaſed. Or this following:

Take of the Juyce of *Damask Roſes* two pints: the Juyce of the Roots of *Danewort*, *Flowerdeluce*, *Succory*-leaves and *Agrimony*, of each half a pint: the ſeeds of *Danewort*, *Mechoacan* Roots and of the beſt *Rhubarb*, of each two ounces: *Spicknard* three drams: *yellow Sanders* two drams: *Cryſtal of Tartar* one dram and an half. Infuſe them a whole Night, and after a little boyling ſtrain them: then put as much white *Sugar* as is of the *Liquor*. Boyl it into a Syrup, and add to it of the Salt of *Wormwood* half an ounce. Let him take two drams with opening Broth once in a Week.

Or inſtead of this Syrup, or at other times when it is not taken, you may give theſe Pills which purge the evil Humors, and alſo open Obſtructions.

Take of the beſt *Aloes* ſteeped in the Juyce of *Wormwood* half an ounce: *Gum Ammoniack* diſſolved in *Vinegar* and ſtrained, the beſt *Myrrh* and *Crocus Martis* prepared with *Sulphur*, of each three drams: Salt of *Wormwood* and *Tamarisk*, of each two drams: *Diagridium* and *Troches of Alhandal* of each one dram; *Saffron*, *Ginger* and *Sal-gem*, of each one ſcruple. With *Oxymel of Squils* make a Maſs of Pills, of which give half a dram twice in a Week two hours before Dinner.

X x Alſo

Also purging Wines are much commended for the Cure of the Dropsie, of which there are divers Forms. But these are best:

Take of the Roots of *Asarabacca* and *Mechoacan*, of each two ounces: the French Flowerdeluce, and Bark of the Roots of *Danewort* and *Elder*, of each one ounce: *Elicampane*-roots half an ounce: dry *Wormwood* and *Dodder* of *Thyme*, of each one pugil: clean *Senna* one ounce: *Soldanella* or *Sea-fool-foot* two drams: the Troches of *Rhubarb* and *Agrimony*, of each one dram: *Mace* and *Cinnamon*, of each half a dram: *Scammony* four scruples: *White-wine* two pints and an half. Infuse them three days in *Balneo Mariæ*; the Vessel being well stopped, keep it with straining. Let him take two or three ounces in the morning twice or thrice in a week.

Among Medicines for drawing forth of Water, the Juyce of French Flowerdeluce is very much commended, if it be drawn forth with *White-wine*, it may be given to three ounces; it provoketh Stool and Urine very powerfully. But because it is very offensive to the Mouth and Stomach with its sharpness, it useth to be mixed with *Manna* or *Honey*. *Masaria* gives it thus:

The of Juyce of Flowerdeluce newly drawn with *White-wine*, three ounces: the best *Manna* one ounce and an half. Mix them for a Potion.

Platerus in his Observations; I gave (saith he) to one in a Dropsie, of the Juyce of Flowerdeluce to drink with *Hony*, two ounces, and he often pissed and purged, and after he had taken it twice or thrice, his Belly ceased swelling, and his Feet and he was cured.

Rhubarb is commended of some, because it purgeth noxious humors, and strengthneth the Liver. And *Stocheus* saith, that he cured many with the use of *Rhubarb* given every third or fourth day, one or two drams in an opening Decoction. Also in *Scoltzins* his Epistles, there is a famous Story of one who was cured of a Dropsie only by the use of *Rhubarb*, which he took every day in such a quantity as was necessary to purge.

The Troches of *Rhubarb* are much commended by all Authors. And *Matthens de Gradi* reports, That a certain Duke of *Orleans* was cured with them alone, taking two drams twice in a Week.

Michael Paschalus saith, That he cured a Dropsie with the same, making them into Pills, by reason of their bitterness.

The Chymists commend the Extract of black Hellebore, *Aquila Cælestis*, and *Mercurius vita*, and they mix them with other vulgar Medicines, from whence followeth a plentiful Evacuation of Water. But they had need of strong bodies who takes them.

Mercurius Dulcis works most gently, and *Mercurius Diaphoreticus*. But *Antimonium Diaphoreticum* cures without manifest Evacuation, if it be calcined with *Salt-peter* till it be white: but the Diaphoretick or Sweating Medicine made of the Butter of *Antimony*, cures all kinds of Dropsies best.

But you must observe in the giving of all sorts of Purges, that they, especially if strong, are not to be given often, as *Galen* teacheth, *Lib. 9. Cata Topous*, because they weaken the body, and then there will more water be bred afterwards. Therefore you must prescribe strengthners and openers oftner than Purgers. And Experience teacheth us, That the Evacuation by Urine in this Disease hath better success than that by Stool.

Instead of Purgers, you may give Clysters which discurf Wind, purge Water, and take down the Belly, made thus:

Take of *Mallows*, *Mercury* and red *Coleworts*, of each one handful; *Soldanella* or wild *Mercury*, half a handful: *Annis*, *Caraway* and *Dill*-seeds, of each three drams; *Camomel*, *Melilot*, *French Lavender* and *Broom-flowers*, of each one pugil. Boyl them to a pint: In the straining dissolve of *Diacatholicon* one ounce: *Hiera Picra* half an ounce; *Oyl* of *Dill* and *Lillies*, and of common *Honey*, of each two ounces Make a Clyster twice in a Week. Or,

Take of very sour *Leaven* half an ounce; common *Salt* one pugil. Boyl them in as much Water as is sufficient: strain it, and add to it the Urine of a Child four ounces: *Oyl* of *Rue* three ounces: clarified *Honey* one ounce, Make a Clyster. This *Valeriola* commends highly.

This following Clyster brings forth Water in abundance:

Take of *Coloquintida* one dram, infuse it for a night in three ounces of *White-wine*; when it is strained add thereto *Tripe-broth* one pint; common *Oyl* two ounces; *Salt-peter* melted one ounce; strong *Vinegar* one spoonful. Make a Clyster. Or,

Take of the Pulp of *Coloquintida* one dram; clean *Bran* one handful; boyl them in *White-wine* for a Clyster. Or,

Take of *Carthamus*-seeds one ounce: the best *Agarick* half an ounce; the Pulp of *Coloquintida* three drams; *Centauri* the less, *Germander* and both the *Wormwoods*, of each half a handful. Boyl them to a pint; In the straining dissolve of *Oyl* of *Camomel*, *Rue* and *Capars*, of each one ounce; *Honey* of *Roses* two ounces. Make a Clyster. Or,

Take of the Emollient Decoction one pint; thick vomiting Wine, the Infusion of *Crocus metallorum* four ounces; *Diaphenicon* one ounce. Make a Clyster.

Bloud

Blood-letting here is for good reason omitted, except the Disease come from stoppage of the Terms or Hemorrhoids. And then you must not bleed except it be in the beginning of the Disease before the Liver be grown too cold.

Issues, Blisters, and Scarrifications use to cause Gangrenes, or Mortifications in a Dropsie, because the heat of the part being small, is quickly extinguished: Therefore it is better wholly to abstain from these kind of Remedies, although sometimes they have done some people good.

Paracentesis, or cutting of the Skin is seldom to be used, because few are cured thereby, especially because the Patients, or their Kindred will not yield to it before the Disease is confirmed, and the Bowels are so putrified that there is no hope. Therefore for the most part they die the second or third day after they are cut. The wiser sort will have the Incision made in the beginning or increase of the Disease, before the Bowels are corrupted. Neither is it necessary at that time, because the Disease being small may more safely be cured with other Medicines.

Among emptying Medicines, Sweatings are accounted most profitable, which as they are always good in Anasarca, so in a Tympany or Ascites, they sometimes hurt, namely, when driness of the Liver (which is usual) causeth the Disease. Moreover, it is commonly impossible to make men in Dropsies sweat. But if the Liver be not dry, Sweats are good in all kinds of Dropsies, especially when they decline, to discuss the reliques of the watry humor by the habit of the body. So *Valeriola* reports, That he cured an Ascites with a Decoction of Guajacum given forty days together. It is good to make the Decoction with steeled Water and Wine. The Chymists commend Antimonium Diaphoreticum.

Martinus Rulandus makes a Sudorifick of Juniper-berries, which because they are forceable to provoke Urin, may do good both ways. It is thus made:

Take of Juniper-berries bruised three handfulls: Sack as much as is sufficient; boyl them to halfe, and give two ounces every morning, covering warm after it.

Horatius Reserus in *Scholtzius*, boasteth that he hath cured many Boys, and some Women of the Anasarca, with Syrup of *S. Ambrose*, which is a Sudorifick. Its description is in an old Dispensatory called *Luminare majus*, thus:

Take of Gromwel-seeds husked two ounces: Spring-water half a pint; boyl them till three or four ounces of water only remain; which being strained, mix with as much Sack, and give it warm: it will sweat him plentifully if he be covered warm.

But those Medicines are best which purge by Urin, and the Cure is commonly better this way.

One of the chief is two Ounces of the Juyce of Chervil given every Morning in Wine for many days.

Opening Wines that purge by Urin are good in this case; as this:

Take of Elicampne, Smalage, Fennel, and Flowerdeluce-roots dried, of each one ounce and an half: Roots of Valerian, Gentian, Asarabacca, and Squills or Sea-Onions, of each one dram: the middle Bark of an Elder, and Saxaphras, of each six drams: dried Wormwood, Agrimony, German-der and Maiden-hair, of each two drams: the tops of Centaury the less, and Broom-flowers, of each one dram: Parsley, Annis, and Dill seeds, of each one dram and an half: Cinnamon two drams: Spicknard half a dram; bruise them together, and infuse them in White-wine for a few days; and let him drink thereof every Morning.

The steeled Compound. Wine prescribed in the obstruction of the Liver, is good for the same.

The Decoction of Juniper mentioned is to be reckoned among the Diureticks. And if you fear it is too hot, you may make it in Water, and put a little Spirit of Vitriol to it.

Fonseca commends the use of Turpentine washed with Barley-water, and he gives half an ounce thereof twice in a Week.

And lastly, The Spirit of Salt, Tartar, and Vitriol, given in a true quantity with an Apozeme, or other opening Decoction for some days, do wonders; because they being very thin, do run into all the parts of the body, and open them.

The Salts of Wormwood, Juniper, Bean-stalks, and the like, given in White-wine, do the same. Or in want of Salts you may make a Lee of the Ashes of the same, which will be sufficient.

Matthiolus upon the 87. Chap. lib. 1. of *Dioscorides* saith, That a Lee made of Juniper-Ashes with White-wine, and four or five ounces thereof taken, doth powerfully provoke Urin, so that I have seen some men cured of a Dropsie with it alone.

Moreover, In the whole time of the Cure, you must use Strengtheners to the Liver; for it is in vain to purge water, if you do not hinder the increase of it, which you cannot do except you refresh the Liver, and bring it to its former temper.

Among the chief Strengtheners is Cinnamon-water, of which you may give one Spoonful every Morning, and before Supper.

But *Galen* in his Eighth Book *Kata Topous* commends the Electuary called *Cyphoides* by the *Arabians*, from the Wine whereof it is made, of which you may give half an ounce in the morning; according to *Hollerius* it is thus made:

Take of *Curran*s cleansed half a pound: boyl them in old Sack to the consistence of the *Pultis*, strain them after they are pounded, and then add of the Conserve of *Rosemary*-flowers, *Citron*-bark candied, and *Cinnamon*, of each one dram: the Powder of *Aromaticum Rosatum*, *Diamargariton Calidum*, and *Diacinamon*, of each two scruples: *Lignum Aloes* half a dram: *Saffron* half a scruple. Mix them for a soft Electuary.

The Opiates prescribed for the obstruction of the Liver are here very profitable.

The Conserve of Sea-wormwood is very good, made of one part of the Leaves, and three of Sugar, with which *Matthiolus* in his Chapter of Wormwood saith, some have been cured.

Poterius makes an Opiate of Conserve of *Roses*, Specificum Stomachicum, and *Crocus Martis*, and Oyl of *Vitriol*, by which only Medicine he saith, he hath cured Dropsies. The Specificum Stomachicum is Antimony fixed.

The cure of men in Dropsies lieth much in their drink, therefore there must be care of that, that he drink sparingly, and indure thirst as much as may be; for it is known that many have been cured only with abstaining from drink, and eating of dry meats, without other means. For drink, let him take *Elicampne* or Wormwood, Juniper or steeled Wine, or let him use the aforesaid steel Medicines. *Avicen* forbids men in a Dropsie to see waters. But if you fear too much heat or driness, or if the Patient be abstemious, he may use the Decoction of Juniper, of *Guajacum* or *Saxaphras*, or of *Madder*, which provokes Urin very much, either alone, or with White-wine. But because he must abstain from drink (as we said) and yet there is great thirst, it must be asswaged by Fits with washing the Mouth with Steeled Water and Vinegar, or with often chewing Mastick, or the like; for it will draw Water to the Mouth, not only (as some think) out of the Head alone, but from the Stomach and Cavity of the Abdomen, and therefore it will do much.

Of Meats we say thus, That he must chuse the driest, and avoid Sweet meats as the Plague.

While you use Internals, forget not Externals, for they are of great force to discuss the humor of the Belly; as Fomentations, Bags, Oyntments, Pultisses and Plaisters. The chief are made thus:

Take of *Marsh-mallow* and *Lilly Roots*, *Cypress-barks*, *Caper-barks*, middle Barks of *Ash*, *Tamarisk*, *Dwarf-Elder*, and the greater *Snakeweed*, of each three ounces: *Wormwood*, *Agrimony*, *Marjerom*, *Organy*, *Calamints*, *Peniroyal*, *Rue*, *Ground-Pine*, *Southernwood* and *Elder*, of each one handful: *Parsley*, *Dill* and *Cummin-seeds*, of each one ounce: *Camomel*, *Melilot* and *Broom-flowers*, of each three Fugils: *Spicknard*, *Schoenanth*, *Nutmegs*, *Cloves* and *Cinnamon*, of each half an ounce: *Salt* and *Allum*, of each half a pound. Boyl them all in a Lee made of *Oak* Ashes or Branches: with this foment the whole Belly with Spunges dipt therein and strained. Or,

Take the Urin of a sound Boy, four pints: *Lapis Prunella* three ounces: boyl them to the consuming of the third part of a Fomentation.

Aquapendens commends Lime-water, in which he dips a new Sponge which will compass the whole Abdomen: this he strains, and binds on, by which he affirmeth, that the waters that cause the Dropsie are consumed, the cold and moist distemper of the Bowels are taken away, and the hardness of the Spleen dissolved.

Clandinus quencheth the Lime in a Salt Bath Water, that is either of Brimstone or Salt-peter, and bindeth close the Spunges dipped therein and strained, with Rowlers to the Belly, and keeps them there long, and then changeth them.

You may make Bags of the Ingredients of the former Fomentation boiled in White-wine, and applied warm to the Belly.

After the Fomentation, let the Belly be anointed with Oyl of *Dill*, *Rue* or *Flowerdeluce*, mixed with Powder of *Ammoniacum*, *Galangal*, *Dill*, *Bay-berries*, and the like.

It is also good to anoint with the Oyl of *Scorpions*, according to *Matthiolus*, and with a little oyl of *Rosemary*.

Many do make Oyntments and Liniments of strong Purgers, which draw Water violently from the Dropsie, and assuage the swelling of the Belly, but they are dangerous; for the purging Quality getting between the Muscles and the Membranes, doth often stir up a deadly Looseness.

After Liniments, or if they be omitted, you may apply Cataplasms or Emplaisters. This following is the best.

Take of the Roots of wild Cucumers well bruised and steeped twenty four hours in Vinegar of Squills one pound: clarified Honey two pints. Mix them, and boyl them to the consistence of a Cerat, and add in the end four ounces of the Powder of Cummin-seed. Make an Emplaister for the Belly to be renewed every day. Or,

Take

Take of dried Cow-dung one pound: Brimstone and Cummin-seeds powdered, of each two drams: New wine boyled called Sapa: or of the Urin of a Boy, as much as will make a Cataplasm.

A Cataplasm of Rhadishes bruised and laid to the Navil and Reins, doth provoke Stools and Urin.

Galen commends a Cataplasm of Snails bruised with their Shells, which must be kept to the Belly till it fall off of its own accord; it draws water forth violently.

Valeriola makes it in form of a Plaister thus:

Take of Cow-dung one pound: Goat-dung half a pound: boyl them in strong Vinegar, and beat them in a Mortar with three ounces of Brimstone, and one ounce of Allum: the Juycce of Spurge and Dwarf-Elder newly drawn, of each three ounces: Lupine and Orobus-meal, of each two ounces: the Powder of Soldanella, Annis, Fennel and Cummin, of each two drams: common parched Salt three drams: Turpentine four ounces: Pitch six ounces. Make a Plaister.

It is worth the observation which Wierus and Varignana say they found by experience, that a Toad found in the Woods, cut through the Belly and tyed to the Reins, doth provoke Urin violently, and when you will evacuate more apply another.

Petrus also reports, That the Powder of the same Toad dried and calcined in an Oven, drunk half a dram in Wine or other Liquor, doth wonderfully expel the Dropsie by Urin.

The first Inventor of which Experience desiring thereby to destroy himself, was cured thereby contrary to expectation.

Also this following Cerat made of a Toad is excellent.

Take of Toads two pound: the Juycce of Dwarf-Elder three pints: Oyl one pint: Wax half a pound. Boyl them in a luted Pot to the consumption of half, strain them for a Cerat; spread this upon a Leather, and lay it to the Spleen, it evacuateth all waters.

All the time of the Cure you must strengthen the Liver and Stomach, if the humor doth begin to abate, or is not so great that it hinders the Vertue of outward Medicines from coming to the part.

Take of the Oyl of Orange-flowers one ounce: the Oyl of Spike three drams: the Oyntment of Roses, the Stomach Cerat of Galen, of each two drams: distilled Oyl of Mastick two scruples: the distilled Oyl of Wormwood one scruple: Oyl of Nutmegs one dram and an half: white Wax a little: mix them for a Liniment to be applied to the Stomach.

Take of Sea-Wormwood three drams: Horeboud and Rosemary, of each two drams; red Roses two Pugils; Camomel-flowers and Bay-leaves, of each half a handful; Orange-peels and Sweet-wood Aloes, of each three drams; Cypress-roots, Schœnanth, and Spicknard, of each half an ounce; with two parts of the best Wine, and one part of Wormwood and Agrimony-water, make a Decoction, with which foment the Region of the Liver with a sponge first wash'd in Wormwood-water.

Take of the Oyntment of Roses and Cerat of Saunders, of each three ounces; red Roses, Endive and Sorrel-seed, of each one dram; Spicknard, Schœnanth, dried Wormwood, and Styrax Calamita, of each three scruples; Oyl of Mastick or Wormwood, as much as will suffice to make a Liniment to be applied to the same part after the Fomentation.

For the most part in a Dropsie the Thighs, Legs and Feet have a cold swelling, and for the discussing of it a Lye is good in which the Roots of Dwarf-Elder and Elicampagne, Rosemary-leaves, Marjerom, Thyme, Bays, Organy, Salt and Allum have been boyled.

Although the things aforesaid are chiefly used, yet sometimes they are not necessary, namely, when the Dropsie comes in a hot and dry Constitution from hot Causes which disperse the Natural heat, as in vehement Cholerick Feavers, for then cold things for the Liver mixed with warm Openers are best, such as are used in continual Feavers: And the Magistral Syrup above-mentioned made of the Juycce of Roses, Succory and Agrimony.

For ordinary drink give a Decoction of Succory Roots and Calcitrapa or white Chamelion, which is not unpleasant; or of other Openers, but in a greater quantity than above, which may quench thirst, assuage the heat of the Liver, and moisten the drinels thereof, it is not amiss to confirm this Doctrine by a famous Example (although it be allowed by Avicen, Trallian, and others) because it seems strange to some, and is of great consequence: Baptista Montanus reports, Conf. 263. in these words; I saw (saith he) in Venice a certain Predicant Frier that was cured of an Ascites and Tympanites; there were with me many famous Physicians, namely, Papiensis, Eugubinus, Trancavella, and others: He had (as I said) an Ascites with a Tympany, and a Consumption with a Heftick Feaver; therefore we were bound both to dry and moisten; therefore we were in a great contention, I was willing that he should drink much, but things that open, because he had many Obstructions

structions, and that moisten because he had a Consumption: I prescribed the Syrup of Vinegar with all things that provoke Urine. Eugubinus would not allow him to drink, and told a story of one who was cured by drythings. Papiensis to end the controversie, said, that he should neither drink much, nor at all; we argued till Night: the Noblemen brought their Physicians to their Boats, and there Papiensis said to a Nobleman, what he had concealed formerly, If you would have this man cured, there is nothing to be done but what Baptista Montanus saith.

In this case also Medicines of Steel, Tartar and Vitriol are excellent, because they strongly open and provoke Urine without any great heat.

But the tart Vitriol Mineral waters are best, because they powerfully open the bowels, provoke Urine, and correct the distemper of the Bowels, whence experience sheweth us that many Dropsies are every year cured at the Spaw.

Avicen reports in the Chapter of the Cure of the *Ascites*, Of a Woman which had a great Dropsy, and eat an incredible number of Pomegranates, whereby she was cured.

And Varignana reports out of Platearius, That an old Woman boyled the Juice of Plantane to the consumption of half, and gave it to one that had a Dropsie from a hot Cause every day, and so cured him.

By these Examples it is plain, That sometimes a Dropsie is cured with cold things; and to these we may add the Testimony of Christopher Vaga, lib. 3. Art. Med. Sect. 8. Cap. 12. who saith there, We saw one that had a Tympany from the hot distemper of the Liver, whom we cured with cold things, laying upon the Liver the Juice of Endive and Succory, with a little Vinegar, and giving Endive and Succory to be eaten.

The End of the Eleventh Book.

THE

THE
TWELFTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

Of the Diseases of the Spleen.

The Preface.

Although the Spleen may be afflicted with all kinds of Diseases, both Similary, Organick, and Common; yet we will onely speak of those which are most ordinary in Practice, and we will contain them in six Chapters. The first shall be of the Inflammation of the Spleen. The second of the Pain. The third of the Obstruction and Tumor, or puffing up of the Spleen. The fourth of the Schirrus, or hard Tumor. The fifth of Hypochondriack Melancholy. The sixth of the Scurvy.

CHAP. I.

Of the Inflammation of the Spleen.

THe Inflammation of the Spleen is of the same Nature with that of the Liver, only it differs in this, That it seldom comes from pure, but from Melancholick blood, It hath the same causes, both Conjunct and Antecedent: but the *Diagnosis*, or knowledge by Signs is different.

SIGNS The Signs of the Spleen inflamed, are swelling and pain in the left side under the Ribs, which sometimes reach to the Midriff and the left shoulder; also heaviness and beating in the same side, a constant Feaver, loathing of Meat, Thirst, blackness of the Tongue, troublesome lying on the right side by reason of the heaviness of the part lying upon the Stomach then; sometimes troublesome lying upon the left, if the Tumor be great, for then it is pressed both by the stomach and the Liver; sometimes the Tumor is in the shape of the Spleen, sometimes it fills the whole left Hypochondria, sometimes it appears below the Navel, when the matter is increased, and when the Inflammation reacheth to the parts adjacent, and especially to the Navel.

These Signs are greater or lesser, according to the divers mixtures of Humors. For if Choler be mixed with Melancholick blood, the Urine is more red, the Mouth bitter, the Thirst greater, the Feaver stronger and worse every third day; great Watchings, and sometimes doting; if it be mixed with

with Flegm, the colour is pale, the Feaver and Thirst is less, and the pain less. But if the blood be only melancholick, the hardness is greater, the colour is black, and sometimes the Urin, and there are other signs of melancholy predominating.

PROGNOSTICK. The Prognostick is almost the same with that of the Liver inflamed, but less dangerous, because the Liver is the nobler part. If it kill not the Party, either it ends in a Crisis, or it is dissolved or suppurated, or grows hard and turns into a Schirrhus. A good Crisis is when the left Nostril bleeds, or when there is a purging by Stool or Urin.

CURE. The Cure of this Disease, is the same with that of the Liver, only observe these Differences.

First, You must open the Vein of the left Arm in this, and not so often as in the Inflammation of the Liver, because the Liver being the Fountain of blood, wants greater Evacuation. That which is reported of the Salvatella-vein to discharge the Spleen so properly, is but a conceit, and is now out of use: you may better take blood out of the Liver-vein called Basilica.

Secondly, You must apply those Topicks, or outward Medicines now to the left side.

Thirdly, You must not take such care in the use of binding Medicines outwardly, because the Spleen is not so noble a part, and needs less strengthening.

Other things are to be taken out of the Cure of the Inflammation of the Liver.

CHAP. II. Of the Pain of the Spleen.

Sometimes the Spleen is pained without Feavers or hardness, and this comes from Wind which doth not only stretch the substance of the Spleen, which is almost insensible, but the Membranes that cover it.

It is easily distinguished from the Inflammation by the Feaver, and hardness being absent, but hardly from the Cholick, because the Colon is just under and over the Spleen; yet the pain of the Spleen is weighty, and in one place: but the pain of the Colon is stretching, sharp, and moveable, and runs about the whole Belly.

The Cure of this Disease is with Clysters that are Carminative, or that expel Wind with convenient purging, and with Emollient and Discussing Fomentations mixed with Vinegar. As also with Liniments made of Oyl of Lillies, Camomel, Capers, and Wormwood, with a little Spike and Vinegar.

If the pain remain after the use of these, apply a Cupping-glass to the left Hypochondrion, if there be no suspicion of the Inflammation or Defluxion.

Chap. 3. Of the Obstruction, Tumor, or Puffing up of the Spleen.

THE Spleen is no less subject to obstructions than the Liver, but more, because it receiveth the thicker and fouler blood, which is more easily contained in its Veins, or insensible passages, by reason of the softness and looseness of the part, which is more fit to receive thick humors. And when thick humors stick in the substance of the Spleen, it makes a Tumor, and an Inflammation in the part. And if the humor by long continuance grow thick and hard, it breeds a Schirrhus; but as long as it is moist with Flegm, it is like Oedema or flegmatick Tumor, which is most usual with them who live in Marshy moist places, or who live upon cold Diet. But if this Tumor be soft and loose, it is called simply an Inflammation or Puffing up, the cause whereof is partly Flegm, and partly Wind: They are commonly called Splenatick People who are thus afflicted.

CAUSES. The Causes of the obstruction of the Spleen are the same with them of the Liver, and this or that part is affected, as it is more or less disposed to receive them. Sometimes both Liver and Spleen are affected together; for a gross humor can hardly be in one part, but some of it must be carried to the other.

DIAGNOSTICK. The obstruction of the Spleen is distinguished from the obstruction of the Liver, from the Situation of the part; for there is a heaviness in the left Hypochondrion, and sometimes pain, especially after running or great walking or riding; and when you handle the Hypochondrion, there is a stretching and resistance; besides, the Face is blewish, and there are other signs of Melancholy.

This

This disease is stubborn and of long continuance, by reason of the softness and looseness of the part, which cannot therefore easily discharge the humor; and if it last long and be not cured speedily it turns into a Schirrus.

CURE.

The Cure is the same with that of the Obstruction of the Liver, by adding some things which do more properly respect the Spleen, and are fitter to prepare and purge Melancholy.

The Pills of *Ammoniacum* which follow, are to be added as most excellent, and to be used often.

Take of the best *Ammoniacum* dissolved in Vinegar of Squills one ounce; the Extract of Aloes half an ounce, Crystal of Tartar one dram, Myrrh and Saffron, of each half a dram: Mastich, Benjamin, salt of Ash and Wormwood, of each one scruple; with Oxymel of Squills make a mass of Pills. The Dose is half a dram twice in a week, with purging between.

In Apozemes and other opening drinks, Oxymel simple, and of Squills, or Sea Onions may be very well dissolved, to cut and dissolve powerfully the gross and earthy humors.

Of all other Medicines those which are made of Steel are the best to open the Obstructions of the Spleen.

Also you may give Steeleed or Ironed waters for ordinary drink, which are known to lessen the Spleen (as *Celsus* saith) by this, because Beasts that are brought up at Smiths houses have little Spleens.

To the Fomentation put Vinegar instead of White wine, which will make them pierce better, which is requisite in a gross humor.

Moreover, *Galen* commends Vinegar exceedingly in the diseases of the Spleen, used both inwardly and outwardly.

Put Hemlock to the Cataplasms, as being powerful to soften and discuss humors.

There is an excellent Cataplasm made of Green Tobacco, boyled in Oyl and White-wine.

Of which also boyled to the Consumption of the Wine, you may make a rare Liniment.

Amatus Lusitanus, curat. 6. cent. 5. mentioneth a Cure of an Obstruction of the Spleen remaining after a Quartane Ague, That it was taken away with a decoction of *China* used twenty days after convenient Purging.

CHAP. IV.

Of the Schirrus or hard swelling of the Spleen.

THE matter of the Spleen causing obstruction by continuance grows thicker, and makes a Schirrus: And since the Schirrus of the Liver and Spleen are both of one Nature, whatsoever we have said of the Schirrus of the Liver, may be here also useful.

DIAGNOSTICK. The Knowledge also of the Schirrus of the Spleen is the same with that of the Liver, but only the hardness is on the contrary side.

It is distinguished from a windy Tumor, because there is more heaviness in a Schirrus than in a windy Tumor, which yieldeth to the Finger, and maketh a Noise; all which are not in a Schirrus.

If it come only of Melancholy, there will be evident signs thereof; but if it be mixed with flegm, there is apparent in the whole body a Flegmatick evil habit.

PROGNOSTICK. The Prognostick also is the same with that of the Liver; only this of the Spleen is more easily cured; because the less Noble the part is, the stronger Medicines may be applied without danger.

CURE. And Lastly, The Cure is the same with that mentioned in the Schirrus of the Liver.

And because it is to be done by degrees, from mild to stronger Medicines: first you must use those Remedies which we said were good for the Obstruction of the Liver and Spleen: and among the Chalybeat Medicines there commended, the principal of the Pills of Steel made with *Ammoniacum*, and other things mentioned in the Obstruction of the Liver.

Pills of Aloes, *Ammoniacum* and *Mercurius dulcis* are the best among the Medicines for the Schirrus of the Liver.

But this following Opiate is the Medicine will Cure, if it be not incurable:

Take of Gum *Ammoniack*: *Opopanax* and *Bdellium*, of each two drams: dissolve them in White-wine; strain and boyl them, then add of *Confectio Hamech* and *Diaphœnicon*, of each two drams:

Y y

double

double *Catholicon* half an ounce; *Pilulæ Foetidæ* two drams: make an Opiate, of which let him take half an ounce with twenty grains of *Mercurius dulcis* for many days together, and so the Tumor and hardness will vanish.

And besides what was said concerning the Liver, you must observe these following Precepts in this disease.

First, Because Blood-letting is much questioned, we resolve that it may be good in the beginning. But it is good for nothing when the disease is old.

Secondly, The dead or blind Nettle called *Galiopsis*, or *Pliny's Arch-Angel*, is commended by *Solenander* and *Fonseca*, for a special Remedy; the *Italian* call it the Spleens Herb: this is given boyled in Wine, the quantity of an ounce, or one dram in Powder, with Wine or other convenient Liquor or Decoction, with most admirable success.

Thirdly, Besides the Fomentations there mentioned, *Aquapendens* in his Chirurgery commends the fomentation of the Belly, with a Sponge dipped in Time water, and squeezed; and with that he saith he hath cured the Schirrus of the Spleen and Dropsie.

Fourthly, Besides the Oyntments afore-mentioned, *Amatus Lusitanus* commends this following as admirable, by which he saith he cured a Schirrus of the Spleen; and he saith that he had it from the Physicians of *Ferrara*.

Take of Common Oyl three pints; the Marrow of an Ox bone one pound; fresh Butter half a pound; the Juices of Briony and Sowbread, of each one pint: boyl them gently till the juices are almost consumed. Add to the straining yellow Wax eight ounces; the Powder of Ceterach or Spleenwort, Capar Barks, Tamarisk and *Agnus Castus* seeds, of each three drams. Mix them into an Oyntment.

Thus it is described by *Amatus*; but there is too much for one Patient, therefore you may lessen it thus:

Take of Common Oyl three ounces, Ox Marrow one ounce, fresh Butter half an ounce, the Juice of the Root of Briony and wild Cucumers, of each one ounce and an half: boyl them as afore, and add one ounce of Wax, and of the powder of Ceterach, Capar and Tamarisk Barks, and *Agnus Castus* seeds, of each two drams.

Fifthly, The Cataplasms following are excellent:

Take of the Roots of wild Cucumers one pound: Mallows and Violets, of each three handfuls: boyl them till they are soft, beat them and strain them: then add of the Oyl of Capars and Tamarisk, Vinegar of Squills a little. Make a Cataplasme.

Take of sower Leaven two pound; boyl it in equal parts of Oyl and Wine to a Pultis.

Besides the Plaisters mentioned in the Schirrus of the Liver, these are very good:

Take of Gum Ammoniack four ounces: dissolve them in strong Vinegar: then strain them, and boyl them till the Vinegar be consumed: then with a little Wax make a Plaister.

Take of Hemlock four handfuls, Ammoniacum half a pound; infuse them in Vinegar eight days: then boyl them till the Ammoniacum be dissolved: then strain them through a Linen clout, and boyl the Liquor again a little while, and with Wax and Oyl of Almonds make a Plaister.

Take of the juice of Mallows, Cressonis, the Stalks and Roots of Fern, of each two ounces; Gum Ammoniack four ounces: with a little Vinegar first dissolve them with a gentle fire, then boyl them and strain them: then boyl them again to the consistence of a syrup, and with one ounce of Oyl of Capars and a little Wax, make a Sparadrap for the Spleen, to be renewed every third day.

Aquapendens in the place cited, saith, That he cured many with this Plaister, which is made of two parts of Ammoniacum dissolved in Vinegar, and one of the juice of Tobacco; one of the Rozin of the Pine-Tree, Turpentine and juice of Danewort; one of Oyl of Capars, and a little new Wax in the form of a Cerat.

CHAP. V.

Of Hypochondriack Melancholy.

Although all the parts beneath the Ribs called *Hypochondria*, are affected in this disease, yet it's thought the Spleen is most, because it receives the Melancholy, and therefore it is fitly placed among the diseases of the Spleen.

CAUSES, This disease comes of preternatural Melancholy and other adust humors, especially Bloud or Choler, or Natural Melancholy.

This

This Melancholick Humor is not pure by its self, but commonly mixed with others, as Choler, Flegm, and Water, from whence come the diversity of symptoms, which hereafter shall be mentioned. These humors breed in the Spleen, especially when it is distempered with heat, and also in the Liver. Hence it is that they draw meat and drink to themselves, which is not concocted, that which is thin of the Chyle sooner than that which is thick: and then the thicker part for want of something to carry it, stays in the Meseraick Veins, and the longer it stays, the thicker it grows, and sometimes is burnt: and afterwards coming to those parts, it is not well concocted. Moreover, those parts in their Natural state should concoct by boiling, now do it by roasting: Hence comes this great adustion of humors.

It may also be, that this Disease may be bred without the distemper of these parts, from evil Nourishment that breed Melancholy blood; and also from good blood retained too long in the Vessels, and being too much, as in stoppage of the Terms and Hemorrhoids, which continuing long in the Vessels is burnt, and turned into melancholy.

It may also come from the Stomach not well concocting, but turning it into a parched Crudity, from which those evil Juices are bred in the Liver and the Spleen. And *Galen 3. de loc. affect. cap. 7.* following *Diocles*, thought the proper seat of it was in the Stomach, because in this Disease there are commonly signs of an ill Stomach: But it is more probable that the Stomach should be afflicted secondarily from the Liver or the Spleen, as we will clearly shew hereafter.

These evil humors are gathered into the Veins and Arteries, which are in the bottom of the Stomach, especially in the great branches of the Gate-vein, the Spleen-veins, and those of the Mesentery, Caul and Belly, in which they have often great and grievous fermentations or workings; from whence stinking Vapors are sent to the Brain, Heart and Midriff, which cause those divers Symptoms in those parts, which we shall after mention.

Also the humors are contained in the Bowels, especially in the Spleen and Sweet-bread, and the Glandules of the Mesentery, the substance of which parts is soft, and like a Sponge, and therefore is more ready to receive them, and harder to cast them forth. Besides, the Glandules which are dispersed through the Mesentery, to be a prop to the Veins and Arteries, and to hinder lest they should be pressed by the Guts being full, or by any other thing; If these swell much, they do press upon the Vessels, and hinder the passage of the humors, whence come obstructions in those passages.

Boys and young men are little subject to this Disease, by reason of their moist temper unfit to breed Melancholy: but men often, because the humors are burnt by heat in youth; and when that heat decays, and the thin parts are exhaled, there is a great increase of Melancholy.

The Antecedent and principal Causes of this Disease are, first, Meats of evil Juice, and hard of Concoction, which are fit to breed Melancholy; as brown Bread, or unleavened or crusty, Pulse, Cheese, hard Eggs, and fried Meats, Water, Fowl, Beef, Venison, Hares, and all salt and smoked Meats, and many other things of hard substance.

Secondly, Great passions of long continuance, especially Sadness, are very powerful to breed this Disease, because they disperse the Spirits, by which means the Concoction is weakened, and so there is great Crudity, which being burnt by the hot bowels, turn into Melancholy.

Thirdly, Idleness, by which the Excrements are retained, especially if there be much study and watching: Hence it is that Learned men, and such as sit much, are very subject to this Disease.

Lastly, The stoppage of the Terms and Hemorrhoids, both in respect of their quality and quantity produce it: For when Melancholick, salt and burnt humors, used to be discharged by those ways, if they are stopped they return to the Hypochondria and cause this Disease.

DIAGNOSTICK. The knowledge of this Disease is taken from the Symptoms which follow, and they are many, because almost all parts of the body suffer thereby when it is high: We shall reckon them up, admonishing first, that all do not happen to all Patients, but some to one, some to another, according to the diversity of the humor, and the part affected.

First therefore, the Stomach commonly suffers, not principally, as *Galen* from *Diocles* supposed; but secondarily: When blood coming from the branches of the Gate-vein, to nourish the Stomach is not good; from whence the Stomach being ill nourished, doth ill concoct, and turns its Meat into corruption. Hence comes a Circular Evil, when the Liver and Spleen send evil blood to the Stomach, and the Stomach breeds evil Chyle to return to them, of which they make bad blood.

Therefore in this Disease the Stomach commonly concocteth ill, and turns the chief part sometimes into water, sometimes into sharp, sour and clammy substance; which being not drawn by the Guts and Meseraick Veins, because unfit for nourishment, stays in the Stomach; and coming upwards sometimes fills the Tongue with Spittle, so that the Patients spit much, and sometimes vomit.

Sometimes the matter in the Stomach boileth, and fermenteth: from whence comes wind, which doth not only stretch the Stomach, but the parts adjacent, and make the Heart so sick, that sometimes

the Patient swooneth. Sometimes the Wind is sent out upwards and downwards, and by insensible transpiration, or the matter causing them is vomited forth.

Yet you must observe that all that is vomited out is not bred in the Stomach, but is sent from the Spleen and other parts to it: for sometimes the humors vomited are so sharp that they set the teeth on edge, and these are sent by the short Vessel from the Spleen to the Stomach.

In some there is blood so sent, with Melancholy and other evil Humors, which is cast forth partly upward, and partly downward; as we shewed at large in the vomiting of blood.

In this Disease there is often belching and noise beneath the Ribs, by reason of the abundance of Wind made of those Crude Humors: hence it was wont to be called the windy Disease. Now, how Wind is bred of Melancholy we shewed in the Tympany.

Sometimes pains arise in the Stomach and Hypochondria, of the same winds which reach to the Back and Loins, so that you would think it the Stone of the Kidneys, especially if the Urin be thick and red, as usually it is.

The Belly is often bound, because the Meat is turned into clammy Matter, which sticks to the Guts, which the expulsive Faculty cannot cast out without help of Medicines, and therefore the Patients are constrained to take Purgers and Clysters often.

Sometimes there is a Flux of the Belly, if the humors grow sharp, and have in them much Choler or burnt Melancholy.

There is a heat in the Hypochondria, and a certain Inflammation upward, sometimes in one side, sometimes in another, from hot humors contained therein, especially when they are moved by inward or outward means; so that the Face will grow hot and red from those vapors, and sometimes there is an Ephemeral, or Feaver for a day, by those vapors sent through the whole body.

The Urin is sometimes thick, sometimes thin. Thin, when thick humors stop the passages through which it is as it were strained, thick, red and troubled, by reason of the mixture of the thick matter, which is very salt, and therefore called (*Materia Tartarea*) and it lies at the bottom of the Urinal like a thick Sediment. Or some part of it sticks like red Sand to the sides, which makes many fear the Stone without cause: this same is not bred in the Reins, but in the Liver, from a burnt and salt humor; and you may know this, because it dissolves between the Fingers like Salt, which will not when it comes from the Reins.

Sometimes there is a Palpitation, or beating of Heart, by reason of the vapors ascending, which while it labours to expel, makes it move violently; and then the Patient thinks himself in great danger.

Sometimes there is a beating in the left Hypochondrion, when hot humors are there; from whence vapors arise, and make the Pulse, or Systole and Diastole of the Arteries greater; so that both the Patients and the standers by may feel it, which is chiefly after heat with anger, motion, or drinking of much Wine. This beating is chiefly in the Cœliack Artery, which is the chiefest in that part. In an old Disease it is sometimes constant; and this signifies an habitual and incurable Disease. An Aneurism sometimes followeth this great breathing, from the enlarging of the Cœliack, or some other Artery, and from the hot blood in them, which being very thin, and full of many hot Spirits, continually dilateth and stretcheth the Arteries while there is an Aneurism, such as *Fallopins* observed, *Lib. de Tum. præter naturam, cap. 14.* in an old woman, who being opened, had an Aneurism in her Belly, into which he put his fist. From which, mark by the way, the great Providence of Nature, which fearing the breaking of an Artery through too much enlarging, hath made the Coat of it hard as a bone, as *Fallopins* observed in the same place. Also *Paræus* in his sixth Book, *Cap. 28.* tells the like story of an Aneurism, found not in the Belly, but the Breast, in the Venal Artery, which was so stretched that it could contain his fist; and also the inward Tunicle thereof was like a bone. And we have seen the like about two years ago, namely, an Aneurism in the Breast by the dilatation of an Artery, which would hold the fist of a Boy of fifteen years old; and the Tunicle thereof was grown like a Gristle.

The evil vapors that ascend from the Hypochondria produce many symptoms: for being sent to the Palate and Tongue, they dry these parts, and cause a thirst; when they go to the Lungs and Midriff, they cause shortness of breathing: when to the Membranes of the Brain, Head-ach; when to the Brain, noise in the Ears, dimness of Sight, Giddiness, Fear and Sorrow, and divers Melancholy Phantries. And if they be malignant, and very sharp, they cause an Epilepsie, or Falling-sickness; if they come to the Nerves, Convulsions; and if they be stupifying they cause a numbness, and bastard Palsy, Coma and Apoplexy, if they get into the Brain. But if these vapors be hot and dry, they dry the brain, and cause watchings, troublesome sleep, and frightful dreams: and at first, though they sleep well after Supper till midnight, afterward they wake, some three or four hours, and some sleep again about three or four a clock, others not at all. The reason whereof is this: Because while the Chyle is carried to the part that serveth for the second Concoction, then the evil humors lying in the Vessels are stirred, and send up vapors, which being sent by the Veins and Arteries to the head,

head, cause watching; and if they be quickly discuffed, they sleep again; but if they continue long, they watch the other part of the night.

We have formerly spoken of all these symptoms, and we say again, That all are not in all men, but more or fewer, according to the variety of the humors and parts affected.

This also is to be marked; It is not Essential to Hypochondriack Melancholy, that stretching, hardness, pain and swelling, should be in the *Hypochondria*, because the cause is for the most part in the branches of the Gate-vein, and Arteries adjoyning, and sends from thence vapors to the heart and brain. Oftentimes there is stretching in the Liver and Spleen, which signifieth, that the humors stick in those parts, but if there be no stretchings, it is a sign that the evil humors lye in the Veins of the Mesentery, Caul, Sweet-bread and Stomach. These proper symptoms shew that the Stomach is affected with four belchings, and flinking or loathing, vomiting, want of concoction, and sometimes Flux of the Belly.

PROGNOSTICK. This Disease is not deadly for the most part, but of long continuance, many times the whole life, therefore it is commonly called the disgrace of Physicians, because they do seldom cure it; and if the Patient seem to be cured, it returns again in a few Months: it is also called the Scourge of Physicians, because they who have it are continually asking new Medicines, and presently wearied therewith, and daily complain to the Physicians, and often change them.

The Flux of the Hemorrhoids doth good in this Disease, if it be moderate; but if it continue long it is dangerous.

A thick Urin is better in this Disease than a thin and watery, which shews that the thick humors are detained in the body. Black Urin without a Fever, doth often cure this Disease.

It's good in this Disease to have a loose Belly, and bad to be bound. Also Vomiting, if the Patient be refreshed thereby, is profitable; but if it continue long, it is dangerous.

A giddiness and continual pain in the Head in this Disease, ends in an Epilepsie, Blindness or Apoplexy.

CURE. The Cure of this Disease is in three things chiefly: first, in opening Obstructions: Secondly, in amending the distempers of the Bowels; and in discharging of the peccant humor, not omitting Strengtheners: For which a wise Physician may use these following.

First give a Clyster, then this Potion:

Take of Senna half an ounce, Annis seeds and Cream of Tartar, of each one dram: Borrage-flowers, Fumitory and Sorrel, of each half a handful; Liquoris three drams, boyl them to three ounces. Dissolve in the straining, Rhubarb infused in Lavender Water one dram and an half: double Catholicon three drams: Compound Syrup of Succory one ounce. Make a Potion; to which you may well add in a strong Melancholy, one dram of Confectio Alkermes.

The day following, let blood from the left side chiefly, or as the Liver or Spleen are most affected.

Then give these Broths:

Take of Sparagus, Dogs-tooth and Succory Roots, of each half an ounce; Agrimony, Ceterach, Maiden-hair, Bugloss and Succory, of each half a handful; Cream of Tartar, one dram: boyl them with a Chicken, and make Broth ten or twelve days, adding four drops of Spirit of Vitriol to cool and open more.

In old obstructions, you may add to the former, China Roots, Saxafras, white Sanders, Smallage Roots, and male Fern Roots, Betony, Scabiotus, Coriander prepared, Raisins, and the like.

If the Belly be bound, or the Body very foul, give in every third draught of Broth, half an ounce of Senna, with Annis seeds.

Or this Apozeme instead of the Broth:

Take of Bugloss, Sparagus, Succory, and Sorrel Roots, of each one ounce; the middle rind of Tamarisk and Ash, of each half an ounce: Agrimony, Ceterach, Maiden-hair, Dodder, Succory, Fumitory, Hops, Bugloss and Borrage, of each one handful: the four cold seeds, Annis and Fennel seeds, of each two drams; Currans one ounce: Senna and Polypody of the Oak, of each two ounces; Dodder of Time one ounce; the best Agarick and Rhubarb infused by themselves in Cinnamon water, of each two drams; Mace and Cloves, of each one dram; the three Cordial Flowers, of each one pugil: Boyl them to a pint, and dissolve in the straining Syrup and Succory with Rhubarb, and of Roses solutive, of each two ounces. Make an Apozeme clarified and aromatized with two drams of yellow Sanders for four mornings draughts.

Or give Cock-Broth thus made:

Take of the Roots of Asparagus, Bruscus, and the Bark of Caper Roots and Tamarisk, of each half an ounce; Agrimony, Ceterach and Maiden-hair, of each one handful; Annis, Citron, and Carduus seeds, of each one dram; Senna half an ounce, Polypody of the Oak, and Epithim, or Dodder of Time,

Time, of each three drams; Cinnamon one scruple, Crystal of Tartar one dram. Boyl them all with half a Cock, which let him take four mornings.

After you have sufficiently purged, a Bath of warm water is most convenient, used many days, in which cool Herbs have been boiled, and sweet Apples. Sometimes it is made of Barley and Almonds beaten, and put into a Bag, and boyled in water. It must be often repeated, if the season will permit; for Galen 8. de loc. aff. cap. 6. saith, that he cured many melancholick men, only with the use of hot Baths, without any other Medicine. And if the Patient cannot endure a whole Bath, let him have one for half the body.

And lest often washing should hurt the Stomach, when he enters into the Bath, let it be anointed with oyl of Nutmegs by Expression, or the like.

When he goes forth of the Bath, let the Region of his Liver be anointed with the Cerat of Sanders, or oyntment of Roses washed in Oxycrate.

After his last Bath, let the Hemorrhoids be provoked with sharp Suppositories, or with rubbing the Anus with Fig-leaves, or with a rough linnen Cloth; and with two or three Horse-leeches applied to the most apparent places, take away five or six ounces of blood. And this must be done every Spring and Fall, and sometimes once a Month.

They who are used to have the Flux of the Hemorrhoids, if it hath been long stopped, so that they will not appear, must have a Cupping glass applied.

If after the Leeches are fallen off, they bleed still, as sometimes they will, stop them with Clay or Powder of Coal, or with Spiders Webs, or with Powder of Lime, or with astringent Powders taken up with the white of an Egg and Pledgets.

And if you cannot conveniently open them, it is good to draw blood from the inferiour Veins, that the most impure may be voided.

An Issue burnt in the left Leg doth purge the Spleen and other Bowels from superfluous humors, and therefore forget it not.

But because this Disease useth to be very stubborn, and after Purging new humors return, you must purge by fits, that the body may be freed from them by degrees; which may be well done by a Magistral Syrup, made thus:

Take of new-drawn purified Juices, of the Flowers of Borrage, Bugloss, Endive, Succory, Fumitory and Sorrel three pints; the Juice of sweet Apples newly drawn and cleansed two pints; fresh Polipody of the Oak half a pound; clean Senna eight ounces, Dodder of Time three ounces, Agarick newly made into Troches one ounce; Ginger and Cloves, of each one dram. Infuse them and strain them according to art, till there remain five pints and a quarter of the Liquor, in which dissolve the straining of an ounce of Rhubarb dissolved in the said Juices by themselves with a little Cinnamon, and one pound of Sugar. Make of these a well boyled Syrup; clarify it, and aromatize it with two drams of the powder of the three Sanders, keep it in a Glass, and let him take two ounces thereof, twice or thrice in a month, with a little Chicken Broth, boyled with Endive, Sorrel, Borrage and Burnet.

Or instead of the Syrup, you may give Pills, especially in Winter, such as were mentioned in the obstruction of the Liver; or if you fear they are too hot, you may make these following:

Take of Polipody of the Oak half an ounce, Asarabacca Roots, and Broom-buds, of each one dram; Currants three drams, Crystal of Tartar one dram and a half, Bugloss and Borrage-flowers, of each half a pugil; Boyl them in Spring-water. Take half a pint of the straining being well clarified, and six ounces of the Juice of sweet Apples also well clarified, and infuse therein one ounce of clean Senna: Turbith and Agarick, of each three drams; Mace, Cloves, Cinnamon and Dodder of Time, of each one dram; digest them four days in Balneo Mariæ, then strain them, and add to the straining one ounce of the Extract of Aloes made in Endive and Sorrel water; Myrrh dissolved in Wine and strained, two drams: Salt of Tartar one dram. Evaporate them all, and inspissate and thicken them upon a gentle fire, adding towards the end when the matter is almost evaporated, Diarrhodon Abbatis, Letificans Galeni, and the Troches of Dialacca, of each half a scruple; bring them into a mass for Pills, and let the Patient take half a dram once in a Week, two hours before Meat.

Pereda witnesseth, That he hath cured many Melancholick men with this following Powder; and he calls it Blessed and Divine.

Take of Dodder of Time half an ounce, Lapis Lazuli, and Agarick in new made Troches, of each two drams: Scammony one dram, Cloves twenty: mix them into a Powder, and give two drams twice or thrice in a month with Whey or Borrage Water.

If you cannot conveniently give often Purges, it is good every other day to give a Clyster to reveal vapors, and draw forth some part of the humor: for if they go deep into the Guts, they take away the greatest part of the filth from the Mesericks. We knew a Noble Man, who being long troubled with this Disease, was cured by often Clysters, when other Medicines did nothing.

While

While you give intermitting Purges, let the body at other times be moistned with Baths, or half Baths or Fomentations, by which, both the violence of the Humor is restrained, and the Body made moister.

Also at those times you must use strengtheners, which will all open Obstructions, and they use to be made often like Opiates, or a hard Electuary or Lozenges, thus :

Take of Conserve of Bugloss Roots half an ounce ; Conserve of Borrage flowers and Violets, of each one ounce ; Conserve of Roses and Candied Citron peels, of each half an ounce ; one candied Myrobalans ; Confection Alkermes three drams : Powder of Ivory, Harts-horn and Bezear stone, of each one dram : Latificans Galeni, Diarrhodon Abbatis, of each two scruples : Coral and Pearl prepared, of each half a dram : Ambergreece half a scruple : the best Musk five grains : Gold three Leaves : with Syrup of Apples and of Candied Citrons make an Opiate, of which give the quantity of a Chesnut two hours before meat, every day drinking after it a little White-wine.

A plainer and better tasted Opiate is made of one part of Confection Alkermes, and four parts of Conserve of Borrage Flowers. And to open more powerfully, if you fear no hurt by hot things, add Conserve of Tamarisk Flowers, Elicampane Roots, Wormwood, Maiden-hair and the Salt of Wormwood and Tamarisk, &c.

You may make Lozenges thus :

Take of Diambra, Diamoschi dulce and Latificans Galeni, of each one scruple : Confectio Alkermes three drams : Sugar dissolved in Borrage and Rose-Water, four ounces : make Lozenges of two drams in weight gilded. Let him take one every day two hours before meat.

Or you may make them more pleasant thus :

Take of Confectio Alkermes two drams : Ambergreece one scruple : Sugar dissolved in Rose-water four ounces. Make Lozenges.

Ambergreece alone, given five or six grains at a time every day with Wine or Rose-water, doth cheer the Spirits and the Natural heat, and much rejoyce the heart.

Some Authors do much commend the use of Bezoar stone against all Melancholick Diseases, because it doth much strengthen the heart, and you may give five or six grains in Rose water, or other Liquor.

After the body is well purged, if it be Spring or Summer, you may give Whey for fifteen or twenty days, which will open the Obstructions of the Bowels, and amend the hot distemper. Make it by boyling and clarifying it, and putting into it every night two drams or half an ounce of Epithimum.

You must proportion the quality according to the strength of the Stomach. For if it can easily pass through the Veins, being somewhat open and be sent forth by stool and urine, it is good to give it in great quantities, as Mineral Waters prescribed in the hot distemper of the Liver, with this Caution, That you strengthen the Stomach with Bags and other things hereafter mentioned, and give every day at Evening a Cordial strengthening Opiate. Instead of Epithimum, you may mix with the Whey, the juyce of Succory, Borrage, or of any other proper cool Herb, thus :

Take Goats Whey four or five pints : the juyce of fresh Lemmons four ounces : the new juyce of sweet Apples six ounces : Conserve of Roses or Violets, or white Sugar one ounce. Clarifie these with whites of Eggs. Let him take every morning three or four Cups thereof, if his Stomach will bear it.

In bodys that are very lean, after the Obstructions are a little opened, you may give Asses Milk with Sugar of Roses, and if there be rumbling in the Hypochondria, a little *Aromaticum Rosatum* or Diarrhodon Abbatis will do very well.

But your sharp and Vitriol Mineral Waters are beyond all Medicines, which by correcting the distemper of the Bowels do powerfully open Obstructions, especially the warmest, which do make the humor thin, and cleanse it.

There is great dispute among Authors concerning drinking those waters. Some (with *Sennertus*) do allow it, because they receive virtue from their Minerals, and do thereby both cleanse the passages, and send forth the filthy humors which stick to them by stool and urine: they warm the stomach, and strengthen the Liver and Spleen : And we may rather fear that these waters will hurt by the use of them external than internal, by heating and drying. Others (with *Claudinius*) do altogether deny them, by reason of their drying quality. Others (with *Montanus*) do neither altogether reject them, nor wholly approve of them ; they say they are good, by reason of the coldness of the Stomach, which is always in this disease, and by reason of Obstructions. But in regard the Liver and Spleen are hot, they will have them defended with the cool Oyntment of *Galen*. And also the Loins, for then (saith he) the water will not hurt, because it stays longer in the Stomach, and cold places, but onely passeth through other parts. We suppose that the use of them is convenient, if the Stomach being cold have much thick and clammy slegm in it, and if the heat of the Liver be not very great,

Great. Which part is not like to suffer, if the aforesaid Oyntment be not only given, but also cool Broths after the Waters: and after they have been used enough, cold and moistening Baths for some days.

Medicines made of Steel, use to be of great Vertue to open these Obstructions, such as are mentioned in the Obstruction of the Liver, and of the Spleen, avoiding those which do heat and dry much. In hot bodies you may give Steel prepared with Brimstone or Vinegar, with Conserve of Borrage and Succory, made in the Form of an Opiate.

For dainty Folk, the Syrup of Steel aforementioned in the Obstruction of the Liver and Spleen is excellent; or the Froth which remains in the Glass after the Evaporation of the Wine which hath been often steeled mixed with the aforesaid Conserve.

But Salt of Vitriol of Iron goes beyond all Medicines, because it opens Obstructions, strengthens the Bowels, and qualifies their heat. The Dose is from twelve to twenty grains, with a fit Liquor, Syrup or Conserve. But because it is displeasing to the tast, I use to make it into Pills with the Mucilage of Gum Tragacanth. You must use it long, and therefore get a great quantity, which is not easie to be got after the way that *Beguinus* and others make it. We will shew you the easie way of making it, which few men know.

Take of the Oyl of Vitriol, or of Sulphur half a pint: the spirit of Wine one pint: Put them in a new Iron Pan that is clean, and cover them well: within fifteen days, of them there will be a Salt-like gathering, which you must set in the Sun to dry it thoroughly, sometimes stirring it with an Iron Spatula: In Winter you may dry it upon a gentle fire, or in a Hot-house. Let the Salt being well dried, be kept in a close glass: for if it be exposed to the Air, it easily turneth moist. Also the Pills that are made thereof, of Tragacanth, must be hardened with the Powder of Tragacanth, and after put in a Glass, otherwise they will grow moist. You may continue this Medicine for a moneth or two, not only without hurt, but with great profit.

Fonseca commends these Pills following, which he calls *Diatartarum* for opening Obstructions by degrees, and purging Melancholy gently, and for allaying it.

Take of the Powder of Senna, and Salt of Tartar, of each one dram: Powder of Cinnamon half a scruple: with Syrup of Lemmons make a Mass, of which give three Pills made of half a dram one hour before Supper, to give him two or three stools, for Salt of Tartar hath great Vertue to allay black melancholick humors: for it draweth to it self by certain propriety sowre things, as you may perceive when it is mixed with Vinegar, or Spirit of Vitriol whose sowreness it taketh away: For we must know, that *Fonseca* by Salt of Tartar, meaneth Crystal of Tartar. Yet you may as well infuse your Senna with the Salt of Tartar, and some drops of Spirit of Vitriol in some convenient Liquor.

To open the same Obstructions, some commend the decoction of China, as we said in the Obstruction of the Spleen; which a wise Physician may do with good success.

Some commend the Juyce of Wormwood, thickned into the form of a Pill, given either by its self, or with Gum *Ammoniacum*; and after that presently, Oxymel made of the decoction of Asarum Roots and Liquoris.

Others say, That Hypochondriack Melancholy hath been cured with the decoction or Wine of Wormwood taken thirty or forty days every Morning.

The Juyce of Bugloss is excellent, not to open Obstructions as Wormwood, but to qualifie the Melancholick Tumor. Therefore they give two ounces thereof with two drams of Sugar, and as much Wine as of both, for ten or twelve days every morning.

The principal thing for this Cure, is to keep the body always soluble: Therefore the Patient must have some familiar Medicines, which he may often use before meat, sometimes one, sometimes another, lest he grow weary of them. For this he may take the Magisterial Syrup, and the aforesaid Pills, and those which were prescribed for a costive Belly. To which he may add (out of *Montanus*) Venice Turpentine, which he orders to be swallowed in the quantity of an Acorn, three hours before dinner, once, twice or thrice in a week; for besides that it loosneth the belly, it also cleanseth the stomach, opens Obstructions, provokes Urine, warms the stomach, and doth not heat the Liver, but doth it good by opening and cleansing it.

For his ordinary drink let him use water wherein Gold hath been quenched, or the infusion of Tamarisk, Agrimony, Burnet in thin Wine, either alone, or made Physical Vintage time with the Roots of Bugloss, Borrage with a little white Sanders and Rosemary Flowers.

The decoction of the Sweet Bryar Root, is commended for ordinary drink; for it openeth and strengtheneth all natural parts.

The decoction of *Lignum Nephriticum* doth open the Obstructions of the Bowels without any manifest alteration. But steeled water is more usual. All which Waters and Decoctions, you may also mix with Wine.

While

While the internal Medicines mentioned or any of them are used, you must apply External, as Fomentations and Oyntments to the Hypochondria, such as are prescribed for the Obstructions of the Liver and Spleen, making choice of the coolest.

You must also apply strengtheners to the Stomach, because that part doth always suffer in this Disease; therefore you must use those Fomentations, Oyntments and Emplasters mentioned in the Diseases of the Stomach: Also those internal which will not inflame the Liver; and especially the Digestive Powder to be taken after meat: in a Fit when the Vapors arising from the Hypochondria do trouble the Heart, Brain and other parts, and produce great Symptoms, as Swoonings, Palpitations, Tremblings, Convulsions, Head-ach and the like; you may use those things which are given in Swooning or the Mother; but among the rest Laudanum used wisely doth wonders.

CHAP. VI.

Of the Scurvy.

THe Scurvy is usual in the North, in most places thereof Common, but almost unknown in the South; So that all Writers that have practised in these Parts, have never mentioned it: and we may well leave it out, because in our Preface to this Book we promised to meddle only with the usual diseases of the Spleen; but Experience hath taught us, That our Country is not altogether without it; for though it be not in every Symptom the same with that of the North, yet it hath enough to confirm it to be the same: for the aforesaid Authors say that one Symptom is sufficient to discover it; we have seen many symptoms of it in many people, but because it is not familiar here, and all our Physicians say we have it not, we would not absolutely call it a Scurvy, but we thought it better to call it a Scorbutical Disease, such an one as comes next to it, though it be not a true Scurvy.

For the Scurvy is nothing else but an Hypochondriack Disease: having a peculiar degree of Malignity from which more symptoms arise than in the Hypochondriack Disease: this malignity comes from the Putrifaction of Melancholy, not of every kind of Melancholy, for it is often corrupted, from which other Diseases arise and not the Scurvy, as a quartan Ague, an Imposthume in the Mesentery and other parts; but of a peculiar and proper Melancholy which is agreeable to that Malignity. This is known by the infection which is found in this disease, because all Authors hold it to be infectious. And because all the degrees of Malignity which lie in the Humors and produce divers diseases are unknown unto us and all Men, therefore is this of the Scurvy obscure and hidden; and it is wonderful that so many diseases should arise from the variety of the Malignity which is in the humors, as Malignant and Pestilential Feavers, Small-Pox and Measels, Cancers and Elephantiasis, the Pox and many others. And especially Elephantiasis comes from a peculiar Malignity in a Melancholick humor, and so doth the Scurvy, and yet these two diseases differ so much, that none can tell their divers degrees of Malignity.

Divers Symptoms common to both do shew a great likeness of the Scurvy and Hypochondriack Melancholy: for all they which were mentioned in the former Chapter are found in this disease, as Crudities and want of Concoction in the Stomach, often spitting, flegmatick, sharp and stinking vomitings, noise in the Hypochondria, belchings, breaking of Wind downwards, vomiting of blood, and purging of blood, pains from wind under the Ribs and in the Stomach, sometimes Costiveness, and sometimes looseness, heat in the Hypochondria, beating of the Left side, Urine now thin, then thick, heart-beating, thirst, drought of the mouth, short breath, head-ach, noise in the ears, dimness of sight, giddiness, sorrow and sadness, and divers dotings, convulsions, falling sickness, numbness, coma, watchings, troubled sleep and terrible dreams: The reasons of all which were shewed in the Chapter above, and they may agree with this of the Scurvy.

But if any Symptoms appear besides these, which are not to be found in that, nor mentioned by Authors, nor belong to another Disease; you may conjecture that it is the Scurvy: The chief are these, which are not all found in one Patient; but one of them is sufficient to shew that the Disease is such.

The First most remarkable sign is in the Gums, Mouth and Teeth, in the Gums, redness, itching and putrifaction, and sometimes bleeding and stink, which were sometimes in the Palate, Jaws and Teeth, which are loose and black.

The Second, which is an evident Sign also, is Spots in the Legs which at first are Red, and after purple, blue and black: Sometimes there are in the Legs broad spots, black or blue, or both; these come from the ferous filthy part of the blood which is unfit to nourish the body, and therefore is sent by nature out of the Veins of the Skin, by the Nauseosis of the Veins, as Hippocrates saith of Fractures, and this happens often in the Shins and Legs, because nature useth to send the worst Humors

to the most ignoble and remotest parts; sometimes when there is more plenty of matter you shall find them in the Back, Arms, Neck and Face.

The third Sign is shortness of Breath, and straightness of the Breast, which comes commonly from thick Vapors arising from the Hypochondria that get to the Midriff, as also from Tumors and swellings by wind of those parts that press upon the Midriff, especially from the swelling of the Sweet-bread, which commonly in this disease is filled with gross Melancholy: Hence the Patients complain not of their Breast, but of the part affected, whereby they feel the weight, and by reason whereof Breath is short, as *Eugalenus* noted well, who was much acquainted with this disease, and collected many Observations thereof; yet he knew not the cause of this weight, namely, the swelling of the Sweet-bread; nor doth any that write hereof make mention of it. Yet we observed it in my Lord *Andeyer*, President of the Senate of *Gratianopolis*, whom we thought had the Scurvy, as you may read in his History at length, in our Observations, *Cent. 3. Obs. 85*. For being very lean, we did easily perceive with our Fingers, a hardness in the Sweet-bread; and by handling of the part, he confessed that all his shortness of Breath, and straightness came from thence.

The fourth Sign is Laziness and heaviness of body, especially in the Legs, which comes from watery and foul humors, which come through the Veins to the Muscles and whole body.

The fifth Sign is in the Urine, which is divers, as in Hypochondriack Melancholy; but in this they sometimes differ, because they are clear and red like a Lye, from the plenty of Salt Humors. The redness is higher and inclining to black, by how much the more Salt Humor there is. As in a Lixivium sometimes the urine is very thick, with a red thick Sediment, like the Powder of Bricks, and sometimes this Humor is so much, that it causeth burning and pissing by drops, especially in them who have this Disease from stoppage of the Hemorrhoids; and after it is settled, the third or fourth part of the Urinal is filled with thick and black filth, which makes some think it to be the Stone or Ulcer of the Bladder.

Sometimes the Urine varieth without manifest cause; to day thick, to morrow thin; now pale, then yellow or red.

The Sixth Sign is from the Pulse, which is now weak and unequal, leapings or formicans that you would wonder he should live with it; anon it is great and hard, without Inflammation. And this is to be observed, that in time of fainting and swooning, with which he is often troubled, his Pulse is greater and strongest. Which comes from the Heart contending to cast out those Vapors with which it is oppressed.

The seventh sign is the pain in divers parts: in the Thighs heavy, and sometimes stretching; sometimes *Ostokopos*, or at the bone; sometimes in the Shins, Ankles, Soles of the Feet, in the tips of the Fingers, in the Hips, Knees and other Joynts, or parts to which the Salt humors flow; sometimes in the belly, like the Cholerick Cholick; and it comes from these humors flowing upon the Caul: these in the Arms, Thighs and Legs are like those of the Pox, and may well deceive a Physician in *France*, where the Scurvy is rare, and the Pox common.

But they may be thus distinguished; the pains in the Pox are between the Joynts, and if they stay long, make knots, and there are, or have been then also other symptoms of it, as running of the Reins, Ulcer of the Yard, Bubo and the like, or uncleanness with Women. But the Scurvy pains seize upon all parts indifferently; and then there are other signs of it, or at least a Melancholy Constitution; and the matter is certainly known, if the Patient will truly say that he hath not been with unclean Women. Which caused our suspicion in a Magistrate, who had a long time great pain in his Feet, Shins and Thighs, and was brought very lean, so that you would have thought that he had the Marasmus or Consumption: and when no Medicines for a long time would do him good, we from his Melancholick Complexion and other signs, especially because he led a most chaste life, and because for many years his Gums did bleed at certain times, conjectured that it was the Scurvy, and by using things against that Disease for some time, he was Cured.

Sometimes those pains remain in the Hypochondria, sometimes in the Loyns, so that they are weak, and can scarce go. Hence this Disease is called *Lumbago*.

Sometimes the pains are like the Stone, and the Urin is very red or black and if you do not diligently observe, you will think they are bloody, and that it comes from the Reins wounded by the Stone when it is from a Scurvy salt matter in the Spleen, and parts adjacent sent into the Urine.

Some have Head-ach, and heat at nights, if they caught this Disease from stoppage of the Hemorrhoids, by reason of the Vapors which ascend, and all the night after they are as in a Fever all over their Bodys, which the next morning vanisheth by sweating.

They have often the Tooth-ach, without any evident reason or cause; and it is not in one place, but moveable from one Tooth to another, making them loose, and they again fix of their own accord, the pain and Tumor being discussed.

Sometimes

Sometimes the pain of the Scurvy is in the sides, imitating the Pleurisie; from which it is easily distinguished, because it is without a Feaver, at least a strong one; the breath is not hindered, there is no Cough; no spitting, nor is the pain constant, but coming by fits.

Also it will be in the Joynts; and we must declare how it is distinguished from a true Arthritis or Joynt-Gout. The pain of the Joynts in the Scurvy is not fixed and constant in the same place, but runs from one Joynt to another, either on the same, or on the contrary side; sometimes it vaniseth, and then returns; so that he which now seems free, and in perfect health, is suddenly taken with pain, sometimes with swelling, sometimes without. But a true Joynt-Gout seldom changeth the place.

The Joynt-Scurvy hath this peculiar distinction: It is for the most part joyned with a small Palsie, by reason whereof the Patient can hardly move the part affected; and when the Palsie seizeth or returneth, the pain doth so also.

The eighth sign is from the divers hinderances of Motion, they have a Bastard-Palsie, the Examples whereof we laid down in our Observations: and it is distinguished from a true Palsie, because this is constant; but in the Palsie from the Scurvy, he that yesterday could scarce set one foot before another, can now stand and walk with a little help, and it may be presently after he cannot move at all: and sometimes the motion is trembling, and with Convulsion, which doth not happen in a true Palsie. And this kind of Palsie cometh from a filthy kind of matter or vapour, which gets into the Nerves and Muscles. And if the Matter be sharp, it causeth trembling and Convulsion by pulling the Nervous parts.

And Convulsions are not only in some peculiar part, but sometimes in the whole body like an Epilepsie, by a windy or watry matter full of sharpness and malignity, which is sent to the Brain, which being disscussed doth give ease, and gathered again maketh new Convulsions.

Also in this Disease there is a Contraction of the Members, sometimes of all, so that the Patient cannot move one Joynt; sometimes of one, and that principally in the Leg, when the Tendons which are made to move the Leg grow hard and stiff in the Hams. This contraction comes by reason of the salt humor that flows with much moisture to the Nerves and Tendons; and when the thin and watery part through continuance of time is consumed, the thick is dried and made hard: from whence come these contractions of Nerves and Tendons.

Sometimes there is a contraction in the Gullet, so that the Patient can scarce swallow, and is in fear of strangling. And this comes from astringent vapors, which contract the Oesophagus or Gullet.

The ninth sign is the Flux of the Belly, either with, or without blood. The simple Flux which is without blood, is distinguished from others, in that the Excrements are thicker, and more than the quantity of Meat that is taken; when a common Flux is more thin, and of humors only.

The Flux of Blood in this Disease is distinguished from a Dysentery, because it is without pain of the Belly, and it is thick blood which is sent into the Guts by the Meseraick Veins. Sometimes the Hemorrhoid Veins do receive that filthy blood, and send it forth: but if this Flux of the Belly continues long, the Veins swell, and send forth not only much blood, but also other salt and slimy humors.

The tenth sign is a stinking Breath, which is common to all in the Scurvy, as *Eugalenus* witnesseth, so that they which stand by cannot endure it, but must turn aside their Noses.

The eleventh sign is often shivering, with none or little heat following it.

The twelfth sign is an intermitting Feaver, which sometimes they have, which are unlike the other ordinary Agues or Feavers: for in them the Pulse is weak, slow, and unequal, especially in the declination; but in the height it is commonly great and hard. Besides, at the first coming there is such a twitching in divers parts, especially the Legs, that they suppose their flesh to be torn; and sometimes they have Convulsive motions therewith. And though sometimes this Ague is a Quotidian, Tertian or Quartan, yet sometimes the fits are disorderly, coming once, it may be, or twice in a Month without certainty.

The thirteenth sign is Tumors in divers parts; sometimes hard, sometimes soft like Bladders, and sometimes like an Erysipelas, or red Tumor.

The fourteenth sign is Atrophy or Consumption; which is so great in this Disease sometimes, that they are nothing but skin and bones like a Skeleton or Anatomy: especially after long sickness, which comes from the evil blood, so changed from its natural Condition, that it cannot be made like unto the parts which it should nourish.

Eugalenus propounds many other signs of the Scurvy, and *Sennertus* with others: some whereof are common to many other Diseases; which we will conceal, lest they breed confusion.

And though (as we said) the Scurvy is not ordinary in *France*, as in *Poland* and other Northern parts, and almost unknown; yet if any in practising Physick shall observe all the symptoms of Melancholy, he shall find some inclining to the Scurvy, in whom some of the former symptoms proper to the Scurvy will appear.

PROGNOSTICK. As to the Prognostick: This Disease is hard to be cured, as all other that come of Melancholy, and here much more hard, because of the malignity in the Melancholy which doth more cruelly overthrow the body, and will not obey the greatest part of Medicines.

It is also dangerous, because it many times brings a Consumption or Dropsie, and destroys others by sudden death, by an Apoplexy, Swooning, and other acute Diseases.

Yet sometimes they who have seemed desperate have been cured, and oftner in this Disease than in any other: And we have seen some brought to a Consumption by long pain and Bloody Flux (which by many circumstances we conclude to be from the Scurvy) to have been perfectly cured.

Moreover, the Pulse is deceitful, especially in the Fits; it will be so quick, small and unequal sometimes that the Patient seems to be at Deaths door, yet after his Fit he will rise from his bed, and is as formerly: As we peculiarly observed in a *Dutch* Scholar, unto whom we being sent for in the time of his Fit, thought that he would presently die; but the next day we saw him seemingly in very good health; and when we had examined the Circumstances of the disease, we concluded that he had the Scurvy, which he brought out of his own Country where it is very usual.

CURE. The same Cure is to be used in this disease as in *Hypochondriack Melancholy*: because as we said at the first, it comes from the same humor more differing from its natural state; therefore for the most part it needs stronger Medicines.

But because this is a general Rule in Physick, that we always begin with the weakest Medicines, and so proceed to stronger, if the former will not cure: It will be good in this disease to appoint the whole course of Cure for *Hypochondriack Melancholy*, because a stubborn disease requires a long course; and if that will not root out the disease, let us then use the Medicines more specifically proper: And it will not be amiss to mix some with the other at the beginning.

These specifical Medicines are called *Antiscorbutica*, or Medicines proper for the Scurvy, and there are many of them in Authors that have written of this disease; whose strength chiefly depends upon a Volatile or flying Salt, of which they are very full, by which means they make thin and fluid, that thick, earthy and salt humor, and at length dissolv it. Moreover, they have a certain preservative and opposing Vertue against the poison of the Scurvy which is in the Melancholick humor. Among these, the chief is Dutch Scurvy-grass, which is not in *France*. Another is, Cresses of both sorts (but the Water-Cress is best) Brooklime, Horse-Rhadiſh, the lesser Celandine, Wormwood and Fumitory. To which may be added many others, but of less vertue, and all they are such which can prepare, correct and tame the melancholick humor. Hence it is that we directed the Cure against *Hypochondriack Melancholy* to be used here; Those are Carduus, Ceterach, all the Capillar Herbs, Hyſop, Germander, Betony, Agrimony, Borrage, Bugloſs, Elicampane, Asarum, Ditch Dock, Polypody of the Oak, Capar, Ash, and Tamarisk Barks, Flowers of Elder, Tamarisk and Dodder of Time.

In the choice of these Plants, you must always observe this, that you give the least quantity of hot things, and that you always mix them with cold or moderate things, and in a great quantity, especially in hot Countries, in which melancholy is burnt. And besides the Capillar Herbs with Borrage, Bugloſs and Agrimony before-mentioned, when there is a Fever, or we fear heat, you may add Endive, Succory, Sorrel, Juyce of Citrons, Lemons, Oranges, and also Spirit of Sulphur, or Vitriol, or Whey.

Of these former Plants you may make many sorts of Medicines, which are all gathered by *Sennertius* out of all Authors, which every man may imitate as he pleaseth. Yet this we must mark, which all Authors mention, That the aforesaid Plants work more powerfully if you take their Juyce, or make them into Conserves; because the flying salt wherein all their vertue remaineth is gone by decoction, as also if the Plant be dried.

We have used these following forms with good success:

Take of clear Juyces, of Water-Cresses, and Brooklime, of each one ounce; the Juyce of Fumitory two ounces; white Sugar two drams. Make a Potion.

Or,

Take of the Juyces of Fumitory and Water-Cresses, of each two ounces; mix them.

Or,

Take of the Juyces of Sorrel, Fumitory and Water-Cresses, of each two ounces. Mix them.

You may give more Juyce of Sorrel, if you desire to cool more, or Juyce of Lemons, or the like.

The

The power of the Medicines will be more to dissolve that sticking clammy Tartar, if you add one dram of Salt of Tartar with Spirit of Sulphur or Vitriol, one scruple or half a dram; and because in the use of these Medicines we purge often, it is good to infuse one dram or two of Senna all night in the said Juices, and give it every other day, or every third day.

It is worth your while to give sometimes also some steeled Medicines, such as we prescribed in Hypochondriack Melancholy; as also the strengthening and opening Opiates and others, as in wisdom you shall think fit.

And lastly, Mineral Waters that are sharp and of Vitriol, used in due season, are very beneficial for the Cure of this Disease.

The End of the Twelfth Book.

THE
THIRTEENTH BOOK
OF THE
PRACTICE
OF
PHYSICK.

*Of the Diseases of the Mesentery, Sweet-
bread, and Caul.*

The Preface.

MAny Authors are very short in the Explaining of the Diseases of the Mesentery, Sweet-bread, and Caul; and the most of them have left them out, because they are hard to be known; and for the most part only from Dissection of dead Bodies; as appears by Stories in Schenkius, Sennertus, and others. Yet they are very ordinary and usual: from whence Fernelius saith, That oftentimes there are causes of many Diseases in the Mesentery: as of Cholera, Melancholy, Diarrhoea, Dysentery, Evil Habit, Consumption, Faintness, of lingering Feavers, Vomitings, Cholicks, Tumors and Imposthumes. And Sylvius called the Mesentery, the Mother of many Diseases; by others she is called the Physicians Nurse: We may say the same of the Sweet bread and Caul; for they are ignoble parts, and as it were sinks of the Body, to which the Noble Members do send their Excrements. And although these parts (as all other) are subject to all kinds of Diseases, Similary, Organical and Common, and many Symptoms arise from them; yet we will only speak of those which are most in practice, and comprehend this Book in five Chapters. The first shall be of the Obstruction of the Mesentery. The second, of the Inflammation of the Mesentery. The third, of the Imposthume, Schirrhus, and Ulcer of the Mesentery. The fourth, of the Diseases of the Sweet-bread. The fifth, of the Diseases of the Caul.

Chap. I. *Of the Obstruction of the Mesentery.*

CAUSES.

THese Obstructions in the Mesentery come of the same Causes which are mentioned in the Obstructions of the Liver and Spleen; but they happen more easily, and more often, by reason of the straitness of the Meseraick Veins, and especially of the Milky Veins, which carry the Chylous matter to the place of the second Concoction: and when that Chylous matter is filled with crude and
thick

thick juyce it comes to pass that not having a free passage, it sticks in those little Veins and makes Obstructions. Also the Meseraick Veins are stopped by thick Humors sent from the Liver, Spleen and other parts, and there continuing till they grow thicker, so that sometimes they cause a Schirrus. With these humors sometimes gross Vapors are mixed, which use to be the cause of great Symptoms. To the Obstruction, or rather making narrow of these Veins, we refer compression, which comes from the Glandules which are spread through the whole substance of the Mesentery; from whence these grow beyond measure, as in those who have the Kings Evil or Struma, they compress the Meseraick Veins, and hinder both the passage of the Chyle, and of the blood.

SIGNS. The signs of these Obstructions are to be divided into three kinds, as we did in the Obstructions of the Liver; namely. into such as shew the Disease, the Part affected or the Cause.

The signs of the disease (that is) of the Obstructions lying in the Hypochondria, and also the signs of the Causes are the same with the Obstruction of the Liver and Spleen, and are from that Chapter to be taken. But those signs which properly shew the peculiar disease of the Mesentery, are stretching and resistance in the middle of the belly, and under the stomach, and about the Navil; a weight in the same parts, and sometimes a dull pain, and sometimes a most sharp, when wind is contained in those parts; sometimes there is a pain in the Back, because the Mesentery is tied to that part: there is rumbling in the belly, Belching and Vapors flying to the Head, from whence comes divers Symptoms: and lastly, all those which use to happen in Hypochondriack Melancholy, signifie Obstruction of the Mesentery, because that also proceeds, and is maintained by the same Obstructions.

PROGNOSTICK. As for the Prognostick: This Disease of its self, is not dangerous, because an ignoble part can endure great evils without danger of Death: moreover you may apply strong Medicines for the Cure, which being well administred, do commonly bring about the desired effect; except Hypochondriack Melancholy rise from thence, which useth to be called the shame of Physicians, by reason of the rebellious Nature of the Melancholick Humor. But because this part hath not exquisite sense, and the Obstructions do not always gently disturb the Patient, they are often neglected, and become the Causes of other most dangerous diseases.

The Cure of this Disease is the same with that of the Obstruction of the Liver, and you must fetch it from the Chapter treating thereof.

CHAP. II.

Of the Inflammation of the Mesentery.

Seing the Mesentery, as I said, is as it were the sink into which the Noble Parts do send their superfluous excrements, which afterwards are sent forth by Nature, either by Vomit and Stool; as you may see in some who send abundance of humors forth at divers times by Vomit and Stool; if those Evacuations be hindred, by stoppage of the ways by which they are made, or by any other cause those humors which are there detained, staying long in the part, do get a preternatural heat, from whence come Putrifications, Inflammations, divers Feavers and Imposthumes. But an Inflammation is peculiarly made, when blood heaped up in the Meseraick Veins, by the opening of some branch is sent into the substance of the Mesentery: but because by reason of Obstructions it is chiefly gathered in those Veins, therefore all the causes of Obstructions may be referred to the causes of Inflammation.

CAUSES. For the making of this Inflammation, that sharpness and gnawing of the humors gathered together do much conduce, a fall or stroak upon the belly, the weakness of the attractive, concative or retentive faculty of the Liver; too much heat of the body, or inordinate use of cooling things; the critical motion of Nature in Malignant diseases or small Pox, by which it sends the peccant Humors into this sink; a *Diarrhœa* or *Dysentery* suddenly stopped.

SIGNS. The Signs of the Inflammation of the Mesentery are, a lingring Feaver without Thirst, and great Symptoms, want of the Appetite, a sense of stretching and heaviness beneath the Stomach, without great hardness, and the which is not felt by the hand pressing of it, and without pain worth the speaking of, because the part is of dull sense; Cholerick stools, which commonly have thin matter; without pain, sometimes mixed with Excrements.

If the Mesentery be only inflamed, all the aforesaid Symptoms are milder; But if the Liver or Spleen or Guts, are also inflamed, all the Symptoms are stronger: And besides, the signs of the aforesaid parts affected will appear, which are to be taken out of their proper Chapters.

And because the Inflammation and Imposthume of this part, are very hard to be known if they be alone, by reason of the dull sense of the part, and because it performeth no action in the body, whose hinderance may be perceived; but only serveth for the distribution of the Chylus and the Blood: therefore they are rather to be discovered by consequence, than directly, and according to artificial

conjecture

conjecture; namely, when there is a Feaver and other symptomes, and no sign of the Liver, Spleen, or Guts distempered. A half Tertian Ague sheweth that the Guts are inflamed with the Mesentery, which *Spigelius* observed to come commonly from the Inflammation of these parts. Also this disease is distinguished from the Inflammation of the Muscles of the belly, because the Tumor and pains are enlarged according to their proportion, and they are commonly long and over the whole belly, and more in the outward parts, so that they are perceived by the least touch, and they use to bring great pain and a Feaver.

Lastly, This Disease is to be distinguished from the Tumors of the Midriff, which have been, as yet known to few Physicians: for in them there is always great difficulty of breathing, drawing in of the Hypochondria, a Pulse hard and small, without any sence of Tumor in the Hypochondria. And if the Tumor come of a hot cause, a sharp Feaver, great pain, doting, and Convulsions do follow: which symptoms never happen when the Mesentery is only inflamed.

PROGNOSTICK. As for the Prognostick, This disease is very dangerous; for it either ends in an Impoſthume, or there follows a rotteness, and corruption of the Mesentery. Oftentimes the Matter of the disease is sent by Nature another way, and yet it is not clean taken away, whence the disease returns, and continues for many years, sometimes till death, now with a Feaver, then Cholick or Inflammation.

CURE. The Cure of the Inflammation of the Mesentery, is not unlike to that of the Liver and Spleen, and therefore you must peruse that.

CHAP. III. Of the Impoſthume, Ulcer and Schirrus of the Mesentery.

THe Inflammation of the Mesentery often turneth into an Impoſthume, yet every Impoſthume thereof is not from Inflammation, but many times from vitious humors therein contained, which putrifie, so that these Impoſthumes come by degrees without a Feaver aforegoing, or other great symptomes; as we see in other parts, when *Atheromata*, *Steatomata* and *Melicerides* and other kinds of Impoſthumes are bred without Inflammation going before. And when they are broken, the Matter being voided, there remains an Ulcer which is hard to be cured, But if those humors are very flegmatick or Melancholick, and resist putrification, they grow, and sometimes are hardened, and turn into a Schirrus: sometimes they are hard as a stone, as many affirm who have found stones in the Mesentery.

DIAGNOSTICK. The Knowledge of the Impoſthume in the Mesentery is sometimes easie, sometimes hard; for if it comes from an Inflammation of that part, that being perceived by the signs in the former Chapter, it is a sign that the Inflammation could not be dissolved, but suppurated and turned into an Impoſthume. But when an Impoſthume comes from evil humors remaining long in the Mesentery, and at length putrifying, it is hard to know it; so that many Authors who have written Observations upon such kind of Impoſthumes, say, that they never were known but after death, when the bodys were opened. For although for the most part, they may be known by the touch, yet sometimes they lie so deep that they cannot be touched, and the part being dull in sence, they will not be discovered by pain. But because they come divers ways, they must be thus distinguished:

If the Impoſthume of the Mesentery hath a visible Tumor, it is first to be discerned from an Inflammation and a Schirrus: It is distinguished from an Inflammation if it come not from it, when there is no Feaver, or at least but small, when none went before, nor any other signs that may shew an Inflammation; but if it follow an Inflammation, it can no other ways be distinguished than by hardness and continuance; for if the signs of Inflammation have continued twenty or thirty days, it is a sign that it is turned into an Impoſthume. It is distinguished from a Schirrus by hardness, which is great in a Schirrus, but in an Impoſthume there is some kind of softness, as also by want of pain altogether; for in an Impoſthume there is always some pain, especially if it be pressed hard. Moreover, this Tumor is distinguished from the Tumor of other parts, by the situation thereof, as we said before of the Inflammation of the Mesentery. But if the Impoſthume lie in the Mesentery without any visible Tumor, there can be no certain sign, but by an artificial conjecture we may suspect, namely, if there be loathing of meat, or vomiting, without manifest fault of the Stomach, and a great fulness after little meat, weariness of the whole body, and fainting without manifest cause, if the belly be uncustomarily bound or loose, and void stinking Excrements, and sometimes bloody, without suspicion of a Dysentery. To these you may add great watchings, and if they sleep they faint, and have great sweats. And though sometimes there appear neither feaver nor pain, yet there is commonly an obscure one; of which if there appear no manifest cause, we must conjecture that it comes from this disease, especially if any of the
aforeſaid

aforesaid signs be joyned therewith; as also if the *Abdomen* be violently pressed, the Patient will perceive some inward pain: it is true, that by violent compression you may cause pain in found places; but if you perceive more pain in one part than in another, after all parts have been pressed, and when that part is always most pained, and the more by pressing, you may strongly conjecture that the imposthume is there.

If at length there come forth Matter, then the Imposthume will be manifest. Commonly it is voided by stool of divers sorts according to the disposition of the part affected, and of those adjacent.

Hence one while the Matter is pure and white in great plenty, without sense of pain, when it is sent by the Meseraick Veins into the Guts, sometimes when the Imposthume is in the thick and lowest Guts, the Matter is mixed with the Excrement, sometimes it is sent to the Reins, and cast forth by urine; sometimes being sent in great quantities between the *Peritonæum*, and the Muscles of the *Abdomen*, it falls into the Cavity of the belly by breaking of the *Peritonæum*, or breaks outwardly by an Imposthume, so that a great quantity of Matter flows from the Navil and sometimes Worms therewith, through the corruption of the Mesentery. And that which is sent forth by stool (which is the usual way) is sometimes white and laudable, as was said; sometimes mixed with blood or water; sometimes black blood, and stinking; sometimes other black Matter, or of divers colours. But whether this purulent Matter come from the Mesentery, Liver, Spleen, or other part, it is known by the proper signs of every part affected.

When the Imposthume is broken, and the matter floweth, it is certain that there is an Ulcer in the Mesentery, which sometimes is quickly cured, and sometimes it is of long continuance, and brings rottenness upon the whole part, and a Gangrene.

As for the Prognostick; The Imposthume of the Mesentery is dangerous; for if it continue long in the part, as it often happens, it breeds filthy rottenness, or a Gangrene, or brings the Patient into a Consumption or Dropsie. If it break and the Ulcer be not quickly cured, but gets an evil condition, it hath the like event, a Gangrene, Consumption, or Dropsie. Sometimes when the Imposthume is broken, and very stinking matter is sent into the Cavity of the Belly, the Patient dies suddenly. The Schirrhous, or hard Tumor of the Mesentery is least dangerous, and if it be new will admit of a Cure; but if it be old, it brings the Patient to a Dropsie.

The Cure of these Diseases is to be varied according to the diversity of them. And first, an Imposthume bred requires opening and Evacuation, and it must softned with opening and purging medicines, such as are laid down in the Obstructions of the Liver and Spleen, not omitting outward Softners and Loosners, Fomentations, Cataplasms, and Liniments, which do make the matter of the Imposthume thin, and open the passages that the matter may better be voided.

After the Imposthume is opened, you must cleanse the Ulcer and heal it; for which purpose the Remedies mentioned in the Cure of the Ulcers of the Stomach, Liver, Reins, and Womb, are very good; of which a wise Physician may take his choice according to the divers dispositions both of the Bodies, and the Diseases.

And a Schirrhous of the Mesentery is cured with the same Medicines, which are set down for the Cure of the Schirrhous or hard Swelling of the Liver and Spleen.

CHAP. IV.

Of the Disease of the Pancreas, or Sweet-bread.

THE Ancient Anatomists knew no action of the *Pancreas* or Sweet-bread, but the use only, namely, to prop the Vessels, lest they should be in danger of breaking, and to be instead of a Pillow to the Stomach, lest when it is full it should be hurt by the hardness of the *Vertebra* or Back bone. But the Modern Anatomists have ascribed very great action unto it; namely, the first preparation of the Chyle, and cleansing of it, so that it may be brought to the Liver more pure; which the milky Veins seem to confirm, because they are dispersed through the *Pancreas*. Besides, in the Middle of it there is an open passage which goes to the Guts, by which it is probable that the Excrements of the Chyle are purged; therefore the *Pancreas* hath its Diseases which hurt the whole Body, especially Obstructions and Tumors, as the Mesentery hath; namely, when the Chylous matter is crude and thick, and is brought to it from the Stomach, not sufficiently digested, and when it doth not freely flow from it.

Riolanus observed a Schirrhous of the *Pancreas*, in *Augustine Thuanus*, that wrote the History of his Times most elegantly in Latin; who when he had for four years, among other Symptomes, a heaviness continually in his Stomach, especially when he walked or stood still, without swelling or hardness in the Hypochondria, had a *Pancreas* as big as his Liver; after he was dead, hard and Schirrhous full of knots like Pidgeons Eggs.

But because the *Pancreas* is covered with the Stomach, its Tumors are scarce to be felt; and this is

the cause, because there is no mention commonly of them, and they have been found only after death; Yet you may take a handsom Conjecture of them, from what *Riolanus* observed in *Thuanus*, namely, If there be a sense of weight or heaviness in the Stomach, and no tumor or hardness in the *Hypochondria*; and other signs of Obstructions than are mentioned in the Obstructions of the Liver, Spleen, and Mesentery. To which you may add pain, and other Syptomes of the Stomach, by reason of its nearness, shortness of breath, by reason of the compression of the *Diaphragma*; By which signs we suppose, that the Lord *Audeyrus*, President of the Senate of *Gratianopolis*, had a Schirrhus of the Pancreas, and we could perceive it by touching, by putting our hand deep to the sides of the Stomach about the middle, because he was lean; and we found a hardness there, which being touched, pained him; the Story whereof is at large related in our 81. Observation, Cent. 3. And in the knowledge of the Scurvy we observed (which none that ever wrote thereof did) That in all Scurvies there is a Tumor of the Pancreas, because you may find a straitness, oppression, and weight in the region of the Stomach; And this Sign is laid down for a clear one by *Engalenus*, *Sennertus*, and others.

There are some stories in Authors, of Imposthumes found in the Pancreas, which were not discovered while the Patients lived. But by the Symptoms they have, they may be partly known; as some like those of the Schirrhus; to which you may joyn these, a lingering Feaver, which is the companion of almost all inward Imposthumes, much watching, short sleep, and after it, pain, swooning, and cold sweats.

The Cure of the Obstruction, Schirrhus, and Imposthume of the Pancreas, is the same with those of the Liver, Spleen, and Mesentery. There you may fetch Medicines from the Chapters concerning them.

CHAP V.

Of the Diseases of the Caul, or Omentum.

BECAUSE the Omentum is a soft part, and fat, fit by reason of its looseness to receive Humors that come from other parts; It is subject to divers Diseases, as the Mesentery and Pancreas; And these are not described by Authors, because they can scarce be seen in living men, but only by Anatomy, as you may see in some Stories in our Observations. *Vesalius* saith that he saw in a Body opened, an Omentum so swoln that it weighed five pounds, when in its natural condition it would weigh scarce half a pound. *Roussetus* in *lib. de partu Cesareo*, reports, That in *Paris* there was found a great Imposthume in the Omentum. *Riolanus* in his *Anthropographia*, saith, That he saw an Omentum in a Noble Youth of Nineteen years of age, full of Kernels, by which it received abundance of filthy Humors, the Mesentery and Pancreas being Imposthumated, and the Spleen almost consumed: We also saw a Schirrhus Omentum in a Fryar of *Montpelier* all over the lower part of the Belly, and four fingers thick; it was of the colour of the Spleen, so that it was probable that it was caused by Melancholick from thence, because he was of a Melancholick temper, and the passage is very often by branches of the Spleen Veins, to the Omentum; by which branches (as *Hypocrates* teacheth) the water in a Dropsie is brought from the Spleen to the Omentum, from which by degrees it distills into the Cavity of the Abdomen.

Because the swelling of the Omentum can by no means be distinguished from that of the Mesentery, therefore we cannot appoint a distinct knowledge. It is true that the Tumors of the Omentum are easier known at the first touch, because it is immediately under the Peritonæum, but the Mesentery is deeper; but the Tumors of the Mesentery arise greater towards the Peritonæum, and are sometimes so united to it, and the Muscles of the lower Belly, that they are sent forth by suppuration through the Navil, or other external parts.

Yet this difficulty of Knowledge doth not hinder the Cure, because the same medicines serve for all Tumors that are alike in all the parts of the Belly: but the Cure is worse to be made in the Omentum, because it hath not fit way, as other parts have for the purging of its self.

 OF THE
 PRACTICE
 OF
 P H Y S I C K.

Of the Diseases of the Reins and Bladder.

The PREFACE.

THE Reins and Bladder have divers and all sorts of Diseases, both Similary, Organical, and common; from which divers Symptoms arise, both in the actions hurt, and also in the fault of the Evacuations. We will comprehend the chief in Nine Chapters. The First shall be of the Stone in the Kidneys, and the pain of the Reins, called Dolor Nephriticus. The Second, Of the Stone in the Bladder. The Third, Of the Inflammation of the Reins and Bladder. The Fourth, Of Pissing of Blood. The Fifth, Of the Ulcer of the Reins and Bladder. The Sixth, Of Diabetes, or Involuntary pissing. The Seventh, Of the not holding of the Water. The Eighth of Icuria, or stoppage of the Water and Strangury. The Ninth, Of Dyluria, or scalding of the Urine.

CHAP I.

*Of the Stone in the Kidneys, and pain in the Reins, called
 Dolor Nephriticus.*

That is called *Dolor Nephriticus* which doth afflict the Uretors or Reins. the common people call it the Stone-Cholick, because of the great affinity it hath with the Cholick; so that it is hard to distinguish them, as you shall see in the Diagnostick, or signs.

CAUSES. The Cause of this Pain is manifold, but chiefly the Stone or thick flegm. A Stone continuing in the Reins, causeth either little or no pain, because the substance of the Reins hath little Sense: but if it fall upon the head of the Uretors, or get into the passage and distend it, and cannot be brought to the Bladder by reason of its greatness, then it causeth grievous pain. But gross flegm fastened upon the Uretors, doth distend them, and causeth the Nephritical pain.

The less ordinary Causes are, thick blood fixed in the Uretors, or thick Matter coming from the Kidneys, or other parts; sometimes wind gets into the Cavity, and causeth great pain.

There are many Controversies in Authors about the Stone, which is the chief and usual cause of the pain of the Reins, which we shall not accurately declare, but only touch those things which are necessary to declare its Nature and Causes.

And first, they doubt under what kind of Disease they should reckon the Stone; *Galen* placeth it among the Diseases in number of those things which are wholly besides Nature, as also the Worms. For though a Disease in number doth properly respect living parts, whose number being increased or diminished maketh an organical Disease; yet those things which are preternaturally added to the number of those things of which the Body is compounded, ought to be referred to the Diseases in number, so that sometimes the bare qualities are referred to Diseases in number; when they do immediately hurt the actions, as yellowness in the Eye of one that hath the Jaundice, a noise in the Ears and a bitter tast upon the Tongue.

Oftentimes the Stone is reckoned among causes of Diseases, as it breeds Obstruction or Distention.

It may also be placed among the Symptomes, viz. those things are voided or retained; for if it be retained in the Kidneys, Reins or Bladder, when it should be voided, it is to be reckoned among those things that are preternaturally retained: but when it is voided, it is to be reckoned among those that are voided wholly against Nature.

But there is more difficulty about the cause of the Stone both material and efficient. *Galen* and his posterity thought that Flegm was the material cause of the Stone, which is thick and slimy, fit to be hardened, (as they say of late) saculent, slimy and Tartarous, and heat the efficient, which dryeth and hardeneth that matter, and at length turneth it into a Stone. Which Doctrine is opposed with strong Reasons.

First, If it should come of a slimy and thick flegm, then it would often be bred in the Brain and the Stomach, in which such flegm doth chiefly abound. Neither will it suffice to say that there is not sufficient heat in those parts to harden it; because according to the Doctrine of *Hypocrates* and *Galen*, a gentle heat by a continual action is sufficient to congeal; and hence is the reason why old men do more often breed the Stone, when young men have hotter Kidneys; because the matter of the Stone lies longer in old mens Reins by reason of the weakness of the expulsive Faculty, and so it's longer concocted by the heat, and at length hardened.

Secondly, From *Aristotle*, 2. meteor. cap. 4. things which grow together by heat, are melted by moisture, as Clay. But the Stone is never dissolved with Water. Neither doth it hinder to say that a strong heat makes such a Concretion or growing together, that it cannot be dissolved by moisture, as in Bricks. For first, in Man there is not so great a heat: then the not dissolving of Bricks with Water is not because of the strong heat they had, but rather from the disposition of the Clay; for Clay made of common Earth, although it be baked in a Furnace, will never be hard as a Brick, but always be dissolved with moisture.

Thirdly, From *Aristotle* in the place mentioned, the heat that makes concretion must be dry. But there is a continual flowing of moisture into the Reins and Bladder, therefore such a drying and hardening cannot be in those parts.

Fourthly, Stones breed in Rivers and Fountains, in which there is no heat, and in some Dens and Holes that are very cold, the water that falls turns into a Stone; from whence strange shapes do arise. Therefore we must find another cause besides heat, and another Matter besides clammy and glutinous Flegm.

Fifthly, Flegm made hard is like Chalk, and is brittle, as you may see in the knots of the Joynts. But some Stones are like flints, which they cannot be from Flegm: nor is there so much heat in mans Body to make it so.

This slimy flegm hath deceived the Physicians of all Ages, which is found in the Urine of many Patients, and they thought it to be the immediate cause; but they were out. For first, In the Stone of the Kidneys such Urines are seldom made, but often in the Stone of the Bladder. But if this were the matter of the Stone, it will be alike in both. Therefore this Matter depends especially upon the proper Disease of the Bladder, for it is an Excrement of it distempered. The Disease of the Bladder is this; we have seen in the Bodies of them who have died of the Stone in the Bladder, and who voided much of that matter, that the Bladder grew fleshy, as thick as ones Finger or Thumb, so that it filled the whole Cavity, and lay next the Stone, till by stopping the Urine it killed the Patient. But in those who made thin clear Urine, their Bladder was not altered. The reason of these accidents are taken out of *Hyp. Aph. 66. Sect. 3.* If there be no Tumor in great and evil wounds, it is evil. And *Galen* gives the Reason, because there is a suspicion that the Humors which should come by reason of pain to the wound, are gone to some noble part. Moreover, it is Natural to all parts; as *Galen lib. de diff. febr. cap. 11.* that they which are stronger, send that which hurteth them to the weaker, nor do they cease so doing till it come to the weakest. So when the part wounded is very weak, and therefore fit to receive Humors, if they come not thither, it is a sign that other parts are very weak; which

which cannot send, and that others are weaker than the wounded, to which the Humors are carried. Not only the bad Humors are carried to the wound, but also good blood, which Nature sends to refresh it. All these things are in the bladder that hath the Stone. A great uneven Stone, or sharp, hurts the Tunicle of the bladder; hence comes pain and weakness. And Nature to help it, sends more than usual blood, and the stronger parts send their superfluities. These the Bladder concocteth as much as may be into its self, and so groweth thicker. But when it cannot take in all, especially the evil humors, hence come many foul Excrements, which from the nature of the part turn so flegmatick. But in them who have clear Urine, either the Stone hurteth not, which causeth the attraction, or some other parts are weaker than the bladder, to which the Humors flow.

But because this Doctrine doth destroy an old Opinion, we will confirm it by a clear Example of the Womb. The Womb is Membranous, as the bladder; but in Women with Child it is fleshy and thick; so that in the last months it is two Fingers thick; because Nature all the time sends much blood to it to nourish the Child; which when the Child doth not wholly consume, some part of it is taken into the Womb, and so it encreaseth. The same is in the Bladder, though preternaturally (which in the Womb is Natural) that when much blood comes to it, it converts it into its self, & grows thicker. But if without being with Child, the Womb be distempered and made weak, then humors superfluous from other parts come to it, which when they cannot be taken into its substance, turn to the Whites. And that Flux is a proper Excrement of the Womb, as the Flegm is of the Bladder. The same thing is in the Reins, though not so often; as when by a Stone in them there is pain and weakness, Nature sends much blood and Humors to them, which when they cannot be turned into the substance of the part, they are turned into a slimy Excrement, which are voided in abundance; and this vulgar Physicians take for matter or Pus, which is only Flegm, or mixed with a little Pus, as when by the grating of the Stone there is an Ulcer.

Some Modern Writers being converted with the aforesaid Reasons, have made a Juyce, which will turn into a Stone, to be the material cause of the Stone called *Succus Lapidescens*; and the efficient to be *Spiritus Lapidescens*; they call the former a certain Humor naturally proper to turn into a stone: And this they desire to prove by the breeding of stones in the Earth, which are by many Authors said to come of Water, and things cast thereinto to be hardened presently; some Waters in Caves to be made stones, and some part of the Wine groweth to the Vessel, called Tartar; and Urines that are clear, when they are cold grow to the glass. And although the peculiar fitness of the Matter to be thus turned, is not sufficiently known; yet some say they have found it out, saying, that it is of salt mixed with Earth. Some Salts do grow hard in the Sun, and are easily dissolved in Water; and if they be joyned with Earth like themselves, by the force of the efficient cause they may be stones. So we see in Wines turned to Tartar: but Tartar calcined goes all into Salt, which shews that it is chiefly made of Salt. So in the Urines that have much Salt, especially in those which have slimy matter, we see a Tartarous Matter cleaving to the glass. This salt Matter, which is mixed with the Urine, comes from Meat and Drink so affected, and they are cast forth in a sound Body, nor are they retained in the Reins when the efficient Cause is absent.

We have called the efficient Cause, *Spiritus Lapidificum*, or a Spirit that makes a stone. *Fernelius* calls it a stony disposition, which is in the Reins commonly Hereditarily. But we like the foremost Title best. For first, some have stones which have them not Hereditarily, if they eat or drink things that breed them, because in them there is both the Material and Efficient Cause; therefore the Hermites impute the Efficient Cause of Stones to their proper seeds, which in a Matter rightly disposed produce their form.

Moreover, many Histories shew that Stones come from a Stone-making Spirit, of Men, Beasts, and other things turned into Stones by a Breath or Spirit out of the Earth. So in *Aventinus, lib. 7. Annal. Bavar. An. 1343.* that more than fifty Country-men and their Cows, were turned into stones. And so says *Ortelius* in his Description of *Russia*, of whole Herds of Cattel. So also *Camerarius* reports of a South Wind that bloweth sometimes of the year in the Province of *Chilo* in *Armenia*, by the blasts whereof whole Troops of Horse are suddenly turned into Statues of Stone, and stand in the same rank and file in which they were.

This Stone-making Spirit is not only in the Reins of those which have this Disease, but also in the Juyce of those things that are eaten and drunk separated from them; so that sometimes both come together. Hence it is, that some that eat any Meats that incline to the breeding of the Stone, do presently produce it, because there is Stone-breeding disposition, or Stone-making Spirits in their Reins. But if their Reins be free from this Spirit, such meat will not breed Stones, because their Stone-making force is not strong enough without the assistance of the Reins to convert that matter into Stone. On the contrary, if the Stone-making power be greater in the meats that are taken, and they are often eaten, Stones will be bred, although the Kidneys have no such disposition or Stone-making spirit. So we see in divers places, where the Water or Wine are full of Stone-making juyce, the

the greatest part of the Inhabitants are subject to the stone; as we may see in *Ovid* concerning the *Thracians*, in these Verses:

*The Thacian Waters all things Marble make,
Their Guts turn Stone that inwardly them take.*

And on the contrary, if there be that stone making vertue in the Kidneys, it makes stones of any nourishment, though never so wholesome. So about three years since, I saw one who for three or four months voided more than twelve little stones every day by Urine, when all that while he kept his bed very sick, and fed only upon Broth and Panadoes.

The Antecedent and Primary Causes, either respect the supply of matter for the stone, or the constitution of the Reins, by reason whereof the stones do more easily grow.

The Stomach, Liver, Spleen and Reins, do much cause the breeding and heaping up of matter for the stone; chiefly the stomach, if it do not well concoct, there is crude Chyle brought to the Liver, and from thence impure and Earthy Juices are sent with the Serum or Water into the Reins. A hot Liver doth bake the Chylous matter, and makes it fit to breed a stone; as also being too cold it makes crude blood most fit for the same purpose. A Spleen weak or stopped, or otherwise disturbed, doth not sufficiently purge the drossie part of the blood, but sends part of it to the Reins, which will more easily be turned into a stone. And lastly, the Reins beside their conjunct cause, which is a stony disposition, are an antecedent Cause in two respects, Namely, in respect of their Temper, and of their Form. In regard of their hot Temper, they more violently draw the Stone-making Matter, and thicken it more; but in respect of their Form, they are an Antecedent Cause, if the Emulgent veins are more loose, so that the thick and Tartarous matter may be more easily received into the Reins; or if the Uretors and those Vessels that send the serous matter to them be narrow; so that the thick matter hath not a free passage, but is retained in the Reins.

Thick and slimy Nourishment doth chiefly afford matter for the stone; such as are full of Salt, as Beef, Pork, Hares, Geese, or things dried in the smoak, or powdered, as Salt-fish, Shell-fish, Eeles, Pulle, Cheese, and all Milk meats, hard Eggs, Chesnuts, Pears, Quinces, Medlars, unleavened Bread, and Rice: thick Wine, sharp or black, or new Wine not purged, standing Waters, and such as are full of Stone-breeding Juice.

To these add very hot meats, as Pepper, Ginger, Garlick, Onions, old strong Wine, which makes the Liver and Reins too hot, too strong Diureticks, which carry the matter that will cause the disease, too violently to the Reins; thick Garments, Down Beds, Baths, inordinate Lechery, which is a great Enemy to the Reins, violent exercise, especially after meat, too much feeding, or long fasting, great anger, and other passions.

SIGNS. The Signs of the Stone taken by themselves are equivocal, and common to other Diseases: but if you consider them all together, you may have certain knowledge by them.

The first Sign is a fixed pain about the Loyns, sometimes heavy when the Stone is fastened to the substance; which being of a dull sense hath a weighty pain; but as often as the stone gets into the Head of the Uretors, then it causeth a sharp and pricking pain, and this is called the Nephritical pain, or pain of the Reins, and it continueth while the stone is there; neither will it cease to torment the Patient till the stone get into the Cavity of the Bladder, or turn back into the hollow of the Kidneys.

The Second sign is bloody Urine, which comes from the opening or corrosion of the Veins which are dispersed into the substance of the Reins, which comes from the rubbing of the Stone that sticks in the substance; but if there be but little blood voided, being mixed with Urine, it loseth its colour, so that the Urine looks like a Lye. This Sign is not always, but sometimes depends upon other causes. But when it doth appear, it is one of the chief which distinguisheth the Stone from the Cholick. It useth to be caused by riding, much walking, and other violent exercise; for then the stone if it be rough and snaggy, being removed from its place, doth cut and tear the tender Flesh of the Kidneys.

The Third Sign is thin Urine, water-like, and little, in the beginning of the fit; after which sometimes followeth a total stoppage, if both Uretors are stopped: but when the fit is past, and the stone that was fixed in the Uretors is fallen into the Bladder, there comes forth much thick troubled Urine, with a sandy Sediment.

The Fourth Sign is often voiding of Sand and stones. Concerning voiding of a Stone, it is evident, That if the Patient voided any formerly, though never so small, when he had a fit, it is most certain that the Disease is the Stone. But concerning Sand we cannot speak so infallibly; for we may see many all their life time void Gravel, and never be troubled with the Stone; for sand comes often from aduction of Humors in the Liver and Veins, and it sticks to the sides of the Urinal, and goes not to the bottom, as that which comes from the Reins. Besides, if you rub it between your Fingers, it dissolveth, and is like Salt, when the other will not yield to the Fingers, and will not dissolve. And finally, because this Sand is salt, it is dissolved in hot Urine, nor will it appear while the

Urine

Urine is so; but when it is cold it grows together to the sides of the Urinal not unlike the Crystal of Tartar; which being dissolved in warm water, when it grows cold, congealeth and sticks to the sides of the Glafs; for the nature of them both is very like.

The Fifth Sign is if a stone be voided, and this is most certain: For if any former Sign, though equivocal do appear, and a stone be voided, you may be certain of this Disease.

The Sixth Sign is a numbness of the Thigh on the same side that the Back is pained of: for the stone bring great doth oppress the Nerve which is inserted into the Muscles of the Loyns under the Reins, called by the Anatomists *Psenas*, and those Muscles go to the Hip for its motion, such a numbness is perceived by sitting upon the Thigh, through the compression; or in the Arm by long leaning thereon.

The Seventh Sign is the drawing in of one stone, on that side where the pain is: For the Kidneys and Uretors being provoked with the greatness of the pain, do vehemently contract themselves, and then the Spermatical Vessels and all the parts adjacent are also contracted, and these Vessels do raise up the stone which is joyned to them, so that it seems sometimes to be fixed to the Groyn. And this retraction or drawing in of part, reacheth to the Bladder and Guts: For in great pain the Belly is bound, and Urine stopped; so that then Purges will not work by reason they are hindered by that Contraction.

The Eighth Sign is loathing and vomiting by the connexion of the Kidneys with the Stomach, by the Membrane that comes from the *Peritonaeum*, and by the Nerve of the sixth Conjugation, two branches whereof reach from the Stomach to the inward Tunicle of the Kidneys. Therefore when those sensible parts in the Kidneys are pulled, the Stomach consenting is stirred up to exclude that which hurteth; and first it sends out Flegm, then yellow Choler, after green, if the evil continue, because through long pain and watching the blood is altered in the Veins, and that part which is most disposed for it, is turned into green Choler.

Finally, The Nephritical pain is so like the Cholick, that *Galen* himself was deceived in the distinguishing of them, as we shewed in the *Diagnosis* or knowledge of the Cholick. where also we laid down signs by which we may distinguish them, which we shall not need to repeat.

The Signs aforementioned are equivocal, and one of them can scarce give a certain knowledge. Some Authors mention others, which are more equivocal and uncertain, but joyned with others they help the Knowledge of the Disease, therefore it will not be amiss to mention them.

Hyp. Aph. 34. Sect. 7. saith, *They who have bubbles in their Urine, have an old Disease in the Reins.* For these bubbles come from thick Humors full of gross Vapors which are either bred in the Reins, or sent from other parts to them, that matter is proper to breed the stone, and cannot be presently cured, therefore the Disease is long. *Galen* in his Comment upon this Aphorism, saith, that the mouths of the Arteries which come to the Reins are opened by the sharpness of the Urine, and thence come a Spirit which being mixed with the urine, maketh bubbles. But it is not probable that such a gross Spirit that will remain so long, should come from the Arteries, and Urine being cold, may long time so continue, as we see many bubbles many hours swimming thereupon. And also when the Arteries are opened by the sharpness of the urine, blood will also come forth; And the mouths of the Veins having thin Skins, would be more easily opened, and so there would be also blood mixed with the bubbles.

Hippocrates also *Aph. 76. Sect. 4.* saith, *They who void little bits of flesh, and things like hairs, with a thick Urine, doth it from the Reins.* The bits of flesh come from the Ulcer of the Reins, of which we shall speak hereafter. But these threds or hairs are said by *Galen*, in his Commentaries, to come from thick and crude flegm made long and round by the extraordinary heat of the Reins. Yet *Galen* confesseth, *6. loc. aff. cap. 3.* that after a long search he was ignorant of the cause of their length. *Avicen* saith, that these threds grow long in the Vessels of the Reins, or others; for in regard these are taken away by Diureticks, and the Patients acknowledg pain in the Reins, it is credible that they receive their form from thence. *Aëturius* doth directly say that they come from the Uretors: For when the Reins abound with flegm, it goes with the urine in the Uretors, and sticking to them, and growing thick by heat, it gets a long shape like a thred or hair. But *Fornelius* writes, that those hairs come from the Parastates or Kernels, from his Observation, in which they grow long like hairs from the matter of the Seed, which by force of the Disease flowing down by degrees, grows thick by heat, and that they appear much in those who have lately had a filthy Gonorrhœa, and in those Women who have the Whites, or a foul Womb, and in that urine which they make next after they have known a man. Others suppose, that those thick Humors of which those filaments or hairs are made, are first bred in the Veins, but take their form in the narrow passages of the Reins, through which, as through a sieve, they turn small, and after they descend into the Uretors, in which they grow dryer till they are sent into the Bladder, neither can they be broken by reason of their roughness. Whatsoever the cause is, since the best Authors do agree that these hairs breed of thick flesh in the Kidneys,

or

or come to them from other parts, it is certain that they may turn into a stone, if there be an efficient cause fit to produce it. And therefore this may be a probable sign of the Stone.

PROGNOSTICK. As for the Prognostick. The Stone of the Kidneys is very dangerous, for it useth to bring great evils; as Inflammation, Exulceration, great Pains, Watchings, dejection of strength, Feavers, stopping of the Urine, and the like dangerous Symptomes.

If this Disease be Hereditary coming from the Parents, it is incurable.

And because *Hypocrates* saith, That the Diseases of the Reins are hard to be cured in old men, *Aph. 6. Sect. 6.* The Stone of the Kidneys in old men is difficult, if not incurable.

If the pain of the Kidneys continue many days, and cannot be cured with any Medicines. there is danger of death, and it is near at hand when they are cold externally, and have a cold sweat in the face. Urines that are first thin, and after thick, and have sand at the bottom, do signifie that the fit is towards an end,

A Stone joyned with an Ulcer in the Kidneys is incurable: for those things which break the stone, do exasperate the Ulcer.

CURE. The Cure of the pain of the Kidneys and stone sticking in them, or in the Ureters, is by enlarging of the passages, and relaxing them by throwing forth the stone, and any other thing that hurts them, by removing or taking away of the antecedent cause, and by taking away the pain. Which you may do with these Medicines.

Take of Marsh-mallow and Lilly Roots, of each one ounce; Mallows, Violets, Pellitory, Bear-foot, of each one handful; Linseed and Fenugreek seed, of each half an ounce; fat Figs, six; Chamomel and Melilot Flowers, of each one pugil: boyl them to a pint. Dissolve in the straining, Cassia and Diacatholicon, of each six drams; Oyl of Lillies and Violets, of each one ounce and an half; fresh Oyl two ounces: make a Clyster to be given presently.

Afterwards open the Liver-Vein of the right or left Arm, and take away eight or nine ounces of blood, according to the strength and fulness of the Patient: Phlebotomy is very necessary to prevent Inflammation, which useth to come from continuance of pain.

After blood-letting, give this Clyster:

Take of the flowers of Chamomel, and Melilot, the tops of Dill, Pellitory of the wall and Rue, of each half a handful; Annis, Fennel, and Cummin seeds, of each half an ounce: Make a decoction to one pint; in which dissolve Diaphœnicon half an ounce; Turpentine dissolved with the Yolk of an Egg one ounce; Oyl of Dill and Scorpions, of each three ounces. Make a Clyster.

To mollifie more, and assuage the pain after your Laxative, you may make one of Oyl thus:

Take of Oyl of Dill and of Chamomel, of each half a pound; Oyl of sweet Almonds two ounces; Oyl of Rue one ounce. Mix them for a Clyster.

At the same time apply a Fomentation to the part pained, made of the Decoction of the first Clyster, with Annis seeds and Fennel seeds, Oyl and Water, with Spunges.

Take of Oyl of Scorpions compounded two ounces; fresh Butter, Hens Grease, Oyl of Lillies, and of sweet Almonds, of each one ounce: Make a Liniment to be used after the Fomentation.

Or this Cataplasim:

Take of Mallows and Pellitory, of each two handfuls; Parsly with the Roots one handful; Radish Roots two ounces: boyl them soft and beat them; then add of Onions roasted, two; Oyl of Lillies, bitter Almonds, and sweet Butter, of each two ounces. Make a Cataplasim, which you must put between two thin linnen cloaths, and apply warm to the Belly, according to the length of the Ureters, and beat it as often as it grows cold.

You may also apply one either made of Pellitory alone, or with Eggs fryed in a Pan with Oyl of Chamomel, bitter Almonds, and Scorpions in a cloth.

Or make it of Onions shred and fryed with Hogs Grease, or the Oyls aforesaid, with five or six warm Eggs applied.

And because in this Disease there is abundance of crude Humors, after Clysters (which must still be repeated as the pain cometh) you may give a purging Medicine, especially in form of a Bolus, lest it be easily vomited up, because these Patients are commonly squeazy stomached.

Take of Cassia new drawn with Oyl of sweet Almonds one ounce; Diaphœnicon three drams; powder of Rhubarb one dram: with the powder of Liquoris and Tragacanth, make a Bolus.

If the Patient cannot swallow a Bolus, dissolve purging things in the Decoction of Mallows.

But you must diligently observe, that you must not give a purging Medicine before the pain be allayed. For when the pain is great, a strong Purge seldom works, because then all the parts contract themselves, and refuse to help the Medicine.

But at that time you may give a Vomit, by which the plenty of Humors may be abated, and a revulsion is made from the part affected; and often Nature of herself, when the pain is urgent, doth endeavour the same, and after it finds ease.

A gen.

A gentle Vomit which will also assuage pain, may be made thus:

Take of warm Water four ounces, Sallet Oyl one ounce, simple Syrrup of Vinegar one ounce and an half. Make a Vomit.

If you will have a stronger, you must use Salt of Vitriol, or *Mercurius vita*, with which *Angelus Sala* saith, that he hath often cured this disease.

Before and after purging, you must give at the mouth those things which open the passages, and abate the pain: for which purpose the Syrrup of Marshmallows prescribed by *Fernelius*, often given is excellent. But because it is not always ready in the Shops, you may make it simply thus:

Take of Marsh-mallows three ounces, Boyl them to a pint: dissolve in the straining half a pound of Sugar. Let him take it often.

This following Julep given often, is good to mollifie the passages.

Take of Barley one pugil; gray Pease half a pugil; Mallow and Marshmallow seeds, of each two drams; the four great cold seeds, of each one dram; fat Figs eight; *Sebestens* six; *Liquoris* half an ounce; boyl them to a pint and an half. Dissolve in the straining Syrrup of Maiden-hair, four ounces. Give it at four draughts twice or thrice in a day.

Give for his ordinary drink, a decoction of Marsh-mallow Roots one ounce and an half; Barley two pugils; *Liquoris* six drams, in five pints of Water, to a pint.

Or make Broths of Mallows, Marsh-mallows and gray Pease with much Butter, and a little Salt: or boyl the same in fat broth.

Or give Emulsions made of the four great cold seeds.

But Oyl of sweet Almonds above all medicines doth mollifie and relax the Passages, and assuageth pain, if it be new drawn: give three or four ounces by it self, or with Whitewine, or a Decoction of Marsh-mallows, *Liquoris* and gray Pease; or make a Potion of equal parts of Oyl of sweet and bitter Almonds, because bitter Almonds are good also to expel the Stone.

The day after you have opened the Arm Vein, you may open the Ham or Ankle Vein on the same side, for that will derive the Humor, and the Patients find much ease thereby. Which Rule is given us by *Hypocrates*, 6. Epid. Part 1. Aph. 6. and by *Aetius*, lib. 11. cap. 5.

And if the disease last long, you may open the Hemorrhoids, according to *Hyp. Aph.* 11. Sect. 6. who saith, That it is good for Melancholick men, and such as have the stone, to have their Hemorrhoids bleed. From the same branch of the Spleen there are Veins which go to the Reins, Bladder and Hemorrhoids.

If the pain be not assuaged by Fomentations, Liniments and Cataplasms aforesaid, put him into a Bath made of the Emollient Decoction, with Whitewine added, for it assuageth pain, at least while the Patients sits therein; but you must not use it much, lest it take away strength.

And lastly, When the pain is very great with Watching and Weakness, you must give Narcoticks; and put two drams of *Philonium Romanum*, or five or six grains of Laudanum in a Clyster, or three or four grains at the mouth, or one ounce of Syrrup of Poppies in a convenient Julep.

After these Tropicks have been used, in a long pain it is good to apply a Plaister of Melilot, Malaxed with Oyl of Chammomel and Dill.

This pain useth to be Cured with some of these medicines, and with repeating Purges (if they be needful) or giving Cassia often. But if after the use of them it continue, it is most certain that they are great stones which stop the Uretors, which must be sent out by Diureticks, which will break them. But you must first begin with the mildest, lest by strong and sharp you inflame the blood and the Reins. And you must consider the habit of the body: For a full body will endure things that do more pierce and make thin; but a slender, less.

There are abundance of this kind in Authors, that diminish, break and expel the stone, but we will give you only the most choyce.

Take of Smallage, Parsley, Butchers Broom, Couch grass and Sparagus Roots, of each one ounce; Mallow and Marsh-mallow Roots, of each half an ounce; Pellitory of the Wall two handfuls; Anis, Fennel, Dill, Caraway, Carrot, Amye, Carthamus, Cummin, Rue seeds, and Bay-berries, of each two drams; Chamomel, Melilot, Dill and French Lavender, of each one pugil: boyl them in Whitewine to the consumption of half. Dissolve in the straining, being one pint, fresh Butter four ounces, Honey of Roses two ounces, red Sugar one ounce, *Benedicta Laxativa* half an ounce; one Yelk of an Egg; Oyl of Nuts, Lin seed and Dill, of each three ounces: mix them for a Clyster, which let him keep two hours, if he can.

Take of Strawberry Water and Saxifrage Water, of each two ounces; the best Whitewine six ounces, Oyl of sweet Almonds two ounces, Spirit of Vitriol one dram: mix them for three doses. Give the first as hot as may be endured; after six hours give the second as the former: and if this will not do (as it seldom misseth), let him take the third.

You may sooner make a Julep of Saxifrage Water and Syrrup of Violets, with fifteen or twenty drops of Spirit of Vitriol,

Take of the Juycce of Pelitory drawn without fire three ounces: Juycce of Lemons and Oyl of sweet Almonds drawn without fire, of each one ounce and an half. Mix them for a Julep to be given three or four times morning and evening. Or,

Take of the Juycce of Lemons and White Wine, of each two ounces; Sugar Candy half a dram. Take it instead of the Julep.

Concerning Juycce of Lemons you must note, That it must be used warily, for being given often and much, it maketh Exulcerations in the Stomach, from whence cometh the Flux called *Lienteria*.

These Pills following are excellent.

Take of Sal Prunellæ, Crystal of Tartar, Salt of Ivy Berries, and of Water Cresses, of each equal parts; with some proper Syrrup or Turpentine, make a Mass of Pills; of which give one dram every morning.

This following Powder of *Quercetan* is much commended:

Take of the inward skin of Hens Gizzards, and their white Dung, of each half an ounce; the inward skins of Egg shells powdered, two ounces and an half; Rupture-wort and Cinnamon, of each four scruples; Medlar stones two drams; Annis and Fennel seeds, of each one ounce: make them into a very fine Powder, and give half a dram or a dram thereof in White Wine.

The Ashes of burnt Egg-shells from half a dram to an ounce given in White Wine, do powerfully expel the Stone that sticks in the passages of the Uretors.

Goats blood prepared is commended of all Authors, old and modern, as the best Medicine to dissolve the Stone. The Dose is from half a dram to a dram.

The Water of Goats Blood distilled in a Glasse in *Balneo Mariae*, doth wonders. But you must feed the Goat one month with Saxifrage, burnt Juniper berries, Parsly and other Diureticks, without drink.

Hartman commends the urine of a Goat, in these words, as a wonderful Remedy; In the stoppage of the Reins by a great stone, or when the Uretors and Bladder are stopped by Stones sent thither, so that one drop cannot be voided, it is excellent if you take the Urine of a Goat taken out with his Bladder while he is yet alive, and drink: and apply his Panch and Guts to the Belly and Privities, for so the Stone will be presently consumed without hurt to Vessels, and the Patient Cured.

The Powder of Millepedum or Sows is excellent to dissolve the Stone, and we will teach the use thereof in the Stone in the bladder.

Also the infusion of the same in White Wine taken and long continued, is effectual to the same purpose.

There is a Wine of Winter-Cherries commended of *Arnoldus Villanovanus*, and they say it doth so bring forth the matter of the Stone, that you may take it up in your hand. And this is done by beating the Winter-Cherries in White Wine, and giving the strained Liquor.

These also following are very good:

Take of Lapis Judaicus, or Jews Stone, Pulvis Lithontribi Justini, of each one dram; Peach Kernels, Gum Tragacanth and Cherry-stone Kernels, of each half a dram: bring them to a Powder, and with Turpentine make a Bolus, which give in three Doses morning and evening.

Take of Horse Radish scraped two ounces, White Wine four ounces: steep them a few hours; then strain them strongly. Let the Patient take the straining twice or thrice, at convenient hours.

Savin Water given to an ounce or two, doth purge Stones and gravel.

Take of Mallow Roots cleansed in Whitewine, six ounces; Burdock and Couch-grass Roots, of each four ounces; Asarum, Parsley, Valerian and Fennel Roots bruised, of each two ounces; Maiden hair, Saxifrage, Burnet, Golden rod and Betony, of each four handfuls: Basil, Burdock, Carduus, Mountain Oyster seeds, Medlar-stones, and Peach stones, of each one ounce; Growwell seeds two ounces; Lapidis Lyneis, and Judaici, of each one ounce and an half; Turpentine three ounces, Goats Blood prepared two ounces and an half; Saffron two drams; Whitewine four pints: bruise them that must, and mix them all; distil them in *Balneo Mariae*. Take two ounces of this Water three hours before Supper, drinking after four ounces of Whitewine.

Take of the Bark of the Roots of Carduus Asininus one ounce, Liquoris two drams: Boyl them to six ounces: let them take the straining many days. It doth wonderfully cleanse the Stone and Gravel.

Take four pounds of shred Onions that are white; two pound of Sugar, one pint and an half of white wine: distil them in *Balneo Mariae* till they are dry; Give every morning two or three ounces for many days together.

The Ashes of a Scorpion is commended by Practitioners, if you take one Scruple at a time, with Water of Couch-grass, Pellitory or Whitewine; but is seldom used.

Mathiolus his Oyl of Scorpions is more in use; a dram taken at the Mouth with the foresaid Liquors, doth excellently further the voiding of the Stone.

The

The Chymists brag much of their Salts; among which the best is Salt of Bean Cods or Stalks, half a dram whe reof with Whitewine works very well. And also Tartar Vitriolate in the same quantity. They commend also Spirit of Salt, Vitriol, *Mercurius Dulcis*, with their proper Vehicles or Liquors.

Outwardly you may help the stone, if you continually chafe the Reins and Uretors with warm hands anointed with Oyl of Scorpions.

Also many Cupping-glasses from the Kidney affected, downwards, applied without Scarrification.

Then anoint the part with *Mathiolus* his Oyl of Scorpions; to which add a little Powder of *Cantharides*. Or make a Liniment of Oyl of Wax, Brick and Scorpions, of each equal parts; it is very piercing and good, if you fear no inflammation of the Reins.

You must observe in the use of Medicines, to break and expel the stone, That they must not be used twice or thrice, but often, till the passages stoped are open; and while you give them, you must cherish the Reins and Bladder with Baths, Fomentations, Oyntments and Cataplasms, that the other may work the better. And you must give thin Liquor, as Whitewine often; and use inward Emollients, Looliners and Openers; to enlarge the Passages, and temper the sharpness of other Medicines.

By these Remedies the pain of the Reins is cured, and Stone dissolved and expelled. But because they who are disposed to this Disease, and Cured, do often relapse, therefore we must appoint some Preservatives that we may hinder it as much as may be.

And first, if there be a Plethora or fulness, or the Reins and Liver hot, it is good to open a Vein Spring and Fall, a Clyster or gentle Purge being first given: And then to purge the Matter away which is proper to breed the Stone, before it come to the Kidneys, which you may do by a Vomit twice or thrice in a month, to those which easily vomit.

Or you may give a Purge by a Bolus of Cassia, *Diaphœnicon* and Rhubarb, prescribed in the Cure, or some other convenient Medicine every month; or two or three, according to the habit of the Patient, and the plenty of humors, and that in the last quarter of the Moon.

Or if there be evil humors, they must be purged Spring and Fall with a convenient Apozeme: for by that, not only the Antecedent and remote cause will be taken away: but also some part of the conjunct cause; as also the Obstructions of the Bowels, which usually accompany this Disease, will be taken away, if you mix therein cleansing and cutting Medicines.

Or instead of the Apozeme, you may use the Decoction of an old Cock made thus:

Take of Polypody of the Oak, *Carthamus* seeds, of each one ounce an and half: Thyme and *Epithimum*, of each one pugil; Cummin, Annis, Dill, Fennel, Caraway and *Carduus* seeds, of each two drams; Senna one ounce and an half, Gummy Turbith half an ounce; Cinnamon one dram; Crystal of Tartar two drams: beat them and mix them together, and put them into the Belly of an old Cock; and then boyl them till the flesh come from his bones. Let him take the Broth being strained, at four mornings draughts.

Or you may give this following Powder commended by *Solenander*, by the use whereof he testifieth that he cured many of the pain of the Reins, giving it in the fir.

Take of Senna two ounces, the best Rhubarb half a dram, Turbith one dram and an half, *Hermadafts* two scruples, Polypody half a dram; Cinnamon, Ginger, Gromwell seeds, Saxifrage, Broom seeds, of each one dram; powder them finely. Give one dram, or a dram and an half in white or thin red Wine once in a month.

Carolus Piso doth extol this following Powder:

Take of Annis, Fennel, Caraway and Cummin seeds, of each one dram; Coriander prepared half a dram; Liquoris and Burdock seeds, of each one dram and an half; Cinnamon and Galangal, of each one scruple; Gromwell and Broom seeds, of each half a dram; *Diarragacanth frigid* two drams: *Diagridium* one scruple; Senna as much as all the rest: make a Powder. The Dose is one dram, with the Broth of gray Pease.

Or you may make a Magistral Syrrup thus:

Take of Sparagus Couch-grass, Marshmallow, Knee-holm, and Parsley Roots, of each one ounce; Betony, Burnet, Saxifrage, Pellitory of the Wall, and Maiden hair, of each one handful; Bazil, Parsley, Gromwel, Broom and Burdock, and Mountain Osier seeds, of each two drams; Liquoris, Raisins and Polypody of the Oak of each one ounce: Make a Decoction to one pint and an half. Infuse in the straining four ounces of Senna; white Agarick two ounces, Ginger two scruples: boyl them a little, and strain them; after dissolve in it one pound of white Sugar. Boyl it up to a Syrrup, and give thereof two ounces once or twice in a month with the Decoction of Barley, Couch-grass and Gray Pease.

Or if the Body be very foul, make Pills of Aloes and Agarick, and give two or three of them every other day before Dinner.

After Purging, give Diureticks to bring forth the slimy matter, and Sand that is about the Uretors.

For this end, make Decoctions of the Diureticks mentioned in the Magistral Syrrup with Sugar, into the form of a Julep or Apozeme. Or Chicken, Goat, or Mutton Broth, to be taken many days together after general Evacuations.

Also after every Purge, take some of these following, once or twice in a Week.

Take of the stalks and flowers of Beans three pound; Calcitrap one pound: beat them, and add one pound of Sugar-Candy; the Juyce of Lemons one pint and an half: the Juyce of Oranges half a pound: the Decoction of Mallows and Marshmallows well strained two pound: Honey one pint. Distil them with a gentle fire, and let them not be burnt, nor the Liquor wholly consumed. Let the Patient take four ounces of this Water every morning.

Take of the stones of Medlars, and the powder of *Diatragacanth* frigid, of each one ounce; dried Rest harrow Roots, Liquoris, Melon and Gromwel seeds, of each two drams: Saxifrage, Broom, Rhadish, Knee-holly, Calcitrap seeds, of each one dram; Marshmallow and Sparagus seeds, of each one scruple; Sugar-Candy two ounces: make a Powder. Of this let him take one spoonful thrice in a month in the morning, about New-moon, Full-moon, and Wain, drinking after it a little Whitewine, or red Pease-broth, Sea-holly and Liquoris, exercising after it.

Carolus Piso highly commends this following Powder, which he gave with his Purging Powder before mentioned, and took away many boxes of small stones from a President of *Lorrain*.

Take of Marshmallow and Violet seeds, of each half a scruple; Gromwel seeds and Liquoris, of each one scruple: the Jews Stone, and Sponge Stone, of each six grains: the powder of Dates, Medlars and Cherry Stones, of each two scruples; Melon seeds three drams: make a Powder. Give one dram with unleavened bread dipt in Whitewine three days together of the New-moon, and let him drink red Pease broth after it, wherein the Roots of Marshmallows, Fennel, Sea-holly, Rest harrow and Parsley, and Juniper-berries bruised have been boyled, adding a little Whitewine, Honey, Butter and Juyce of Lemons.

This following Electuary prescribed by *Zapata*, is excellent:

Take of the Seeds of St. Johns-wort dried, and finely powdered, three ounces; Conserve of Roses or Violets one pound: mix them into an Electuary, of which let the Patient take half an ounce every morning three hours before meat, the first two Weeks two days together, and after for fifteen days once in a Week; and after that once in a month, or oftener, according as the Disease requireth.

Conserve of Roses is better than Violets, because it correcteth the scent of the Turpentine which comes forth of the Seeds of St. Johns-wort beaten. But Violets agree best with the Reins.

These following Lozenges are very safe, and most excellent:

Take of the four great cold seeds, and of Liquoris, all cleansed, one scruple; Burnet, Bazil, Parsley seeds and Nutmeg, of each half a dram; *Aromaticum Rosatum* two scruples; Sugar dissolved in Winter-Cherry Water, four ounces: make Lozenges of three drams in weight. Let him take one in the morning three hours before meat, drinking after it four ounces of Rest-harrow or Rupter-Wort water, with two ounces of Whitewine.

The Wine of Winter-Cherries described in the Cure, if it be drunk sometimes, doth take away the matter that breeds the Stone, saith *Villanovanus*.

In the use of all Diureticks observe this, They must not be used too often, because they draw to the part affected; there once or twice in a month, or sometimes seldomer, is sufficient, purging before first lest the humors of other parts should be carried to the Reins.

Turpentine may be used oftener; for *Amatus Lysitanus* in *Curat.* 68. *Cent.* 2. reports of a Monk that had the Joynt-Gout and the Stone, both, and could find help by nothing: at length by the use of Turpentine he was Cured within six months of them both. Every morning he swallowed the quantity of a small Nut with Sugar. And the reason why Turpentine often used doth not hurt as other Diureticks, in my Judgement is this; Because it loosneth the Belly withall; so that those gross humors which by other Medicines would be carried to the Reins, are sent out by Stool.

But commonly Turpentine is used seldome, as other Diureticks, either alone, or with other medicines thus.

Take of Turpentine ten times washed in Saxifrage or Pellitory Water half an ounce: With Sugar make a Bolus. Or,

Take of Cassia newly drawn six drams; Turpentine half an ounce; Powder of Liquoris two drams: mix them for a Bolus. Or,

Take half an ounce of Turpentine, and one dram of Powdered Rhubarb; mix them for a Bolus. Or, Take four ounces of Turpentine, burn it upon an hot Iron that it may powder, and give two drams with convenient Liquor. Or,

Take

Take Turpentine half an ounce; Powder against the Stone called Pulvis Lithontribus, two drams mix it for a Bolus.

Zacutus Lusitanus, Observ. 58. Lib. 2. Praxis admir. doth much commend Natural Balsom for expelling Stones, and that a man of threescore years of age that had his Water stopped eighteen days with Stones, was cured thereby. First he took some drops of it with Oyl of sweet Almonds, encreasing the quantity of both till he came to half an ounce of Balsom, and three ounces of Oyl of sweet Almonds, within ten days he voided six stones; and afterwards he was preserved by the same medicine, by taking in a morning half an ounce of Oyl of sweet Almonds, and six drops of Balsom, by which means he made a Sandy Urine, and lived long. If you want Eastern Balsom, you may take that of Peru.

The same Zacutus in the same Observation, doth commend Tobacco Water, in these words; Remember (saith he) that I took away many great stones fastened in the hollow of the Reins, with distilled green Tobacco Water. If you want that, then use the Decoction.

Most wise Verandus my Master, commends the Waters of some Baths; Balarvacan or Bituminous, for Preservatives against the Stone, of which we have seen rare effects. We add his words; There is (saith he) no better Medicine after Purging, than the drinking of Balarvacan Waters; for by the heat which comes from the Bitumen, they dissolve gross Humors and Stones, and by their Nitrous quality they cleanse, and by their great quantity do not only cleanse the Guts, but Reins; so that it is incredible to tell what abundance of thick Water some have made after it. But when we fear the Inflammation of the Guts, we ordered them to abstain from Wine, and gave them Chicken Broth with cold Herbs and Ju-leps. Therefore we put fat Flegmatick men into them once a day in the morning, having first anointed their Reins and Liver with some proper Oynment; and bound them with doubled Linnen Cloaths, that the Excrements might be received from the pores opened. And if their Bowels grow hot, they may after use sweet Water Baths that cool and moisten.

Sharp Mineral Waters, or Vitriol, are also good to prevent, for they do not only dissolve the slimy Tartarous matter that breeds the Stone, but correct the hot distemper of the Liver and Reins, and therefore in hot distempers these are best.

And because hot Bodies are hurt by hot things, we will prescribe more temperate; as Bean and Rupture-Wort Water, and Lemmon Water distilled. Slice them and distill them in Balneo Mariae. And for their better cooling, still them with milk.

The Conserve of Hips is Diuretick and cooling, and is commended by Crato in this case also.

The Conserve of Marshmallow and Mallow flowers, which by mollifying and moistening helps the Stones to come forth.

The inspissate Juyce of Purslain made into Pills, and given one dram at a time, doth powerfully cleanse the Reins.

The dried Flowers of Pomegranates in one dram, doth Purge the matter causing the stone.

And the like Quantity of the dried Sponge of White Thistle, given in like quantity, is excellent.

Fresh Butter with as much Sugar Candy taken every morning fasting, doth cleanse the Passages of the Urine, and hinder the breeding of the stone.

Bitter Almonds taken ten or twelve in a morning, do the same.

Filberts also taken before meat, are commended by Crato, who says that he found by Experience, that many long affected with the pain of the Reins, were Cured by them. Which Amatus Lusitanus Curat. 78. Cent. 7. wisely confirmeth where he thus saith; A man that had the pain of his Back, and pissed often red hairs, complained of his Loins and Guts, for which he had taken many things in vain, but contrary to all hope he was cured with eating of Filberts. For one counselled him, that if he would be cured, he should eat Filberts with their inward Husks before Dinner and Supper. But he considering the Innocency of the Medicine, eat them at meat, and after also by which he was cured perfectly, and his pain never returned. Amatus Lucitanus in his Notes, adds this: That not only that man, but many others have been cured thereby. These are those vulgar Nuts that Avicen reckons among the Medicines that consume the Stone. But the Question is, By what faculty they work? Whether by the dryness of the inward Skin? But some say that they work by their Oily quality.

The Chymists commend the Spirit of Salt, and give some drops thereof in a morning with broth or other Liquor.

Zechius commends boyled Water given warm, the quantity of six or seven ounces, once or twice in a day before meat. For it cleanseth the Reins, and extinguisheth the heat, so that they cannot after breed Stones.

Let his Drink be thin Wine, with the Decoction of Sea-holly. This Crato commends. And we have seen excellent effects thereby.

Sowr Wine called in *French*, *Unies*, drunk often, doth so much good, that some have Vinyards of those Grapes on purpose.

To correct the hot distemper of the Reins, is the best Preservative, by such things as are mentioned in the hot distemper of the Liver. For they help the Reins and the Liver, from whence many times they are distempered.

Among the rest, Whey drunk in Summer a whole month together, is the best. And sharp Mineral and Vitriol Waters to cool all the Bowels.

You may apply this following Epitheme often to the Reins.

Take of Lettuce, Water-Lilly and Rose-Water, of each three ounces; Rose Vinegar two ounces: Apply them very warm Morning and Evening.

This following Liniment is good, especially in Winter.

Take of the Oyl of Roses, water-Lillies and Violets, washed in Vinegar and Rose-Water, of each one ounce; the Mucilage of Marshmallows drawn in Pellitory Water, six drams; Wax, a little. Make a Liniment for the Reins Morning and Evening.

The extraordinary heat of the Reins, is allayed with a Plate of Lead, always worn.

And Lastly, Because the Crudities of the Stomach do breed the Stone, you must have an Eye to that, and strengthen it with such things as are prescribed in the Chapter of the Weakness thereof.

CHAP. II.

Of the Stone in the Bladder.

ALthough we should speak of these Diseases of the Reins in order, yet because the Stone in the Kidneys and Bladder are of the same Nature, and what hath been said of the one, may agree with the other, we shall speak next of the Stone in the Bladder.

C A U S E. The Material and Efficient Cause is the same of both: only this difference there is, That Children are most subject to the Stone in the Bladder, and men to that in the Kidneys. The Reason of which is given by *Galen*, 6. Epid. Sect. 3. because thickness of Urine, which Children often have by Reason of their gluttony, is dissolved by their gentle heat: neither doth it stay in the Reins by the help of the expulsive faculty of the Reins, which is stronger in that age; but being fallen into the Bladder, there it stays longer, because Children given to play and sleep, piss more seldom. Moreover, their Urine is not so sharp, neither doth it provoke the expulsive faculty of the Bladder, while the quantity is burdensome, and so the dregs remain because the Passage is very narrow; besides, the Bladder being stretched by the plenty of Urine, cannot so exactly contract it self to empty out all the Urine, but some remains in the bottom, which is thick and fit to breed the Stone. On the contrary, old men do often piss forth that matter which is in the Bladder, and their passage is larger; but the thick Humor remains in the Reins, because it is clammy, and cannot be dissolved by their weak heat, or strain through by reason of its dryness. Hence *Hypocrates* in *Coacis* saith, That the stone in the Bladder is not bred after fourteen years of age to threescore, except it was there before.

Fernelius mentioned a new Opinion of the Stone breeding in the Bladder, saying, That every stone in the Bladder had its beginning from the Kidneys, and grows afterward in the Bladder: For when in a fit of the stone, it falls from the Reins, if it be great, it stays in the Bladder, and by getting new Matter it encreaseth by degrees. For he affirmeth, that in grinding of some stones taken out of the Bladder he found as it were a Kernel which fell from the Reins, of another colour and substance, and that he never knew any that had a stone in the Bladder, who was not formerly vexed with pains in the Reins. But this Opinion is cast off by divers very good Authors, who by their Experience have found the contrary, and have taken many stones from the Bladders of Children, which have been wholly of the same colour and substance within. And common Experience teacheth us, that Children have the Stone in the Bladder, who never had pain in the Reins, which would be otherwise if the Stone came first from the Reins. It is true, that in men many times Stones fall from the Kidneys into the Bladder, and encrease by the addition of new Matter; but we deny it is always so, and we constantly affirm, that many Stones have taken their beginning in the Bladder.

DIAGNOSTICK.

The knowledge of the Stone in the Bladder is difficult, especially in the beginning, when it is little; but when it is great it is evident. But we shall discover it as much as we can by Art.

The First Sign is pain in the neck of the Bladder, which is worse towards the end of pissing, and reacheth to the end of the Yard, like that which is in difficulty of Urine from Inflammation called *Dysuria*, scarcely at first distinguished from it, but when other signs appear

The

The Second Sign is Itching in the Yard, which makes the Patient scratch it often.

The Third Sign is Weight in the *Peritonæum*, or inward covering of the Guts, and all about the *Pecten* where the Hair groweth, with a heavy pain, when the Stone is great.

The Fourth Sign is, when there is a great Stone there is a great stoppage of Urine, with pain like Women in Travel, and dropping of Water, and often endeavouring to piss.

The Fifth Sign is Stoppage suddenly in time of Pissing, by reason of the stone falling to the Orifice of the Bladder.

The Sixth Sign is Easier making Water lying upon the Back, because it puts the stone from the Orifice to the bottom of the Bladder.

The Seventh Sign is Often standing of the Yard, which comes from stoppage of Urine, and of the Inflammation of the Bladder by the Stone rubbing against it.

The Eighth is an often desire to go to stool, which follows the desire of pissing, by reason of the consent of the Sphincter Muscles of the Anus and Bladder; for when one is provoked, the other is provoked because they have branches from the same Nerve.

The Ninth is the Patient cannot rest in a place, but shakes his Leggs, and if the Stone be great, he can scarce stand upright, ride, or walk in rough places; for then the mouth of the Bladder is much afflicted with the Stone.

The Tenth is that the Patient is helped by no Remedy, but worse commonly; for all Medicines that go through the passages of the Urine, either do bring new matter, and encrease the evil, or carry away the flegm, which being about the Stone made it less offensive, but being bare, doth grate the inward Tunicle of the Bladder.

The Eleventh Sign is when the Patient is in pain of the Reins, and after a fit useth to void stones which caused it, but now voideth none as formerly, it is a sign that the Stone causing the pain, is sent to the Bladder, and there remains, where by degrees it encreaseth, and causeth the aforesaid Symptoms. Therefore if any after such pain, voids no stone, and after a time begins to be stopped from making Urine, it is very probable that there is a stone in the bladder.

The Twelfth Sign is from *Hypocrates*, Aph. 79. Sect. 4. *They who make a sandy Urine have a Stone in the Bladder.* Which Aphorism hath troubled many Wits. *Galen* in his Commentary thereupon, saith, that it is manifestly lame and defective, because *Hypocrates* left out half of it: for whether the Stone be in the Kidneys or bladder, always the Urine is sandy. And *Hypocrates* himself contradicts this Aphorism, *Lib. de internis Affectionibus*, where he reproveth the old Physitians that supposed sand in the Urine to be the Sign of the Stone in the Bladder. *Cardanus* in his Comment upon the same Aphorism, saith, That he voided for thirty years, first red, then white Sand, every day in abundance, without any suspicion of the Stone either of the Kidneys or Bladder; and he further saith, that there are scarce one in ten who doth not void Gravel, yet few there are that are troubled with the Stone in the Kidneys, and fewer with that in the Bladder. The *Spaniards* void much Gravel, and yet are not subject to the Stone.

We distinguished of Sand in the former Chapter, which may signify the Stone: But we said it was an Equivocal sign. For that Sand is sometimes sent forth by the strength of the expulsive faculty, and is not kept in the Kidneys and bladder any while. And if this sand did shew the stone more surely, yet it would never declare that of the bladder only. And therefore that Aphorism, as the words are, is false.

Beveroviti and *Salmasius* have greatly contended about this Aphorism (both Learned men, and good to open dark sentences) and they have written both whole Volumes of the same. It is not our intention to stay long upon it, determining this one thing for an end of all Controversies: That the Opinions of Authors, which at first seem contrary to Truth and daily Experience, are always to be taken in that sense which is most conformable to Truth, although the words will not bear it, which in such a case are to be thought to be added by simple fellows in the Translation, or the whole Sentence to be put in by them; as *Galen* saith often of some of *Hypocrates* his sayings, That they are thrust in by others, when they carry not the weight and Majesty of *Hypocrates*. And the Opinion of *Beveroviti* concerning sand in the Urine, seems not to be according to the mind of *Hypocrates*, nor to be of great use in Practice. First, it seems not to agree with *Hypocrates*, who in his foregoing Aphorisms, takes signs from things contained in the Urine; and following his matter in hand, saith, That Sand in the Urine signifieth the stone of the bladder. But *Beveroviti* inverts that Sense, and saith, that *Hypocrates* is to be understood of sand, which formerly used to be voided, that if they subsist, that is, be retained in the bladder, and be no more sent forth, it is a sign that the sand so retained is turned to a stone in the bladder. This Interpretation, as I said, doth not agree with *Hypocrates* his Intention, and it nothing avails for Practice: for they who use to void Gravel, have some times of intermission, in which there is not a stone bred in the bladder. Nor hath it much weight that *Beveroviti* observeth, That *Hypocrates* in his other Aphorisms, where he lays down the signs to be taken from the things contained in the Urine, doth not use the word *subsidentia*, or settling

ling or falling down; but the word Excretion, or voiding. As for example, they who piss matter or blood, with thick and branny Urine, &c. But here he useth the word that signifieth settling, to shew that he meaneth something else. But we bringing all things to Practice, say that *Hypocrates* in this Aphorism, could not use a word which signifieth only sending forth, or Excretion, because he ought to distinguish that sand which signifieth the Stone from that which doth not. This Sand, as we said in the former Chapter, settles in the bottom of the Urinal; but other Sand doth only stick to the sides; and therefore *Hypocrates*, that he might distinguish them, said well, They whose sandy matter settleth; for others which do not settle, are not a sign of the stone in the bladder.

But that we may bring this Aphorism to Truth, and practical use, we suppose that the Opinion of *Johannes Zechius*, is the best; who makes it a proper sign of the stone of the bladder, and there is great use of the Aphorism in Physical Practice, when by all other Interpreters, it is made unprofitable. And that *Zechius* may be honored by them who have not his Works, we think it worth our labor to repeat his words, which are in his Book of Consultation, §8. Consult. *Hypocrates* (saith he) Ap. 79. Sect. 4. said thus, which was never understood yet, either by Galen, or any other. They whose Urine hath a sandy settling or sediment, have the stone in the bladder. Which sentence, if we should take it according to Galen, would be false, because we observe that many men do piss sand all their lives (whereof I am one) without any suspicion of the stone in the bladder. From whence, I cannot but wonder at Galen, and all the rest after him, that they should either not understand so useful an Aphorism (which I can scarce believe) or by reason of its ambiguity pass it by. The whole difficulty is in the signification of the word [Sabulosa] in Greek called Plamimodea: *Hypocrates* would have nothing understood thereby but thick gravel mixed as it were with fat Earth like Clay or snot in the bottom of the Urinal; a certain sign of a great stone in the bladder. But because there is nothing constant in man, it is not to be admired that some that have this Disease have not this sign; as when the stone is small, as we observed in Cardinal Paleotus. Now the cause of this muddy Excrement hath been shewed in another place. So far *Zechius*; but where he shewed the cause of it, we could never find. But we plainly shewed it in the former Chapter, when we said that this snot-like matter is the proper Excrement of the bladder distempered, when it cannot concoct the great quantity of blood, and superfluous humors which are sent thither, and turn them into its self, but turns them into that consistence like snot; and this evil disposition of the bladder comes from the stone therein. Let that be perused, for it maketh much for the understanding of what hath been said.

But there still remaineth one difficulty, for some have daily flegmatick slimy matter in their Urine, and yet are free from the stone in the Bladder. And *Cardanus* reports of an Augustine Monk called *Leo*, that shewed him often so much congealed flegm in the bottom of his Chamber-pot as was bigger than a Goose Egg. and yet he had not the Stone. To this doubt we answer, That the slimy matter that comes from the bladder, is to be distinguished from that which comes from other parts, because that which comes from the bladder is more clammy and glutinous, so that it sticks fast to the bottom of the Pot or Urinal, and cannot be shaken off when the Urine is poured forth; but that which is from other parts doth not so cleave, but comes presently forth with the Urine; Experience hath taught me this, which hitherto no Author ever yet observed. This clamminess comes from the Nature of the bladder, which is a Membrane; and apt to produce this glewiness, as you may see Glew is made of the Membranous Skins of Beasts.

This tough glutinous Matter, I say, comes from the evil disposition of the bladder, which is caused by the stone there, and we can thus prove it besides what hath been said; Because we have known a Child of twelve years old, that had a stone in the bladder, and pissed continually a glutinous matter that cleaved to the bottom of the Glass. And after the stone was cut forth, he voided the same for a month, but afterwards none at all. Which clearly shews, that matter comes from the evil disposition of the Bladder, which could not presently be cured after the cutting: but after the Bladder was cured, that matter appeared no more, which shews that it came from no other part but the bladder.

For a Conclusion of this, let us take notice. That whensoever this slimy matter appears with all the aforesaid conditions, there is a stone in the Bladder; but when it doth not appear, it doth not follow that there is no stone, for it often happeneth that the stone is smooth, or little, and so doth not hurt the bladder, and the Urine is always clear. This is a true sign, that there is a stone when it appears; but when it is absent, it is not the sign of no stone.

Nor would this Objection, or rather Cavil, become a wise man, because from our Observation before mentioned, we proved that such matter might be voided by Urine, and yet no stone in the Bladder; for it was cut forth. It is sufficient that either a stone was lately there, which was the cause of this Disease; and so this kind of matter signifieth, either a stone there now, or lately hath been there.

The last sign is by tryal with the Catheter, and putting the finger into the Anus, which operation

must

must be used to take away all doubt; for the most part it doth: for sometimes the stone is covered with slimy matter or a bag, so that the Cutters themselves are deceived thereby. But the Catheter is more uncertain than the Finger, by which you may ~~may~~ be certain not only of a stones being there, but of the form and bigness of it.

PROGNOSTICK. As for the Prognostick of this Disease: It is always painful and dangerous; painful, because only very small stones can pass through the neck of the Bladder.

The great ones, if like Flint, cannot be dissolved; if soft, like Chalk, or brittle, they may be dissolved with long use of powerful Medicines, which for the most part the patient will not stick to, and therefore they are seldom cured; therefore there is often cutting, which how terrible it is, daily Experience will declare, because many die under the Operation. Hence *Hypocrates* in his Oath, commands his Disciples that they use it not, but leave it to men of that Profession only. But in Women, the Operation is less dangerous, because their Passage for Urine is wider, and it may be done without cutting, only by enlarging the part.

CURE. The way of Cure is the same with that of the Kidneys: first, Evacuation of the antecedent matter, Revulsion and hindering of the breeding of it: and let the matter conjunct, of the stone it self, be diminished, worn away, or dissolved, for which there are good Medicines in the Chapter aforegoing.

Of which, the distilled Water of Onions is most excellent, by which continued twenty days, we saw a stone bigger than a bean, thrown out of the bladder.

But the best Authors, and Experience teach, That things taken at the mouth cannot dissolve the stone in the bladder. Hence it is, that we commonly refer them to the Cutter. But because there are many stories of men cured by such Medicines; we will speak of the chief, that every one may try them, if he please, before he go to the terrible Chyrurgeon. Sometimes the Stones are so soft and newly congealed, that it is not impossible to dissolve them; but hard flinty stones cannot.

Horatius Augenus, Tom. 2. Epist. Med. Lib. 9. Epist. 8. *I* (saith he) have twice seen the Stone broken in the Bladder. Once by chance I had the same of one *Janetus* a Printer at Rome, in Cure, whom I purged, that he might be cut with more safety. For he had tried all the Venetian and Florentine Physicians. But when nothing did him good, he sent for the Priest to consult about his Soul, and resolved to be Cut. The Priest being a Jesuite, and hearing his Confession, and the condition of his Disease, told him a Medicine, of which he had made tryal in himself and others. He tried, and was cured in the space of nine days. The Medicine was this:

Take of the powder of Hog-lice or Sows one dram, or four scruples at the most. Aqua vitæ half an ounce; red Pease Broth nine or ten ounces. Let him take it five hours before dinner.

I Cured one of eighteen years of Age, of a hot and dry complexion, by taking away some part of the Aqua vitæ, and gave it him but every other day, and at other days of Bean and Strawberry Water, of each five ounces, with six drops of Oyl of Vitriol, and one ounce of the Julep of Violets, to cool him, thus:

Take of the Powder of Sows prepared one scruple, Aqua vitæ two scruples; red pease Broth eight ounces. Mix them, and give it six hours before meat. Thus *Augenus*.

Sennertus in his Chapter of the Stone in the bladder, tells a famous story of *William Lauremberg*, Professor of *Rostoch*, who being old, and troubled with the stone, was unwilling to be cut, and therefore sought for other Remedies. First he tried the Famous Water against the stone, which is so much prized by Princes, which is thus made:

Take of Salt of white Tartar one ounce, Parsley water one pint: mix them, and strain them with a brown paper; and with Orange peels make it yellow. He used also the Indian Jewel, called in Spanish, *Igiada*, which is most famous for breaking the stone; but both to no purpose. Therefore he desired to make tryal of the Medicine of Sows, which *Horatius Augenus* saith, cured two young men.

In imitation of whom, after general Physick, and good Diet, he took of Sows one scruple, the Spirit of Juniper two scruples; red Pease broth ten ounces, which he took in the morning; but the first and second time he found a straitness in his breast, and a fainting, so that he was constrained to take one dram of Treacle with the Potion; and so used it fifteen days: but all this while he voided no Gravel. And then he added other things, and made it thus:

Take of prepared Sows two ounces, a Hares and Goats blood prepared, wild Rose Flowers, and purple Violet seeds, of each one ounce, Species Lithontribi two scruples; mix them for an Antidote, of which take two scruples; the Diuretick Decoction ten ounces; the Spirit of Juniper two scruples.

Which Medicines after he had taken it the second time at five a clock in the morning, four hours after he felt a great pain under the *Os Pubis*, about the neck of the bladder: A little after he made a little Water, and therewith some red things like scales of fishes; which though they seemed to be slimy, yet when they were touched, turned to Sand. So that it plainly appeared, that they were the outside of the Stone.

By the continuance of this Medicine, every fourth or fifth day he voided the like scales, and sometimes bigger pieces, especially when he used a sweet bath. But when the neck of the bladder was wounded by the fragments and the Stone, he used Medicines to assuage pain; and by the use of these medicines, was in seventeen months cured. The Decoction was:

Take of *Liquoris* four scruples; *Roots of Marshmallows, Couch-grass, Rest-harrow*, of each half an ounce; *Winter-Cherries* twenty, *red Pease* six ounces; *Raisins* one ounce, the four great cold Seeds of each one scruple; *Barley* two handfuls. Boil them in *Winter-Cherry Water, Rest-harrow, Strawberry and Bean flower water*, of each one pint and an half: to the straining, add of the Syrrup of *Marshmallows* four ounces.

The Sows are thus prepared:

Take of live Sows two pound, wash them in *Rest-harrow Water*, then drown them in *Spanish Wine*, then pour the Wine out, and put them in Glasses, the more the Glasses the better, because then they will dry better. Put these Glasses well stopp'd into the Oven when the Bread is drawn, that they may dry gently till they will powder; then put some *Spanish Wine* upon this Powder, as much as it will take in, and dry it again; do so thrice: and fourthly, wash it with this *Liquor* and dry it.

Take of *Strawberry Water* three ounces, *Spirit of Vitriol* half a dram: mix them, then dry it, and make it fine, and keep it in a Glass for your use.

Besides the aforelaid, the use of distilled Water of Goats blood, or of the Urine of a Goat newly slain, which was formerly mentioned in the Stone of the Kidneys.

If the Stone cannot be broken with Medicines, necessity requireth the manual operation, though it be dangerous: lest the Patient die with lingering pain. This requires a skilful and well exercised Artift, and that it may have good success for the most part, as we have observed.

It is the Duty of the Physitian, before the operation, to prepare the body by bleeding, purging, and Diet, as the state of the business requireth. And observe, that the taking away of a stone from a Woman hath no danger, because it is done by enlarging the Passage of the Urine, which in them is very short.

If the Patient fear cutting, or want a good Chirurgeon, he may use assuaging Medicines, lest the Stone should cut and ulcerate the neck of the bladder, such as are prescribed for heat of Urine.

But if a Stone fastened in the neck of the bladder stop the urine, it must be shaken back with lying upon the back with the Legs up, and the body shaken; and then by a good fomentation or bath, and with a Catheter, let the stone be sent back into the bladder.

CHAP. III.

Of the Inflammation of the Reins and Bladder.

BECAUSE the Inflammation of the Reins and Bladder are cured with the same Medicines, therefore we will put them in the same Chapter, although the Signs are different, as shall be shewed.

This Inflammation is a Tumor of those Parts, from the flowing of Blood or Choler unto them.

This is not very ordinary, because the substance of those parts is solid and thick; but sometimes it happeneth, because the Kidney and fleshy parts are apt to receive blood: but the Bladder, though it be without blood and spermatick, because it receives blood for its nourishment through the small veins, is without question subject to Inflammation by too much blood; as other Membranes of the Brain or Meninges: the *Pleura Mediaſtinum*, and the like.

We said that these inflammations come from Blood or Choler, as when Flegm or Melancholy, if the blood make the parts thicker, because they cannot pierce into their thick substance.

CAUSES. The Causes of this Disease are either from things Natural, not Natural, or Preternatural.

From Natural things, when there is a Natural Infirmary of those parts from the Parents, or a great looseness of them, a great heat originally in them, by which they draw plenty of Humors: In Youth these conduce much to an Inflammation.

From things not Natural, as much Venery, which weakeneth those parts, and draws much blood or other Humors to them; Gluttony, Drunkenness, and eating of Salt and Spiced meats; great Passions of the Mind, lying upon the back in a soft bed, great Exercise, stoppage of some great Evacuations, as of the Months and Hemorrhoids, or usual bleeding at the Nose, those things which cause repletion and evil concoction, and drive the Humors to the inward bowels.

From Preternatural things, as a stroak or wound upon the Reins, or about the Bladder; pressing or bruise of those parts, constant Feavers, foulness of the Vessels, or other parts that purge themselves

selves by Urine; as in a Pleurisie, Empyema or Imposthume in the side, Obstruction of the Spleen, breaking of the Mesentery and the like. And lastly, Diseases of those parts do cause Inflammation, as the Stone, great pain, exulceration, heat of urine, and stoppage thereof, or the like.

SIGNS. The Signs of the inflammation of the Reins, are a weighty pain in the Reins, sometimes beating, if the place be affected where the Arteries are: And this pain extendeth to the parts adjacent, so that the Patient can neither lift himself up, nor stand upon his Feet, and scarce turn himself; and neither lie upon his side, nor his belly, because then the part inflamed will hang down; therefore he lies always upon his back, and if he neither neeze, or otherwise move his body, the pain is encreased. He hath a numbness or pain in the Leg on the same side, by reason of the nerve that goes from thence to it. He hath difficulty of Pissing, by reason of the heat which is sent to the urine, and filth mixed with it coming from the inflamed part. The urine is first thin and yellow, but after red and thick; he hath a constant sharp Feaver, which is attended often with watchings, dotings, and other great Symptomes; also loathing and vomiting, by which he voids Choler, Hlegm and other Humors.

Sometimes the Gut Colon is inflamed, and if it be that part which is near the Liver, it brings the like Symptomes: but here is the difference; In the Inflammation of the Reins, the pain reacheth to the short Ribs, the back and bladder; but that of the Colon tends more to the belly, and there is a greater change of Excrements of the Belly, than the Inflammation of the Kidneys.

But in the Inflammation of the Kidneys, there is a pain about the *Pubis* and *Perineum*, in which there is heat, and sometimes redness. There is constant heat of urine, but that is stopped when the part swelleth, and stoppeth the passage.

The straight Gut suffers by reason of its nearness; hence it is, that there is often desire to go to stool with burning, sometimes the Belly is bound, when the Gut is stopp'd by the inflamed Bladder. There are also other common Symptomes mentioned in the Inflammation of the Reins, as a Feaver, watching, doting, thirst and the like.

PROGNOSTICK. There can be no good Prognostick in this Disease: For the inward Inflammation of the noble inward parts do threaten continual danger of death. It is most deadly when a Convulsion or dotage followeth, or the like great Symptom: and if there be a cold sweat, death is at hand.

In the Inflammation of the Reins, if the Hemorrhoids follow, it is good.

If the Inflammation Suppurate, and the Imposthume break, and go into the passages of the urine, there is hope; but if it go by the Emulgent Veins in the Liver, and labour to get way through the Guts, it is dangerous.

A small Inflammation of the Bladder with a Sediment in the urine that is white and equal, promieth health.

An Inflammation of the Bladder is sometimes cured by an Erysipelas, or Cholerick Tumor arising in the Skin suddenly, and by making much urine.

CURE. The Cure of the Inflammations of the Reins and Bladder, is made by revelling, deriving, cooling, and moderately repelling, by Anodines, Resolvers or Ripeners, if need be, and the like, whose Matter and way of using shall be as followeth:

And first, Phlebotomy is very necessary in the Liver Vein, on the same side the pain is, twice, thrice, or four times, or oftener, if the strength will bear it, till the defluxion ceaseth, which you may know by the abating of the pain. But in the Inflammation of the Bladder, the right side is to be chosen by reason of the Liver, from whence, as from a Fountain, the blood floweth to the part.

After much blood is taken away, and revulsion is made by the upper Vein, you must also open the inferior for derivation sake in the Ham or Ankle; as also the Hemorrhoids are to be opened, especially if they be swelled.

Cupping Glasses with Scarrification, are also good for revulsion, both above and beneath, and Frictions with strong Ligatures of the extream parts, to draw the Humors outward.

After, and before blood-letting, give a mollifying and cooling Clyster that is little loosening, and let it be of a small quantity, lest it oppress the Tumor, thus made:

Take of Marshmallow Roots one ounce; Mallows, Violets, Lettuce, of each one handful; sweet Prunes four pair; Barley and Violet Leaves, of each one pugil: make a Decoction to eight or ten ounces. In the straining, dissolve of Cassia or Diaprunes simple one ounce; Oyl of Violets four ounces, two Yelks of Eggs. Make a Clyster.

Allay the heat of blood with Juleps and Emulsions made thus:

Take of Endive, Lettuce and Purslain Water, of each four ounces; Syrrup of Pomegranates two ounces; Syrrup of Water-Lillies one ounce. Make a Julep for three draughts morning and evening. Or

Take of Sorrel Roots two ounces; Mallows, Plantane, Purslain and Endive, of each one handful; the tops of white Poppies half a handful, Annis and Lettuce seed, of each one dram; Borrage, Violets and Water-Lilly flowers, of each one pugil; boyl them to a pint and an half: then add four ounces of the Juyce of Pomegranets. Or,

Take of sweet Almonds blanched one ounce; fresh Pine-Nuts half an ounce; Lettuce, Sorrel, Purslain and Poppy seeds of each three drams; beat them according to art, pouring out by degrees of Barley, Lettuce and Purslain Water, one pint and an half. Dissolve in the straining, Sugar of Roses one ounce. Make an Emulsion for three doses, in which we leave out the great cold Seeds, because being Diuretick they may draw something to those parts, especially in the time of the defluxion, but in the declination they may be useful. You may profitably add to the Emulsion, the Syrrup of Poppies to stop the flux more violently.

Also the parts inflamed may be cooled by Clysters made of the Decoction of the Julep aforesaid, with oyl of Roots of Violets two ounces.

In the beginning of these Inflammations, purging is not proper; for it is to be feared, lest the Humors being moved, should flow to the parts affected; so that if there then be a great flux of the Belly, it is to be stopped for that cause. But when the Inflammation is a little allayed, and the disease declineth, a Purge made of gentle things may be good; as of Manna, Cassia, Rhubarb, Tamarinds, Diaprunes simple, Catholicon and Syrrup of Roses, with a Decoction of Lettuce, Purslane and other cooling things prescribed in the Juleps. Or you may make a Bolus of some of them.

Outwardly, All the time of the Disease, you must apply cooling things that gently repel; as moist Epitheme of the Water and Juyce of Plantane, Sorrel, Endive, Nightshade, Roses, with a little Vinegar, red Sanders and Camphire. Liniments also of Oyl of Roses and Olives, Violets, Cerat of Sanders, white Oyntment, or Populeon alone, or mixed with a little Vinegar, which you must apply to the parts aforesaid every hour cold.

Or you may make a Liniment of an Egg well beaten, with a Little Oyl and Rose Vinegar.

Or you may make that which is excellent of Oyl of Roses, with Vinegar and Juyce of Knot-grass or Purslain; to which add, if you please, a new yelk of an Egg. Let these be applied cold upon a Cloth.

If the pain be very violent, it is not amiss in these Epithems and Liniments, to mix a little Opium or Saffron.

Also you may make a Cataplasim of Barley meal, with Juyce of Endive, Purslain and Nightshade with Oyl of Roses and Populeon. But this must be often changed, lest it grow hot.

Three things are to be diligently observed:

First, That you use not Coolers too long, lest the Matter be kept from breaking forth, and the Tumor grow hard or Schirrous.

Secondly, In the Inflammation of the Bladder, you must use less astringers and coolers, lest you stop the urine; which Symptome alone is very useful and dangerous in this case.

Thirdly, Cataplasms in the Inflammation of the Bladder are less necessary than Oyntments and Liniments, because they burden the part, so that it is more hard to dilate it self.

After you have used Coolers a short space, and often bleeding; when the defluxion is somewhat stopped, you must use Softners and Dissolvers; such are Fomentations of the Decoction of Marsh-mallow Roots, Mallows, Violets, Pellitory, Linseed, Foenugreek, Mallows, Cotten-weed, with Melilot, Camomel, Rosemary-flowers and Rose Leaves, to strengthen the part.

Then apply a Liniment of Oyl of Lillies, with a little Oyl of Camomel.

Among the dissolvers and Anodines together, there is none better than the Cataplasim made of Crums of Bread, made thus:

Take of white Bread Crums one pound; boylit in Goats Milk to a Pultis: then add three Yelks of Eggs, four ounces of Oyl of Roses, half a scruple of Saffron: make a Cataplasim, change it often. You may add a little Opium and Camphire, if the pain be very great.

In the Inflammation of the Bladder, if you fear a Gangrene, you may make a strengthening Cataplasim of Bean meal, and Orobus meal, or Lupines boyled in Wine.

When the greatest part of the Inflammation is abated, then you must use Decoctions and Liniments which do not only dissolve, that the reliques may be consumed.

In the whole time of the Cure, you must have a special care of great Symptomes; as the Feaver pain, watching, stoppage of Urine and Belly; of the Stomach and other parts.

And as for the Feaver, pain and watching, it is most certain, that the things mentioned to evacuate and alter, do much for the mitigation of them. But to them you may add Epithems, Liniments and Rose Vinegar, such as use to be applyed to the Region of the Liver, Heart and Brain; and in time of necessity, Narcoticks both by mouth and Clyster.

There are special Anodine Suppositories to take away the pain of the Bladder or Knots, made with yelks of Eggs, and a little Opium, and Juyce of Henbane, or the like.

If the Strangury or stoppage of Urine follow this Inflammation, you must cure them with medicines taken from their proper Chapters.

If the Inflammation of the Reins cannot be cured by what hath been prescribed, but it tendeth to suppuration, which you may know by the encrease of the Feaver, Pain and other Symptoms, as also

so by trembling and vomiting, by greater weight about the part, especially when the Patient lieth on his sound side; you must help Nature with Cataplasms of Roots and mollifying Herbs, Linseed, Camomel flowers: To which being boyled and beaten, you must add Meal, Butter, Grease, or Oyls of the same vertues. With which, if the Imposthume break not presently, and come forth by Urine, the Matter will get into the Cavity of the Abdomen, whence will proceed either sudden death, or a Hætick Fever. Sometimes the Tumor appears outwardly, and then you must open it either with a Potential Cautery, or an Incision Knife.

Sometimes those Tumors grow hard and Schirrhous, when the Fever is gone, and the pain remains, with a greater fence of weight and a kind of numbness of the subject parts: And this is commonly incurable, and brings an evil habit, or a Dropsie. Yet you may try with mollifying, cutting and digesting medicines, such as were mentioned in the Schirrhous of the Liver.

Chap. 4 Of Pissing of Blood.

Blood may come from divers parts to the passages of the Urine, and be mixed with it, and make it look like Blood: but because this happeneth but seldom, and we here treat only of the Disease of the Reins and Bladder; we shall speak only of that bloody Urine which is made so from the defect of the Reins and Bladder. Blood flows from these parts, as from all the rest (as we said in Hemorrhagy, Hemoptysis, Vomiting of Blood and Hæmorrhoids) either by Anastomosis, or opening of the mouths of the Veins by Rixis or Rupture, by Diabrosis or Corrosion, and seldom by Diapedesis or Rarification.

CAUSES. The usual Causes are much sharp Blood, or a Stone fastened in the Reins; the Veins are often broken with plenty of Blood; but Corrosion or Anastomosis, or opening, comes from sharpness: also corrosion or tearing may come from the stone, when being fixed in the Reins or Kidneys through violent riding, or other exercise, it is moved so, that it hurts the parts with its roughness.

Also other causes may break the Vessels besides repletion, as a fall or stroak, lifting, carrying, vehement motion, and the like.

That Blood which is brought forth by Urine from Plethory, is not always a Disease or Symptome, but sometime for the good of the Patient, when Nature lays down that which is burdensome unto her by that means; as *Aretæus* reports that some piss blood at several times; and when they do not, they have the Head-ach, mists before their eyes, and giddiness.

Also the Bladder may bleed if it be wounded by a stone, or corroded by a sharp Humor; but it is but little, because it is membranous, and without Blood; but if the Sphincter Muscle be hurt, or the passage of the Yard, there will be much blood, as in extraordinary Venery is seen often, especially when the Prostates are inflamed by a Gonorrhæa, or running of the Reins.

SIGNS. The Signs of this Disease are from the Kind of it, from the Part affected, and from the Cause.

The Kind of this Disease is apparent to the Sences, for it is easie to know when Blood is mixed with Urine, for it is like the washing of flesh, with small clodders at the bottom; sometimes the Urine is like a Lye, when it stays too long in the Bladder, by which means it grows black.

The place of the pain shews the part affected; for if it be in the Loyns, it signifies that the Kidneys are affected; but if it be in the Belly below the Navel, the Bladder is the part suffering. Moreover, if the Blood comes from the Reins, it is mixed perfectly with the Urine; but if from the Bladder it is not mixed. *Hippocrates* sheweth this Sign in two Aphorisms, namely, in Aph. 78. Sect. 4. *They who suddenly piss blood without force, have a Vein broken in their Reins*; and Aph. 80. of the same Section, *If men piss blood, or there be clots or drops in the Urine, and pain in the lower part of the Belly, the Pecten or Perinaum, these have their Diseases from the Bladder.*

If it come from the stone, the signs thereof which are mentioned in its proper Chapter, will appear; if they do not, you must conclude that it comes from too much Blood or sharpness thereof. The abundance of Blood will be known by the signs of repletion and sharpness; by the signs of Choler or Melancholy predominating; also salt flegm in the Urine will make a great stoppage of Urine, and pissing of blood; this hapneth often in old men that are very apt to be troubled with salt flegm. And the pissing of blood from sharp humors is distinguished from that in the stone, that in which there were first pains of the Reins, and voiding of stones; but not in the other whole Urine is clear, with no strange things therein. And the Disease proceeds not only from immoderate exercise, which is ordinary to both Causes, but also from the passions of the mind, when it comes from sharp Humors which are much stirred up by passions, so that they who are subject to this Disease, after Anger and Sadness, or great disturbance of the mind, use commonly to piss blood.

PROGNOSTICK. As for the Prognostick. A plentiful and often pissing of blood is very dangerous; for it will bring either a Consumption or a Dropsie: And if it continue long, it may

may cause an Ulcer in that part from whence the blood floweth; if much blood flow at one time, it will cause a great stoppage of urine in the Bladder, or some other evil Symptomes, as it encreaseth therein, and grows evil qualified.

CURE. The Cure of this Disease is divers, according to the variety of the cause.

And first, if it come from blood abounding, or from sharpness; it must be first cured with Phlebotomy on the same side, often and little, for the better revulsion: And by Cupping, Friction and Ligatures in the upper parts; and if blood flow violently, Cupping-Glasses must be applied to the Hypochondria.

For Derivation, let the Vein of the Ankle be opened, and the Hemorrhoids.

When watry Cholerick Humors cause it, let them be purged with Medicines mentioned in spitting of blood, often repeated at distance. To which also you may add these following at your discretion:

Take of the Powder of torrifed Rhubarb one dram; prepared Coral half a scruple, Goats Whey, or Plantane water three ounces. Make a Potion.

Take of Cassia newly drawn half an ounce; the Pulp of Tamarinds six drams, Eastern Bole-Armenick half a scruple. With Sugar make a Bolus.

After due Evacuations and Revulsions, or at that time, if need require, you may use things to stop blood, and knit the Veins. And these are not presently to be used at the first, lest being stopped too suddenly, it should grow cloddy in some part. For this purpose the Juyce of Plantane newly drawn is much commended, given four or five ounces in a morning and evening, which is good for any kind of bleeding. But if you fear it will cool the Stomach too much, you may boyl it a little with Sugar.

Sheeps Milk is much commended by *Forestus*, Lib. 24. Observ. 13. Often (saith he) I have cured pissing of blood, with only Sheeps Milk six ounces, and one dram of Bole armenick. The same is an Experience of *Gatinaria*; who also commands that none do sleep presently, or exercise after it. Also *Hollerius* and *Duretus*, from *Avicin* and *Hypocrates*, commend the same.

Also Decoctions of Knot-grass, Horse-tail, Purslain and Bramble tops are good for this, adding the third part of the Juyce of sharp Pomegranates or Quinces.

Or to allay the heat of the blood, let him take the Apozeme following many times, morning and evening.

Take of Lettuce, Purslain, Plantane and Comphry, of each one handful: all the cold Seeds, of each one dram; Fijubes three pair; Liquoris half an ounce; Water Lillies, Violets and Roses, of each one pugil; boyl them to a pint and an half. In the straining, dissolve of Gum Tragacanth one dram and an half; Syrrup of Violets and dried Roses, of each one ounce and an half: Lapis prunellæ half an ounce; the Troches of Winter-Cherries without Opium, half a dram. Make a Julep for four Dose.

To thicken and stop the blood more, put one ounce of Syrrup of Poppies thereto.

Also you may give the Powders that stop blood, as of red Coral, Blood-stone, Bole-armenick, settled Earth, either with the Apozeme, or with Rose or Plantane Water.

If the Disease continue, give this Opiate:

Take of Conserve of Roses and Comphry Roots, of each two ounces; Sealed Earth, Bole-Armenick, Sanguis Draconis, red Coral, Blood-stone and Troches of Amber, of each one dram; Hypocistis, or Conserve of Sloes, Kermes berries and Plantane seeds, of each one scruple; with Syrrup of Poppies and Mirtles, of each equal parts: make an Opiate, of which let him take the bigness of a Chestnut morning and evening, drinking after it a little Plantane Water.

If it yet continue, it is good to give at distance the Decoction of Myrobalans in Whey, or the like.

Hollerius affirms and *Duretus*, That the Troches of *Gordonius* are the best for it.

Christopher Vega commends the Troches of Amber given with Plantane Water, and saith, that he cured this Disease with giving them only once at night.

For ordinary Drink, give the Infusion of Mastich-wood in Wine, made thus:

Take of sliced Mastich wood one ounce, spring water four pound; infuse them in Balneo Mariæ very warm in a close Vessel. Keep the straining for your use.

But because clods of Blood are often retained in the Bladder, which beget grievous Symptomes, give warm Water and Vinegar, or Mallow Water and sharp Vinegar warm. Let the Vinegar be so little that it is scarce tasted.

Apply Topicks to the Loyns that cool and astringe:

Take of Snakeweed and Comphry Roots, of each one ounce; Plantane, Purslain, Horse-tail, Knot-grass and Shepherds-purse, of each one handful; Pomegranate peels half an ounce; Sumach and Myrtle berries, and Hypocistis, of each two drams; Acorn Cnps. and yellow Sanders, of each one dram; red Roses three pugils: boyl them in Smiths Water, and a little Vinegar. With the straining, let the Reins be fomented hot.

Of the same Decoction you may make a Bath to sit in, adding more simples :

Take of Unguentum Comitissæ, and refrigerans Galeni, of each one ounce and an half ; wash it with Oxycrate, and anoint the Loyns therewith. Or to bind more;

Take of the Juice of Plantane and Blood-wort, of each two ounces ; Vinegar half an ounce ; Oyl of Olives six ounces ; boyl them till the Juices be consumed, then add of Sanguis Draconis, Mastich and Pomegranate peels, of each two drams ; Camphire half a dram ; Unguentum Comitissæ four drams, Wax as much as will make a Liniment ; put a little Vinegar to it when you use it.

Also a Plate of Lead full of holes worn about the Reins is good.

You must guard the Liver when it comes from sharp Humors with Epithems and Oynments.

When it comes from the stone and Gravel ; after Purging, Revulsion, and things that allay sharpness, mentioned ; you may use those things that may gently cleanse, as these that follow :

Take of Pills of Turpentine, with Rhubarb one ounce ; give half a dram in a morning, with two Spoonfuls of Syrrup of Scurvy grass every other day.

But when he takes them not, give this Powder and Confection following :

Take of Liquoris two drams ; the four cold Seeds, of each one dram ; Purslain and Lettuce seeds, of each half a dram ; the Troches of Amber and burnt Harts horn prepared of each one scruple ; Sugar as much as all the rest ; make a fine Powder, give one dram with Mallows Water in which Quince seeds have been infused.

Take of Blanched Almonds, and Pine-seeds cleansed, of each half a dram ; Marsh-mallow seeds and Winter Cherries, of each one scruple ; Lettuce and white Poppy seeds, of each half a scruple ; Starch and Tragacanth, of each half a dram ; Liquoris two drams ; Sugar six ounces : With Pellitory Water make a Confection in Morsels. Take it morning and evening half an ounce.

Stronger Diureticks are not convenient, for they will provoke the Flux.

And lastly, Vitriol Waters are good to stop blood, cool the Reins, and expel stones.

CHAP V.

Of the Ulcer of the Reins and Bladder.

CAUSES.

THe Ulcer of the Reins and Bladder comes of three Causes: from an Imposthume broken after Suppuration ; from the sharpness of Humors, such as causeth pissing of blood, which being violent and continual, doth ulcerate the parts ; or from a sharp stone that corrodeeth them ; the last is most usual, the former seldom.

SIGNS. Among the Signs, the chief is voiding of Matter with the Urine, which lasting long, doth shew that there is an Ulcer certainly in the parts which are employed about the Urine. But whether the Reins or the Bladder be affected, is known by the place of pain, whether it be in the Loyns, or near the Privities. Moreover, If Matter come from the Reins, it is better concocted, white, thin, and not stinking, because the body of the Kidney being fleshy, doth better concoct ; besides, the Matter is more abundant, and more mixed with the Urine, which is voided like milk, till after long standing it settle to the bottom. That matter which comes from the Bladder is little, and not much mixed with the Urine, nor so well concocted, but crude, of divers colours, and stinking ; for that part being without blood, and having little heat, cannot concoct sufficiently : But often pure matter is voided without urine, from the neck of the bladder, and then there is a continual difficulty of urine, and pain in that part, which is not in an Ulcer of the Reins but by fits.

When the Ulcer is in the Reins, sometimes much blood is voided, which is hard to be stopped, and sometimes pieces of flesh and matter or blood, sometimes so big as they hardly pass, and cause pain ; but from the bladder come scales, or Skin, or Bran.

And from an old Ulcer of the bladder that is callous or hard, there flows that snotty slegm which we spake of in the stone of the Bladder.

PROGNOSTICK. As for the Prognostick : All inward Ulcers are dangerous, but these most, because of the most constant Flux of Humors to these parts ; for although the serous Humor hath a cleansing quality, yet here being mixed with other qualities, it doth not act in its natural condition ; and if evil, Salt and sharp Humors are mixed therewith, they will make and nourish an Ulcer.

New Ulcers of the Reins and Bladder are curable, old not.

They are incurable in old men, sometimes curable in young men but with difficulty.

Ulcers that come from the Stone, and are maintained by it, cannot be cured before it be taken out.

The pain and Symptoms which accompany the aforesaid Ulcers, cause watchings, and consume the body.

CURE. The Cure is by cleansing, drying and heating, as all other. For this purpose use these following :

First, If there be a repletion, or inflammation in the part affected, let blood first in the Arm, then in the Hand.

Then purge often, to take away the vitious Humors that flow to the part affected, but with gentle things, as Cassia, Manna, Syrrup of Roses, Agarick, Rhubarb, made into a Bolus ; because in a moist form being drunk, they quickly go to the Uretors, and encrease pain.

You may give this Opiate following :

Take of Polypody of the Oak and Liquoris, of each half an ounce ; the four great cold Seeds, of each one dram ; Borrage and Violet flowers, of each half a pugil ; Fijubes six pair, Damask Prunes three pair ; small Raisins half an ounce, Senna one ounce and half : Infuse them all night in Barley Water ; then boyl and strain them : then dissolve of Manna one ounce and an half ; Cassia three ounces : boyl them to an Opiate, adding in the end half an ounce of Rhubarb in powder. Give one ounce at a time, once in a Week, two hours before meat. Or,

Take of Cassia two ounces, Manna one ounce and an half, the Mucilage of Fleabane seeds six drams ; the four great cold seeds, of each one dram ; the Juice of Liquoris two drams : With Syrrup of Roses solutive make an Opiate.

These Opiates will be better, if you put *Mercurius Dulcis* to them, because Mercury doth cleanse and heal all Ulcers both internal and external.

Turpentine is purging, and excellent in this Disease, because it cleanseth the Ulcer. And you must give half an ounce thereof washed at once with Powder of Liquoris. But it is chiefly good when the Urine is thick.

Avicen commends Vomiting for this Disease, *Cap. de Ulcer. Renum*, *AVomit* (saith he) is the best way to cure an Ulcer in the Reins, because it cleanseth and emptieth, and draweth the Humors from the part. But *Ætım* in his Chapter *de suppuratis Renibus* ; If (saith he) any man will take a strong Vomit every month, he will happily cure the Ulcer of the Reins, or any other evil that ariseth from them. Many Modern Physitians follow these ; some gave warm Oyl and Water one hour before meat : which only Medicine being often repeated, hath cured this Disease, as they say. But *Rondeletius* will have them vomit after meat, because then men vomit most easily ; and he gives warm Water and Oyl, and anoints the Stomach with Oyl of Lillies. But you must never give a Vomit, but to them that are easie to vomit ; for otherwise it would Inflame the Ulcer.

After due Evacuations and Revulsions, you must use Cleanfers. The chief is, Whey taken every morning in abundance ; or thin Hydromel, six or eight ounces in a morning in ordinary drink, or the Decoction of Barley and Liquoris with Sugar, and give Water and Sugar for ordinary Drink. You may boyl in Hydromel, if you fear heat, the cold Seeds, Liquoris and Mallows. Asses milk doth not only cleanse with its Wheyie part, but heal with its Cheezy part ; but you must not give it in a Feaver : or you may make this following Decoction to cleanse and ease pain.

Take of Marshmallow Roots half an ounce, Plantane, Agrimony, Maiden-hair and Mallows, of each one handful ; Mallows and Melon Seeds with their Husks beaten, of each half an ounce ; Winter Cherries six drams, scraped Liquoris one ounce, Barley one pugil ; boyl them to two pints. Dissolve in the straining three ounces of Honey, and two ounces of Sugar-candy, make a Julep. Take eight ounces every morning for ten days.

Those Medicines you give for the Reins or Womb, must be given in great quantities, lest they lose their vertue before they come there.

Instead of them all, you may use Mineral Waters of Allum and Iron, by the constant use whereof the heat is corrected, and the Ulcer mundified and healed.

Some commend the Decoction of China, Sarsa or Saxaphras, or of Guajacum given thirty days or more together with a Decoction thereof for ordinary Drink, and a thin drying Diet ; and lest the Bowels should thereby be too much inflamed, they give cooling Broths at night, and anoint the Reins with cold Oyntments. And this course is taken to dry up the matter, to purge and cleanse, especially in them that are flegmatick, or have the French Pox, and have neither Feaver nor Flux of blood.

But in any case you may use with more safety this following :

Take of Sarsaperilla three ounces, Shavings of Mastich Tree two ounces ; Saxaphras one ounce ; Shavings of Ivory and Harts-horn, of each six drams ; Fijubes and Sebestens, of each half an ounce ; Lignum Nephriticum four ounces ; Barley two ounces : Infuse them twelve hours in five pints of spring Water, boyl them to three pints, for six draughts to be taken twice in a day ; aromatize them with two drams of Cinnamon.

After the use of Cleanfers, when you see by the decrease of the quantity or Matter in the Urine, that the Ulcer is ceased, as when it is white and even, and not filthy ; give drying, astringing, glutinating and heating things ; as these Troches following :

Take

Take of Bole-armenick, sealed Earth and red Coral, of each three drams; Gum Arabick and Tragacanth, of each half an ounce; with Agrimony Water make Troches of two drams a piece. Let him take one every morning with boyled milk, or the Decoction of Comphry.

The Troches of Gordonius are best of all, because they assuage pain and heat. Their Dose is two or three drams, with Hydromel or Barley Water, when you will cleanse more; or with Goats or Sheeps milk, when you will glutinate more.

For the same, use this following Opiate:

Take of Conserve of old Roses three ounces, Purslain and Plantane seeds, Myrtle Berries, Bole, sealed Earth, Sanguis Draconis, of each one dram: the shavings of Ivory, and Troches of Winter Cherries, of each half a dram: with Syrup of dried Roses make an Opiate, of which give the quantity of a Chesnut twice in a day.

You may make knitting Juleps thus:

Take of Comphry Roots two ounces; Plantane and Mouse-ear, of each one handful; the tops of Malloes and Maiden-hair, of each half a handful; Liquoris half an ounce, Starch and Gum Arabick, Tragacanth and Bole, of each one dram, Lettuce and Purslain seeds, of each one dram and an half; red Roses one pugil: boyl them in Rain Water to one pint and an half. In the straining dissolve four ounces of Sugar, of Penides two ounces; make a Julep. Give eight ounces in a morning for ten or twelve daies.

Also the following Pills are good:

Take of Turpentine washed in Plantane Water one dram; Juyce of Liquoris and Gum Tragacanth, of each two scruples; Bole and Troches of Winter-Cherries, of each half a scruple: With the Juyce of Horse-tail make Pills. Let him take half a dram morning and evening.

They are stronger made thus:

Take of Marsh-mallow Roots and Comphry dried, of each two drams; Gum Arabick, Cherry and Plum-tree, of each one dram; Olibanum and Myrrh, of each four scruples; white Poppy seeds, and Winter cherries, of each one dram and an half; Camphire two scruples, beat them finely, and add the weight of the third part of them all of Antimonium Diaphoreticum; and with Venice Turpentine make a Mass. Give one dram morning and evening long before meat, and after it, as a little of his ordinary Drink.

If Turpentine cause pain, give instead thereof Juyce of Liquoris dissolved in Pellitory Water.

And above all, new Milk from the Cow, with one dram of Bole-armenick that is true, every morning, is excellent, as *Forestus* says: And it is a secret of his Master *Helidius*, because it cleanseth and healeth the Ulcer.

Quercetan in his Dispensatory, commends the Water that is given for the Gonorrhæa, as good for the same, as well as other Ulcers.

Hartmannus commends an Opiate made of Conserve of Roses two parts, and the Powder of the Seeds of St. Johns-wort one part, given in the end of the Cure many evenings together. And also two or three grains of *Mercurius Dulcis* given every day in Plantane-Water.

But *Mercurius Diaphoreticus* is better, if well made, and as it were fixed; this cures all internal Ulcers miraculously.

In old Ulcers, the Decoction of round Birthwort in white Wine with Sugar, is very good.

Also observe what *Garcias ab Herto* says, That in Goa they give Aloes and Milk for Ulcers in the Reins and Bladder, or to such as pisse filth, and it presently cureth.

Outwardly to knit give this Oyntment.

Take of Juyce of Plantane and Nightshade, of each four ounces; Oyl of Roses three ounces; Vinegar one ounce; Litharge finely powdered one ounce and an half; washed Ceraass half an ounce; fine powder of Tutty two drams; Sanguis Draconis one dram. Make them into an Oyntment.

Also you may use this following when there is no Inflammation:

Take of Oyl of Roses and Mastich, of each two ounces; Myrrh, Aloes, Sarcocol, Sanguis Draconis, of each one dram; Starch and Gum Tragacanth, of each four scruples; Styra calamita one dram, white Wax as much as will make an Oyntment.

In the Ulcer of the Bladder it is proper to make an Injection twice in a day; first with Hydromel or Whey, or the Decoction of Barley with Honey of Roses to cleanse; then with astringers and Binders made of Iron Water, in which Comphry Roots, Myrrh, Allum and Sarcocol, with Tragacanth have been boyled. But especially with the Troches of Gordonius dissolved in milk.

Fabricius Hildanus cured a great Ulcer in the bladder with this following Injection, and some few other Medicines, Obs. 69. Cent. 3.

Take of the Roots of Comphry one ounce; Agrimony, Pauls Betony, Water Germander, Ladies Mantle, Sanicle, of each half a handful: boyl them to a pint. In the straining, dissolve two drams of Honey of Roses: mix them for an Injection.

And you must observe, that these Injections are not only to be made with a Syringe, because they will not enter into the Cavity of the bladder, the Sphincter Muscle being shut, but you must convey it in with a Catheter.

And because in these Ulcers the pains are usually great, you must through the whole Cure abate them with Anodines inwardly and outwardly. Inwardly with Syrup of Poppies, Laudanum, and the Troches of *Alkekengi* made for this purpose; as also with Emulsions made of the cold Seeds and white Poppy seeds, with a little Syrup of Poppies, or with the often giving of Conserve of Marsh-mallow flowers.

Outwardly you may apply this Fomentation following to the Reins:

Take of Marsh mallow Roots two ounces; Mallows, Pellitory of the Wall, Violets, of each one handful; Linseed, Fenugreek, and Winter Cherries, of each three drams; Camomel, Melilot flowers, and Water Lillies, of each one pugil: make a Decoction, with which foment the part, not with Spunges, because they have a saltness in them from the Sea.

After the Fomentation, you may apply this Liniment:

Take of the Oyl of Violets, and of sweet Almonds, of each one ounce and an half; Oyl of Roses one ounce; Musilage of Marsh mallow-seeds and Fenugreek of each two ounces; Saffron one scruple: make a Liniment.

Make this following Injection against the pain of the Bladder:

Take of Fenugreek and Quince seeds, of each one scruple; steep them one hour in one pint and an half of Barly Water, after strain them, and make a moist Musilage; of which add of Oyl of sweet Almonds two ounces, Honey of Roses strained one ounce: mix them for an Injection.

And if you inject warm Milk, it is excellent for the same purpose. In which if you dissolve the Troches of *Gordonius*, you will compleatly ease pain, and cure the Ulcer.

CHAP. VI.

Of Diabetes, or extraordinary Pissing.

Diabetes is a quick and plentiful sending forth of Drink by Urine; after which there comes a violent Thirst, and consuming of the whole Body.

It is called Diabetes *apo tou diabainein*, from passing through, as Water through a Conduit pipe, which is called Diabetes. This Disease is also called *Dipsacos* from the unquenchable Thirst, and the Piss-pot Dropsc from the continual making of Water. It is seldom seen, for *Galen* in 6. *de loc. aff. cap. 3.* saith that he saw it but twice.

CAUSE. The next and immediate Cause of this Disease from *Galen* and all his followers, is held to be a hot distemper of the Reins, which makes them draw Water violently from the Veins, and send it to the bladder, being not able to contain it themselves: the Veins being drawn dry, suck from the Liver, the Liver from the Guts and Stomach; hence comes a continual Thirst after drink, which as soon as it is taken, it is forthwith carried from the Liver and Veins into the Reins, where by its quantity it stirreth up the Expulsive Faculty, and burdening the Retentive Faculty, it is sent to the bladder.

Some suppose that this cause is insufficient, because the hot distemper of the Reins is an usual Disease, but Diabetes is very rare; therefore there must be something else that is less usual, namely, a sharp or salt matter in the Kidneys, either of Choler or of Flegm, which doth continually provoke the attractive vertue of them; as in Cholerick Feavers there is a Thirst which cannot be quenched from the Cholerick humor which is fixed to the Coat or Tunicle of the Stomach, or from Cholerick Vapors sent from some adjacent part into the stomach, by the motion of some putrid Choler which lodgeth there. This Opinion is probable; but we think good to add thus much to it, That the Kidneys alone are not affected in this Disease, because Choler and other burnt Humors are first bred in the Liver; and therefore they cannot be in any quantity in the Kidneys, but the Liver must participate of them. And if we may reason where Nature seems to be silent, we can say that there is a venemous quality concurring for the producing of this Disease. For that kind of Serpent called *Dipsacos* found in *Lybia*, when it bites any man, doth send into him such a poyson as begets an unquenchable Thirst. The like kind of venom may be bred in our Bodies by a peculiar corruption of some humors, which may cause such a Thirst; for *Galen* testifieth, that divers kinds of poysons may breed in our Bodies. And if such a kind of poyson may be bred in our bodies as may cause a detestation of

Drink,

Drink, as in *Hydrophobia*, in which the Patient cannot endure the sight of Water, or any Drink, why may not there then be produced another poyson, which hath the contrary quality, to cause a great and unquenchable Thirst? And hence may be the reason why this disease is so rare; because this kind of poyson is seldom bred, but Cholér and salt flegm, and the Diseases from thence are ordinary. And as the disease called Dogs Appetite, which is compared to this for the unsatiable desire of meat, is ascribed by the wisest Physicians to an occult quality; so this unquenchable thirst may be said to come from a peculiar and hidden quality.

SIGNS. The Signs of this disease are clear from what hath been said; as an extraordinary making of Water, an unquenchable Thirst, and a sudden pissing forth of what is drunk. a decay of the whole Body; for the moisture which would nourish the body, is pissed forth with the drink. And though there be often a large Evacuation of Urine in sharp Feavers, and other cases, yet that is not to be called Diabetes, because the afore said Symptoms, as great Thirst and Consumption of the Body are not joyned therewith.

PROGNOSTICK. The Prognostick of this disease is deadly, for it is incurable, except it be in the beginning thereof; for it presently brings a Consumption. In old men it is more dangerous; and when it comes after inordinate Lechery or Agues.

CURE. The Cure is wrought by allaying the hot distempers of the Kidneys, and by strengthening them, by thickening the Humors that flow unto them, and by opposing the malignant quality thereof; all which may be done with these Medicines following:

In the beginning of the disease while there is strength, you may open a Vein, for to repel or pluck back, and cool the Humors; but it must be done divers times, and but a small quantity of blood taken away. But if the strength be decayed, or if this follow another disease, Phlebotomy must not be.

You must give Mollifying and Asswaging Clysters to draw forth the Excrements, made thus:

Take of Lettuce, Purslain, Mallows and Plantane, of each one handful; cleansed Barley and red Roses, of each one pugil; make a Decoction to one pint and an half. In the straining, dissolve of Diaprunes simple six drams: Honey of Roses, and Sallet Oyl, of each two ounces; make a Clyster, and use it often.

You may also give a gentle Purge with Cassia, and Pulp of Tamarinds, or the decoction of Plantane, Purslain, Lettuce, Tamarinds and Myrobalans, with Syrup of Roses.

Some commend Vomits made of the decoction of Rhadish Seed, and Dwarf-Elder with Oxymel, which doth Evacuate and draw from the Uretors.

To correct the Distemper of the said parts, and to thicken the Humors, Juleps made of the Waters or Decoctions of Lettuce, Purslain and Plantane, with Syrup of Myrtles, Quinces, and the like, and Syrup of Poppies, in a small quantity, adding the Powder of Diatragacanth frigid, and the Troches of Sealed Earth, and the like.

Or to astringe more, make them thus:

Take of Comphry and Plantane Roots, of each one ounce; Plantane Leaves one handful, Pomegranate Flowers and yellow Myrobalans, of each one dram; Plantane and Purslain seeds, of each half a dram; red Roses one pugil; boyl them to a pint. In the straining, dissolve of Syrup of Quinces three ounces: make a Julep for three Doses.

For the same end you may make a Powder, or an Opiate thus:

Take of Plantane, Purslain, and Coriander seeds prepared, and red Roses, of each one ounce; prepared Coral, Bole-Armenick, prepared Pearl and Tormentil roots, of each one scruple; Nutmeg half a dram: mix them into Powder.

Take of old Conserve of Roses four ounces; Bole, prepared Coral, and burnt Harts horn, of each one scruple: With Syrup of Quinces make an Opiate.

Erastus highly commends the Syrup of Comphry Roots and Sloes, which he saith he used with good success in these Diseases.

Also Narcoticks or Stupefactives used wisely, are very good; as new Treacle, Syrup of Poppies and Laudanum.

If it continue long, Sheeps milk, Cow or Asses milk are excellent, if you first consume the Whey thereof, with often quenching flints therein, and he may use it in the morning, as we shewed in other Cures.

Sweating is commended by Authors, by which means the serous Humors are drawn outward. But it is to be mistrusted, because it is very like to purge by Urine, and encrease the distemper of the Bowels. But if it be used at any time, it must be of the mildest sort, as of Roots of China, Sarsa, Endive, Borrage, Sorrel boyled in Water, or for those who are consumed in Chicken Broth; but we think it safer to provoke sweat by outward means; as by a vapour from some convenient Decoction in a wooden Instrument.

Such Sudorificks as are prescribed in malignant Feavers, are excellent, especially if Spirit of Vi-
triol be in them, to quench Thirst, stay the Flux, and resist the malignity.

For drink, let the Patient use Iron'd Water with sharp and astringent Syrups, or a decoction of
Sloes, and the inward Bark of an Oak; by which Medicine even alone, *Erastus* saith, That he cu-
red this disease in a Boy.

Outwardly, Apply a Fomentation to the Loyns made of Sorrel Roots, Plantane, Pomegranate-
peels, Sumach Seeds, and the like, with a little Vinegar; or, which is most proper, make a Bath of
the same decoction to sit in.

And anoint the part with Unguent of Roses, Sanders and Comitiffa mixed together, or this fol-
lowing:

*Take of Oyl of Roses and Myrtles, of each one ounce; red Sanders, red Roses, and red Coral, of each
one scruple; Juicyce of Plantane one ounce; Wax as much as will make an Oyntment.*

Then you mult allay the Symptoms that accompany this disease; as thirst, watching, consumption,
and the like, by their Remedies mentioned in their proper Chapters.

CHAP. VII.

Of Pissing of the Bed: of Involuntary Pissing, or not containing of Urine.

THe not holding of the Urine consists in the hurting of the retentive action of the bladder: as Di-
abetes, or extraordinary pissing comes from the hurt done to the attractive faculty, and Dysuria
from the distemper in the expulsive: so this comes from the Disorder in the retentive Faculty of the
Bladder. This comes sometimes to people awake, and then the disease is worse; sometimes to them
asleep, and then it is less, because then the Animal Functions are exercised less freely. And this in
time of sleep comes two ways, either from weakness and looseness of the Sphincter Muscle of the
bladder, as in sucking Children, weak people, and sometimes in them of years; or from the hurt of
the Imagination: for many do piss their Beds, either from too much drink, or from the exquisite sense
of the bladder, and the urines sharpness, with some consent of their will, when they dream they are
pissing against a wall, or other place; and they are so accustomed to it, that it is done without any
distemper either of the bladder or its Sphincter; nor are they to be cured with Medicines, but by
change of their foolish Imagination, as Children by Whipping; or in those of years, by adorning
those places which they dream they piss upon with some costly things, and shewing them often.

The true cause of this is in the Sphincter Muscle, which suffers either from its self, or by consent
from other parts.

It comes divers ways by consent, as when the whole body is weak, and the vital heat spent, as in
dying men, or when the whole body, or half of it is taken with the Palsey, or those branches of Nerves
which come from the *Os Sacrum* to the bladder: sometimes the looseness of the Muscle comes from
the pain only, and nearness to other parts affected; as in Women with Child, from the swelling and
pain of the Womb, and in the great Disease of the straight Gut.

The Sphincter muscle suffers divers ways by its self, as when it is wounded, as in cutting for the
Stone, or in deep Ulcers, which hinder its contraction and shutting. But the chief and usual cause
is, a cold and moist distemper, which is most fit to weaken and make loose the part. Which is produced
of a cold and moist Native temper, in Youth, old Age, Women, and the diseases of the whole body,
or some parts thereof, coming of a moist and cold distemper: to these you may add external causes
often mentioned.

But here we may dispute how contrary effects may be produced of the same cause: for *Hypocrates*
in *Coac.* says. That stoppage of the urine comes of a cold cause in these words; *A stoppage of Urine
coming of a cold cause is worst of all*: now not holding and stoppage are contrary. We must answer,
That when a cold Distemper doth only hurt or abolish the sense of the bladder, there may be a sup-
pression of Urine, because the bladder cannot be sensible of provocation to expel urine: but if the
motive faculty which is in the Sphincter muscle be hurt by reason of the looseness of it, the urine
cannot be retained.

SIGNS. The Signs of this Disease, either shew this disease to be by consent, and these must be
taken from the diseases before mentioned, which are apt to produce this not holding the urine; which
if you find, you may conclude, that the disease comes from them: but if they be absent, then you
must bethink your self of the propriety of the disease to the part, which will be easily discovered if it
come from a wound and Ulcer, or the like disease of the Sphincter: but if neither of these appear, you
must consider of the cold and moist distemper of the part; and this is known by the causes both inter-
nal and external, and by the effects which depends upon them, as softness of the whole body, white-
ness,

ness, looseness of the Nerves and Privities, Childhood, Age, evil Flegmatick Concoction, and the like.

PROGNOSTICK. This Disease is incurable in old men, by reason of their great moistness, and the loss of vital heat, which cannot be repaired.

In an acute Feaver, involuntary Pissing is very dangerous; for it comes either of a Delirium, or from a great destruction of all the faculties which followeth the extinction of the natural heat.

In Children it is cured when they grow elder, and the superfluous humidity is by degrees consumed, and the parts that were loose, are more knit; But if they be not cured before twenty five years of age, they are incurable.

CURE. The Cure is wrought by amending the cold and moist distemper, and looseness of the Sphincter muscle; but that which comes by sympathy from other Diseases, must be cured by the removing of them; as also that which comes from Wounds, Ulcers, and other manifest diseases depends upon the Cure of them. Therefore we shall lay down a way of Cure proper both for Children and Men, provided that the Physician be skilful in the choyce of his Medicines, to give the gentlest to Children, and that he encrease and diminish the quantity according to the Patients age.

First, Here is little use of Phlebotomy, because it comes from a cold distemper and flegm; except there be a general Plethory in the whole body, being youthful.

But Purging is always necessary in this Disease, made of things that purge Flegm, mixed with some astringents that are not onely Alterers, but Purgers, as Rhubarb and Myrobalans, and the like.

After, to dry up the matter that is Flegmatick, and to knit the part, you may use Powders, Opiates, and Physick Wines, and the like, made thus:

Take of Cypress Nuts, and Myrtils dryed at the fire, shavings of Ivory, Coriander seeds prepared, red Coral and Amber, of each two drams: Spodium or burnt Ivory one dram; Cypress Roots and Galangal, of each half a dram: With the Syrup of Citrons make an Opiate, of which let him take the quantity of a chestnut morning and evening. Drink after it a little red Wine.

Or you may give the aforesaid Powder from half a dram to a dram, with red Wine twice in a day, long after and before meat.

Take of Comfry Roots half an ounce; Cypress Roots and Galangal, of each one dram; Plantane, Horse tail and Five leaved Grass, with the Roots, of each one handful; Cypress Nuts, Acorn cups, of each four scruples; Rue seed, Agnus castus, Frankincense, and Ivory shavings, of each half a scruple; red Roses one pugil, red Wine four pints. Infuse them twenty four hours, strain them through an Hippocras Bag, adding of Cinnamon half an ounce: Sugar as much as is sufficient to make a Claret, of which let him take three or four ounces twice in a day.

Many proper things are propounded by Authors, which do conduce to the Cure of this Disease. Galen in his Book of Local Medicines, and of things easie to be prepared, commends the Brain and Stones of a Hare burnt. Also a Snail burnt with its shell, given to Drink: The Modern Physitians give Hares dung, powder of burnt Mice, the Hoofs of Hogs burnt, the ashes of Dates stones, roasted Hazel Nuts, powder of Egg shells. But above all, are commended the powder of Agrimony, and the inward Skins of Hens Gizzards dryed, given either by themselves, or mixed together with red Wine.

Solenander witnesseth, That he saw happy success in a Medicine invented by one Gilbert Holland, a Roman Physitian: He took the Throat of a Cock, and dryed it at the fire till it would powder. He gave it before Supper in red Wine, or with Oxycrate for some days together.

In people of years, Sweating Decoctions used twenty days together, are good to dry the Body, made of Guajacum and Saxaphras; or Stuphs, Hot-Houses, Brimstone Baths, and those of Nitre.

For his drink, let him take sharp red Wine without mixture, or with a little Ironed Water.

They who can drink onely Water, may take Ironed Water, or that in which Coriander seed, or a little Mastich hath been boyled. Or lastly, for the better astringing, let them take Water in which new Tiles have been quenched, and boyl their meat with the same. But they must drink but little, especially at Supper: And let the Patient make water when he goes to bed, and be raised again at midnight, and in the morning, for the same purpose, and this will alter custome.

Outwardly to the Privities, apply warm, strengthening and drying things, thus made:

Take of Elicampane Roots, Calamus Aromaticus, Acorns and Cypress Roots, of each half an ounce; Mints, Sage, Organ, Calamints and Wormwood, of each half a handful; Cypress Nuts, Myrtils, Galls and Pomegranate flowers, of each one dram; red Roses one pugil: boyl them in equal parts of Smiths Water, and red Wine to two pints. In the straining, dissolve of Sali and Allum of each one ounce. Foment the Privities and Perinæum warm morning and evening.

Or

Or you may make a bath of the same things in larger quantities.

After the Fomentation, anoint the same parts with an Oyntment of Oyl of Foxes, Rue, Flower-de-luce, Unguentum Martiatum, Aregon, with Powder of Mastich, Cypress and Myrtles.

Or you may use Storax Liquid, or Indian Balsom, dissolved with a little Wine; or for rich folks, Musk and Civet dissolved in Muskadel.

Or apply this Plaister to the parts aforesaid:

Take of Labdantum and Mastich, of each two drams; Wood of Alees, *Styrax calamita*, Cinnamon, Turpentine, of each one dram; Myrtles and cypress Roots, of each half a dram; Juycce of Mints and Hors-tail drawn with red Wine, as much as will make a Plaister.

Lastly, If there be a defluxion from the head, which causeth the weakness; you must divert by Errhines, Masticatories and Causticks to the Neck or arm, and other Remedies mentioned in the cure of the Catarrh.

CHAP. VIII.

Of stoppage of the Urine and Strangury.

THe stoppage of the Urine is called by Authors *Ischuria*; but when little is voided, it is called *Stranguria*: although this word be larger, and comprehends all dropping of Urine; but if it be without pain, and the Urine come by drops with straining, it is a small *Ischuria*; but if it be with pain, it must be referred to *Dysuria*, or scalding of Urine.

Therefore *Ischuria*, or a whole suppression of Urine, is two-fold, namely true, when the bladder is full; or Spurious, when the Bladder is empty, and nothing comes to it from the Reins.

CAUSES. A true *Ischuria* comes of three Causes: The first is, when the sense is lost in the Bladder, by reason of the Palsey, and obstruction of the Nerve that comes to it, or by the eversion of the Spirits, by whose defect it comes, so that the bladder feeleth no pricking to expel, as in dotings, and sleepey Diseases.

The second cause is, a cold distemper of the bladder, coming from internal or external cold Causes, which dull the sense of the bladder, and weaken its expulsion.

The third Cause is, the narrowness of the Neck of the Bladder, which will not suffer the Urine to pass. *Galen* gives three causes of this, 1. *de loc. affect. cap. 1.* either the muscle is swollen by an Inflammation, Schirrhus or Imposthume, or the like; or there is a little flesh grown in the passage, by reason of a former Ulcer; or there is a hardness from some thick Humor of long continuance. Also the Passage is stopped by the Stone, by a Crude and thick Humor, by a clod of blood or matter.

Besides, The Urine may be stoppt by a Tumor in some part nigh to the neck of the bladder, from the swelling of the Womb, from the Excrements in the strait Gut, or from the Hemorrhoids growing big.

Sometimes it comes from the long holding of the Water, by which the bladder is so stretched, that it cannot contract it self to expel urine, by which stretching, the passage is stoppt and contracted. Now the bladder is filled by urine too long detained, two ways. First, when a sound man by urgent occasions in the Market, Senate, Church, Banquet, Running, and the like, holds his urine for want of opportunity to void it, which stretcheth it so, that it cannot again contract it self; and the pricking of the urine is not perceived by reason of its dull sense from the distemper of the Nerves which come thither, when those Nerves which are for the contracting of the muscle are well and sound, which *Galen* saith hefeel one, 6. *de loc. aff. cap. 4.* when the Back-bone was strained.

This is called a bastard *Ischuria*, in which the urine is stopped, and the bladder empty, because no Water descends into it. There is a two-fold cause why no urine comes to the bladder, either because the Kidneys do not draw that whereof the urine is made, and send it down; or because the Uretors will not receive it: therefore either the attractive or expulsive Faculty of the Reins is hurt. The attractive or drawing Faculty is hurt by the Error of the Object, or in its self. This is from a strong distemper, especially cold, or from some stoppage in the Reins, or in the Emulgent Veins. These Obstructions proceed from the stone, thick flegm or matter that falls down thither. The obstruction of the Emulgents comes sometimes from too much blood, or serous matter; A story whereof we have in our Observations, *Observ. 1. Cent. 1.*

By the fault of the Object, the attraction of the Reins is hindered, when the serum or water is spent, as in burning Feavers; or sent to other parts, as in a Dropsie.

The Expulsive Faculty is hurt by the same causes, namely, distemper, the stone, clods of blood, matter, or gross Flegm or Inflammation.

*

The

The Uretors do not receive the Serum, nor send it to the Bladder, by reason of Inflammations, or Obstruction by the Stone, a clod of blood, matter, or thick flegm, or by a compression from some humor in a part adjacent.

We must observe, that both Kidneys or Uretors are affected, for the total stoppage of urine; for if one be open, the urine may pass.

The aforesaid Causes, if they be violent, may make a total Obstruction of urine, which is called *Ischuria*; but if they be small and remiss, they make only an evacuation in part, which is called a Stranguary; and both Diseases come from the same cause, different in degrees.

A true *Ischuria* is known by the weight and enlarging of the lower part of the belly, and by a Tumor in form like the bladder.

The Causes are known by things aforegoing, or that accompany it: For if it come from too great a quantity of urine, which hinders the contraction of the bladder, the Patient will tell you how that he forbore to piss by reason of long riding, or the presence of some people of Honor, and that before he never had any distemper in those parts. But if he hath had a Delirium, a Palsy, or the like, you may refer the stoppage to them.

The stoppage which comes from Tumors of those or the adjacent parts, or other Causes before mentioned, will be known by their proper Signs.

The stoppage of passage of the bladder is known by a searing Candle put in, or a Catheter; which if they cannot pierce, but are stopped by the way, shew that there is either a Stone or a Caruncle, or a little Excrecence of flesh, or the like in the passage.

And these are to be distinguished; for if it be a stone, there was formerly a pain of the Reins whether it came from the bladder or Reins. If a Caruncle, there was a stinking Gonorrhœa, or running of the Reins, or an Ulcer in the passage of the Yard that did long run.

And lastly, if there be a clod of blood, or matter, or flegm, you shall see some part of it come out of the Yard, or it will stick to the Catheter.

A bastard *Ischuria* is hence known, That there is neither Extension nor Tumor, nor weight about the Privities, but rather a kind of emptiness thereabout; there is no desire to piss, no tickling in the bladder, and no urine made, there went before the signs of the stone in the Kidneys or Uretors, or of Inflammation, or great fulness, or much drink was taken, which was not plentifully pissed forth: whence the Veins might be swoln, or else there is a burning Feaver, or a Dropsie, which signifie the revulsion, and turning away of the Water or serous matter.

PROGNOSTICK. The stoppage of Urine is very dangerous, and if it continue above seven days, it is deadly: for the Serum being retained in the Veins, doth oppress the Liver, infect the Blood, and run into the whole Body; it brings danger of choaking, and being carried to the brain, produceth a Coma, or kind of Lethargy.

The stoppage of urine which comes from the back being wounded, or by a fall, or straining of the Vertebrae or back-bone, is incurable.

If the Patient stink of Piss at his mouth or nose, it is deadly.

If a Tenasmus or needling follow a suppression of urine, it is death in seven days. And also if the Hiccough follow upon it.

CURE. The Cure of the stoppage of urine, whether it be total or partial, must be by aiming at the Causes. And first, that suppression which is called spurious, and depends upon the diseases of the Reins or Uretors, is to be found in the Cure of the Inflammation, pain, or stone of the Kidneys; that which comes from the fulness of the Emulgent Veins, is to be cured by large bleeding, and Medicines that purge Water. A true *Ischuria* is cured by things that take away the cause: and first, if it come from Inflammation of the bladder, or parts adjoining, you may find Medicines for it in the Cure of the Inflammation of the bladder.

But if it come from a stone in the neck of the bladder, you must use these Remedies following.

First you must lay the Patient upon his back with his Thighs lifted up, and then shake him soundly, to make the stone return into the bladder: And if this will not do it, use the Catheter. But if the stone be in the passage of the Yard, you must labour to get it out with your fingers, gently stroaking it to the end of the Yard; and you must put the yard into warm Water or Milk, or the Patient into a Bath to open the passage. But if you can neither get it out nor in, Practitioners say, that you may bind the yard on both sides of it, and take it out by Incision.

The Obstruction of the neck of the bladder, which comes from Inflammation, will be cured with the proper Medicines against Inflammation. But in the mean while, if the Urine be there long detained, you may gently convey in a searing Candle dipt in a little Oyl of sweet Almonds, avoiding the Catheter, lest it cause pain, and so encrease the Inflammation.

If the stoppage of Urine comes from a Caruncle, you must take that away. This is done by proper medicines conveyed thither with a Wax Candle, which must be done by a skilful hand. And if
the

the Caruncle swell and stop the passage, necessity will constrain you to use the Catheter to draw away the urine, although there be danger lest the part disturbed should swell more. But you must first make use of Revulsions, by bleeding, vomiting, and Repellers to the Privities, to take away the Inflammation of the Caruncle, that way may be made for the urine.

If suppression of the urine come from thick flegm, first it is good to purge with a Bolus made of Diaphœnicon and Rhubarb, and then to give Turpentine often with Powder of Liquoris; afterwards a Decoction of opening Roots with Oxymel, or *Syrupus Bizantinus*; not omitting in the mean while Clysters, Fomentations and Baths that mollifie and open. And all those things will be proper which were propounded for the dissolving and expelling of the stone.

And among the rest, Experience hath taught us, that these following are excellent:

Take of Benedicta Laxativa half an ounce, the Troches of Myrrh two scruples, the Decoction of Savin three ounces. Mix them for a potion. By this a Woman was presently cured of the stoppage of Urine.

If there be abundance of Flegm in the whole body, or in the Head, after blood-letting, from the beginning of the Cure, you must purge with an Apozeme three or four days together.

Also the Julep mentioned in the Cure of the Stone of the Kidneys, made of the juyce of Pellitory of the Wall, Sea fennel and Lemons, with Oyl of sweet Almonds.

The Syrup of Rhadishes, of *Fernelius* his prescription, given two ounces at a time, is very excellent.

Dodonæus in Observat. Cap. 48. Reports of one of fourscore years of age, that was cured of a stoppage of urine with dropping, by a Lixivium or Lye made with ashes of Egg-shells and Rhenish wine once taken.

Arnoldus Villanovanus commends the Wine of Winter Cherries in this following History, mentioned in his Book of Wines. There was in my time a Cardinal, who had not pissed for four days, who was desperately swoln; and cured by the advice of a weak Physitian with Winter Cherry Wine, and he voided as much Urine as would fill a Bason. By that only experiment, that Physitian being poor, and of small parts, became a great rich man. Many God bestows his Blessings upon, his ways are unsearchable. This kind of Wine, as *Arnoldus* shews, is made by taking five, or seven, or more Winter Cherries, and beating them with good Whitewine, and then straining them, and giving them to be drunk.

Hog-lice also beaten with Whitewine, and given to be drunk, are good for the same.

The Oyl of Scorpions, as *Mathiolus* prescribed it, given five or six drops in broth or other Liquor, doth powerfully provoke urine.

The often use of the Crystal Mineral doth provoke urine, especially when you fear Inflammation, which is often caused in the inward Skin of the Bladder, by the stoppage of urine.

The Spirit of Salt doth it better.

The Vulgar Medicine of the Juyce of Pellitory of the Wall refined four ounces, with half an ounce of Sugar, doth very much good. You may mix therewith *Sal Prunella*, or Spirit of Salt.

If these stoppings from Flegm do often return, there is nothing better than Brimstone and Nitre Bath-waters; which both by drinking and bathing, do easily dissolve, cleanse and consume that slimy matter.

A certain Nobleman having his Urine suppressed many days, after other Medicines taken in vain, by this following Clyster kept two hours in his body, was cured.

Take of the Roots of Smallage, Parsley, Butchers Broom, Dogs-tooth, Sparagus, Mallows and Marsh-mallows, of each two drams; Pellitory of the Wall two handfuls; Annis, Fennel, Dill, Caraway, Carrot, Ameos, Carthamus, Rue and Cummin seeds, with Bay-berries, of each half an ounce; Camomel, Melilot, Dill and French Lavender flowers, of each two pugils: boyl them in Whitewine to half. In a pint of the straining, dissolve of fresh Butter four ounces; Honey of Roses two ounces, red Sugar one dram, Benedicta Laxativa half an ounce; one Egg, the Oyl of Nuts, Dill, Lin-seed, of each two ounces. Make a Clyster.

The Chymists brag of their Medicines against this Disease; namely, Spirit of Salt, Vitriol, Sulphur and Turpentine, which they give to half a scruple in convenient Liquors, or Chicken Broth.

They commend also the Salt of Tartar, and of Bean Stalks, given from half a dram to a dram.

And for Revulsion of the Humor from the part affected, they give Vomits, and they boast that very many have been cured thereby.

You must all the time of the Cure use Liniments, Fomentations, Cataplasms and Baths, and other external things which must be the same that were before mentioned for the pain in the Kidneys: Among the rest, a Cataplasm made of Pellitory of the Wall fryed in Butter, or Oyl of Scorpions, is excellent. Also a bladder half full of Oyl, which will be of more force, if you boyl Spanish Flies, called Cantharides, therein.

Commonly

Commonly they apply a Cataplasim of fryed Onions with Hogs Grease to the Loyns and Privities with some Eggs.

But raw white Onions beaten with Oyl into the form of a Cataplasim, do far better, if they be applied to the Kidneys, Uretors and Privities.

A Cataplasim made of beaten Rhadishes, is good for the same.

When the Iſchuria comes of clotted blood, you must dissolve it. For this purpose use Troches of Amber, the Rennet of a Kid or Hare, Mummy, simple Oxymer, and Oxymer of Squils, Syrup of Vinegar, and the like. Outwardly a Cow-turd doth wonders, according to the Judgment of Learned *Atius*, Terr. 3. Serm. 2 Cap. 7.

Lastly, When the Urine is stop'd by Matter, or comes only dropping, you must use Cleansers and Cutters, such as were set down in the Cure of the Ulcer of the Reins and Bladder.

CHAP. IX.

Of Dysuria, or Scalding of the Urine.

BY the word *Dysuria*, we understand all painful pissing, which the Modern Writers call Scalding of the Urine. Many Authors make it all one with the Strangury, because there is painful pissing; but they will have it differ from Dysuria in this only, because in Dysuria there is a greater quantity of Urine made; than in Strangury, which is therefore called pissing by drops. But we had rather for Instruction sake, call that Strangury which is pissing little without pain, and put them in one Chapter, because they must be cured both the same way; and to treat here of all painful pissing under the name of Dysuria, being they come all of the same Causes, and are cured by the same Medicines.

CAUSES.] The immediate Cause of painful pissing is a solution of continuity in the Sphincter Muscle, or the passage of the Bladder: and therefore whatsoever can cause a wound in those parts, may cause heat of Urine.

The most usual Cause is sharpness of Urine, sometimes without mixture of other humors, which is caused by a hot distemper of the Bowels, or of the whole Body or by eating of hot and sharp Meats; but it often comes by mixture of hot and sharp Humors, as Choller and salt Flegm. Sometimes matter coming from the Reins or Bladder, being ulcerated, may cause such a sharpness of Urine. Sometimes a white Humor like Milk comes plentifully forth with the Urine, and causeth scalding, which is commonly thought to be matter from the Reins; but *Sennertus* denies it for this Reason, For if all the Reins were turned into matter, they could not afford so much as is many times voided at once every day for a week together. And he supposed that it comes from an evil Concoction, first of the Stomach, then of the Liver, because the error of the first Concoction cannot be amended in the second; hence the Chylus, and then the Blood remains crude, not freed from its Salt and Tartar like parts, which ought to be separated in the first Concoction, and they being after sucked into the Reins, and sent to the Bladder, cause pain in pissing. He saith, that he was brought to be of this Judgment, because a Learned man, who was troubled some weeks with heat of Urine, which he voided plentifully with half an Urinal full of such white matter, was (when nothing else could assuage these violent pains) cured only with drinking of Sack.

Also a stone in the Bladder, if it strike against the Neck of it in time of pissing, causeth pain; and also large Gravel which grates upon the passage of the Urine.

Also Inflammation, or an Ulcer of those parts, causeth heat of Urine, because the sense is more quick at that time; and though the Urine be well tempered, it is troublesome; as we see externally how the least touch is offensive to a sore place. So in a Gonorrhœa, as long as the Parastates are inflamed, there is a continual heat of Urine.

DIAGNOSTICK.] The Knowledge of this Disease is evident, for the Patient is forced to roar sometimes with pain. But you must distinguish the Signs of the Causes thus:

If it come from sharpness of Urine, it will be thin and high coloured, sometimes like fire; or, there will be visible mixture of Choller, Flegm or Matter; the Bowels will be distempered, or the Patient hath eaten hot and sharp meats, and endured great heat.

The Stone and Inflammation of those parts are known by their proper Signs.

PROGNOSTICK.] As for the Prognostick. This Disease of it self is not dangerous, but very painful: and according to the cause, it is sometimes hard to be cured, especially in old men, which if they be decrepid, die thereof; and in all ages if it continue long, it ulcerateth the neck of the Bladder.

[CURE.] The Cure is, first by taking away the Cause. And therefore if it come from the Stone, Inflammation or Ulcer, you must cure them according to the Rules in their proper Chapter. But these things after mentioned will be good to allay the Symptom.

They who have it from the sharpness of Urine mixed with hot Humors, are to be cured by the Medicines following.

And first, Phlebotomy is good to correct the distemper of the Liver and other parts. This must be often according to the Plethory and Inflammation; first from the right Arm, to evacuate and reveal the matter; and after in the lower Veins, to derive it from the part affected; for which cause, *Hippocrates*, and *Galen* who followed him, do command the lower Veins to be opened in Diseases of all parts beneath the Reins.

Purging also is good, of mild and gentle things that cool, lest the heat be encreased. Therefore do not give any thing but a Bolus of Cassia alone, and indeed that is best. But you may make it cooler, if you add the Pulp of Tamarinds. Or you may mix it with the Decoction of Lettuce, Purslain, and Mallow Tops, and give it many days together, that the sharp Humors may be brought back from the part by stool. But if you desire to purge more by reason of the plenty of Humors, use this following.

Take Lettuce, Purslain, Plantane and Mallow-tops, of each half a handful: Tamarinds half an ounce, yellow Myrobalans one dram: boyl them to six ounces, and add to it strained one ounce of Cassia: strain it again, and then add one dram and an half of Rhubarb infused in Lettuce Water, with yellow Sanders, Manna, and Syrup of Roses, of each one ounce. Make a Potion.

In an old Dysury, the purging Opiate prescribed in the Ulcer of the Bladder, is very good.

A gentle Vomit is excellent, for it reveleth from that part affected, and hinders those inconveniences which use to come by purging: Therefore give it once or twice in a week to them that can vomit easily.

By often Clysters, the sharp Humors are not only brought to the Guts, and sent out by degrees, but the distemper of the parts is qualified.

They are made thus:

Take of Marsh-mallow Roots one ounce: Mallows, Violets and Lettuce, of each one handful: Water-Lillies and cleansed Barley, of each one pugil; boyl them to a pint: Dissolve in the straining, Cassia new drawn one ounce, one Egg, and two ounces of Oyl of Violets. Make a Clyster.

The Musilages of Seeds of Marsh-mallows, Quinces and Fœnugreek, may be mixed with Clysters to assuage pain.

But Clysters of Milk only, or mixed with the aforesaid thing, use to be so powerful to allay heat and pain, that we have known some of long continuance cured by them alone, and a Bath, whereof we will speak hereafter.

Experience hath found out many things good to be taken at the mouth, to allay heat, and to correct the distemper of the parts. The chief are these following:

Take of Water Purslain Lettuce, Roses and Water Lillies, of each one ounce: Syrup of Violets and Water-Lillies, of each six drams: Sal Prunella one dram. Mix them for a Julep, repeat it often.

Take of Marsh-mallow Roots one ounce, Lettuce Endive, Purslain and Mallow tops, of each one handful: Melon, Gourd, Mallows, Lettuce and white Poppy seeds, of each three drams: Fijubes and Sebestens, of each six pair: Violets, Roses and Water-Lillies, of each one pugil: boyl them in a pint and an half of white Wine, Dissolve in the straining, Syrup of Violets, Fijubes and Poppies, of each one ounce and an half: Sal Prunella half an ounce: make a Julep for four Doses to be taken twice in a day.

Emulsions also may be used, although they be Diuretick, because they cool and cleanse the passage of the Bladder. Make them thus:

Take of the four great cold Seeds, and white Poppy seeds, of each three drams; Sweet Almond blanch-ed and infused in cold Water half an ounce: beat them in a stone Mortar, pouring on them by degrees the Decoction of Barley, Liquoris, Purslain, and Mallow tops one pint and an half: make an Emulsion for three Doses, adding to each Dose one ounce of the Syrup of Violets, and one dram of Lapis Prunella; and if the pain be great, add a little Syrup of Poppies, and one dram of Gum Arabick in powder, or the Syrup of Marsh Mallows, according to Fernelius, or of Musilages.

You may make Broths thus:

Take of Marsh-mallow Roots half an ounce, Mallows one handful; Liquoris half an ounce: Quince seeds one dram: boyl them with Chicken Broth: make it often.

The Whey of Goats Milk is very good given in great draughts, as we said in the hot distemper of the Liver.

And if there be no Feaver, you may with more profit give Milk by it self, because it doth not only cleanse, but allay pain, and temper the sharpness of the Humors.

In an old Disease, it is good to give Mineral Waters that cool, especially Allum, Iron and Vitriol Waters; for by experience we find that they have cured this Disease when it hath been inveterate.

Instead of the foresaid Juleps, the simple decoction of Mallows, with Syrup of Violets, may be used; by which *Forestus* saith, *Obs.* 4. *Lib.* 25. he cured a grievous Dysury many times, and that there is nothing like it.

Forestus also *Obs.* 3. of the same Book, saith, that an Apothecary cured himself and others with the white of an Egg beaten with Rose Water.

He also reports, that a Woman cured an old man of *Delf*, with Camomel flowers boyled in Milk.

Amatus Lusitanus, 58. *Curat.* Cent. 6. saith, that a woman was cured, when all means failed, with Conserve of Mallow flowers; she took one ounce morning and evening, and drunk after it three ounces of Mallows water. And *Curat.* 59. he saith, that one who had a Dysury, after he had voided a stone, was cured by the same in three days. The Conserve of Marshmallow flowers is of the same or greater Vertue.

Some commend the Troches of Winter-Cherries given with convenient Liquor, the quantity of a dram, because they are Diuretick, abate sharpness and pain.

When the pain is very great, it is good to put the Yard when you piss into warm Milk, or a Decoction of Mallows and white Poppy seeds, or warm Water only.

A small Decoction of Mallows with Syrup of Violets and Conserve of Roses is good for ordinary Drink.

You may also make Injections into the passage of the Bladder, of Milk, or of an Emulsion of the cold Seeds, Plantane Water or Whey, with the water of a white of an Egg beaten, or on a scruple of the Troches of Winter-Cherries.

External Medicines are good, as Baths, half Baths, Fomentations to the Privities made of the cool Herbs, Liniments of Oyl of Roses, Water Lillies, Unguent of Roses, *Galens* cooling Oyntment Populeon with Camphire, and the Mullage of Fleabane made with Plantane water. Also you must apply Epithems that cool the Reins and Liver, and the aforesaid Liniments, and the things mentioned formerly for the same.

When sharp and cholerick Humors flow from the Liver, you may derive by an Issue in the right Leg, or by opening the Hemorrhoids, which is very good in all diseases of the Reins and Bladder; according to that of *Hypocrates*, *Aph.* 11. *Sect.* 6. because from the Spleen Vein called *Ramus Splenicus*, there are branches go to the Reins, Bladder and Hemorrhoids.

OF THE
PRACTICE
OF
PHYSICK.

OF WOMENS Diseases.

THE PREFACE.

Those are called Womens Diseases which are proper to them only, and come from the defect of that part which is distinct in them from men, viz. the Womb; of which Democritus in his Letter to Hypocrates said, That it was the cause of six hundred miseries, and innumerable Calamities. But we to lay down those Diseases of the Womb which are most usual, will divide them thus: Some come from the Vessels, and some from the Body of the Womb or Cavity; others are in respect of its chief and not least act of Generation. From the distemper of the Vessels of the Womb, and the preternatural causes, come Chlorosis or Green Sickness, stoppage of the Terms, immoderate Flux, the Whites, Rage of the Womb, and the Mother. In the Cavity of the Womb are, Inflammations, Ulcers, Schirrhus, Cancer, Gangrene, Dropsie coming forth, and shutting up thereof: These may hinder Generation but by accident. The Diseases which are in respect of Conception, Breeding and Bringing forth, are Barrenness, acute and Chronical Diseases of Women with Child, Abortion, difficult bringing forth, dead Child, Secundine retained, immoderate flux, or suppression of blood, and the acute Diseases of Women in Child-bed. All which Diseases we will speak of in as few words as the dignity of the matter will permit.

CHAPTER

Of the Green-Sickness, called Chlorosis.

This Disease by Hypocrates is called *Chlorosis*; by the Modern Physicians, the white Fever, the Virgins Disease, the Pale colour of Virgins, the white Jaundice, but vulgarly the Green Sickness.

DIFFERENCES. It may be defined thus: An evil habit of Body from the Obstruction of the Veins of the Liver, Spleen and Mesentery, and especially of those which are about the Womb, which is accompanied with a heaviness or unvioldiness of the whole body, beating of the heart, difficulty of breathing, a desire of evil Food, and the like.

This

This Disease depends immediately upon the Obstruction of the parts in the lower Belly, especially of those Veins which are about the Womb, whereby the free passage of blood to the Womb is hindered, which abounding in Virgins when they begin to have their Terms, and being hindered of its natural course by those obstructions, runs to the upper parts, and oppresseth the Heart, Liver, Spleen, Diaphragma or Midriff, and other parts, destroys their natural heat, and stops the Vessels; hence is there an evil concoction in the Bowels; and from thence their body is full of Crudities, which being carried forth, make an evil Habit. In other parts they produce divers Symptomes in the Hypochondria, as swelling of the Bowels, by which the Midriff is oppressed, which causeth shortness of breath. And because gross blood and wind are carried by the branches of the hollow Vein, and great Artery into the Heart, which contend against them for fear of Suffocation, by often moving of its Arteries, there is a palpitation of the Heart, and often beating in the Temples. Besides, they have in this Disease a loathing of meat, because the Stomach is filled with crude excrements by reason of its evil Concoction and distribution: which excrements having gotten an evil quality by a peculiar kind of corruption, cause a desire of evil meats, and things not ordained for nourishment, as Salt, Spices, Chalk, Coals, Athes, and the like, which Disease is called *Pica Malacia*, or strange longing, which we have at large spoken of in its proper place, among the Diseases of the Stomach.

CAUSES. The Causes of Obstructions in the Veins of the Womb and the Hypochondria, are thick slimy and crude Humors, coming commonly from evil Diet: for this, Virgins drink great draughts of Water at bed time, or in the morning fasting; or eat Vinegar, Herbs, unripe Fruits, Snow or Ice; hence it is, that they lose their Natural heat, and there is abundance of crude Excrements. Others sleep too much, or are very idle, as Seamstresses, which by sitting still all day are very cold. Others watch too much, and use unreasonable exercise, as dancing presently after meat, and so continuing with their Sweet-hearts all night. Moreover, they have great cares and disturbances of mind, by which the Concoction is destroyed, and the Body filled with evil Juice.

PROGNOSTICK. The Knowledge of this Disease is easie from the Symptomes following:

First, the Face and all the Body is pale and white, sometimes of a Lead-colour, blew or green; for crude, flegmatick and serous Humors abounding, and being carried to the habit of the body, do discolour it: and if Choller or Melancholy be mixed with that flegm, the colour will be yellowish, greenish or blew.

The second is swelling in the Face and Eye-lids, especially after sleep, because the motive heat being closed and contracted at night, raised more vapors than it could disperse. The Legs also and Feet, especially about the Ankles, and the whole Body, is loose and soft by reason of the abundance of flegm.

Thirdly, Heaviness and Idleness in the whole Body, a lazy stretching forth of the Legs, from the Humors being fallen down.

Fourthly, There is difficult breathing, especially when they move themselves, or go up Hills, or steep places, then the thick blood grows warm, and thence arise many vapors, which cause shortness of breathing.

Fifthly, There is palpitation of the Heart, and beating of the Arteries in the Temples when the Body is exercised; by reason of the same Evaporation, which is raised from thick Humors heated by Exercise.

Sixthly, There is often a great Head-ach, and sometimes in the hinder part of the Head, when the Womb suffers; but in the Forehead when the vapors arise most from the Hypochondria.

Seventhly, The Pulse is swift and quick, as if they were in a Fever, and therefore this Disease is called the White Fever; by reason of the quickness of the Pulse, which is so for this reason: The vital faculty being weak, makes the Pulse little, therefore Nature supplies the smallness of it with often beating.

Eighthly, The sleep is very sound, they sleep till Noon, except they be forcibly awaked; and this is from many thick vapors which arise from the filthy flegm.

Ninthly, There is a great loathing of wholesome meat, by reason of the great collection of Crudities in the Stomach and parts adjacent; and these Humors when they grow worse, cause the Pica, or longing for things that are not to be eaten.

Lastly, When the evil encreaseth, and the Obstructions are multiplied, the Terms stop, which shews the Disease to be at the height, and confirmed.

PROGNOSTICK. As for the Prognostick: That Disease commonly is not dangerous, and continueth a long time.

But if it be too much neglected and suffered to take root, so that the nourishment is hindered, there follow great diseases of the Natural part, as Schirrus and other Tumors, and corruption of the substance of them, which cause death by Dropsies, long Feavers and the like.

When the disease is less, and comes only from the Obstruction of the Veins of the Womb, in young Women it is cured by Marriage.

Women

Women that have long been in this Disease, either are barren, or their Children are diseased and weak.

There is great hope of Recovery, when the Terms keep their ordinary course, and their due quantity and quality.

CURE. The Cure of this Disease is by opening Obstructions, by emptying of the filthy Humors from the whole Body, and correcting the distempers of the Bowels, and strengthening of them.

The Obstructions are taken away by the Medicines which were mentioned in the Cure of the Obstructions of the Liver and Spleen, adding some things which respect the Womb, and that are more proper to open those Veins.

First then, give a purging Medicine agreeable to the Patients temper, made of gentle things, to cleanse the first Region only, and a Clyster before it, if the Body be bound.

Then open a Vein, if the Disease be not very old, and the Maid very much without Blood, and inclining to an evil habit. Let the Vein of the Arm be opened first, although the Terms be stopped; for if then you draw blood from the Foot, the Obstructions of the Veins of the Womb will be greater by their fulness. And if the Liver be most stopped, take blood from the right Arm; if the Spleen, from the left.

After you have bled sufficiently, you must give an ordinary Purge, by way of an Apozeme, such as was prescribed in the Cure of the Obstructions of the Liver. To which you may add some Herbs that are proper to the Womb, as Mug-wort, Feaverfew, Penny-royal; and if the Spleen be stopped, you may add proper things for that, as Caper barks, Ceterach or Spleenwort, Harts-tongue. If the temper be Cholerick, and there be signs of a hot and dry Liver, you must take all the hot simples out of the Apozeme, and put in cold openers instead thereof.

For the more delicate Virgins, instead of Apozemes, you may give the Broths prescribed in the aforesaid Cure of the Liver, and change the simples as we said of the Apozeme.

In the mean while you may use Fomentations and Liniments prescribed in the same Chapter, not only to the Liver, but to the Spleen and Womb.

After Purging, make this Bath following, to open and loosen the Vessels, and to dissolve and digest the Matter causing Obstructions, which are of such force, that we have known sometimes the Terms to begin to flow at the third or fourth bathing, when they have formerly been long stopped.

Take of Marsh-mallow Roots, Lilly Roots, Elicampane, Briony, wild Cucumber, of each two pounds: Mallows, Violets, Mercury, Pennyroyal, Feaverfew, Balm, of each four handfuls; Linseed and Fenugreek beaten, of each two ounces; boyl them in Spring Water for a Bath. Let her go into it warm twice in a day, not sweating, long before and after meat, for two days, renewing each day the Decoction.

The day after the last Bath, if the Terms be stopped, let the lower Veins be opened, and take away three ounces of Blood; and this may be done twice or thrice at a time, in which the Terms used to flow. Or if they never did appear at that time in which the Patient is most afflicted.

After these Medicines, to strengthen the Bowels, and to wear away the reliques of the Obstructions, an opening and strengthening Opiate will do very well, described in the place mentioned; to which you may add two drams of *Fæcula Brionie*, and as much of Salt of Mugwort.

But because sometimes the Obstructions are so great that they will not presently be cured, you must make a Magistral Syrup of the Ingredients to the Apozeme before mentioned, with an encrease of the purging Medicines in quantity, and let the Patient take it twice or thrice in a month.

The ordinary Pills mentioned in the Cure of the stoppage of the Liver, are most excellent; to which you may add the Medicines there mentioned, of Tartar, Vitriol and Steel.

Zacutus Lusitanus, Obs. 99. Lib. 2. reports of a certain Woman which had the Green sickness ten years with stoppage of her Terms, and could not be cured with divers opening and purging Medicines and some made of Steel, yet that he cured her with nothing but Conserve of Mugwort given thirty days together, drinking after it the distilled water of Savin, in which Rhubarb had been a whole night infused.

The same *Zacutus*, Obser. 117. Lib. 3. tells of a Virgin, which eating much Salt every day, fell into a Diarrhoea of Choller, mixed with a Consumption, which he cured after general Medicines with Goats milk steeled, and cold things applied to the Liver.

In the greatest Obstructions, an Issue made in the right or left Legg, as the Liver or Spleen is affected, is very good.

After the Obstructions are opened, you must discuss the flegm like serous Humors, that remain in the Veins, and in the habit of the Body by sweats; for which you must use the Decoction of Guajacum in cold Constitutions, or of China and Sarsa in those that are hot, for fifteen or twenty days, with this Caution, That every fourth or fifth day, you give a Purge to cleanse the Bowels of humors which cannot be sent forth by sweat; and which if they continue, will grow hard and putrifie; and be the occasion of Feavers, and other Diseases. For this purpose you may use Brimstone Baths both for drink and bathing; for by the drinking thereof, when the passages are first open by the Medicines

afore-

aforesaid, the Humor that is contained in the first and second Region of the Body, is cleansed and sent forth by the Belly and Urine; and the third Region is cleansed by sweating in them.

And lastly, Copulation, if it may be legally done, after the use of opening Medicines, is very good; for thereby the Natural heat is stirred up in parts Natural, by which the Vessels of the Womb are much enlarged. And Experience teacheth, that sometimes these Women have their Terms the first night after marriage, and that others who are in good health, have them before their accustomed time.

C H A P. II.

Of the stoppage of the Terms.

THe Terms are said to be stopped, when in a Woman ripe of Age which gives not suck, and is not with Child, there is a seldom, small, or no evacuation of blood by the Womb, which used to be every moneth.

CAUSES.] The Cause of this stoppage is either in the Womb, or its Vessels, or in the blood which comes, or ought to come that way.

Divers Diseases of the Womb may cause this Disease; namely, a cold Distemper and dry, which thickeneth and bindeth the Body of the Womb; or a hot and dry distemper by drying the part, or burning up the nourishment thereof, from whence come evil humors, which being fastened in the part, hinder the Terms from flowing. Also the Organical Diseases of those parts, as Inflammation or Schirrhus, the turning of the inward mouth thereof, or compression from the Tumors of the parts adjacent, or the Omentum or Caul growing too thick: The thickness of the Womb it self, Ulcer or Scars which they leave, or from the tearing of the Cotyledones, or mouths of the Vessels, in a great Abortion.

The Vessels of the Womb do often suffer Obstruction, which is the chief cause of stopping of the Terms, and they come from cold and thick Humors; sometimes there is a suppression of those Veins by binding of them, and that is from the parts adjacent being stretched and swoln, as we said in the binding or closing of the Womb.

The blood offending either in quantity, quality or motion, may be a cause of the obstruction of the Courses. It offends in quality, when it is too much or too little; too much, when it stretcheth out the Veins; so that they cannot contract themselves to expel it; as in the bladder, when it is too full of Urine, it cannot contract itself to send it forth; too little, when the Body hath not blood enough to nourish it.

The blood offends in quality, when it is thicker, and more slimy of its own Nature, by reason of the cold distemper of the Liver, or other parts, or from the mixture of thick and flegmatick or Melancholick humors, from whence commonly Obstructions come.

The blood offends in motion, when it passeth otherways, as by the Nose, vomiting, spittle, Urine, Hemorrhoids, and many other parts. I saw a Maid who had a Sore in her head, which opened every moneth, and bled plentifully; and we have many that have sent forth blood at fixed times by their Lungs; and this evacuation was instead of a Menstrual flux.

The External Causes are cold and dry Air, Northern Winds, often going into cold water, especially in the time of their flux; too little or too much meat, either too thick and cold, or too astringent, also hot things, as too much Salt and Spice, by drying of the substance of the Liver, and other parts, and by drying up the blood, by which it groweth thick, and fit to stop; violent exercise and watchings, which do consume the blood; long sleep and idleness, which do weaken the Natural heat, and cause Crudities; too long retaining of Excrements, by usual bleeding at the Nose, Hemorrhoids, Diarrhoea, and other evacuations by Vomit, Urine or Sweat; and lastly, great passions of the mind, anger, sudden fear, sorrow, jealousy, and the like.

DIAGNOSTICK.] The Knowledge of this is to be taken from the Patients relation; but because it comes either from Natural or Preternatural Causes, we shall lay down some distinguishing signs, lest the Physician be deceived by Women that would dissemble their being with Child, and lest he should rashly prescribe Medicines to provoke Terms to women with Child.

First, If they be with Child, they have commonly their Natural Complexion; but others are pale and ill coloured.

Secondly, The Symptoms which Women with Child have at the first, do daily decrease; but in others, stoppage of the Terms, by how much the longer the Terms stop, by so much the more the Symptoms encrease.

Thirdly, In Women with Child, after the third Moneth, you may perceive the Situation and Motion of the Infant, by laying your hand upon the inferior Belly; in others there is a Tumor to be felt

but

but it is Oedematous or Flegmatick, not hard ; neither is it proportionable to the Womb.

Fourthly, If a wise Midwife touch the inward mouth of the Womb, it will not be so close shut as in Women with Child, but rather hard and contracted, and full of pain.

Fifthly, Women with Child are commonly merry, and little disturbed ; but when the Terms are otherwise stopped, they are sad and sorrowful.

SIGNS.] The Signs of the Causes are these :

The faults of the Womb which use to cause stoppage of the Terms, shall be laid down in the following Chapters ; but the greatest part of them is found out by touching, seeing, and relation of the Patient.

The Obstruction and straightness of the Vessels of the Womb are known by pain in the Loyns and parts adjacent, especially in the time the Terms should flow ; and if any thing flow at that time, it is slimy, white and blackish. Now the Diseases of the adjacent parts, which may shut the mouth of the Womb, or the Veins, will appear by their proper signs.

You may know the abounding of blood in the Veins, by the swelling of the Veins in the Thighs and Arms, especially if the Woman be fleshy and red, and have fed high. You may suppose there is want of blood, if the Woman be fat, if she have had a long Feaver went before, or loathing of meat. The evil quality of the blood is known by the evil habit of the Body, by the distemper of the Liver, and other parts, and especially by the blood it self, if you can see some of it. The preposterous motion of blood, when it flows another way, is manifest of it self.

PROGNOSTICK.] As to the Prognostick. The stoppage of the Terms is very dangerous, and many great Diseases come thereof, and some in the Womb it self ; as swellings, imposthumes and Ulcers ; others in the whole Body, and divers parts thereof, as Feavers, Obstructions, evil Habits, Loathing, Dropsie, Heart-ach, Cough, short Breathing, Fainting sore Eyes, Madness, Melancholy, Head-ach, Joynt-gout, and the like. *Hypocrates*, Lib. 1. of Womens diseases, hath shewed the encrease of Diseases from the stopping of the Terms, in these words. *The third moneth after the stoppage of the Terms, they begin to feel suffocations, or shortness of breath, with horrors, heaviness of the Loyns, and sometimes a Feaver.* But if it last long, the Belly grows hard, they piss much, they loath meat, and watch much, they grate their Teeth in sleep ; and if they continue longer stopped, the pains will be greater ; but in the sixth moneth, that Disease which was formerly curable, will be then incurable : then she will be troubled in mind, and faint, vomit flegm ; be thirsty, the Belly about the Privities will be pained ; there will be a Feaver, and the Body bound, and the Urine stopped, the Back will ake, and she will stammer. Afterwards the Legs, Feet, and Belly will swell and the Urine be red, bloody, and pain over all the Body, especially the Neck and Back-bone and Groyns, and so they die of a Dropsie : Thus far *Hypocrates*. But here is a doubt, because the Author saith, That in the sixth moneth the disease is incurable, when Experience teacheth the contrary : and *Hypocrates* himself, 4. Epid. reports, that a Maid who had her Terms stopped for seven years, was restored to health by the return of them. *Hypocrates* may be reconciled to himself, by saying, That after six moneths the Disease is incurable, when the Terms are in the Body or Cavity of the Womb, because they putrifie, and come to suppuration, as in the After-birth, or Blood retained. But this is not to be understood of every Suppression.

That stoppage is least dangerous which comes from plenty of good blood, or Fat, bleeding, or other Evacuations, because those Causes may easily be removed.

That is harder to be cured which comes from heaviness of Humors, Obstruction of Vessels, or straitness, because that stubborn Humor getting into the innermost passages, cannot be got forth but by long pains and Medicines, which Women are very unwilling to receive.

That stoppage which cometh from the distemper only of the Womb is worst, because the part being hurt by propriety, is hard to be cured by reason of the continual flux of Humors, which the part is disposed to receive, and therefore it is called the Jakes of the whole Body.

CURE] The Cure of this Disease is divers, according to the variety of the Causes. And first if it come from too much blood, you must abate the quantity by Phlebotomy in the Arm ; for if the lower veins should be first opened, the blood would be drawn more to the Womb, where it would make greater obstruction and distention of Vessels, and break them, or cause Inflammation of the Womb.

After the Plethory or abundance of blood is taken away, you must draw the blood down by opening the lower Veins about the time that the Patient used before to be cleansed, as also by Frictions, Ligatures, Cupping-Glasses, dry, and with Scarrification.

These things done, you must relax and soften the parts of the womb with Fomentations and Baths, and moistning Unguents ; which if they cannot master the disease, you may give Hysterical Purges, and such as do properly provoke the Terms, which we shall after describe, chusing the mildest.

If want of Blood be the cause, as after long Feavers, great Evacuations, and Extenuation of the body, you must not provoke them till you have used Restoratives, and blood be renewed, and whatso-

ever

ever is the cause of extenuation be removed; which things being done, the Terms do commonly flow of themselves; which if they do not, but Nature forgets her office, you must open the inferior Veins, and use the Medicines aforementioned, so that you take not away too much blood, because the strength is little, and lest the Patient fall into a Consumption. But hear you must diligently mark, That every extenuation of the body doth not signifie want of blood, but only after great evacuations and consuming Causes; for it comes to pass sometimes, that the Terms stopt, in the Veins get an evil quality, which makes the blood unfit to nourish: hence comes leanness, although the Veins be filled with much bad blood and then large bleeding is very good, as Galen confirms, Comment. 3. in Lib. 6. Epid. I (saith he) cured a Woman that had her Courses stopped eight months, when she was lean, by drawing much blood; as also others. But what hapned to that famous Woman was remarkable; I opened a Vein when other Physitians feared the success, and were against me, saying that it must hurt her, not only because she was lean, but also because she had no stomach to Eat. But these young Physitians had a more Sophistical way, to observe what hapned to the Patients, and to neglect the effects and Causes, which are the ground of Cure. I took (to my best remembrance) the first day a pint and an half of blood from the Woman; the next day one pint: the third not above half a pint, or eight ounces. Thus Galen. By which it is manifest, That from lean women, of this Disease, you may take a great quantity of blood, although the Women of our Age will not endure it.

The stoppage of the Courses comes from a preposterous motion of the blood, when it is sent forth by the Nose, Vomiting, spitting, or Hemorrhoids, and the like: The Cure is by repelling it from those parts, and brining it to the passage of the womb. First (while they bleed) you must wash Arms, Head and Face, with the cold water, and keep them from the use of those parts, especially loud speaking; then you must open a Vein beneath. Two or three days before they bleed, apply Cupping-glasses to the Thighs and Calves of the Legs, sometimes dry, sometimes with scarrification; by provoking the Hemorrhoids, by Frictions, Ligatures, walking, Fomentations, Baths of opening Herbs, Oyntments, Pessaries, Clysters from the womb, and the like, which shall be discribed hereafter. The use of a Natural Bath is principally commended, if it be of Brimstone or Bitumen; into which let the Patient go often, long before, and after meat, not above the waist, and at the same time let the upper part be cooled with a Fan, lest by heat of the Bath, they also wax warm.

If blood flow from the Hemorrhoids being diverted from the womb, it is hard to be cured; for if you use Attractions to the lower parts, they will go by stool, and if you use Astringents below, they will repel from the womb through the nearness of parts. Therefore there is no way of Cure but this, That after you have used Attractive things beneath, you apply Topical Medicines to the womb, which may draw the Humor now in motion, more unto the womb.

But that suppression of the Courses is of all other most frequent, which is caused by obstructions of the Veins of the womb. The Cure whereof, is in a manner the same which hath been propounded in the Case of Pale and discoloured Virgins, some things only being added, which do more specifically respect the womb.

In the first place therefore, All those things may be used in their order one after another, which have been prescribed for the Cure of the Green-sickness. And for the most part it falls out that the Obstructions of the Bowels being opened, the Courses flow of their own accord: whose Eruption may yet be furthered by the use of such things as cause the Humors to work downwards; as opening of the Inferior Veins, about that time when the Courses have been wont to come down; or instead of Blood-letting, Cupping-Glasses fastened unto the Hips and Ancles, both without and with Scarification, frictions of the same parts, and painful bindings.

If the Disease be so rebellious as not to give way to the former Remedies, we must proceed to such as by a proper and specifical vertue do move the Courses, which are wont to be used under divers forms. And in the first place, most effectual Powders, and grateful to the Taste, are thus made:

Take Cinamon and Amber, of each one scruple: Saffron half a scruple. Mix all, and make them into a Powder to be taken divers mornings one after another. Or,

Take Powder of the Roots of Madder, such as Diers use, and Sugar Powdered, of each one ounce: Mix them, divide all into three parts; of which, give one at the time in which the Courses should flow, early in the morning in hot Wine, while the Patient is yet in her bed; wherein let her continue five hours, well covered with cloaths. If her courses shall not flow the next course of the Moon, at the wonted time, give her the second part: If yet they come not, give her the third part at the third return of the time of her Courses. Or,

Take Roots of round Birthwort half a dram: Savin Leaves dried one dram and an half; Dictamnus Cretensis, and Troches of Myrrh without Assafetida, because of the strong smell, of each one dram. Elect Cinnamon two drams; white Sugar two ounces. Make all into a most fine Powder, of which let her take two drams in the morning for certain days together, with broth of red Vetches, wherein two drams of Cinnamon, and half a dram of Saffron have been boyled.

Most excellent Pills made after this manner :

Take Troches of Myrrh one dram : Castorium half a scruple. With Juyc of Mugwort make small Pills.

Among familiar Medicines easily provided, are accounted the flowers of Lavender eaten with Honey many days together, or Conserve of Mary-gold flowers, given to the quantity of two drams at a time.

The Blood of a wild Goat and likewise of a tame one, hath mighty vertue to bring down the stopped Courses, according to that preparation and dose propounded in our Cure of the Pleurisie.

In hot Constitutions, Cream of Tartar used many days together in Broth, or some Melancholly driving Decoction, does further the Courses stopped.

But the Pills of *Montagnana* are mightily praised, being thus compounded :

Take Troches of Myrrh one dram and an half ; Parsley-seed, Castorium, Cinnamon, of each one scruple : Musk ten grains. With Juyc of Smallage form all (being powdered) into twenty two Pills, gilt with Gold. Let her take two in the morning, or at her entrance into bed, for some days together. Or,

Take Madder Roots and round *Aristolochia*, or Birthwort, of each three drams : Agarick and Cinnamon, of each one dram : Saffron one scruple : With Juyc of Mugwort, make a Mass of Pills ; whose dose is one dram.

Old Leven is commended by many, the quantity of a Chesnut, with the same quantity of Sugar given three days together. Yet it will do more good, if powder of the Troches of Myrrh, *Dictamnus*, or some such like be mixed therewith.

The most usual and profitable Decoctions are made in this manner :

Take Roots of Parsley, and great Madder, of each two ounces : red Vetches four pugils : boyl them to a pint and an half. In the strained Liquor boyl Cinnamon Powder one dram : Saffron half a dram, Honey as much as shall suffice : mix them. Let her take six ounces warm, in the mornings or twice a day, before her Courses break forth, or when they begin to flow, if they flow but sparingly. Or,

Take the Roots of Smallage, Asparagus, Fennel, of each one ounce : Feaverfew, Maiden-hair, Nep, Penny-royal, of each one handful : Boyl all to a quart. To four ounces of the straining, add one ounce of Syrup of Mugwort. Let her drink it hot twice a day as before. Or,

Take Cypress Roots, Angelica, Valerian and Madder of the Diers, of each half a dram : Leaves of Mugwort, Penny royal, Savin, of each half a handful : Seeds of Carrots and Seseleos, of each one dram : *Dictamnus Cretensis* one dram and an half : Choyce Cinnamon four scruples : Saffron one scruple : make a Decoction to four ounces. In the straining add Syrup of Mugwort and Hysop of each half an ounce : Make a Julep for one dose. Let her take it every other day.

Quercetanus in his *Pharmacopœia*, doth exceedingly commend two Decoctions : the first of which is thus made :

Take Gromwell seed, Annis seed Mistletoe of the Oak, of each three drams : *Dictamnus Cretensis* one dram ; Saffron one scruple. Beat what is to be beaten, and steep all in rich Whitewine twenty four hours : afterwards let them boyl a little. Of this Decoction give the Patient four ounces.

The other Decoction is thus Described :

Take the whole Spleen or Milt of an Ox, cut it in bits, and put it in a Capacious Glass, so as it may fill the Glass half full, adding of Cinnamon grossly powdered, one ounce : Cloves half an ounce : Saffron two drams : of the best Whitewine as much as shall suffice only to moisten all that is in the Glass. Let the Glass closely stopped, be put into *Balneum Mariæ* exceeding hot, so that it boyl twenty four hours together, until the Spleen shall be boyled and consumed into little crums, and there remains a great quantity of Broth excellently well boyled and of a very fragrant smell ; of which let the Patient take in the morning four ounces, continuing the same for four or five days ; When her Courses ought to flow.

Distilled Waters ought to be preferred before other Liquors, as being more pleasant to the taste : and because of their subtil thinness of parts, they pierce more easily to the obstructed Vessels of the Womb.

The Preheminence above all the rest, is by *Mercatus*, *Rodericus a Castro*, and *Sennertus* given to the following.

Take a Loaf almost as sower as Leaven, indifferently well baked and hot, take away the Crust, and add thereto of Honey twelve ounces, Powder of Nettle seeds, Carrot seeds, Amy, Annis and Fennel seeds of each one dram : Troches of Gallia Moschata, red Myrrh, of each one scruple : *Cotula Foetida*, or stinking Fennel, half a dram. Infuse all in three pints of the Decoction below described, which is made of red French-Beans, and red Vetches, of each half a pugil : Juniper berries one ounce ; Roots of Madder, Butchers Broom, Wild Rhadish, Asparagus, Smallage, and Parsley,

Parsley, of each two ounces: Green Germander one handful: Seeds of Amy, Annis and Fennel, of each two ounces: Boyl all according to Art. Then still the Liquor out in Balneo Mariæ; of which give to the Patient two ounces early in the morning. Also there may be added Syrup of Maiden-hair of Opening Roots of Mugwort. Also the Dose may be augmented the following days, if the Stomach be not offended.

A Decoction of Guajacum or Saxifras is good in flegmatick bodies; also *Dictamnus Creticus* may be added, taking the same twelve or fifteen days without sweating. *Jacbinus* relates an Experiment thereof, writing upon the ninth of *Rhasis*, Chap. 66. I boyled (says he) the Indian wood, and added *Dictamnus* thereto, by which I procured both her Courfes, and Child-bearing to a Woman which had wanted her Courfes five years, and had been Barren.

The Chymists commend *Tartarum Vitriolatum*, Spirit of Tartar, *Mixtura Spiritualis*, Salts of Mugwort, Bawm, Celandine roots, and Valerian.

This Treacle-Water following is marvellously effectual to this intent.

Take old Venice-Treacle five ounces, Red Alexandria Myrrh two ounces and an half, Elect Cinnamon, Oriental Saffron of each half a dram; Camphire two drams. Pour upon them of the best Spirit of Wine, till it stand three fingers breadth above the Ingredients, and draw out the Tincture with a gentle heat, whereunto being poured off, without straining and a sixth part of the Spirit of Tartar. The Dose is one spoonful with some appropriate Water or Wine.

Whilest the aforesaid Remedies are in Use, Clysters frequently injected are exceeding good, because the Womb does rest upon the straight Gut, or *Intestinum Rectum*; and they may thus be compounded.

Take Roots of Lille one ounce, of Orice and Valerian, half an ounce of each; of Mercury leaves two handfuls, Mugwort and Savine of each one handful; Chamomel flower and Lavender, of each one pugil, Seeds of Caraway and Nigella, of each one dram; boyl all to one pint. In the strained Liquor dissolve of Hiera simplex and Benedicta Laxativa, of each half an ounce; Oleum Cheirinum two ounces; Electuarium de Baccis Lauri half an ounce. Mix all into a Clyster.

Yea, And the truth is, Purgations repeated at certain convenient seasons will be very good, which may be in divers manners prepared.

And in the first place *Galen* exceedingly commends the Pills of *Hiera*, simple and compound; because over and above their purging of superfluous humors, they have a faculty of opening the narrow passages, and of cleansing the Womb. Or,

Take Aloes three drams, Mass of Cochia Pills one dram, with juyce of Savin form twenty Pills, of which give the Patient three before dinner, every thrd day. Or,

Take Aloes one dram, Choice Rhubarb one dram and an half, Diagridium one scruple; Myrrh and Asarum Roots of each half a dram; Spicknard one scruple. With Syrup of Mugwort make a mass of Pill-Paste. The Dose is from two scruples to a dram, made into Pills. Or,

Take of the Mass of Cochia pill-paste half a dram; Mercurius Dulcis twenty grains, with Syrup of Roses solutive, form eight pills, or six, Let her swallow them early in the morning.

Also outwardly, the Courfes supprest are want to be holpen with these Topick Medicaments following, which must be outwardly applied, to widen the passages, make thin the humors, and to route and awake the Expulsive faculty.

Take Roots of Briony, Lillies, Cyperus, Valerian, Angelica, Asarum, Orice and of Parsley, of each an ounce; Leaves of Mugwort, Bayes, Rue, Savine, Thyme, Rosemary, Penroyal, Nep, Mallows, Mercury, of each one handful; Flowers of Elder, Cherry, Chamomel of each two pugils: Juniper berries, two ounces: Boyl all in water and Whitewine, with the strainings let the Patients belly and the parts about the Privities be fomented with a sponge.

With the same Decoction, the quantity of Ingredients being augmented, may be made a Bath to sit in; wherein the Patient may sit up to her Navil; and the boyled Herbs being put into a bag must be applied to her Belly. But let her take heed of sweating, which doth stop the Courfes.

Take Oyl of Lillies, Dill and Rue, of each one ounce and an half; Generous Wine three ounces; Squinanth Roots of Bindweed, Angelica, the two Birthworts and Savin leaves, of each half an ounce. Let them boyl till the Wine be consumed. Let them be strained and the Oyl pressed out, wherewith warmed, let the share and parts about the Privities be anointed, after fomentation or sitting in the Bath.

Moist suffumigations are made of the Vapour of the Decoction for the Fomentation, and for the sitting Bath, which being moderately heated, must be covered with a cover that hath a hole in it, whereunto must be fastened a long Pipe, which must teach into the neck of the Womb, through which let her receive the smoak morning and evening, being covered with cloaths.

A dry Suffumigation may be thus made:

F f f 2

Take

Take Cloves, Cinnamon, Mace, of each two drams; Juniper-berries half an ounce, Nigella seeds one dram, Storax two drams. Make all into a gross Powder, which being laid on Coals, let her receive the smoke into her womb, after the manner aforesaid. Or,

Take Storax two drams, Frankincense one dram; Benjamin, Aipta Moschata, of each half an ounce; Cloves, Lignum Aloes, Cinnamon, of each two scruples: With the Musilage of Gum Tragacanth extracted with Cinnamon Water, make little Cakes for to burn as aforesaid.

Pessaries may be made after this manner:

Take of leaves of Mercury bruised one handful, Powder of Hiera Picra and Benedicta Laxativa, of each two drams; Powder of long Birthwort one dram; Honey and juyce of Mercury, as much as shall suffice: make all into a pessary. Or,

Take of Agarick, Myrrh, of each two drams; Galbanum half a dram; Saffron one scruple: With clarified Honey make all into a Pessary, which put into a warm thin rag, and convey into the Womb; but let it not abide long there for fear of Inflammation.

Pilule Cochiae minores, brought into the form a Pessary, do excellently move the Courses.

Also Injections are wont to be made into the Womb, which are wont to be called Womb-Clysters, for they wash away the filth which cleaves to the sides of the Womb, and they open the internal Orifices of the Veins. Now they are made of the Decoction of the Fomentation aforesaid, leaving out the more sharp things; or with a Decoction of fat Figs, with Mugwort, Pennyroyal and Mercury; or of the Juyce of Mercury alone purified, in which a little Benedicta Laxativa is dissolved. For we must by no means use more sharp Ingredients for fear of Inflammation. Yea, and after the use of the aforesaid Injections, which ought to be retained but an hour, it will be good to Inject a Decoction of Mallows, Barley, and Violet-leaves, or a little Hydromel tempered with Whey of Goats-milk.

In an old inveterate Disease, Issues made in the Legs, may do very much good. For although Sennertus approves not of them, because they rather derive from the Womb, and teach the humors which were wont to flow unto the Womb, to come rather that way, and hinder their inclinations to the Womb: yet have they been found to do much good by the frequent experiences of Mercurialis Varandaeus, and others. For by those Issues the superfluous humors are continually evacuated, and the Course of the humors is guided into the inferior parts. And the derivation of superfluous humors from the Womb is so far from hindering the Flux of the Courses to the Womb, that it rather furthens the same, by making the blood more pure, and more obedient to the command of Nature, which with the humors aforesaid, is not drawn unto the Issues. Add hereunto, that these humors, if they be not by these ways evacuated, being retained in the Vines, they double the Obstructions, and so do augment the suppression of the Courses. Howbeit, We are of Opinion, that the menstrual purgations, being restored to their due Courses, the Issues ought to be closed up, that Nature may accustom her self to exclude superfluous humors by the Womb.

In the Use of the Remedies aforesaid, some precepts are to be observed worthy of Note.

First, That we must never use Medicines that move the Courses, but after Universal Purgations, lest the humors being plentifully carried to the Veins of the Womb, should encrease Obstructions; or being much attenuated, should reach into other parts of the Body, and produce grievous Diseases. As Schenkius relates in his Observations, That a Physician of Venice gave a woman that wanted her Courses a certain Apozeme to move them, not having first purged the Body of Flegm; and a little after she had taken her Apozeme, she fell into a Palsey.

Secondly, That in giving such things as bring down the Courses, we must begin with the gentler, proceeding by little and little to such as are the stronger.

Thirdly, That Medicaments procuring the Flux of the Courses, must be given in greater quantity than ordinary, because their vertue is abated in their long passage from the Stomach unto the Womb.

Fourthly, That Medicaments aforesaid are to be given either in the morning when the Patient is fasting, or sometimes at her going into, or coming out of the Bath: For so the Medicine slipping into a warm and opened Body doth powerfully exercise its strength; and this it doth yet more effectually, if it be given a little before the inferior Veins be opened.

Fifthly, That Pessaries and Womb-Clysters, or Injections, are only to be prescribed to married Women, and such as have been carnally embraced by men; but to Virgins we must prescribe Nasca-lia (viz. Wool dipped in the Medicament) Fomentations, Baths to sit in, and Suffumigations.

Sixthly, In Cholerick or Melancholick Constitutions, all hot Medicaments are to be avoided and only the gentler and milder sort are to be used; and with temperative Aperitives or openers, as also moistening and softning Medicaments are to be mixed.

Chap. 3. Of the Immoderate Flux of the Courses.

WOmens monthly Courses being moderate in quantity, and flowing in due season, are Natural: But if they exceed in quantity, or come too often, or stay too long, they are to be accounted Immoderate, and besides the intent of Nature.

CAUSES. The Causes of this Immoderate coming down of the Courses, are the same which (we in its proper place have shewed) do concur to cause spitting of Blood; viz. An opening of the ends of the Veins, a soaking of the blood through the Coats of the Vins, a forcible rending of the Veins, and their being eaten through by sharp Humors: all which are caused by the bloods over great abundance, Heat, Thinness, or Sharpness: by some blow, fall or wound: Which we have at large declared in our Speculations touching spitting of blood, so that it is needless here to repeat the same. Let the Reader be pleased to peruse that Chapter.

SIGNS. The Signs of this Infirmary, are either of the Disease it self, or of its Cause. Immoderate Flux of the Courses is known by the ill-bearing of the Patient, decay of strength, want of appetite to meat, indigestion of Humors, ill-Habit of the whole Body, colour of face like a dead Corps, swelling of the Legs, and other more grievous maladies, caused by Natural heat past away in the Blood.

To know the Causes, observe these signs following: A thin habit of Body and softness of the Flesh, with such a Diet as tends to encrease the Wheyish and thinner parts of the Blood; and especially the blood it self appearing thin and watery in the cloaths coming from the Patient, doth shew that the blood hath soaked through the Veins.

That the Immoderate Flux is caused by an opening of the ends of the Veins, or a breaking of their Coats, is known by the foregoing of Wounds, Falls or Bruises; by the use of dancings, long out-crys, carrying unufal weights by a Person corpulent and full of Blood: By some foregoing great heat, extream Cold, Immoderate carnal Imbraces, great Anger, and the like. The same may also happen after sore labour in Child-birth, or by the unskilful handling of a Midwife, after a miscarriage, or after a long stoppage of the monthly blood, which makes the same being collected in too great a quantity, break out on a sudden with violence.

That there is an Exulceration in the womb, whereby the Veins are eaten through, appears by the Blood dropping out by little and little with a sence of pain and sharpness; and by the Bodies being replenished with Salt and sharp Humors. Also the blood which comes away, is at first Matterish, Wheyish, Blackish or Yellow; and afterward if the Exulceration encrease, some bits of the parts affected are eaten off, whereupon follows a great effusion of blood, hard to be stopped. Also there have preceedeth such things as are wont to breed bad blood, such as are the use of sharp things in Diet, the use of Salt meats, of meats putrified, and such like.

PROGNOSTICK. As for the Predictions belonging to this infirmity, we are to know, that all large and long-lasting Issues of blood are dangerous; especially those from the womb, which hurts not only her that suffers them, but hinders posterity.

That which comes by a soaking of the blood through the Veins, is of all others the least dangerous, as causing less expence of heat and Spirits, yet it continues longer, by reason of the continual supply of raw and Wheyish blood.

The breaking of Veins, and the opening of their mouths, cause greater danger, because there do suddenly issue forth great quantities of blood; yet are they sooner cured, as happening for the most part, only in bodies over full of blood, and otherwise healthy.

But of all others, that which springs from Exulceration is most hard to cure, because where the Ulcer is, there some part of the substance of the Vein is perished, which hinders the growing together again of that breach, whence the blood issues.

If the sick party grow daily weaker and weaker, and the disease stronger and stronger, it portends her death.

In an elderly Woman, over great Flux of her Courses is commonly incurable and deadly.

CURE. The Cure of Immoderate Flux of Courses must be in a manner the same which we have prescribed to cure the immoderate running of the Hemorrhoids.

For in the first place, to draw the Blood from the part affected the Patient must bleed in her Arm, not all at once, but by degrees, now and then stopping the Orifice with your finger, and then letting it bleed again. She must bleed plentifully, as much as her strength can bear. For *Hollerius* in his Comment upon the 50. Aphor. of the 3. Sect. doth testify that he hath seen many Women cured by large Blood-letting, when the Issue of their blood could by no other remedies be stopped.

Rubbings, Bindings and Cupping-glasses are good to cause revulsion, as in the Cure aforesaid we have

have shewed, especially if the Cupping-Glasses be fastened upon her Dugs, according to that Sentence of *Hypocrates*; If you would stop a Womans Courtes, fasten a very large Cupping-Glass unto her Dugs: Howbeit, if upon the setting on of the Cupping glass, she grow short-breath^d, you must quickly take it off again.

Likewise the same purgation may serve which we propounded in the Cure of the Hemorrhoids; and it must be reiterated once or twice in a week, until the impurity of the Bowels and the Veins be taken away. For when the Chollerick and wheyish humors are taken away, which make the blood thin and sharp it leaves running of it self. If the wheyish parts seem most to abound, Mechoacan with Rhubarb will be a good Purge.

A Vomit likewise doth powerfully draw the blood upwards, and is commended by *Hypocrates*, in his Second Book of womens Infirmities. But the Vomit must be gentle, and often repeated. Also it may suffice for the Patient to put her finger into her Throat, and so procure Vomit: Yea, and the Truth is, it may serve the turn, and will be very profitable for her to provoke her self to Vomit before her Dinners, but so as not to vomit, only to use some forcing thereunto. Unto which Remedies, these which follow may profitably be added, as being tried by very learned Physitians.

Take the Shells of two new laid Eggs burnt, Frankincense, Mastich, of each half an ounce; Pearls prepared, red Coral prepared, and Amber, of each two drams; Bloodstone and Smarage prepared, of each half a scruple; Barley meal without Bran, two pugils: four whites of Eggs, and if need be, add a little Water, in which red hot Steel hath been quenched and make two Cakes, which must be baked so hard in an Oven, that they may be beaten to Powder. Of which Powder give from half a dram to a dram early in the morning, in a draught or mess of Broth made of Sheeps Trotters.

John Michael Paschalius doth witness that many Women long troubled with this Infirmity, have been cured with this Powder.

Also the Powder of Egg-shells alone is commended, a dram thereof being given divers mornings together, and it is accounted by some for a Secret.

Forestus commends the following Powder, which he sayes was one of the Secrets of his Doctor, or Instructor, *Helideus*.

Take a Turtle Dove moderately fat, draw it, and wash it with astringent red Wine and Rose water mingled together, and put an ounce of Mastich in the Belly of it, and sow up the belly that none of the Mastich may fall out: Then roast it upon a Spit, and instead of Butter, bast it with Vinegar of Roses, and save the fat which shall drop from it for your use. When it is excellently well roasted, put it into a new glazed pot or pipkin, closed up with such materials as the Chymists use to close their Vessels with, that nothing may vapour out. Then let it be set into the Oven, till it be so dry that it may be beaten into a Powder, of which Powder, let the Patient take one spoonful every morning in Plantane Water, or in some astringent Decoction. And with the fat which was reserved at the roasting, let the Reins of her back, her groins and Privy part, with the shars, be anointed.

Our Country-women have an ordinary medicine of the Flowers of the long-stalked common Thistle, wherewith they use to curdle their Milk when they would make Cheese: They administer these Flowers in Broth, or other convenient Liquor. Others use of the Runnet of a Kid or an Hare, to the quantity of ten grains, which both stops the flowing of the Blood, and dissolves that which is clotted together in the Womb.

Galen account Juyce of Plantane newly made to be the best medicine in the World, being given to the quantity of three or four ounces.

Solenander adds to the aforesaid Juyce a quantity of Colophony, and avouches it to be a remedy that never fails; his words are these: To stop an old Flux of the Courses, take two ounces of the Juyce of Plantane, and mingle therewith a dram of Colophony powdered, and give it the Patient to drink. Let her take it four times, and she shall be undoubtedly healed, with Gods Blessing.

The Juyce of Yarrow is very convenient in this case, if two or three ounces thereof be given with Syrup of Corla, or some other convenient Syrup.

The Juyce of Nettles is no whit inferior to, or rather exceeds the former in efficacy: It may be given alone or in mixture with others of little faculty: Or a Syrup may be made of Nettles to be ever in a readiness.

A Water drawn out of the most tender Oak Leaves, which are of a reddish colour, stops the aforesaid Flux.

Mercatus makes up a very effectual Water, after this manner:

Take a Loaf made of Wheat Flower, Barley Meal and Rice: break it in pieces, and pour upon it seven pints of Water in which red hot Steel hath been quenched: Whereunto add red Rose Leaves dried, three pugils: Juyce of Plantane a pound: the Roots of the larger Comfry, being green and bruised, two ounces: the Herb Horse-tail, or Shave-glass, one handful, the pulp of Choak-pears

Choak-pears, and Quinces, of each two ounces: Purslain two handfuls: Bole armonick one ounce: Balaustins, and the three sorts of Sanders, of each half an ounce: Let all these be distilled in an Alembick. Let the Patient take of this Water three ounces mixed with half an ounce of Syrup of Purslain, or of dried Roses.

For the more tender sort of Women, Broths may be made of Calves feet, with Plantane Leaves or Blood-wort. Or to thicken the Blood, a Broth may be made of red Rose-Water alone, and the Yolks of new laid Eggs. Likewise a Conserve of Bramble Roses is good for them, being often used, especially if their Liver be distempered with heat.

In all Fluxes of Blood, Practitioners do use to administer Water and Vinegar in a large quantity to be drunk down. But in this Flux of the Courses it is to be feared as an Enemy to the Womb, which is a Membranous Part.

Among the Specifick or appropriated Medicines, are reckoned Filipendula Roots, with the outer Rind of the Mulberry-tree Root, whose Powders are administered to the quantity of a dram, in some convenient Liquor.

The Flowers of the Nut-trees are gathered when they are ripe and ready to fall, and powdered, and a dram given in a Cup of Wine warmed in the mornings, for divers days together. *Solenander* witnesseth that all that he undertook he cured with this Medicament. Also it hath a peculiar propriety to help fits of the Mother.

Spicknard in very fine Powder, and taken to a dram in some convenient Liquor, stops the Courses: Also being conveyed into the Womb in Lint, Wool, Cotton, Raw Silk, &c.

Milk in which red hot Steel hath been quenched, being drunk many days together, is very effectual in an old flux of the Courses; for it allayeth the sharpness of the Humors and thickens them; it nourisheth the Body, and stops the flux. *Avicenna, Rhasis*, and the rest of the Arabian Physitians, extol this Medicine to the Skies: and so doth *Horatius Augentinus*, a noted Italian Physitian. Yet it is not to be used, if we suspect the Body is not yet clear of vitious Humors.

The Acid Mineral Springs, whether they have their Tincture from *Vitriol, Iron, or Alum Mines*, do much conduce to the stoppage of immoderate Courses; both by removing the Causes, and by strengthening the Bowels affected.

The Chymists do much commend the Tincture of Coral, and *Vitriolum Martis* (Vitriolated Steel) and many other Medicines, which you shall find in their Books.

Let the Patient use to drink the Decoction of Mastich, Yarrow, or of the dried Lentisch, or Mastich-tree. Also the Lentisch or Mastich Wood may be steeped in black harsh Wine; which doth very much strengthen the Bowels, and stop defluxions.

It must be diligently remembred, That in an old Flux, very astringent and thickening Medicaments, are not to be used long together. For it is to be feared, lest they should fill, straighten, and shut up the secret passages of the body, and so breed Obstructions, and very much hurt the Principal Bowels, which are wont to suffer very much in this disease. But it is much better to persist in the use of such things as strengthen the Liver, which have some astringent, but so moderate as can do no harm.

Ludovicus Septalius in his Medicinal Animadversions, in the 144. Article, gives such commendations of the Decoction of Orange Peels, as of a Medicine that never fails, that it will be worth our while to transcribe his very words. *When such Medicines as these* (quoth he) *have been judiciously administered; in the next place, such Medicines as have a thickening and astringing quality are to be used; among which there is one which I cannot omit to set down, wherewith I have cured almost an infinite Number of Women troubled with this Infirmary; which I kept long as a Secret, and afterwards communicated to some young Students, whom I did inform in the Art of practising Physick, and now publish the same to the whole World for the good of Mankind: which Medicine hath scarce ever failed me, when there was no Vessel of the Womb exulcerated, that fed the Flux. It is a Medicine easily gotten, and easily made, Thus:*

Take Seven pints of Water; boyl therein the rindes of three sower Oranges not thoroughly ripe, being cut in little thin bits or chips, and boyl them till two parts of the Water be consumed. Give eight or nine ounces of the strained Liquor to the Patient in the morning to drink. If you would have it more effectual, put an handful of Mous-ear into it, when it is almost boyled. And it will be yet more powerful, if you boyl it in Tunbridge water, or the like Medicinal Spring-water: or if you boyl the aforesaid Ingredients in eight pints of water, till two third parts be consumed, and then strain it, and quench red hot Steel divers times therein.

Externally this flux may be stopped by Medicaments applied to the outward parts of the Patients body.

And in the first place, Fomentations may be thus made:

Take the Roots of Bistort (Adder-Wort) Tormentil, and the peels of Pomegranates, of each one ounce: The Leaves of Plantane, Knot-grass, Shepherds-purse, and Horse-tail, of each one
*
handful;

hand ul; Cypress Nuts, Balaustins, Myrtle berries, Sumach, of each one ounce; Boyl them in Water that hath had Iron quenched in it, and in red harsh Wine mixed together. Strain out the liquor and Bath therewith the whole Share and Privy parts, warmish, but not hot.

Also, Boyl a piece of Sea sponge in strong Vinegar, and lay it upon the Patients Share, and Privities, it will powerfully stop the immoderate Flux of the Courses.

A Bath made of the aforesaid Decoction, the Dose being augmented, will be good for the Patient to sit in: But care must be taken that it be not hot, but only warmish; otherwise it will by its heat, the more open the Veins of the Womb. A Bath made of the Decoction of Allum is very effectual; but it causeth barrenness.

After Fomenting and Bathing, the Patient must be anointed upon her Loyns, her Share, and Privities, and between the water-gate, and the Dung-gate, (which space is called *Perinæum*, and wants an English name) with an Oyntment made as followeth.

Take of Oyle of Myrtles, of Mastich, and of Quinces, of each one ounce; Bole-Armonick, Dragons-blood, and Carabe, of each one dram; Vinegar one spoonful. Make all into an Oyntment.

Unguentum Comitissæ may also be used, *Unguentum de bolo* newly made, or this following Cerate, which is very effectual.

Take Ship pitch half an ounce; Male Frankincense one ounce; Mastich half an ounce; Turpentine one ounce; Dragons blood, red Roses, of each two drams. Make thereof a Cerate to be applied to the Reins of the Back.

Plaisters are also profitable applied unto the Navil, and Loyns, made of the Mass of Plaister against Ruptures, the Plaister against the Mother, and of Mastich Plaister, either alone, or mingled together: Or of the Plaister of *Vigo* for Fractures, which is most excellent; and works its effect without heating the part.

The following Cataplasms are much more effectual, and very prevalent in a large Flux of Blood, causing danger of Death.

They are made, either of Bole-armonick incorporated with Juyce of plantane and a little Vinegar, and so applied.

Or of Plaister of Paris one pound, incorporated with ten drams of Gum-arabick toasted at the Fire, and laid upon the parts aforesaid in Cotton-wooll: The whites of four Eggs being first mingled with it. *Solenander* saith, that this Cataplasma stops all womens Fluxes in one day.

A Cataplasma, or Pultis made of Nettles, fried in a pan, and laid upon the Share and privities, works more kindly than the former; rather by a specifical property, than by its astringency.

Injections made of juyce of Plantane alone, are likewise conveyed into the womb by an Instrument for that purpose; which is very effectual, and much cryed up by the Practitioners. Juyce of Knot-grass may be used to the same intent. And sometimes we are wont to add to the aforesaid Juyces, of the Mucilage of Gum Tragacanth one ounce; Starch one dram; water of Rose-stalks, and feeds three ounces, which are mixed, and Injected into the womb. Or,

Take of the Leaves of Knot grass, Plantane, Yarrow, Shepherds-purse, Horstail, of each half a handful: Boyl all in water sufficient to half a pint. In the strained liquor dissolve three drams of Acacia, Dragons blood, Bole-armonick, and Blood-stone, of each one ounce: Mix all, and make thereof a Clyster for the Womb.

A Fume made with Vinegar, powred upon a red hot Iron Plate, and received by the Patient sitting over a Close-stool, is very profitable; or a Fume may be compounded after this manner.

Take of Frankincense, and Mastich, of each two ounces: Mirtles and Labdanum, of each one ounce: Amber, red Roses, Balaustins, of each half a dram: With the infusion of Gum Tragacanth in red Rose Water, make Cakes to burn under a stool as before.

John Michael Paschalius doth testify that he cured a Woman troubled near seven months with this Disease, with the smoak of burnt Frogs: and he affirms that the smoak of a Mules Hoof, is an experimented Remedy: wonderfully effectual in this Case.

Astringent Pessaries are likewise usual in this Cure. Howbeit, they profit little, seeing they can hardly reach unto the Orifice of those Veins, which are opened in this Disease. But if the Veins of the Neck of the Womb are opened, they may be useful; and are thus Compounded.

Take of the Juyce of Plantane, or Knot grass two ounces: Troches of Carabe in Powder, and Acacia, of each one dram: Mix them with the White of an Egg, rowl them in silk, and make a Pessary. Or,

Take of the powder of Hypocistis, Acacia, Bole-Armonick, Dragons-blood, Comfry Roots, Lambs tongue, Plantane, Galls, of each half a dram; Juyce of Purslain, or Plantane, or Syrup of red Roses, or Myrtles, as much as shall suffice, and with Cotton Wool make a Pessary.

Pessaries are likewise made of the Leaves of Purslain, Plantane or Knotgrass, or some other convenient

venient Herb bruised, and rouled in a piece of fine Linnen; or the Countesses Oyntment wrapt in Wool, and put into the Womb.

Neither are we to neglect the washing of the Patients Legs with cold Water, or some astringent Decoction, which is commonly used by practitioners, and doth not a little further the stoppage of the immoderate Courses.

Touching the administration of Topical Medicaments, it is to be observed, That astringent medicines, especially the stronger sort of them, are not to be applied before sufficient Revulsions have been made; especially by Blood-letting: for it is to be feared lest they cause Tumors, or other worse Diseases in the Womb. Wherefore always as far as the Disease will allow time, the Cure must be begun with internal Medicines of a thickening and astringent Nature; before we make use of the Topical medicines aforesaid.

This Method of Cure aforesaid may with judgement be accommodated to the Flux of Courses, arising either from an opening of the mouths of the Veins; or from a draining of the Blood through their Coats, or from a breaking of the Coats of the Veins: But if it arise from an eating or exulceration of the Coats of the Veins, it ought to be cured after the same manner as an Ulcer of the Womb is cured; of which hereafter.

In the whole Course of the Disease, while the aforesaid Medicaments are used; care must be had to strengthen the Bowels, and to correct the vitious quality of the Blood; as we shewed in the Cure of the Hemorrhoids.

And to conclude, when the Flux is allaid, the same Rules of prevention are to be used in this Disease, which we prescribed concerning the Hemorrhoids.

Of the Whites.

A Woman is said to have the Whites, the Womans Flux, the Flux of the Womb, or the white menstruals, when Excrementitious Humors do flow from the Womb, either continually, or at least without any certain order or course of time observed in their flowing.

And the said Excrementitious Humors are sometimes white and flegmatick, very like to Whey or Barly Cream; sometimes they are pale or yellow, or green by the mixture of Choller; sometimes watery by the admixture of serous humors; sometimes blackish, by the admixture of Melancholy; sometimes sharp and corrosive, so as to eat into, and exulcerate some parts of the Womb; sometimes they are strong, and have a beastly smell; and other whiles again, are not at all offensive in that kind.

This Disease is wont to seize upon grown Women for the most part, and such as are of ripe Age; yet are not Virgins always free from the same: so that some have done ill in daring to affirm, That such Maids as are troubled with this disease, have parted from their Virginity, taking their Ground from the straitness of those passages Naturally: For if Virgins have the Veins of their Wombs so large, that their wonted Courses can flow through them, why may not the Whites likewise drop out by the same passages, seeing they are many times more thin and fluxitive than the Blood it self, as being Wheyish and Cholerick. The same is confirmed by the produced Experience of most Learned Physicians, and daily Practice teacheth me as much, *viz.* That the most chaste and perfect Virgins in the World have had this Infirmary, of whom there could be no suspicion that they had been corrupted. And *Fernelius* doth witness, That he saw a Girl eight years old which had this Disease, and was afterward a long time grievously troubled herewith.

The Excrementitious Humors aforesaid are bred either in the whole Body; or in some principal part of the Body, or in the Womb it self.

CAUSES. If the humors flow from the whole Body, they proceed either from bad Dyet, or from a vicious habitual distemper of the whole Body, and they take their course unto the Womb as unto a Cinque or Common-Shoar, wherunto the rest of the parts of the Body disburden themselves.

The particular parts, by whose consent the Womb suffers in this Disease, are chiefly the Brain; Stomach, Liver; Spleen, Mesentery and the Bladder; which dispatch their Excrements unto such parts as are more weakly, and so more disposed to receive them.

These Excrementitious Humors are bred in the Womb, because when it is unable to digest its proper nourishment, by means of the weakness of its Retentive or Concoctive Faculty, the greater part of its Aliment is turned into Excrements, being imperfectly digested or corrupted rather. It is imperfectly digested in cold distempers of the Womb; and it is corrupted in hot distempers thereof. And seeing the Womb by want of Digestion is defrauded of its Nutriment, it presently draws new Aliment, which being turned into Excrements, is by the Womb expelled as unprofitable; and new Aliment, is continually drawn, whereby this flux of evil Humors from the Womb, becomes both plentiful and continual. The Womb is weakened and more disposed to the Reception of these Excrements by Child-bearing, travelling in Child-birth, Abortion and Contusion, Inflammation, Imposthumes or Ulcer.

S I G N S. The Signs of this Disease are referred to the Infirmary it self, to the part affected, or to the cause producing the Disease.

DIAGNOSTICK. The Disease it self is easily known by relation of the sick party, and it is oftentimes attended with divers Symptomes, *viz.* Paleness of Face, want of Appetite, sickness of Stomach, short breathing, weakness, swelling of the Eyes, fullness, pensiveness and sadness, thick Urine, turbulent, and many other accidents, which differ according to the diversity of the Humors offending as we shall declare more distinctly by and by.

The part affected, and the place in which these Excrementitious humors causing the Flux are bred, may be known by these following tokens.

If the matter of the Flux is bred in the whole Body, these signs do shew it. *viz.* Weariness and heaviness, not proceeding from any work; of which the Patient is eased, having disburdened her self by the flux plentifully; and then again, when new matter is collected, she begins to be weary and heavy as before; her Veins are full; her Feet, Hands and Thighs are apt to be numbed. And these signs do especially discover only a plenitude of humors. But that corrupt humors do abound in the whole Body, is known by an evil habit in the whole Body, [that is, an ugly sickly appearance in the looks, and whole outward state of the Body] a puffing up of the Hands and Feet, and itching and stinging in the whole Body, if the humor be sharp, and many such signs as these.

If the matter offending reside in some peculiar part, the Symptoms and Excrements proper to that part discover the same. As for example, A pain, heat, and swelling of the Liver, with Cholerick Excrements, do shew the Liver to be affected; and the same Symptoms happening on the left side, with Excrements of a Melancholick appearance, do argue the flux to spring from the Spleen: Flegmatick Excrements, Stomach sickness, want of Appetite, and sometimes extream Appetite, frequent corruption of the meat, and sour belchings, or fatty, (as of the Dripping pan, or over-scorched flesh) as sure tokens of the Stomachs faultiness.

Pain of the Head, Frothy Excrements, some usual evacuation by the Mouth or Nostrils being stopped, do witness that the flux springs from the Head. If none of the aforesaid signs of some part affected appear, then we may conjecture that the flux proceeds primarily from the Womb. Also the Woman (in such a case) is well coloured, the matter flowing is but little in quantity, being the Excrement of the womb alone. There have preceded such causes as weaken the Womb; as are hard Travel, Abortion, a Fall upon the Belly or Back, immoderate Carnal Embraces, especially if the Woman have been too young married, Tumors, Ulcers, and others Infirmities of the Womb, whose signs are propounded in their proper Chapters.

The Humor causing the Flux is known chiefly by the colours of that which comes away, which were a little before declared, and which appear in the cloaths wherewith it is received, if, as *Hypocrates* teacheth in his second Book of Womens Infirmities, the said cloaths being dried, shall be after washed in Water alone, and dried in the shadow: for so they manifestly declare the colour of that Humor which most abounds in the Excrements. Hereunto may be added the signs of an humor abounding in the whole Body, usually delivered in that part of the Institution of Physick, which treats of Signs.

In the last place, We are to propound such Signs as distinguish this disease from others like unto it; as namely, Excretion of Purulent matter proceeding from an ulcer of the womb, and the Gonorrhœa, or flux of Seed.

It is distinguished from Purulent matter by the signs of an ulcer in the womb, which shall be set down in their proper Chapter; as likewise because the Purulent Matter or Quittor is much thicker, whitish, and lesser in quantity, if it be digested rightly; but if it be of a goary, sanious and fleshy appearance, like blood and water mingled, there is then blood amongst the matter, and it is wont sometimes to come away with strings from the womb, and with exceeding pain: also the Women that have Ulcers in the Womb or its Neck, admit not of Copulation but with pain, which exasperates their Disease: but those which are troubled only with the Whites, do willingly and patiently suffer themselves to be embraced by their Husbands.

In the Gonorrhœa, the matter which comes away is not so much in quantity, is thicker, of a more shining whiteness, holds up longer from flowing, and seldom or never stinks. But if it be a virulent or venomous Gonorrhœa (such as accompanies the Letchers pox) it is known by sharpness of Urine, Ulcers of the privy parts, and other signs that argue Malignity.

PROGNOSTICK. The Predictions or Prognosticks of this Disease, are as followeth:

This disease in one respect may be called good, in another respect bad: Good, forasmuch as commonly it is not attended with any danger of death; and bad, because it is a stubborn Disease, long lasting, and most exceeding hard to be cured; forasmuch as the Flux of evil humors having once taken this course, is very hardly turned out of its Channel, because the Womb (as we said before) is the Draught of the whole Body, whereby even in time of health, the superfluous humors of the whole Body are monthly evacuated.

If this Infirmitie get head, it may bring many other Evils upon the Patient, as Barrenness, falling down of the Womb, Exulceration, Cachexia, Dropsie, and Consumption.

A Flux of Whites, blewish, bloody, stinking, is worse than the white, pale, not stinking.

The longer this Disease hath lasted, the harder it is to cure.

It attends old Women to the grave for the most part, because of their abounding with flegm, and the weakness of their Concoctive Faculty.

CURE. The Cure of this Disease is to be begun by a convenient purging of the Peccant Humor. And because flegmatick and wheyish Humors do most commonly offend, such things as purge those humors must chiefly be used, and with them Purgers of Choler, or Expellers of Melancholy must be mingled, according as Choler or Melancholy is adjoined to the humor offending. An Apozeme therefore may be appointed both altering and purging for four or five days by way of a solemn purgation, always remembering that to the purging Medicaments, some astringent and corroborating things are to be added, lest the Humors of the Body being stirred, should fall more abundantly into the Womb.

Touching Blood-letting, it is a question, whether it be convenient in this Disease or not: For seeing this Flux is caused by ill Humors in the Body, which by blood-letting are drawn into the Veins, and so may corrupt the Mass of Blood; it seems there is in this case no place for bleeding. Also, since in this lingering Disease, the Patients strength is much abated, and the Body often brought into a Consumption, it seems unfit to weaken it yet more by blood-letting, and so defrauding it of its nourishment. Which Controversie is thus decided; That if the flux be not pure and simple, but in some measure mingled with blood, and it appear reddish, that then a vein may be opened; as also if the Liver is very much heated, and the sharpness of Choler be joyned with the flux. In other Cases, especially if the Flux have endured long, it is better to abstain from blood-letting.

Binding of the upper parts of the Body, and Cupping-glasses applied to the shoulder-blades, and to the back, will be very useful to draw the Humors upward; also rubbings of those parts will be specially profitable, first with finer and softer cloaths, then with rougher and courser, which Galen daily practised upon the Wife of Boetius, whom he cured in the space of thirteen days, as himself relates in his Book of Prognosticks dedicated to Posthumus.

And besides the Universal Purgation already propounded, ordinary Purgations are also to be administered, and frequently reiterated, that the superfluity of Excrements may be the better evacuated by little and little, and that Nature may get a custom to void those Humors by stool, which formerly had their recourse unto the Womb. To this intent, Magistral Syrups, Pills, and usual Opiates may be compounded, suitable to the temper of the Patient, and the Humors offending. In this Disease caused by flegm, *Mercatus* commends a Syrup of the Decoction of *Lignum vite*, with Senna, Turbith, and Agarick; as also the following Pills:

Take of the Mass of Pills of Hiera Picra one dram; Agarick trochiscated one dram and an half; with Honey of Roses make them into Pills, of which let the Patient take early in the morning six or seven every third day: afterwards only three of them every fifth or sixth day.

Or for the greater Astringent, as well as purging, they may be thus compounded, in whatever Complexion.

Take Choyce Rhubarb oft-times sprinkled with the Juicy of Roses two drams; Citrine coloured, white and black Myrobalans steeped in the Juicy of Roses, of each one dram; Mastick one scruple; Spicknard half a scruple: With Syrup of Roses make all into a mass of Pills. Let the Dose be one dram twice in a week.

For a Flux arising of Serosity or Wheyish Excrements, Jallap is most excellent, which may be thus used;

Take Jallap finely powdered one dram; Cinnamon finely powdered half a scruple. Mix them, and with a draught of Chicken Broth, give it the Patient in the morning.

A Laxative Prisan daily taken for a month together, hath cured a stubborn Flux of Whites, when nothing else could; as is to be seen in our Book of Medicinal Observations.

Vomiting is likewise much commended in this Disease, especially in such as are easie to vomit, because such indigested humors as are wont to be gathered about the Stomach, are hereby both evacuated and powerfully revelled or drawn back from the Womb among convenient Vomits. *Diasarum* of *Fernelius* his Invention, is commended, half an ounce whereof given in Water and Honey, or with one ounce of Oxymel, and warm Chicken Broth, twice or thrice in a month, moves three or four Vomits, without any trouble.

After sufficient Purgations, sweat may be procured to expel the remnants of the Excrementitious Humor; and also to cause a further Revulsion of the Humors falling into the Womb.

To this intent, a Decoction of *Lignum vite*, and Saxaphras, will be good in such as are flegmatick; and of China and Sarsaparilla in such as are Cholerick and Melancholick; cooling and temperate Herbs added, lest the evil Humors be more exasperated, and become more sharp.

Or sweat may be provoked by Decoction of hot Herbs, as Nep, Calamint, Fennel, Hyssop, Elicampne, Chamomel, Dill, and such like; the evaporation of which Herbs being artificially received upon the Patients Body, will procure sweat. A Bath may also be made of the same Decoction, by which sweat may be provoked. But in hotter Constitutions, a Bath of fresh fair Water blood-warm, will be sufficient, in which moderate and gentle sweats only may be procured.

Sulphurous Baths do also powerfully cause sweat, and consume the reliques of this Disease: and by help of such Baths we have known some Women cured, that no other means could help.

As touching Piss-driving Medicines, its a weighty question whether or no they are fit to be administered in this disease. For they do not only provoke Urine, but the Courfes likewise, by heating and attenuating the Humors contained in the Veins. Yet are they allowed by all Authors, and by *Galen* himself, who used them in the Cure of the Wife of *Boetius*: And the reason is, Because Piss-drivers do provoke Urine Primarily, and the Courfes secondarily, and as it were by accident or chance. Again, the Kidneys do perpetually draw Wheyish Humors unto themselves, whereas the Womb does only receive them; whereupon it is credible that the greatest part of such Humors will have recourse unto the ways of Urine.

Now the Piss driver which *Galen* used in the aforesaid Woman, is a decoction of *Asarum* and *Smallage* in fair Water; howbeit, it will be better tempered if it be made in *Succory* Water.

A more compound Piss-driving Broth, may be thus made:

Take the Roots of *Asarum*, and of *Smallage*, of each one ounce: Leaves of *Calamint*, and *Soldanella* of each one handful: Elder flowers half a handful: *Polypody*, and *Carthamus* seeds of each half an ounce: boyl all to a pint. Give five ounces of the Liquor or Broth strained, in the morning. If you would make it purgative, add a little *Agarick*, and a little *Turbith* boyled with the rest in a Rag.

Its questioned whether Issues in the Legs are good for this Disease; for by drawing the Humors downwards, they may increase the Flux. Howbeit, experience hath shewed that they do good in old Fluxes, because by such passages, some of the Excrementitious Humor is voided.

If *Cholerick* and sharp Humors cause this Disease, not only purgers of *Choler* are to be given, but likewise Alteratives which cool and thicken, and are moderately Astringent; such as these Juleps following.

Take of the Leaves of *Succory*, with the Roots of *Endive*, *Borrage*, *Lettuce*, and *Purslain*, of each half a handful: of new *Sebestens* and *Fujubes*, of each seven in number: of the four greater cold seeds, and white Poppy seeds of each half a dram; of red Rose-leaves a pugil. Boyl all in Water sufficient unto a pint, and in the strained Liquor Dissolve Syrup of *Quinces*, or of dried red Roses three ounces; and make a Julep for three Doses.

But if the *Melancholick* Humors abound, they are to be altered and purged away, by Medicines proper to that intent.

The use of *Chalibeate* milk taken forty days together, the quantity of four or five ounces, is very proper for either of the aforesaid Humors; whereunto may be added towards the end, a little *Bolearmenick*, or *Terra Sigillata*.

In the whole cause of curing, it is to be considered, whether any part of the Body be misaffected, and so may send the matter of the Flux into the Womb; and if so, then care must be taken for the Cure of that part.

For if Humors flowing from the Brain, do cause this Disease, Remedies are to be applied to that part: especially such as revel and divert the Fluxion, viz. Cupping-glasses frequently fastned upon the shoulders and Back, Medicines snuft up into the Noftrils, Masticatories, Vesicatories, and Issues made in the hinder part of the Head, or in the nape of the Neck; instead whereof *Setons* may be used, which are more effectual. And *Fabritius Hildanus* in the forty one Cure of his first Century, relates that he Cured a Woman long troubled with the Whites, and thereby Barren, by a *Seton*.

If the Humors flow from the Stomach, Liver or any other part, suitable Remedies must be applied to that part.

The Body being prepared, and the offending Humor for the most part evacuated, or derived another way, We must proceed to corroborating and Astringent Medicaments. But they must never be used until the Antecedent matter be well evacuated, and diverted. Otherwise, those Humors retained, do rush into the more noble parts, and stir up more grievous Symptoms. As *Galen* in the aforesaid place relates to have befallen the Wife of *Boetius*, whose Belly swelled, by means of the unseasonable use of astringents, by which the Wheyish Humors were retained in her Body, which were wont to pass away in the Flux. It is likewise to be remembered, that whilst we are in the use of Astringent Remedies, we do then divert the Antecedent Matter, and hinder the same from increasing, by the Remedies aforesaid. Amongst these principal corroborating Medicines, Treacle is reckoned, which is to be used in flegmatick Constitutions. Conserve of Roses, and of Wormwood, may

may be mingled with the Treacle; Or the following Opiate may be commended.

Take Conserve of Rosemary-flowers one ounce: Conserve of Calamus Aromaticus two drams: Species of Diarrhodon Abbatis, and of Aromaticum Rosatum, of each one dram: Red Coral prepared half a dram; Treacle two drams; with Syrup of preserved Citron peels make all into an Electuary. Or,

Take old Conserve of Red Roses, Roots of Comphry, Bugloss, and Citron peels of each one ounce: Red Coral burnt, shavings of Ivory, Bole armenick, Terra Sigillata, Dragons blood of each one dram; with Syrup of Red Roses dried make all into an Opiate.

The powder of Sage, Sarsa-Perilla, and Balauftins taken every morning in Broth, is the Court Ladies Medicine.

Zechius commends this following Electuary, which he had often used with happy success.

Take Gum Arabick and Gum Tragacanth, of each two drams; white and red Coral, burnt Egg-shells, Harts-horn, Dill-seeds, Amber, of each four scruples; Honey of Roses, as much as will make all into an Electuary. Of which give half an ounce two hours before me it. Let the Patient swallow it down, and drink after it four ounces of Plantane Water, mingled with two drams of red Wine.

Juleps may be made of Rose-water, Knot grafs, and Plantane waters, with the Syrup of Myrtles, dried Roses, and the like: Some of the aforesaid powders being added.

Mercurialis says he frequently used a Decoction of Oak-leaves, with the Runnet of an Hare: wherewith he cured many Women of this Disease. His manner of making his Medicine was thus.

Take of the Decoction of Oak leaves five or six ounces, of the Runnet of an Hare one dram:

Let her take this Medicine eight or ten days.

When the Disease comes from Choler, the following Syrup may be prepared, which is strengthening, Astringent and cooling. Thus,

Take red Rose-water four pints: Spirit of Vitriol, So much as will make the Water a little sharp; but so as scarce to be perceived by the taste; red Roses dried three pugils; Steep them in the Water cold, two days; Strain it, and add thereto so much Sugar of Roses, as will make a Syrup.

And Finally, Those Astringent remedies mustred up in the former Chapter, touching the Immoderate Flux of the Courses, may be likewise useful in this Cure.

The Patient may use instead of ordinary drink, a Diet-drink of China roots or Mastich wood, with Astringent Wine mingled.

The same time that the Patient takes in such things as are Astringent, and do strengthen the Womb, she must likewise use outward Remedies applied to the place affected, viz. Fomentations, Baths to sit in, Oyntments, Plaisters, Injections, Fumigations, and Pessaries; such as have been prescribed against Immoderate Courses.

But before these external Astringents are applyed, the Womb must be cleansed. Otherwise such impurities would be therein retained, as returning back into the Body, may cause more grievous Diseases. And in our cleansing, we must regard the Humors offending; for one sort of Cleanfers are fit for Flegmatick, another for Cholerick Humors.

If the Humor be Cholerick, let the Cleansing Injections be made of Barly-Water, Whey Water sweetned with Sugar. If it be Flegmatick, let them be made of Hydromel, or of the Decoction of Wormwood, Feverfew, and the like.

A fo a Detergent Pessary may be made of Treacle, and Turpentine; or of Mercury-leaves bruised and wrapped up in a fine Linnen rag very thin worn.

Let the Patient use these Cleanfers before the Astringents be applied, until her Womb be well purified; which may be known, if little or no Humors come therefrom.

After the use of the Cleanfers, the Fumes are first to be received over a Close stool, because they dry and strengthen the Womb; and they may be fitly made of Frankincense, Laudanum, Mastich, Sanders, Nutmeg, and red Rose Leaves. And afterwards we must proceed to other Astringent Remedies.

Chap. 5. Madness from the Womb.

Womb-Fury is a sort of Madness, arising from a vehement unbridled desire of Carnal Imbracement, which desire dis thrones the Rational Faculty so far, that the Patient utters wanton and lascivious Speeches, in all places, and companies, and having cast off all modesty, madly seeks after Carnal Copulation, and invites men to have to do with her in that way.

CAUSE.

This Immoderate desire of Carnal Conjunction, springs from the abundance of Seed from it's Acrimony, and heat transcending the bounds of Nature, whereby it is made to heave and work in the Seminal

Seminal vessels as Yest works, whereby the parts made for generation, are vehemently stirred up, and Inflamed with lustful desires. And from the same Seminal matter so affected, Vapors ascend unto the Brain, which disturb the Rational Faculty, and depose it from its throne. Howbeit, the Immoderate appetite of carnal Conjunction alone, without the help of any such vapors, is able of itself to master the Rational faculty, as also all other Immoderate passions; but especially Immoderate Love, which is called *Eroticus affectus*, or Love-Melancholy.

Now the Seed acquires the aforesaid qualities, when it is over-long retained in Bodies prone to lust, and full of heat; and therefore this Disease is incident to Virgins, and young Widows peculiarly; although it may also be-tide married Women, that have impotent Husbands, or such as they do not much affect, whereby their Seminary Vessels are not sufficiently disburdened, or their amorous affections duly satisfied.

Some hold, That the Seed being corrupted, acquires a malignant quality which causes these grievous Symptoms. But they are not well able, so holding, to shew any difference between this Disease, and fits of the Mother, which arise from the Seed being corrupted, and thereby infected with a malignant quality. For although several degrees of putrefaction do produce different degrees of malignity, from whence a great variety of Symptoms are wont to arise; yet these manifest qualities aforesaid, viz. great plenty of Seed, its heat, Acrimony, and Fermentation in excess, together with the great heat of the genital parts, are sufficient to produce this Disease we treat of.

Now the Causes producing so hot, plentiful and sharp stinging Seed, are youthful age, Sanguine complexion, and Cholerick or melancholick adust; meats that nourish much, a plentiful table, especially if the meat be spiced; the frequent smell of Spices, Musk, Amber-greece and such like: large sleeping, and upon soft beds filled with Feathers, or Down; amorous Courtings, reading of lascivious Books, Dancings, and other pleasures usual in the meetings of youthful persons.

SIGNS.] The Signs of this Disease may easily be gathered out of what hath been already said: But because it is wont to discover itself gradually, by little and little, it is fit to relate its progress. In the beginning, whilst the sick persons do yet enjoy their understanding, they are more sad, and silent than ordinary, but with a wanton rowling of their Eyes, and a ruddiness of countenance; which ruddiness is sometime more than at others: especially when mention is made of matters belonging to bodily lust, for then their breathing is changed, and their Pulse too, by Sympathy of the Heart, which made *Galen* boast that he knew the furious lusts of Women by their Pulse; because such Lovers do of a sudden undergo divers changes of their Pulse, when desirable objects are presented unto them, or brought into their remembrance. Afterwards when the Disease is exasperated, they begin to scold, and to weep, and ever and anon they fall a laughing, they speak many things without rime or reason, unadvisedly, out of which no certain sense can be gathered; a while after, they repent of this their folly, until another fit take them, by reason of the inordinate motion of the Peccant matter, which observes no certain period in its Fomentations. Women possessed with this kind of dotage when the Disease is come to its height, do openly before all the World ask men to lie with them, expressing the action of Generation in the most proper and broadest language their Mother-Tongue affords.

PROGNOSTICK.] As for the Prognosticks of this Disease. It is a curable sickness, if means be used in time. But if it continue long, and take firm rooting, it turns into a true and perfect Madness.

There is great hope of Recovery, when the distance between the fits begin to be longer than ordinary, or when the Patients Body being grown lean, becometh fat again, and when mention of matters pertaining to Generation, doth no longer affect or disturb them.

CURE.] The Cure of this Disease tends to correct the hot distemper of the Bowels; especially of the Womb, and the Blood and Seed; likewise to evacuate the sharp Humors, and Seminal matter offending. All which may be done by the following Remedies.

And in the first place, Blood must be often drawn, as far as the Patients strength can bear; that so the whole Mass of Blood, and the Womb it self may be cooled, and the fervent Blood may be withdrawn from the Veins of the Womb.

And if the Patients monthly Courses be stopt, the inferior Veins are afterwards to be opened, that they may by that means be brought down.

But if the Blood seems to have recourse to the Hemorrhoid Veins, which is known by their swelling and redness, the said Veins are to be opened by Application of Leeches.

Afterwards a Purgation is to be given, made of the gentle sort of Medicines purging Choler or Melancholy, according as the one or other Humor shall seem to abound.

This purgation is to be followed by Juleps that prepare the matter offending, viz. Such as cool and gently open; which must be given three days together.

Then a more strong purgation is to be administered, which may wholly extirpate the foresaid humors. To which intent those Purging Medicaments may be used, which were set down in the Cure of Madness, which must be now and then repeated.

* After

After iterated Purgations, the following Bath being frequently used in the whole Course of the Disease, will be very useful to cool the whole Body, and temper the fervor of the peccant Humour.

Take Leaves of Lettuce, Willow Tree, Water-Lillies, Vine-Tree, Purslain, Penny wort, of each a handful; Flowers of Violets, Water Lillies and Roses, of each two handfuls. Boyl all for a Bath, into which Blood warm let the Patient enter twice in a day, without sweating, far from meal tide.

And forasmuch as a compleat and entire Bathing cannot conveniently be continued for so many days together; at least the Patient may bathe her lower parts frequently in a part of the aforesaid Decoction, yea or of meer Water, and the liquor must be only warmish: For the prime intention of this Cure is, that the Womb may be cooled to the purpose: which is confirmed by a remarkable Experiment propounded by Dr. Harvey, in his Treatise of the Child-bearing of a Noble Lady, who had been more than ten years besides her self, by reason of this womb-fury; whose womb (after all things had been tried to reduce her to her wits, in vain) fell out, which they did not put up till the coldness of the external Air had healed its distemper; the event was, as the Doctor imagin'd, and she grew quickly well, and her Womb was at last restored to its proper place.

For the greater cooling of the Body, it may be convenient to give the Patient Whey or drink many days together.

And to be brief, whatever hath been prescribed in our Cures of Madness and Hypochondriacal Melancholy, will be good in this Disease, according as it shall be caused either by Choler or Melancholy.

Unto all which may be added such things, which by a peculiar property diminish and cool the Seed: Among which take these that follow for example:

Take Leaves of Water-Lilly, Willow, Agnus Castus, of each four handfuls: Lettuce, Purslain, Penny-wort, or Two penny Grass of each a handful: the four larger cooling Seeds, Lettuce and white Poppy seeds, of each half an ounce: Dill-seeds two Drams: the flowers of Water-Lilly and Violets, of each one handful. Let all be stamped, being fresh, and let them be sprinkled with juyce of Lemmons, and distilled in Balneo Mariæ; and to every pint of the Water, add a dram of Camphire: Let the Patient take an ounce divers times.

Or of all, or some of the Simples aforesaid, a Decoction may be made, and sweetned with Sugar, and a little Camphire put to it, to be taken divers times one after another.

Or an Emulsion may be made of the greater cool Seeds, Lettuce seeds, and white Poppy seeds, extracted with the waters of Lettuce, Willow and Water-Lillies, and sweetned with Syrup of Violets.

An Electuary may be prescribed after this manner:

Take Conserve of the Flowers of Water-Lillies, Violets, and Agnus Castus, of each half an ounce; Conserve of Roses half an ounce; Lettuce stalks preserved one ounce; Coral and Smarage prepared, of each one dram: With Syrup of Violets and Water-Lillies make an Opiate.

In the greatest extremity of the Patient's raving, such things as procure sleep are very profitable, both inward and outward Medicaments, as they are set down in the Cure of Phrenzy and Madness.

In the whole Course of the Disease, Clysters which cool and gently purge, are to be used, taking heed of sharp Clysters, and such as vehemently purge, which do exagitate the humor contained in the Womb or its Vessels, whereby the Symptoms are wont to become more fierce.

Also Injections may be made into the womb, of the Decoction of such Herbs as have formerly been set down for Baths and other Remedies, whereunto *Sal Saturni* may profitably be added.

Frequent Clysters may likewise be good to the same intent, being made of Vinegar allayed with Water.

Also cooling Oyntments are to be applyed to the Loins, Privity, the Share, and between the Water-gate, and the Dung-gate, made of Oyl of Water-Lillies, Oyntment of Roles, *Unguentum Album Camphoratum*, with the Juyces of Nightshade, Henbane and Water-Lillies melted together, adding a little Camphire.

Also a Plate of Lead is good to be worn continually upon the Reins.

In regard of the immediate Cause, seeing the evacuating of the sharp and corrupted Seed, may cure the Disease; it is very good Advice in the beginning of the Disease, before the Patient begins manifestly to rave, or in the space between her fits, when she is pretty well, to marry her to a lusty young man. For so the Womb being satisfied, and the offensive Matter contained in its Vessels being emptied, the Patient may peradventure be cured.

But if the Patient cannot so conveniently be married, or the condition of her life will not bear that estate, some advise that the Genital Parts should be by a cunning Midwife so handled and rubbed, as to cause an Evacuation of the over-abounding Sperm. But that being a thing not so allowable, it may suffice whilst the Patient is in the Bath, to rub gently her Belly on the Region of the Womb, not coming

coming near the Privy Parts, that the luke-warm temper of the Water may moderate the hotness of the Womb, and that it may by the moisture be so relaxed, as of its own accord to expel the Seminal Excrement, and that nothing else be done with the Hand, save a little to open the Womb, so as the Water may pass into its more inward parts; forasmuch as the Water will operate as much as any of those Medicines which we are used to extinguish the seed withall.

Pessaries may be compounded to the same intent, of the Leaves of *Mercury* bruised, with a little Myrrh, or the Powder of *Aristolochia* or Birthworth; which must be put up when the Patient is in the Bath, lest otherwise the Womb should be over heated; and after an hour, it must be taken away. And afterward, let an Injection be made into the Womb of Whey, or Barly-Water, with a little Juyc of Nightshade, Houfleeke, or Hemlock, which is especially commended in this Disease.

To purge out the Seed, the following Bolus or Morfel will be very profitable.

Take of Venice Turpentine three drams: Agarick Trochiscated one dram: Carrot seed Hempseed, and Lignum-Aloes powdered, of each eight grains: With Sugar make all into a Bolus or Morfel to be swallowed.

If the Disease do yet continue, let Issues be made in her Thighs; for nothing is better than by such means to draw the matter downward, from the Womb, to those inferior parts.

And if swellings of the Spleen shall arise, and Obstructions, during this Cure, as it oftentimes happens; they must be carefully cured with their proper Medicaments.

Finally, Because in this Disease the Brain and Heart are grievously affected by reason of Vapours arising from the Womb, they are both of them diligently to be provided for; the Brain being secured by rubbing and chafing the lower parts, and by Cupping-glasses frequently fastned upon the Hips and Groins; and the Heart defended by Cordial things outwardly applyed, both Liquid and solid, such as are described in our Chapter touching decay of strength.

Chap. 6. Of the Mother-fits, or Womb-sickness.

WHen Seed and Menstrual Blood are retained in Women besides the intent of Nature, they putrifie and are corrupted, and obtain a malignant and venomous quality: from whence venomous Vapours are elevated and carried to divers parts of the Body, from whence divers Symptoms do arise, and those so divers, that *Democritus* might justly say in his Letter to *Hypocrates*, that the Womb is Author of a thousand sad Sorrows, and innumerable Calamities. And *Hypocrates* himself says in his Book of Virgins Diseases, *That miserable Woman-kind are commonly laden with incomprehensible and manifold Diseases.* All which Infirmities we intend to explain in this Chapter, under the name of *Mother-fits*: herein imitating *Galen*, who in his Sixth Book of Parts affected, and the Fifth Chapter, says that the Mother or Hysterical Passion, is but to one name indeed, yet comprehending under it divers and innumerable Accidents. Notwithstanding all late Writers in a manner, do handle the Suffocation of the Womb, under the Title of Hysterical Passion, calling a particular Symptom by such a name as is common to many others, because it, of all the rest, is most frequent and most troublesome. But herein the very best Authors seem to have been superfluous in their Treatises of Womens Diseases, while in different Chapters they describe several Diseases springing from the Womb, viz. Suffocation of the Womb, Head-ach, Epileptical Fits, Palpitations of the heart, Pulsation of the Arteries about the short Ribs, and in the Back; the Diseases of the Stomach, Liver and Spleen arising from the Womb, and divers pains in sundry parts of the Body arising therefrom; seeing all these Infirmities do arise from one and the same cause, and are to be cured, by the self-same Medicines; so that the aforesaid Authors are fain to repeat the same things over and over, in several Chapters, not without much weariness to the Reader.

We therefore, That we may more briefly and Methodically set down the Nature of all these infirmities, think it worth our labour, first to set down the universal Causes of them all; and afterwards to declare how those Diseases arise from the said Causes.

CAUSES. We have shewed in the beginning of this Chapter, that there are two special Causes of all these Symptoms, viz. the Womans Seed, and the Menstrual Blood, being retained besides the intent of Nature, and corrupted, and possessed of a malignant and venomous quality; out of which malignant Vapours do arise, and afflict divers parts of the Body. Unto which Doctrine generally propounded, two other things of greatest moment must be added, viz. First, That not only the Seed and menstrual Blood do produce Hysterical or Womb-sicknesses; but divers Humors also of an excrementitious Nature flowing into the Womb, and by a long abiding, growing putrified, and sending out filthy Vapours. This is verified by many Ancient Women, who being destitute of menstrual Blood and of Seed, are yet very much subject to these Womb-sicknesses or Hysterical passions. Secondly, That not only Vapours arising out of the aforesaid substances, are causes of these distempers, but the very Humors themselves are a cause, which finding no free vent by the

the Veins of the Womb (into which as a Common-shore Nature disburthens superfluous Humors) by reason of the stoppages of the Monthly Courses or of the Whites, they flow back again into the superior parts of the Body, and do infect the said parts with that vitious quality, which they have contracted by their long abiding in the Vessels of the Womb, or by their mixture with Seed, or Menstrual Blood corrupted.

These foundations being thus laid down, let us see how Hysterical Symptoms are stirred up by the Causes aforesaid, beginning with the Suffocation, or strangling fits of the Mother, which is the most frequent and principal Sickness of these kind of Women, being accompanied with very many, and those most grievous Symptoms. For besides their breathing impaired, and sometimes abolished, their whole Body becomes cold, their Speech and Pulse is intercepted, so that they lie like dead Women; and some have been accounted dead, and laid out for Burial, and yet afterward Revived.

Now this Sickness comes by fits, which make their return sometimes sooner, sometimes later; and endure sometimes a longer, sometimes a shorter time, according to the quantity of the Humor offending, which is sometimes quickly collected, and sometimes long in gathering; sometimes soon dissolved, and sometimes long before it can be dissolved: For such like causes of Diseases in the Body of Women, have their times of digestion and exaltations; which having arrived unto, they do suddenly, and as it were in a moment, break forth into action. Yea, and such Humors being already collected in the Body, may for a season lie hid, until being stirred by some internal and external Cause, they shed forth their poisonous blasts and vapors into other parts of the Body. Now the most frequent and noted Causes of this Commotion and Agitation of these Humors, are sweet smelling things coming near the Patients Nose, or sweet meats taken in, which quickly bring Women subject to this infirmity into their fits; also vehement Anger, Terror, and other grievous Passions of the Mind.

DIAGNOSTICK. Now there are divers Degrees of this Sickness, according as the Matter offending differs in Quantity, or Malignity. For sometimes the Choaking-Fits, with want of breathing, are light and soon go over; sometimes it is extream, so that the Patient breathes not at all, and is attended with other Hysterical or Womb-sickness, such as Vomiting, Raving, Convulsions, and Swoonings, or Faintings away.

And for the most part, more grievous Symptoms do arise from corrupted Seed, than from Menstrual Blood, or other corrupted Humors. For look how much Seed retaining its Natural Disposition, is of a more excellent Nature than Menstrual Blood, by so much does it degenerate when corrupted, into a greater or worse kind of Venom or Poyson.

There are likewise other Differences of this Choaking Mother-sickness to be observed, viz. That sometimes the Patients have their Breath stopt as it were, sometimes they complain that they are choaked, as it were with a Rope that strangled them; and sometimes their breathing is much abated, or abolished, without any pain or sense of strangling. The Reason of which diversity is this; That the simple Suffocation, and difficulty of breathing, do arise from abundance of vapors, which do sometimes very much abound in Hysterical or Womb-sick Women, especially when the Hysterical Passion, and Hypochondriacal Melancholy are joyned together. Which vapors or Winds do compress the Midriff and Lungs, as it is wont to fall out in the windy *Asthma*; but the sense of choaking, in which the Patient feels her self as it were strangled in her Throat, depends upon a special property of the venomous vapor; as there are other Poysons in the greater World, which have such a property of throttling and choaking, as is known of one sort of Mushrooms. And that the venomous qualities bred in Hysterical Women are divers, *Galen* does sufficiently hint in his sixth Book of the parts affected, Chap. 5. where he compares the malignity of this vapor, to the venom of the Fish *Torpedo*, and to the sting of the *Scorpion*; which Poysons, though in quantity they are small, in operation they are mighty; and being received into mans Body, they do in a short space of time, grievously afflict the same, and produce therein most vehement Symptoms. As for Respiration diminished or abolished, it is caused by the said vapors being endued with a Narcotick or Stupefactive power, which being mighty contrary unto the Heart and vital Spirits, their action is thereby hindered, whence follows a cessation of Respiration, because there is now no need thereof. For seeing that drawing of Breath is necessary to cool our Hearts, when the heart is extreamly cooled by the venomous vapors aforesaid, it needs none of that cooling which is caused by drawing in the Air, and so breathing ceases, because there is no use thereof. We may also say, That the said venomous and stupifying vapor, does assault the Brain, and hinder the Influx of the Animal Spirits, whereby the motion of the Midriff and the Muscles serving for respiration, is hindered; add hereunto, That the vital Spirits being destroyed, the Animal Spirits, which are made of the vital, must needs be destroyed likewise.

In the place before alledged, *Galen* resolves a Doubt, which is this: That seeing it is generally held that a man cannot live without breathing, therefore it is impossible that Hysterical persons should in their fits be quite deprived of breathing. To which he answers, That in an extream cooling of the

Heart there is no need of respiration, which if it were stopped, and the Heart vigorous and hot, present death would follow; but that little warmth which is yet remaining in the Heart, is cherished only by transpiration, or ventilation through the Pores of the Body; even as Creatures lying all the Winter in holes, do live only by transpiration, because they are exceeding cold, and that little heat they have, needs no ventilation by way of drawing in the Air into their mouths.

Besides, The fore-mentioned cause of Womb-suffocation, viz. A Malignant and Venomous Vapor, some add another, Namely, The ascending or rising of the Womb into the superior parts of the Body whereby the Stomach and midriff are compressed; from whence, not only Hysterical Suffocations, but other sicknesses also do arise. This ascending of the Womb, *Hypocrates* propounded in his Book of the Nature of Women, in these words: *The Wombs of Women being turned from their Natural posture, do strive towards the Liver, and bear violently upon the Midriff: for they are carried upwards, seeking moisture to refresh them, being over dried with Labor; and the Liver is the fountain of pleasing moisture.* And *Fernelius* in his sixth Book of Pathology, that is, of Diseases and their causes, Chap. 16. says, he had often felt the Womb thus ascending, bearing up against the Stomach like a round Globe, and grievously oppressing the same, from whence it hath been often thrust down by force of hand, and manifestly driven back into its proper place. *Eustachius Rudius* in the Second Book of his Practice, in the 51. Chapter, saies the same thing, viz. That he with his own hand, hath felt the Womb arising as high as the Navil, and sometimes above the same, and hath by little and little thrust the same down into its proper place. But *Galen* in his sixth Book of Parts affected, Chap. 5. opposes this Opinion, and teaches that although the Womb may in some sort be moved, and ascend, yet that motion and ascension is very little, neither is it any ways possible, That the Womb should ascend unto the Stomach, so far is it from being able to transcend the same so far as to reach unto the Midriff. A very strong Reason hereof is brought from anatomy, seeing the Womb is so fastened in its proper place by four very strong Ligaments, that cannot be lifted up so high. Whereunto the Defenders of this Opinion do make answer, That in the falling out of the Womb, those Ligaments are so relaxed that it is wont to come without the Water-gate, and therefore it may ascend as far up as it can go down, when those Ligaments are relaxed or slackened. To this we reply, That the falling out of the Womb comes to pass by little and little, through length of time, by the moistening and softening of the Ligaments, caused by a defluxion of Flegm thereupon; but that which they call the Ascent or rising of the Womb or Mother, happens in a moment, and is as soon restored; and it is requisite that the Ligaments should have been first relaxed, and consequently that all Women should be troubled with the falling out of their Wombs who are subject to this Ascent or rising we speak of, because the occasion of this Ascent being ceased, the womb would of its own accord, and by its own proper weight fall downwards, and lie continually without the Body.

It is hard to make Answer to the Experience of *Fernelius*, *Rudius*, and others; of which they testify themselves eye-witnesses, who profess they have with their own proper hands perceived the Womb to ascend like a Globe or Bowl to the Navil and higher, being afterwards by them thrust down into its own proper place. *Sennertus* makes answer to this, that the round Body, which was by them so felt, was not the Womb, but the Stones, with that blind Vessel, which from *Fallopian*: the finder or first Observer thereof is called *Fallopian* his Trumpet, because he likened the same to the broad end of a Trumpet. For the Stones appertaining to the Womb being pendulous (that is, Hang dangling moveable as on strings) and the Body of the Trumpet aforesaid being hollow as a pipe, lax and apt to move this way, and that way; when they are filled with corrupt Seed, with vitious Humors, and with windy Vapors, and swell and strout again, they may move this way, and that way in the lower Region of the Belly, and ascend as high as the Navil. And that such a round swelling may happen in the Stones and Trumpet, as is sometimes felt in Hysterical Women, The Observations of *Riolanus* may teach (propounded in his Book called *Anthropographia*,) where he relates that in Hysterical Virgins such as have had the Womb-sickness, He had found their Stones greater than his Fist, strouting with Wheyish seed; also the Trumpet of the Womb Amplified or enlarged and very much widened. And *Vesalius* observed some such thing in a certain noble young Damself troubled with suffocation or strangling of the Womb, in whom one Stone was swelled to the greatness of a large hand ball, being filled with a saffron-color'd Humor, very stinking, and sendeth forth a filthy and poysonous kind of Vapor: Which Humor died the adjacent parts yellow, just as we see the Gut Colon where it is carried under the Liver, is by the Bladder of Gall rendered of a clay-like yellowish Colour.

Yet is not *Sennertus* very far from the judgement of the Authors aforesaid; for granting, as he saies, that the Stones and Trumpet of the Womb, being filled with corrupt Sperm, vitious Humors, and vaporous winds, do strout again, move to and fro in the lower Region of the Belly, and can ascend as high as the Navil; seeing those parts are contiguous with the Womb, they cannot be moved in the Region of the lower Belly, nor ascend unto the Navil unless the Womb be moved with them

them: so that this motion may be ascribed to the whole Womb very well, as it consists of its own perfect parts, together with such parts as are knit thereunto. Again, if the Stones and Trumpet being filled with vitious Seed, Humors or vapors, may be diversly moved to and fro, Why may not the Womb being filled with like Humors and vapors, be moved with the same motion? The reason indeed of *Sennertus*, which he borrowed from *Galen*, does convince, that the Womb tied with four Ligaments, cannot ascend so high as the Midriff, no not as high as the Stomach; but it must be denied that it may be carried as high as the Navil, where the Authors aforesaid perceived that Globe, both because those Ligaments may be somewhat stretched by matter working in them like yeast; and likewise because the Womb while it is blown up, fills a greater space; and may be perceived towards the Navil; so that whether the whole womb, or the parts fastened thereunto, viz. The Stones and the Trumpet be moved upwards, we may still call it the Rising of the Womb or Mother, and cleave to the Doctrine of *Hypocrates*.

Head-ach from the Womb comes divers ways; for sometime it possesses the whole Head, other-whiles the forepart, and then again the hinder part thereof, and sometimes it is felt about the Eyes, in such manner as if the Patients Eyes would leap out of her Head.

Now these parts are caused by the aforesaid sharp and Malignant Vapors mounting into the Head, and twitching as it were, or grating upon these Membranous parts: Also evil Humors brought from the Womb to the Head, may cause the said pains. For vitious Blood, especially the more thin and Wheyish parts thereof, ascend from the Womb into the head, and being shed into the Membranous parts, breeds those pains. Which pains are sometimes Pricking, Smarting, and sore as an Ulcer, by reason of the sharpness of the Vapors, or humors ascending: Sometimes they are stretching, as it were, and swelling, because of the plenty and multiplicity which descend and stretch: Sometimes they are pulsatory pains beating like the Pulse, when the Vapors or humors are carried thither in the Arteries, or when the Arteries of some peculiar part of the Head are filled with over-hot Blood.

The Falling-sickness springs from the Womb, being caused by the aforesaid sharp and Malignant Vapors, which being possessed with a very great Acrimony and malignity, do vehemently and sharply smite the Nervous parts, whereby they come to be contracted; and whilest they endeavour to expel what offends them, they draw themselves together, and express these convulsive motions.

Palpitation of the Heart, is often caused by the said Vapors, being carried from the womb to the Heart, and provoking the expulsive faculty of the Heart.

Also a Pulsation is caused in the Arteries of the Back; and about the short Ribs, by reason of an over hot Blood, carried from the Womb into those Arteries, and distending them, where their Pulsation becomes greater, which smiting the adjacent parts, causes a feeling of the said Pulsation in them: Yet, sometimes such Pulsations are caused in Hypochondriacal Melancholy, which when we come to the Signs of this Disease, we shall distinguish.

Divers disorders are likewise raised from the womb, in the Stomach, Liver, and Spleen; from the Stomach disorders arise, as appetite lost, or more than is fit, or desirous of absurd things; or Hiccoughs, Vomitings, Belchings, and Heart-burning: all which Symptoms do spring from the aforesaid vapors, sent into the Stomach by the Hypogastrick, and Cæliack Arteries, or other blind passages; and those Vapors do stir up this variety of Symptoms, according to the diversity of their Nature, and the different degrees of their putrefaction and malignity. For by their heat they cause want of appetite, and thirst; but if they be cold, they hurt digestion. And the coveting of absurd things (as Chalk, Oatmeal, Small-Coals, Linsey-wolsey cloath, &c.) is caused by the malignant quality of the humors and vapors, as we have shewed in our discourse touching that Symptom: and according to the different kind of Malignity, it comes to pass that the Patients appetite inclines her to long for this, or that odd thing; as some for Coals, others for Clay or Morter, Salt, Cinnamon, Nutmegs, &c. And from a certain kind of Malignity springs likewise the loathing of some certain meats; and which is more wonderful, in some hath been observed an universal loathing of all kind of Drink: as *Ludovicus Mercatus* relates concerning a noble Gentlewoman, which would not away with any Drink; and of another, who though she desired Drink, yet did she Vomit it all up again, being likewise vexed with other grievous Symptoms; Where we may conjecture, that the evil Humors in that Gentlewoman, had attained such a kind of Malignity, as that is which causes Water-Fear in such as have been bitten with a Mad Dog. It is notwithstanding undeniable, that the diversity of the parts into which these Humors and Malignant Vapors are carried, conduce not a little to the variety of the Symptoms. For, if they are carried unto the mouth of the Stomach, they stir up Belchings, and Vomitings; if they stick to the Coats of the Stomach, they induce perpetual inclinations to Vomit; if they are endued with any singular Acrimony, they cause Hiccoughs, or pains of the Stomach; which pains may also arise from the plenty of Humors, weighing heavy upon, and stretching the parts containing.

The Liver is easily offended by menstrual Blood retained, and by the Veins flowing back therein; hence springs the Green-sickness, by reason of bad Blood flowing from the Womb into the Li-

ver, and from the Liver shed abroad into the whole Body. Hence come Swellings, Feavers, and other Diseases very many, in the whole Body, and several parts thereof: forasmuch as all of them are nourished by the Liver.

But if the vitious Blood aforesaid do flow back from the Womb unto the Spleen, Swellings, Stoppings, and Melancholy, and Hypochondriacal Diseases are wont to be raised.

And, to conclude, Women feel divers kinds of pains in their Loins, Thighs and other parts, which arise from filthy Humors, and Vapors conveyed from the Womb into the said parts: All which Symptoms, taking rise from the womb, shall be distinguished from others which arise from other parts, and are like them, but produced from different causes, in our following Description of the Signs of this Disease.

In the first place therefore, womb sickness is known for the most part by what hath already been said of it. For the fore-recited Symptoms do appear therein, not all in every one, but some in one Patient, some in another, according to the differing condition of the Causes. Now these Symptoms are, Breathing depraved so, as sometimes the Patient seems to be choaked; otherwhiles her breathing is lessened or wholly taken away, without any trouble of Sense or Suffocation; Refrigeration or cooling of the whole Body, and stopping or Interception of the Pulse; sometimes also a taking away of Sense and motion; sometimes Raving, Convulsions, Swoonings, Vomiting, and Hiccoughs are joyned together.

SIGNS. But for a more clear Discovery of this Disease, those Signs are first to be propounded, which shew the Disease approaching, such as have a noyse in their lower Belly (first from the Navil downwards) with belching or inclination to Vomit; Weariness, Yawnings, and stretchings proceeding from a flatulent matter, which begins to mount from the Womb into divers parts of the Body; a sad Look, pale Face caused by the drawing back of the Natural heat from these parts, to its Fountains.

When the Disease gathers strength, a sense of strangling begins to trouble the Patient, as if they had swallowed some great morsel which stuck in their Throat. Afterward their breathing stops, and their Suffocation is increased. And in conclusion all their Vital and Animal actions, are depraved, diminished, or abolished. Hence spring Ravings, Convulsions, and other grievous Symptoms. In some the Womb is sensibly tossed and tumbled, and gathered round like a Foot-ball; and felt after that manner in divers parts of the lower part of the Body. And when the Hysterical, or Womb-Fit begins to go over, a certain moisture flows out of the Water gate, their Guts rumble, they lift up their Eyes, redness springs up in their Cheeks, Sense and motion is restored, their Body grows warm, they fetch deep Sighs, and so the sick Party by little and little, is freed from her Fit.

By the Signs propounded, Womb sickness may easily be distinguished from such infirmities as are of kin, or otherwise like the same, viz. the Syncope (Swooning sickness) Apoplexy (blasting, Plaguet-striking) and the Falling-sickness: howbeit the difference between the Womb-sickness, and those Diseases aforesaid, is peculiarly to be noted.

And in the first place, by three general Signs we may conjecture that these Symptoms which are common to Womb sickness, and the aforesaid Maladies, do proceed rather from the womb, than from any primary misaffection of the Heart or Brain. The first whereof is, that if the sick Patient be subject to Womb sickness, and hath been often annoyed with the aforesaid Symptoms, when they come fresh, we may conclude the Disease to be no other than Womb sickness. The Second is, That when women begin to feel those Symptoms, they complain that their womb is out of order. A third is, That in womb sickness, women do feel great ease when stinking things are put to their Noses, and sweet smelling things are put in by the Water-gate, which in those other infirmities falls not out.

And the Hysterical, or womb sickness is more peculiarly distinguished from that which we call Syncope, or the Swooning-Fits, because in the Syncope, the breathing and pulse do wholly cease; but in the womb sickness, it remains in a small measure, till they come into the very height of the Fit, wherein is most danger. Secondly, The Swooning Fits come more quickly, and seize upon the Patient as it were on a sudden. But in the womb-fits, there precede evident tokens of the approaching Fit. Thirdly, the Patients Face is paler in the Swooning-Fits, than in the Womb-fits; yea verily, some Women have a ruddy countenance in their Fits of the Mother, and then the Disease is sufficiently known by that Sign alone. Fourthly, In the Swooning-Fits, we find commonly cold, and Diaphoretick Sweats, which in the womb-fits appear not. Fifthly, the Swooning-Fits are shorter, and the Patient is soon either well or dead; but the strangling Fits of the Mother last longer, continuing a whole day, or divers days together sometimes. But it is to be remembered, that the Swooning-sickness, and the Womb-fits are sometimes joyned together, when the Heart is more grievously afflicted than ordinary, or when the Patients strength hath been much weakened by protraction of the Disease; and then the Symptoms of both Diseases may be mixed one with another.

The womb Fit is distinguished from the Apoplexy; First because that in the Wombs-Choaking

ing Fits, the Joynts are not so loosned; neither is the Sense of feeling wholly gone, as in the Apoplexy; but if they be pricked, or have their hairs pull'd off, they give a sufficient Sign with their hands that they feel the pain. Secondly, In persons Apoplectical, Planet struck (as the simpler sort do phrase it) there is a perpetual snorting of the Patient; but in the Womb stranglings, not. Thirdly, Womb-strangled Patients when their Fit is over, remember what was done and said, during their extremity; but in the Apoplexy it is not so.

It is distinguished from the Falling-sickness; First, Because convulsive motions are not always joyned with Hysterical Suffocations; and those that do accompany the Womb Fits are not so Universal as in the Falling-sickness; but molest only one or two members. Secondly The pulse is greater in the Fits of the Falling-sickness, than it uses to be when the Patient is well; but in the Mother-Fits it is quite contrary. Thirdly, In the Falling-sickness, the Patient fumes at the mouth, but in the Mother-Fits there is no such fuming. Fourthly; In the Falling-sickness, the Patient remembers not what was done to her during the Fit, but in the Mother-sickness she remembers all, as we shewed before. Fifthly Those that have Fits of the Mother, do in the end of a Fit come to themselves like persons awaked from sleep, with a noise in the lower part of the Belly, the womb as it were becoming quiet, and returning to its natural place, and sometime much humor flows from the womb, which doth not befall such as have the Falling-sickness.

We must also enquire how such as are in the Fits of the Mother, may be distinguished from those that are quite dead; seeing many Histories relate that some Women in that case have been accounted dead, appointed to burial; yea, and some buried. The ways which Authors prescribe to make this tryal, are divers: For either they lay teazed wool, or light Feathers upon the Patients mouth, and if they stir not, she is given over for dead; or they apply a bright Looking-glass to her mouth, which will be dulled with her breath, if she be yet alive; or they set a Cup full of Water upon her breast, and if the water stir not, they account the party dead. These Signs do for the most part hold good, but they are not perpetual, neither do they put the matter past dispute; seeing as was said before, some Women in these Fits do live only by Transpiration, as those live-wights which live in holes all the Winter, and fetch no breath at all by their mouths. Which though it very seldom falls out, yet it is a very good Caution, not to suffer women which die of this Disease, to be buried till the third day after their death, or at least till they begin to stink.

The Signs of the Causes are likewise to be declared; which Causes we have shewed to be three, *viz.* Seed retained and corrupted; Menstrual Blood in like manner retained and corrupted; and evil Humors contained in the vessels, or the Cavity of the womb.

If this Disease arise from Seed retained, or corrupted, there have preceded all those Causes, which might encrease, gather together and corrupt the seed in the Vessels; as flourishing age, ripe for generation, or formerly accustomed to the actions thereof, which of late it hath left off; Sanguine complexion, an idle life and given to pleasures; a rich and plentiful table, with the use of such meats as are easily corrupted. In such persons if the Womb-Fits happen, they having their Courses well, we may guess they come from seed retained.

If these Womb-Fits depend upon the menstrual Blood retained and corrupted, as their cause; and the Patients Courses are either wholly stopt, or flow very little, and to no purpose, and she herself is not to seek for carnal Embracements, but well provided; And some Symptoms do attend this suppression, as Melancholy, Wasplishness, Sluggishness, Drowsiness, Head-ach, swelling of the Dugs, heaviness of the Loins and Thighs.

That this disease comes from evil Humors is known, by the Patients having her Courses well, being exercised sufficiently with actions of Generation, by her being steeped into years, or being very full of evil Humors, or being troubled with some other Disease in her Womb.

We must also set down the Signs of those other Symptoms which we formerly described, as springing from the Womb.

Head-ach coming from the womb is known, because the Patient hath not her Courses right, the pain does chiefly trouble her, or is most encreased at or near the time of her Courses flowing, and her womb is out of order. Also we may distinguish whether an Humor, or a Vapor cause this pain; for if the pain be not great, heavy, and pressing, and come by fits, it comes certainly from a Vapor; but if the pain be continual, joyned with heaviness, it shews an Humor contained in the part; which if it be Chollerick, the pain is biting, pricking, and acute or sharp; if it be Flegmatick, it causes sleepiness; If Melancholy, Sadness.

Panting of the Heart, and beating of the Arteries about the short Ribs and Back; Diseases of the Stomach, Liver and Spleen; and divers pains may be conceived to arise from the womb, if the other Signs and Symptoms of the womb affected, before recited, be likewise present. As also, if by putting sweet smelling things to the Water-gate, and stinking things to the Nose, the Patient do find some kind of ease.

PROGNOSTICK. What concerns the Prognostick, or Predictions of this Disease: It is a malady

malady which seldom kill the Patients, but use to stick a long time by them. But sometimes they are in danger of death by reason of swooning fits that happen, or by some extraordinary Convulsion. Likewise if the fits are frequent and hard to be removed, it is to be feared lest Respiration being so often hurt, the Native heat should be suffocated, and the Patient come to die.

That Womb-passion is worst, in which more parts are drawn into consent; and that is bad which springs from corrupted Seed, or from a long suppression of the monthly Courfes.

In Elderly persons this Disease is hardly curable, because of that plenty of Corruption wherewith they are wont to abound. In younger Women, it commonly ceases when they begin to bring forth Children.

In Women with Child, and that lie in Child-bed, it is a dangerous Disease; in the former, for fear of miscarriage; in the latter because of their weakness after Child-bearing.

For a Woman troubled with these Womb-fits, to sneeze is good, for it signifies strength of Brain; and by the motion of sneezing, the malignant Vapors which besiege the Brain, are discussed; and likewise the vitious Humors contained in the Womb evacuated.

C U R E. A two-fold Cure belongs to this Infirmary: one in the fit, another out of the fit. In the fit, those vapors which cause it are to be discussed and drawn back from the part affected; the Humors contained in the Womb which send up those Vapors, must be voided; and the Womb when it is removed out of its proper place (which often happens according to *Hypocrates*) must be restored to the same again.

First therefore, The sick party must be laid upon a bed in such a posture, that her Neck and Shoulders lie high and sloping, but her Thighs and Privy parts lie low and shooting downwards, for so the Womb is more easily reduced.

Then must her lower parts be tied very hard, so as to cause pain; likewise they must be well rubbed and chafed; also Cupping-glasses are to be set upon her Hips; and a very large Cupping-glass set upon her Share is very profitable. But take heed that you do not apply a Cupping-glass upon the Patients Navil, which many ignorantly are wont to do, for by that means the Womb is drawn upwards again. When Convulsions happen, or swooning fits, hard rubbings with coarse cloathes are good upon the Soles of the Feet, also with Vinegar and Salt; it is good likewise to pluck off some Hairs from the Head and Share, to cramp the fingers of the Patient, whoop aloud in her ears, and such like.

It is also good to lay unto the soles of her Feet this Epispastick, or drawing Cataplasme or Pultis.

Take Leaves of *Artemisia*, *Mugwort*, *feaverfew*, *Rue*, of each one handful: *Sage*, half a handful: *Pidgeons dung* powdered three ounces: *Black Soap* an ounce and an half: *Amber*, *Frankincense* *Mastich* powdered, of each a dram and an half: *Juyce of Rue* and *Vinegar*, allayed with *Water*, as much as sufficeth to make all into a Cataplasme.

At the same time, stinking and strong smelling things are to be put unto her Nose; as *Partridge* feathers burnt, old *Leather* burnt, and *Brimstone* fired; *Jeat* or *Agate Oyl*, a *Pomander* of *Assafoetida*, *Castorium*, *Galbanum*, *Rue* moistened with *Syrup of Artemisia*, or with *Vinegar*; *Garlands* of *Rue*, *Tansy*, or *Wormwood*. But if the Woman be *Epileptick*, or subject to the *Falling sickness*, we must abstain from the stronger things before mentioned, because the Brain being therewith offended, is put into a Commotion, by which means the Humors are troubled suddenly in the *Ventricks* thereof, and the Symptoms are made more grievous.

The smoak of *Tobacco* blown into the Mouth and Nostrils of the Patient, does quickly free her from the fit.

Contrarywise, sweet smelling things must be put unto the Womb, as some grains of *Musk* or *Civet* wrapped in *Cotton-wool*.

The following Powder may be blown up her Nostrils:

Take white *Pepper*, *Mustard-seed*, *Pellitory*, *Castorium*, of each one scruple; make it into a very fine Powder:

If the Patient be very much oppressed with her fit, let her be provoked to sneeze, according to that Aphorism of *Hypocrates*, in his 5. Section, 35. To a Woman troubled with Womb fits, or hard Labor, if she happen to sneeze, is good. Sneezing is many times provoked by the aforesaid Powder; and if that alone will not do it, a little white *Hellebore*, or *Euphorbium* may be added.

Also Oyl of *Amber* or *Agates*, may be anointed upon her Nostrils.

But laxative and wind-expelling Clysters do exceed all other Medicaments, in discussing such filthy Vapors as cause the fit: which may be made after this manner:

Take *Mercury Leaves*, *Pellitory of the wall*, *Mugwort*, *Penyroyal*, *Rue*, *Calamint*, of each one handful: *Caraway seeds*, *Cumin seeds*, and *Bayberries*, of each two drams: Boil all to a pint and an half. In the straining dissolve *Hiera Picra*, and *Benedicta Laxativa*, of each six drams: Oyl of *Rue* three ounces: *Camphire* half a scruple. Mix all into a Clyster.

If the first Clyster be not sufficient, another must be given of the same or such like Decoction, dissolving therein, Diaphanicon ten drams: Turpentine dissolved with the white of an Egg one ounce: the aforesaid Oyl, and half a scruple of Camphire dissolved in Oyl of Water lillies.

And in a word, The Disease continuing, a third Clyster must be given meerly Hysterical and dis-cussing, but not purging, which will be very effectual, compounded after this manner:

Take Oyl of Rue four ounces: Aqua vita one ounce: Canary Sack three quarters of a pint Gal-banum two drams: Mix all, and make a Clyster, and administer the same after a Laxative Clyster.

A Clyster of Vinegar tempered with Water, does presently assuage the Mother-fit, by compressing and coagulating the vapors, which cause the same.

The same does a draught of Vinegar allaid with water, being taken in at the mouth.

Authors do likewise counsel that the Patients belly above the Navil be strongly girt with a swath-band, that the Womb may be thereby reduced, and the vapors hindered from ascending.

Concerning letting blood, it is a great question, whether it be convenient in the fit, or no? For seeing there is at that time a great weakness in the Patient, and sometimes despair of life, and the body is cooled all over by malignant vapors which infect the Brain and Heart, which can no ways be expelled by blood-letting; no question the use thereof is very dangerous during the fits. And of this Opinion are *Varandans* and *Sennertus*. But *Mercatus* and *Rodericus a Castro*, do determine contrarily, That a vein ought to be opened in the Patients Ankle or Instep, when the Disease springs from an abundance of Menstrual blood retained; and that the Patients strength oppressed with the burden, the passages obstructed with too much blood; and the danger of suffocation hence arising can be remedied by no other means but bleeding; seeing in this case, neither stinking smells nor sweet smells, nor Cupping-Glasses, can bring the Patient out of her fit. *Philippus Hoechstetter* in the second part of his Observations, makes it appear by certain Histories, that bleeding in the Foot hath done much good; Inomuch as a certain Nun, which had been speechless, and in Convulsion fits for two days together, two hours after she had bled, began to speak, and to eat and drink. I am of Opinion, a Vein may be opened, if the Pulse be strong, and there be evident tokens that blood doth super-abound: But if the Pulse be weak, we must forbear, and stay till the fit is over for a more convenient season, in which blood may be safely taken away.

Plaisters are profitably applied under the Navil, of the Mass of *Emplastrum Coroneum*, which mollifies and discusseth, and so is better than the vulgar womb-plaister, which doth somewhat bind, and therefore may retain the vapors and malignant humors. Plaisters are likewise made of Galbanum and Assafoetida, or of Caranna, and Tacamahacca, either alone, or with some Spices mingled with them.

As for Example:

Take Gum Caranna half an ounce; Powder of Nutmegs, and Cloves, of each half a dram: Oyl of Amber four drops: Turpentine two drams. Make all into a Plaister: Such Plaisters are to be made in fashion of a Shield or Scutcheon, and in the pointed part of the Plaister, which must be laid towards the Water-gate, some grains of Musk or Civit are to be put, that they may send forth a sweet smell, and thereby allure the Womb back again. Three grains of musk may be put in a little Cotton moistened with Oyl, and thrust into the hole of the Navil: then lay on a small Plaister of dissolved Galbanum. This some Women use for a Secret.

Or four grains of Camphire may be dissolved in Oyl of sweet Almonds, and put into the Navil, and a Diapalma Plaister laid over it.

If the Disease seem to be fostered by plenty of wine and vapors, Fomentations and Baths will be good, of the Decoction of Rue, Mugwort, Thyme, and Calamint, Fennel seed, Annis seed, Cummin seed, Bay-berries, Chammomel flowers, Dill flowers, &c.

Also little bags may be prepared with Cummin seed, Annis seed, Carrot seed, Salt, Rue, Bran, in them, and applied very hot, and often renewed. Or,

Take Oyl of Rue four ounces: Spirit of Turpentine half an ounce: Mingle them, and dip therein a piece of Bread hot out of the Oven, and lay it upon the Navil.

Also it will be good to anoint the lower part of the Belly, and the Region of the Womb, Share and Loyns; because such anointings do dilate the Passages, attenuate the vapors, and discuss them. They may be made of Nard Oyl, Spike Oyl, Oyl of Dill, Sesamine, Saffron, Lillies, and Sweet Almonds.

Authors do very much commend a fume of ^{warts} which grow upon Horses Legs; which being dried in an Oven, and beaten to Powder, they are burnt under the Noses of women in these fits as a present remedy, whereby women are wont to be in an instant delivered of their fits, to the admiration of the by-standers.

If the Disease spring from retention of Seed, nothing is better than carnal Conjunction, as soon as the Patient is out of her fit, if she be married.

Instead of carnal Conjunction, where that cannot be had: many advise that the Patient be rubbed and

and tickled by a Midwife in the Neck of her Womb, into which the Midwife must put her Fingers anointed with Oyl of Spices, that so the offensive Sperm may be voided. But seeing that cannot be done without wickedness, (understood by a silly superstitious Papist, that counts it a meritorious good work to burn Mother and Child in her Womb alive, as at *Ferscy*, and a wickedness to free a sick Body of a little offensive Humor) a Christian Physitian must never prescribe the same.

To Discuss those malignant Vapors which cause the Womb-fit, many Medicines are wont to be given down the Throat, among which is a dram of old Venice Treacle, with Water of Mugwort, Penny-Royal, and Balm; Troches of Myrrh, to the quantity of two scruples; or Oyl of Amber to five or six drops, with the said Liquors.

Pills are frequently used; the best are made after this manner.

Take *Castorium*, Myrrh, *Assa-fetida*, of each one scruple; *Facula Brionia* half a scruple: seeds of Rue and Saffron, of each seven grains: with Syrup of Mugwort make twelve Pills. Let her take three or four; if she cannot swallow them, let them be dissolved in Water of Mugwort.

These following Pills are good in a violent fit, which they are wont to remedy without fail.

Take *Assa-fetida* one scruple: *Castorium* six grains: *Laudanum* three grains: make all into three or four Pills. Let her take them presently.

Pilule Ferida majores, although they be purging, yet are they given to good purpose in the Fit, to half a dram. For they gently evacuate, and are not wont to work till the fit be over; so that there is no danger in their working.

Also many Waters are wont to be given in the fit, viz. *Aqua vita*, Cinnamon water, or Treacle water.

Or a specificall water may be made after this manner.

Take *Zedory* roots, Carrot seeds, Lovage roots, of each two ounces: red Myrrh, *Castorium* of each half an ounce: Piony roots four ounces: Mistle of the Oak gathered at the wain of the Moon, three ounces: pour upon all these being prepared, four pints and a half of Beaver-sue water, Spirit of Wine half a pint; let them digest three days, and afterward distill them. The dose is a spoonful by it self or with some convenient liquor.

A more easie water to make, more pleasant to taste, and no less effectual, is this following.

Take of the juices of Balm, and Borrage clarified, of each two pints: the best Saffron one dram. Let them be infused and distilled in Balneo. The Dose is a spoonful with Broth. This following potion is vulgarly used.

Take of Cinnamon Water half an ounce: Orange-flower water four ounces: *Castorium* four grains. Make all into a potion, or draught.

Oyl of Amber given to three or four drops, in Orange-flower, or some other specificall, doth quickly rid away the Womb-fit.

The following potion is wont to do very much good, as it is to be seen in our Observations.

Take Water of Mugwort, Roses and Orange-flowers, of each one ounce: Cinnamon Water three drams: Confection of Hyacinth-stone one dram: *Diamargaritum frigidum* (that is the cooler perled powder) half a scruple: Saffron four grains. Make them all into a potion.

Orange-flower-water doth good alone, given three or four ounces; but mingled with Musk, and Dragons-blood, it doth wonders: witness *Solenander* in these words. A certain woman was vexed with most cruel Symptomes, Head-ach, Belchings, contraction of the Body, pain in the Groin, grinding of her Teeth; sometimes falling to the ground speechless, with her mouth shut, so as she could not open it; and all this through disorder of the Womb. Many remedies being used in vain, a certain old Woman comes, and gives her thirteen grains of Musk, and as many of common Dragons blood, in four ounces of Orange-flower Water; she was cured, and never felt the like griefs any more. I have in the like case given the same Medicine divers times, and always with good effect.

An Elks Claw is also very good in these fits, according to the experiment of *Apollonius Menabeus* in his Treatise of the Elk, Chap. 10 in these words. I confess I have both heard from others, and found by my own experience, that an Elks Claw is a present remedy for the Suffocation of the Mother. For being called to help a Woman in those Fits, I gave her the raspins of the Elks Claw with Zedoary; with which, and with other remedies administred according to the rule of Art, I did the Cure with Honor. And when I understood, that she was wont to be troubled with those Fits oftentimes, I enjoined her to wear a piece of Elks claw continually about her Neck. Which when she diligently observed, for the space of three months that I was in the place, she was ever free from those Fits, and gave me oftentimes thanks for my advice.

Camphire fired, and cast into the water, and there abiding till it be quenched, is an excellent Remedy, given to the quantity of a dram.

The Cats-tails of the Walnut tree in the Epistles collected by *Laurence Scholezius* in the letter written from *Thomas Mousor* to *Peter Monavius*, are extolled with this Commendation. In Strangulation of the Womb, the Cats-tails of the Walnut tree are a singular Medicine being dried and powdered.

You may give two scruples with two drops of Oyl of Amber. I never knew any thing more excellent in that Disease.

Two most excellent Remedies may be made in the form of Powders, which I have oftentimes tried.

The one is of the After birth of a Woman that lies in of her first Child, dried in the Chimney, and beaten to Powder. The Dose is a dram in some convenient Liquor. It presently takes away the fit.

The other is made of two parts of Brimstone, and one of Nutmeg. Powder them and give a dram.

Powder of Jeat given to half a dram, or one dram, will do much.

The Powder of Elder-berries of *Quercetanus* taken a dram in Wine, cures the Epilepsie, or Falling-sickness, by consent of the Womb, and being taken the second time, makes that the fits return not.

Where that Powder cannot be had, the same quantity of Soot from the Chimney, may be given in an Egg soft boyled.

And because the Womb is oftentimes filled with evil and Excrementitious humors, from whence ugly vapors are raised up; we must be careful to purge the same, which may be most conveniently done by this following Pessary.

Take *Diaphænicon* one dram; powder of *Hiera Picra* half a dram; Turpentine three drams: mix all, and with two make a Pessary.

For her ordinary drink, let the Patient drink a thin weak Decoction of Cinnamon, Caraway or Annis-seeds.

Touching Wine. It is a question whether it may be given a Woman in these fits. *Hypocrates* in his First Book of the Nature of Women seems to commend the same: and there is much reason to back his Opinion. For an extream refrigeration of the body, and Languishment of Natural strength, cannot be better holpen, than by giving the Patient a Cup of rich Canary. But *Avicenna* wholly forbids it. And indeed, Because this Disease depends for the most part upon Seed retained, or of Blood and foul Vapors carred up from the womb; wine by its thinness and exceeding piercing faculty, doth more exagitate and vex the Morbifical matter; whence we see by common Experience, that women troubled with this Disease, are worse if wine be given in their Fits. To compose this Contention, we say, That wine ordinarily is not to be given during the Fit, but upon extraordinary occasion: Namely, when the Patient's strength is extreamly decay'd, or she hath Swooning Fits joyned with the Mother-Fits, or seems to be at the last gasp: all other Remedies tryed in vain, we make use of wine as our last Refuge, and for present help.

In this Cure we must be very careful, if the Patient be with Child, and prudent in our administration of Medicaments; neither must we use those more vehement and stinking ones, lest we cause miscarriage; and we must perform the Cure rather by outward than inward Medicaments.

In the Course of the Cure, care must be taken of the Heart and Brain, and if they seem much oppressed, they must be relieved by such Medicines as are proper unto them. To the Heart, wine and Orange-flower-water, or Imperial water, or Treacle of *Andromachus* dissolved in wine, must be applied by wetting things therein, and laying them upon the Region thereof; or hot living Creatures are to be applied thereunto. For to strengthen the Head, those Remedies must be used which are set down in our Chapter of sleepy Diseases.

When the fit is over, Care must be taken to prevent the return thereof, either wholly, or at least for a long time: which is done by a removal of the Causes, and by strengthening the womb.

In the first place therefore at a convenient season, but especially in the Spring and Fall, the Patient must be yearly evacuated, beginning with a Purging potion, or some other Medicament suitable to the Nature of the Patient; always adding Hysterical things.

And then, If Blood seem superfluous, it must be drawn first out of the Arm and then out of the Foot; choosing as near as possibly the middle space between the Patients monthly Purgations.

Afterwards, That the redundancy of evil humors may be sufficiently prepared and purged out, an Apozeme must be compounded, altering, opening and purging, to be given at four or five times.

If Nature seem to incline to the opening of the Hemorrhoids, they must be opened by Application of Leeches. And *Mercatus* doth witness in the 13 and 14 Counsel, that they have much profited in these Fits.

After general Purgations to discuss the remainders of the Morbifical matter, a sweating Decoction will be good to give divers days together, made of *Saxafras*, *Guajacum*, with seeds of Fennel, Rue and *Agnus Castus*.

To the same intent Sulphurous and Bituminous Baths will be very good, such as we have at *Balernea*, by whose use many are holpen, as daily Experience shews.

In this Disease being of long continuance, besides the Remedies aforesaid, it will be good to purge the Patient frequently by usual Pills, Syrups or Potions. Which may be made after this manner :

Take Troches of *Agarick* one dram and an half; *Hiera* of *Coloquintida* one dram; *Carrot-seed*, *Agnus Castus* seed, of each one scruple; *Myrrh*, *Castorium*, *Diagridium*, of each half a scruple: *Turpentine*, as much as shall suffice to make all into a mass. Let her take hereof half a dram, or two scruples twice or thrice in a month.

The following Syrup is mightily extolled by *Mercatus*, as a wonderful Syrup, and very profitable for all Womb-sick Women, in his 13 Counsel.

Take Juicy of *Herb Mercury* and the Cream of *Carthamus* seeds, of each six ounces: *Scozonera* water seven ounces: Sugar as much as shall suffice to make it into a Syrup. Add hereunto while it boyls, Confection of the *Hyacinth* stone, Confection of *Kermes-Berries*, and Powder of the *Electuary* de *Gemmis* [that is, made of precious Stones] of each two drams: Let the Dose be two or three ounces.

Take *Briony* Roots three drams, *Senna* Leaves half an ounce, *Agarick* two scruples, *Ginger* one scruple, *Cinnamon* one dram: Let them steep all night in *Fountain-water*. In the straining mix one ounce of Syrup of *Damask Roses*. Make hereof a potion to be taken twice or thrice in a month.

Pilula foetida majores [that is, strong smelling Pills made of Gums] taken twice in a month to half a dram, are very profitable.

In such as easily vomit, it is good to provoke to cast, once or twice in a month, after this manner:

Take *Agarick* Cakes [Troches of *Agarick*] one dram and an half, *Oxymel* one ounce, *Bawm* water and *Mugwort* water, of each three ounces: Mix all into a vomiting Potion.

Chymists give salt of *Vitriol* in some appropriate water, from half a dram to one dram, and cry it up for a specifick remedy in Womb-fits.

After all particular evacuations are ended (that is, after each evacuation) some strengtheners are to be administred, such as this following *Electuary*:

Take *Conserve* of *Rosemary* flowers, *Betony* and *Bawm*, of each one ounce and an half; *Species* of the musked *Electuary*, and of *Electuary* of *Calaminth*, of each half a dram: With Syrup of *Mugwort* make all into an *Electuary*.

Treacle by it self is very proper for this occasion, which for hotter Constitutions may be tempered by the mixture of *Conserve* of *VVater Lillies*, *Maiden hair*, &c.

But the following Powder is far more effectual, which heals old and stubborn *VVomb-fits*, if it be frequently taken one dram at a time, in wine, in a Bolus or Morfel made up with Syrup of *Mugwort*.

Take *Gentian* Roots, white *Dictamus*, *Tormentil*, *Pellitory*, *Rhaponticum*, *Bisfort*, *Aristolochia* or *Birchwort* the rounder, *Chamelion* Thistle, *Bay-berries*, *Angelica*, *Master-wort*, *Coriander* seeds prepared, *Annis-seeds*, *Juniper berries*, *Mastic*, *Bole armenick*, *Terra Sigillata*, of each two drams and an half: *Oriental Saffron* three ounces and an half. Make all into a fine Powder, and keep it in a close Vessel.

Neither must we omit such Medicaments, which are wont to help these fits by a peculiar property thought to be in them; An Example whereof may be this that follows, made in Pills, because of the ungrateful taste of the Simples.

Take *Assafœtida* half a scruple: *Castoreum*, *Myrrh*, *Galbanum*, *Sagapenum*, of each one scruple: with Honey of *Mercury* make a Mass; of which give the Patient half a scruple or a scruple frequently.

Placernus makes Pills of extreemly Odoriferous Ingredients, after this manner:

Take of Musk six grains, *Benjamin* half a dram, Sugar one dram: With *Cinnamon* Water make them into a Mass for Pills. The Dose is half a scruple.

Those *Hysterical Waters* before set down to be given in the Fits, may likewise be profitably used out of the Fits, a spoonful or two in a morning, when the Patient is free, by way of prevention.

Mathiolus extreemly commends the *Briony* Root, in these words: *Briony* doth wonderfully help Women subject to strangulations of the Womb, so as to free them from their choaking fits, and cure them. Truly I knew a Woman daily almost, vexed with these Fits for a year together, who being at last taught by an ordinary Herb-man, to drink *Whitewine*, wherein an ounce of *Briony* Root had been boyled, once in a Week, when she was going to bed: when she had used this Medicine for a year together, she was perfectly recovered of that Disease.

The Liver of a Woolf dried, and one dram taken, may prevent the Fits of the Falling-sickness proceeding from the Mother, if it be given three or four times after an ordinary Purgation.

The Chymists do commend *Vitriolum Martis* [that is, *Vitriolated Steel*, or Chaly beaten *Vitriol*, or Salt Steel] whereof they give a grain or two, with a double quantity of Sugar, many dayes together in Wine or other fitting Liquor.

And

And the truth is, it may be given to twelve, fifteen, and twenty grains, in some convenient Conserve; or it may be made into Pills with Mucilage of Gum Tragacanth.

Cream of Tartar frequently taken, is also very good in the cure of this disease.

These two Medicines do good, not only by opening, but also by cooling; for oftentimes an hot distemper is rooted in the womb of women subject to this disease, arising from blood retained within its veins, and over-heated: as *Galen* says in Hypochondriacal Melancholy, That there is a burning distemper in the parts under the short ribs, by reason of blood retained in them by obstructions, and there overheated. Those things therefore which have power to cool the womb, are very proper in this case, such as are Baths to sit in, Vinegar and Water mingled and drunk down, or injected, and such like. Unto which we may add the History related by *Dr. Harvey* touching the children of a woman long afflicted with Womb-fits, not curable by all that could be done; who at length after many years was cured by means of the falling out of her womb, because her womb exposed to the air, was cooled; and so its inflammation and hot distemper was repressed.

Also the use of Steel it self is much commended by some Practitioners, as very convenient for all Infirmities of the womb. Whole Preparations look for in our cure of obstructions of the Liver.

Issues made in the thighs, are likewise very good. For they derive and turn aside evil humors from the womb, by reason of those veins which are common to the womb and thighs.

Neither are Amulets to be neglected; fastned about the Patients neck, and hanging down upon her Navil, as we formerly mentioned touching the Elks Claw, good in this case.

Some commend *Pencedanum*, or Hog-fennel root, hung in a string about the neck. And our women do with good success wear a piece of *Assaetida* in a thin rag of cloth. I have known some that have worn a Fox's Pizzle and Stones dried, tied about their neck in a string, and resting upon their Navil, and by that means preserved themselves from the Womb-fits.

Some wear a piece of Wolfs flesh dried, or of the Liver of a Wolf, not without profit.

As for external Remedys, after every purge, or at least once in a month, eight or ten days before the Monthly Purgations of Blood, Fomentations or Baths to sit in will be good, that the Humor causing this disease being dissolved, may more easily find its way by the opened passages of the Courses, and flow out with them. They may be made of the Roots of Marshmallows, Briony roots, Orris-Roots, Madder, Valerian, Angelica, Mugwort-leaves, Nep, Feverfew, Bawm, Bayberries, and such like.

To discuss the remainder of the matter causing the disease, and to strengthen the Womb after fomentation, or sitting in a Bath, as aforesaid, the following Plaisters may be laid on under the Navil.

Take Gum Tacamahacca and Carranna, of each two drams; *Alipta Moschata* half an ounce; *Agnus Castus* seeds, one dram and an half; of each of the Sanders half a dram; Turpentine, Landannum, Wax, of each as much as shall suffice to make a plaister.

If this Disease arise from the Seed retained, use those Remedies which we have formerly set down to quench and discuss Seed in our cure of Womb-Fury.

Chap. 7. Of Inflammation of the Womb.

INflammation of the Womb, is a Tumor or swelling of that part, springing from blood that is shed into the substance thereof.

And the said Inflammation possesses either the whole womb, or some part thereof; and it is produced either by pure blood, and is called merely *Phlegmone*, an Inflammation; or it comes from blood mingled with Choler, and it is called *Phlegmone Erysipelatodes*, a Cholerick Inflammation of kin to the Rose, or St. *Anthones* Fire; or it hath its original from blood mingled with flegm, and is called *Phlegmone Oedematodes*, a flegmarick Inflammation: or it comes from blood mingled with Melancholy, and is called *Phlegmone Schirrnodes*, which is a Melancholick Inflammation or Swelling.

CAUSES. The Causes which produce or encrease this Disease, may be divers; viz. A Sanguine Constitution over-loaded with Blood, or infected with Choler; a natural looseness of the womb, with wideness of the passages. Air extream hot, inflaming the humors; or very cold, compacting and knitting them together, and so stopping the monthly Courses flowing, or ready to flow; vehement exercise, immoderate carnal Conjunctions, a blow or fall lighting upon the wombs Quarters; Perturbations of mind more violent than ordinary, especially wrath; acrimonious or sharp vehement meats, of a hot Nature, and whatever else is taken in of a fretting vehement operation, as Authors report of Cantharides, That they are very hurtful as well to the womb as the bladder; sharp Pessaries long time used, or purging Medicines, or strong alteratives, such as barren Women are wont to wrap and rend from all quarters; Retention of the Courses encreasing the over-fulness of

blood, or over great flux of Courses relaxing the passages, and bringing the humors from all the parts of the body to the womb; likewise Cupping-glasses fastened about the privy parts, may violently draw the blood and humors unto the region of the womb, and there detain them. Labour-some Child-birth may cause as much; Abortion, a violent handling of the parts of generation by an unskillful Midwife, and a troublesome inconvenient bearing of a child in the womb.

SIGNS. The Signs to know the Disease by, are swelling, heat and pain in the region of the womb, with a continual Fever. But because the strait gut (that is, that which is united in the Dung-gate) and the Bladder, do lodge in the same quarters with the womb, therefore must we distinguish this Disease by other signs; such are, suppression or diminution of the Courses, and their paleness, or yellowish citrine colour, with pain in their coming forth; and in the absence of the Courses certain stinking and rotten stuff sweats through the vessels of the womb, and bedews the Water-gate. Whereunto if search be made, it will plainly discover the Disease; for the inner mouth of the womb will be found to swell, to be drawn inwards, and subject to pain if touched; the neck of the womb will appear red and inflamed, the veins dispersed there through strutting with blood.

If the whole womb be inflamed, all symptoms will be more vehement. If the Inflammation be rather in the neck of the womb, the heat and pain is spread most towards the groins and the water-gate. If the former side of the womb do suffer, the bladder's fellow feeling will be the greater; if the hinder side of the womb be inflamed, the strait gut will be more compassionate, and the pain will stretch itself towards the loins. If the right or left side of the womb be inflamed, the heat and pain will appear most about the one groin, and the thigh of the same side will be heavy, and as it were in a sort burthened.

The Signs of the Causes are these: If the inflammation spring from pure blood, all the symptoms are milder; but if there be choler mingled therewith, the Fever is more burning and all the symptoms are more vehement; but if the blood be flegmatick or melancholy, the Fever will be less acute, but the disease more lasting and more stubborn. And here we are to consider such signs as may inform us what humour is most predominant in the whole body.

If the inflammation turn to an Imposthume, and gather matter, the pain and Fever are encreased, and shaking fits come without any certain course; yet commonly they take their turn about evening, and all the other symptoms are heightened. When suppuration is accomplished, all the symptoms are mitigated, and the swelling rises higher, whereby sometimes the excrement of the guts or urine is stopped. But if the Inflammation be discussed without suppuration, the swelling lessens, and the symptoms become gentler.

If it turn to a Schirrhus (that is, an hard swelling) the Fever, Pain and other symptoms are diminished, the swelling abides, becomes harder; likewise the weight and heaviness remain both in the womb, and the adjacent parts, so that the Patient can hardly stir her self.

PROGNOSTICK. A good prognostick cannot be made of this Disease, because it is very dangerous, and for the most part deadly. But more or less danger is threatened according to the greatness of the disease, its cause and symptoms, as thus:

If the Inflammation possess the whole womb, its a desperate disease; but if only a part be inflamed, there is some hope of help.

If a woman with child have a Cholerick swelling in her womb, its deadly, *Hyp. Aphor. 43. Sect. 5.* For the child dyes by reason of the greatness of the Inflammation, whereupon follows abortion, which coming upon the back of a grievous disease, kills the Mother. *Galen* in his Comments upon this Aphorism, doubts if this be not true of every inflammation of the womb, as well as of the Cholerick, and whether it be possible that a child in such a case can live.

Inflammation of the womb easily degenerates into a Gangrene, because the womb, as it were the bodies Close-stool, receives a mighty charge in nasty excrements, by which the inbred heat is easily suffocated.

Ravings, turning of the womb, Hiccoughs, coldness of the hands and feet, Diaphoretick sweat seizing on a woman in this disease, do portend sudden death.

If an Inflammation of the womb come to suppuration, its hopeful that it may be cured; but a foul Ulcer will follow, which will make the Patient to pine away with a lingering Fever, or to fall into the Dropsie.

If the Inflammation turn into a Schirrhus, the evil becomes lasting, and often brings a Dropsie.

CURE. To cure this infirmity, the course of the blood to the womb is to be drawn back, it is to be driven from the womb, it is to be diverted another way: that which is flown in and contained in the part, is to be resolved. And if the swelling tend to suppuration, it is to be furthered; and when it is broken, the Matter or Quittor must be voided out; which may be done by the following Remedies.

An emollient and cooling Clyster being premised, let blood be drawn from the Basilick vein of the Arm, on that side on which the womb is most affected; or from both arms, if the swellings be in the

the whole womb; and let the Blood-letting be repeated twice, or three or four times, according to the strength of the Patient, and the greatness of the Inflammation.

After sufficient Revulsion, the Disease being come to its height, when there is no longer suspicion of any present flux into the womb, the lower veins are to be opened, to derive from the part affected. In which sense we understand *Galen* in his Book of Blood-letting, and in his 13. Book of the Method of Healing, where he teacheth, that in the Inflammation of the womb, we must open the veins about the Knees and Ankles. But so long as there remains any Indication of Revulsion, it is better to open the veins of the Arm.

Also to revel or draw back the Humors, Frictions are good, and Ligatures or bindings of the upper parts, and Cupping Glasses set upon the Shoulders, Loins, and Back. If vitious humors (especially Choleric) do abound in the Body, which are as it were the Coach of the other humors to hurry them about the body; they are to be evacuated with gentle Medicaments, as Syrup of Roses, and Syrup of Violets solutive, Manna, Rhubarb, Catholicon, or Elecluary Lenitive; for stronger Medicaments by stirring the humors over-much, would excite the Flux of humors more abundantly to the part affected.

And vomiting Medicaments, though prescribed by *Avicenna*, seem no way convenient in this case. For if they be mild and gentle, they evacuate nothing to speak of. If they be stronger, they cause a great Agitation in the Body, by which means the humors being in a Commotion, may flow more plentifully unto the part diseased.

In regard of the greatness of the Fever, cooling Medicaments are to be used, as Juleps and Emulsions; whereunto, if very great wakings, pain, and tumblings and tossings do disquiet the Patient, some Narcoticks may be added, which may likewise be given by themselves.

After the first evacuations, let outward Medicines be applied to the lower part of the Belly, between the Navil and the Share, and about the Kidneys; first of all repelling and cooling things, in the form of a Liniment, an Epitheme and Cataplasm.

The Liniment may be made of Oyl of Roses washed in Vinegar, or of Oymment of Roses *Cera-tum Santalium*, or *Galen's* cooling Oymment, with a little Vinegar added.

The Epitheme may be made of the Waters or Decoction of Plantane, Sorrel, Nightshade, the tops of white Poppies and Roses, adding a little Bole-Armenick, Dragons-Blood, and Terra Sigillata.

The Cataplasm or Pultis may be made of the crumbs of fine Manchet boyled with Milk, to which a little Oyl of Roses may be added with Juyce of Henbane, Nightshade, and the whites of Eggs; or of Barly meal, Linseed, Fenugreek seed, with Oyl of Roses; whereunto likewise the aforesaid Plants being bruised, may be added.

Injectons must be made into the Womb, compounded after this manner:

Take Plantane Leaves, Water-Lilly Leaves, Nightshade and Endive, of each one handful; red Roses two pugils. Boyl all till a third part of the Water be consumed: and add to the strainings Oyl of Mirtils one ounce, Vinegar half an ounce. Make an Injection.

Of the same Herbs bruised with Oyl of Roses and Vinegar, Pessaries may be made, and put into the womb.

Neither must repelling and refrigerating medicaments be long used, lest the Swelling harden and degenerate into a Schirrhus. Wherefore softning and dissolving things are to be mingled with the repelling Simples; with this Proviso, That the longer the Inflammation is from its Infancy, the greater must be the quantity of Digestives. So that to the aforesaid medicaments may be added, Mallows, Marshmallows, Mugwort, Fenugreek, Chamomel, Melilot; their Dose being augmented or diminished, as the case shall require.

In the mean while, if the Patient be costive, she must be helped by gentle Purgatives. Yea, and the truth is frequent Clysters may do a great deal of good to temper the Inflammation, seeing the Womb rests upon the streight Gut, called *Intestinum Rectum*. But let them be little in quantity, that they may be kept the longer, and that they may not compress the womb; of which this may be an Example:

Take Marshmallow Roots, the Leaves of Mallows, Violets, Lettuce, of each one handful; Nightshade half a handful; Violet flowers, red Roses, of each a pugil; sower Pruens ten: boyl them in Barly water. In six ounces of the strained Broth mix three ounces of Oyl of Roses; and make all into a Clyster.

If the Patient be in great pain, to the aforesaid Clysters may be added the Yelks of Eggs, the fat of an Hen, Breast-milk, Mucilage of the seeds of Fenugreek, Linseed or Mallows; yea, and a little quantity of Opium with some Saffron.

In such a case, Injectons into the womb may likewise be made of Goats or Sheeps milk, with Opium and Saffron, of each three or four grains, and a little Rose water.

Or unto Pessaries may be added a little Opium with a little Saffron, the whites of Eggs, and Oyl of Roses. Or Pessaries may be made of *Philonium Romanum*, with Cotton. Or a Fomentation to ease pain, may be prepared on this manner:

Take Marshmallows Branch and Root, Violet Leaves, of each a handful; Chamomel, Melilot, Roses of each a pugil. Boyl all for a Fomentation.

When the Disease begins to decline, Purgation is to be iterated with gentle Purgatives. And when the Disease tends to a Resolution or Conclusion (which is known by remission of the Symptoms, and because the part is not so oppressed with any Heaviness) discutives must be used in greater quantity than any of the foregoing Medicaments. Or this Cataplasm may be made:

Take Powder of Marshmallow Roots one ounce; Chamomel and Melilot flowers, of each two drams; Mugwort Leaves powdered, Barly and Bean meal, of each half an ounce: boyl them a little in harsh red Wine: add new Hogs Grease, Oyl of Chamomel and Lillies, of each one ounce. Make a Pultis or Cataplasm.

Fomentations and Baths to sit in, may likewise do good in this case.

If the swelling cannot be discussed, but seem to tend to suppuration, it is to be furthered by the following Cataplasm:

Take Marshmallow Roots powdered, Chamomel flowers, Melilot, Meal of Lin seed, Fenugreek, of each one ounce: fat Figs, boyl all to the consistence of a Pultis. Then add the yelks of four Eggs; Saffron half a scruple: Oyl of Lillies and fresh Butter, of each one ounce. Make of all a Cataplasm.

When Matter or Quittor is made, which may be known by the abatement of heat and pain, and by a certain inundation perceivable by the touch, the Matter quaking like a quagmire, endeavour must be used to break the Imposthume by moving of the Body by Coughing, by Neezing, by Fastening Cupping-Glasses, by cleansing and attenuating Injections, or by Pessaries that will draw and break. As for Example.

Take Goose Grease half an ounce; Turpentine two drams; Rue seeds powdered, Nitre, Orris Roots, of each half a dram. Mix all, and with Wool make a Pessary.

When the Imposthume is broke, we must endeavour to purge out the Quittor or Matter, and to cleanse and consolidate or close up the Ulcer, as shall be shewed in the cure of an Ulcer in the womb, in the Chapter immediately following.

Chap. 8. Of an Ulcer of the Womb.

After a suppurated inflammation of the Womb, follows an Ulcer, which likewise depends upon other causes, namely, so many as may cause an Erosion, fretting or gnawing the substance of the womb.

CAUSES. The causes therefore hereof are, An Imposthume breaking, sharp humors flowing into the Womb, sharp and corrosive Medicines conveyed into the womb, or taken at the Mouth, as was said before touching Cantharides or Spanish Flies.

The Antecedent Causes are all such things which we have formerly shewed, have power to cause an Inflammation, as Child-birth, violent and unbridled Carnal Conjunction, a long flux of sharp humors from the Womb, wounds, falls and bruises, and especially a venomous Gonorrhea, and the Lechers Pox, the infection whereof is soon communicated to the womb, and its Neck.

DIAGNOSTICK. The differences of this Disease are taken from the place, the magnitude, the Figure and Complication, with other Infirmities.

In respect of the place, that is to say, the several parts of the womb; the Ulcer is sometimes possessed of the Neck of the womb, and its inner Orifice; sometimes it is in the bottom, though but seldom. Sometimes, and that most frequently, it seizes the inner surface of the womb; sometimes, but seldom, it assaults the outward surface; whence it comes to pass, that sometimes the Quittor of these Ulcers come out by the bladder or Guts; or if it settle in the Cavity of the *Abdomen*, Imposthumes arise about the Patients Groyns, of which *Hypocrates* speaks in his 47 Aphor. Sect. 5.

In respect of Quantity, some are great, others small Ulcers, according as they take more or less space in the womb; which if they be little and superficial, they differ little from the Scab and Itch; but if they be great, grievous, and as it were devouring, they are called by *Hypocrates*, *Noma*, that is eating Ulcers.

In regard of their Figure, Ulcers are called Round, Long, Hollow, or Fistulous, that is like a Pipe.

In regard of Complication with other Infirmities, they are called Phlegmonous, Cancerous, Schirrhous, Painful, VVater-bloodish, Poysonous and Infectious.

SIGNS.

The Signs of an Ulcer bred in the womb, are pain and biting in the womb or its Neck, voiding of

of stotty Matter or Quittor out of the womb, which Diagnosis will be more illustrated, if the Causes producing the Ulcer, such as we have mustered up, have preceded.

If the Ulcer possess the Neck of the womb, it is discerned by the sight, by help of the womb-perispective Instrument; also by the Midwives hand, or in the general Embrace, in which the Patient feels a troublesome pain. But if the Ulcer be in the bottom of the womb, the pain is felt about the Share, and the Excrements flow more abundantly.

If the Ulcer pierce to the outward surface, the Patients Urines or Stools appear Matterish, or a Fluctuation is perceived in the Paunch, or a Swelling towards the Groyns, where it threatens to imposthume.

If the Ulcer be single and benign, the Quittor is little, white, and not stinking. But if it be malignant and eating, the Quittor will be greenish, Lead-coloured and party-coloured, coming away with great pain and stink.

If it shall arise of the Letchers Pox, Gonorrhœa will usher it in, or attend upon it, and other tokens of the Whore-masters Pox will appear.

PROGNOSTICK. For the Prognosticks of this Infirmary, *Hypocrates* in the first Book of womens Sickneses, says, That no Ulcer in the womb ought to be slighted, because it is in a part of exquisite feeling, which hath a fellow-felling with the principal parts of the Body, and is very much disposed to receive a flood of Excrements from them.

If the Ulcers of the womb prove Cancerous, Phagedenick or wolfish [such as the simple people call the wolf, and tell strange tales about, how it eats flesh, &c.] hollow or fistulous, they are for the most part incurable, and do vex the poor Patient miserably all their life long.

Ulcers in the Neck of the womb are more easily cured, because Medicaments may be applied to them immediately.

In Women that are recovering of this Disease, it is a token of perfect health, if they begin to conceive, and conveniently to receive the mans Sperm, or if they have their monthly Courses orderly and without pain.

CURE. The Cure of a Womb Ulcer must tend to hinder the flowing in of such humors as either beget or cherish the Ulcer, and to cleanse the Ulcer, and cause it to come to a coalition. To which purpose the following Remedies may be used.

And first of all, If the Patient be over full of blood, or the Ulcer have an Inflammation joyned therewith, a Vein in the Arm must be opened, and repeated so often as there seems danger of a new Fluxion; which is especially to be done when the Patient hath her Courses, that they may flow the less, because they are wont to supply Matter to the Ulcer, and to cause other humors to flow unto the womb.

Also Purgation is very necessary, that the body may be freed from evil humors; and it ought to be procured by the gentler sort of Purgatives, as Senna, Rhubarb, Tamarinds, Myrobalans, Catholicum, and such like; and Purgation is often to be repeated, that evil humors may be diverted from the womb; and it is in this Case of such moment, that *Forestus* witnesseth in the 48 Observation of his 28 Book, That *John Tiengius*, a Physician of *Amsterdam*, cured a Gentlewoman of *Amsterdam* of an Ulcer in her womb, to whom he gave every fourth day five ounces of the Decoction of Senna, Epithimum, red Roses and Indian Myrobalans sweetned with Sugar, using to cast cleansing Decoctions as Injections into her womb.

For to be ever in a readiness, This following Magisterial Syrup may be compounded.

Take of the greater Comfrey Roots, and new Polypody of the Oak, of each one ounce; Citron peels dried, six drams: Leaves of Plantane, Vinca pervinca, Ladies Mantle, Sorrel, Maiden-hair, of each a handful; Liquoris scraped and split, and Raisins stoned, of each one ounce: Senna cleansed six ounces, Carthamus seeds bruised two ounces, Agarick newly made into Cakes and bound in a Cloth, ten drams: Musk-melon seeds and Annis-seeds, of each three drams; the Cordial Flowers, Rosemary-Flowers and Epithimum, of each one pugil. Make of all a Decoction in Barly-water, in part whereof infuse of choyce Rhubarb half an ounce; Cinnamon one dram. In a pint and half of the strained Liquor, dissolve three ounces of the Syrup of Damask Roses, and as much Sugar as shall be requisite to make it in a Syrup perfectly boyled. Of this let her take two or three ounces, twice or thrice in the month with some Decoction of Agrimony and Plantane, or the Infusion of Rhubarb in Endive Water.

If the Patient be easie to vomit, a purge upwards by Vomit is to be preferred before the other, because it draws back the humors from the womb.

In the spaces between purging, a Vulnerary Decoction is long to be used, which may be made after this manner:

Take Leaves of Agrimony, Burnet, Knotgrafs, Plantane, of each half a handful; China Roots three drams; Coriander seeds one dram; Currance half a dram, red Sanders one scruple: Boyl all in the Broth of a Chicken. Let the Patient take of the strained Liquor morning and evening. Or,

Take

Take Leaves of Mugwort, Plantane Tarrow, of each one handful; Rhaponticum half an ounce; Agnus Castus seed one dram. Boyl all in a sufficient quantity of Whitewine, Sweeten the strained Liquor with Sugar, and give her two or three ounces in a morning.

If a Fever urge, and great quantity of blood-like Quittor be voided, Whey and milk will be very good; let her take eight ounces or more in a morning, adding a little Honey of Roses, or Sugar.

If her flesh begin to fall away, with tokens of an Hectick Fever, Milk, especially Asses milk, must be given with Sugar of Roses for a whole month.

Sweat-provoking Medicines may likewise do good where there is no Inflammation, nor hot distemper to dry the Ulcer, and to revel the serous humors towards the habit of the Body.

Turpentine washed in some convenient water for the womb, as of Mugwort or Feverfew; or in some water respecting the Ulcer, as of Plantane, and red Roses, taken now and then with Sugar of Roses, doth cleanse and consolidate or fill up the Ulcer.

Pills of Bdellium given to a dram at a time, or every day, or once in two days one scruple, do very much good, and stop the blood in case it flow.

Or new Pills may be made on purpose, to be used after the same manner; Thus:

Take of Bdellium three drams, Myrrh, Frankincense, of each one dram; Sarcocolla, Storax, Amber, Cheb myrobalans, of each half a dram; red Coral two scruples. With Syrup of Poppies, make a Mass fit for Pills, whereunto, in case of extream pain, a little Opium may be added.

Trochisci Alkekengi. [Cakes compound with Winter-Cherries, of which consult the London Dispensatory] with Opium, are likewise (being powdered) given to drink down, where the Patient is troubled with great pain.

Also to mitigate pain, the same Remedies may be used, which we prescribed for that intent, in our discourse of the Inflammation of the Womb.

This following Powder is very effectual to dry up the Ulcer:

Take Acacia, Juicy of Hypocistis, of each one dram; Dragons blood, fine Starch, Plantane Roots, Birthwort or round Aristolochia Roots, of each half a dram: Bole-armenick one dram; Mastich, Sarcocolla, of each half dram. Make all into a most fine Powder, whose Dose let be one dram, with Plantane water, red Rose water, or water wherein Steel hath been often quenched.

Zacutus Lusitanus in the 87 Observation, and the 88 of his second Book, propounds an Electuary and a water, wherewith he witneseth, that he had cured Ulcers of the womb judged incurable. Any one may find the Description of them in the places above cited.

To cleanse, dry, and fill up the Ulcer, divers sorts of Injections are usually made, which are nevertheless not to be used, until the Inflammation be first taken away, which is oftentimes attendant upon these kind of Ulcers; and until the pain be asswaged, which is not only very troublesome, but also by vexing the part, it is wont to encrease the flux of Humors.

In regard therefore of that same Inflammation and sharpness of Humors, let Emulsions of the cooling Seeds, Whey of Goats Milk, or Milk it self, either alone, or mingled with the Juicy of Plantane and Shepherds purse; or if need be, a Decoction of Poppy-heads, and the tops of Mallows, be first of all injected. Some Practitioners are of opinion, That luke-warm water alone doth very much good in these cases, if it be often injected. And there is reason for it, seeing by that means the heat and Inflammation of the womb is tempered, the pain is asswaged, and the filth adhering to the Ulcer is washed off. *Valescus de Taranta*, doth approve of cold water likewise, in these words: *I have known (saith he) some women, who perceiving they had had Ulcers in their wombs, did wash them with cold Water, and then wipe them clean, and dry them with linnen Cloaths, which they did often put in at the Water-gate. And by these means often renewed, they came many times to be perfectly cured.*

The hot distemper taken away, and the pain asswaged, or for the most part diminished, we must proceed to Cleansers, first using the more light and easie Cleansers, and after the more strong.

The gentle Cleansers are, whey taken with Sugar, Barly-water sweetned with Sugar, or Honey of Roses, to make it more cleansing, or Hydromel simple, (See my Dispensatory) a mixture of water and honey boyled a while together.

For a more strong Cleanser, use the Decoction of Barly, Lentils, shaled Beans, and the Leaves of Smallage, Pellitory of the Wall, Plantane, boyled together, a little Honey of Roses being added to the straining.

When the Ulcer is very foul, the Wound-decoction commonly called *Aqua Catapultarum*, is the best thing that can be used, whose Composition is thus:

Take the Roots of Gentian, Rhapontick, Zedoary, and round Aristolochia or Birthwort, of each one ounce: Whitewine six pints: boyl all till a third part of the Liquor be consumed. In the straining

straining dissolve half a pound of white Sugar. Let it be kept for use as occasion requires.

Or the following Decoction may be provided :

Take of whole Barly, course Bran, and red Roses, of each one pugil : Leaves of Agrimony, Worm-wood, Woodbind, and Smallage, of each one handful : Beans and Lentils, of each three drams : scraped Liquoris, Orris Roots of Florence and Zedoary, of each two ounces. Boyl all in Water, adding towards the end a little Whitewine.

If the Ulcers be very stinking and full of rotten Quittor, there may be added to the Decoction, a little Unguentum Egyptiacum, Colyrium Lanfranci, or the Powder of dulcified Mercury.

When the Ulcer shall be well scoured and cleansed, we must use drying and solidating things, made after this manner.

Take the greater Comfry Roots, Bistort Roots, of each one ounce : Leaves of Plantane, Hors-tail, shepherds purse, Ladies Mantle, Mouse-ear, Yarrow, of each one handful : red Rose Leaves half a handful : Boyl all in water, and make thereof an Injection.

With the which or like Injection, this following flesh-creating powder may be mingled.

Take the Roots of Orris, Birthwort, great Comfry, of each half an ounce : Myrrh one ounce : Aloes three drams. Make all into a powder, of which half an ounce may be mingled with every Injection.

Turpentine wash'd in Plantane water to the quantity of two drams, dissolved with Honey and the Yelk of an Egg, will do very much good, mingled with the Injection ; and the more if the flesh-creating Powder be also added.

The Oyntment Pompholygos, de Ceruis, de Plumbo, of each six drams for a Dose, mixed together, are likewise used in Injections. But the Egg-yelk Oyl, rubbed about with a Pestle in a Leaden-Mortar, is better than all the rest.

Fumes received through a close stool, do pierce to the deep Ulcers which are about the bottom of the womb, and dry them : which may be thus prepared :

Take Frankincense, Myrrh, Mastick, Storax, Juniper-Gum, Labdanum, of each one ounce : Turpentine as much as shall be requisite. Make all into little Cakes for to be burnt under a close-stool.

In a most stubborn Ulcer, Cinnabarus or Minium being added to the Fume-Cakes, bears away the Bell from all other Medicaments.

Also Baths that are drying, Sulphurous, and Allumish, are used in long Ulcers ; and Physitians are wont to send their desperate Patients to those Baths, as the last Remedy.

It will not likewise be unprofitable to apply convenient plaisters to the Region of the womb, seeing their vertue can pass to the innermost parts of the womb, by the invisible pores of the Body.

If an Ulcer be in the neck of the womb, it must be smeared with scouring and drying Liniments, or Oyntments. The Scourers may be made after this manner.

Take of the Juice of Smallage two ounces : Honey of Roses one ounce and an half : Turpentine half an ounce : Barly meal as much as shall seem convenient. Boyl them all gently, and make them into the form of a Liniment or Oyntment. Or,

Take the round Birthwort half an ounce : Horehound, Centaury the smaller, Agrimony of each half a handful. Boyl them in a fit quantity of Hydromel. To the strained Liquor add the powder of Florentine Orris Root two drams : Barly meal, and Clarified Honey, of each as much as shall suffice. Make all into a Liniment or Oyntment.

And sometimes the Oyntment Pompholygos is used, adding thereto, Frankincense, Mastick, Myrrh, Aloes, as the nature of the Ulcer shall require.

When the Ulcer is sufficiently cleansed, a drying and scar-contracting Oyntment is to be laid on, which may be thus made :

Take Tutty Powder washed half an ounce : Litharge of Gold and Silver, Ceruis, Sarcocolla, of each two drams : Oyl and Wax as much as will suffice. Make all into an Oyntment.

It falls out sometimes, that Ulcers of the womb do penetrate unto the streight Gut, and sometimes unto the Bladder ; which is known by the Quittor issuing through the water-gate, or the Dung-Gate.

If the Quittor or Matter come out by stool, Lenitive, Scouring, and drying Clysters are to be used ; such as we propounded in our cure of the Bloody-flux.

But if the Quittor come away by Urine, gentle Piss-drivers and cooling will be requisite, which may purge out the filth sent into the bladder, and further the cure of the Ulcers ; such as are, Emulsions of the great cold Seeds, after which Turpentine must be used, and other Medicines prescribed for an Ulcer of the bladder.

If the Ulcer degenerate into a Fistula, which chiefly falls out when it opens outwardly towards the Hip, though it may likewise happen in the womb it self, and its neck ; it is to be considered, which

is better for the Patient, to leave that passage free and open to which Nature hath been accustomed, and by which she endeavours to disburden her self of manifold Excrements, or to stop the same. If it be judged best to keep it open, a pallative cure must at least be made by Purges frequently repeated, and Sweat provokers are to be administered twice in a year; also scouring Injections, and strengthening must be used, and *Emplastrum Diapalma, Divinum*, and such like Plaisters, are to be laid upon it. But if there be hopes to make a perfect cure, and heal up the Fistula, such Medicines must be applied, as are wont to be used for the cure of other Fistulae.

If Ulcers happen in the Water-gate, or in the Cavity of the womb, by reason of the Lechers Pox, they cannot be cured without the General cure of the said Pox. In the performance of which cure, of many ways, there is none better than Fumigations of Cinnabaris or Minium; for they do not only help to rid the whole Body of that Infection, but being received into the Cavity of the womb, they do in a peculiar manner hasten the cure of these kind of Ulcers. Likewise in the cure of this Disease, by Quick silver'd Oyntments, the said Oyntments must be conveyed into the inner parts of the Womb.

In whatsoever Ulcers of the Womb, if the neck thereof be molested with an Itch, as it often falls out by reason of a deflux of a sharp and salt Humor into that part; to pacifie the said Itch, a Pessary will be good dipped in *Unguentum Enulatum cum Mercurio*; or in *Aegyptiacum* dissolved in Sea-water, or in Alum-water; or in new Butter wherein Quick-silver hath been killed, with some Brimstone mingled.

Chap. 9. Of a Schirrhus, or a Painless hard Swelling of the Womb.

THE Nature, Sorts, and Causes of a Schirrhus, or hard Swelling in the womb, are the same which have been set down in our Chapter of the like Swelling in the Liver, and need not in this place be vainly repeated, but must be fought for in the said Chapter.

CAUSES. Howbeit among the Antecedent causes, this is proper to an hard swelling of the Womb, and is very frequent; Namely, for women when the flux of their courses or Child bed purgations are upon them, undiscreeitly to expose themselves to the cold Air, or to drink cold water; whereby the flux is stayed, and the retained blood grows thick, and is condensed, and at length produceth a Schirrhus or stony hard swelling in the womb.

SIGNS. The Signs of such a Swelling bred in the womb, are, An hardness felt in the Region of the womb, such as resists the touch, which hardness represents the compass of the womb; an heaviness in the same place, and a sense of some weight bearing down, especially when the sick woman stands, as though the womb would fall down into the water-gate; but when they sit or lie, it bears upon the streight Gut with its weight. There is no Fever nor pain, wherein it differs from an Inflammation; or at most there is but very little pain in an imperfect Schirrhus, but in the Womb there is none. If it follow an Inflammation, the Fever and pain ceases, the hardness and resistance abiding. If it be in the body of the womb, it is easily discerned by handling the parts about the share; but if it be in the neck of the womb, it is easily discerned by ones finger. It is distinguished from a Mole by the preceding Causes; and because in a Mole, if the Courses flow, they flow disorderly, but in this hard Swelling they keep their order; and in a Mole the womens Dugs strut with Milk, but in the hard Swelling they are extenuated.

PROGNOSTICK. As for the Prognostick Signs, Every Schirrhus or hard stony swelling is very exceeding hard to cure; for an extream Hardness once contracted can hardly be softened; also Natural heat is so very weak in that part where there is such a swelling, that it can very hardly discuss an hard and almost stony substance.

A great and unvanquishable Schirrhus, or stony Swelling, doth at length bring the Dropsie to keep him company.

A Schirrhus, or stony hard Swelling of the womb, if it be tampered withall with over-hot and moist Medicaments, it turns into a Cancer.

CURE. The Cure of this Disease aims at two things, the antecedent cause, and the conjoynd or concomitant cause.

In respect of the antecedent cause, a vein must be opened first in the Arms, if the Disease be of no very long continuance; afterward in the lower parts, especially when the Patients courses are stopt.

The opening of the Hemorrhoid veins, is also very profitable in this case: For they do both evacuate dreggy blood, and they turn the humor from the womb, because of the communion which the veins have with the womb.

Purging is likewise necessary, by fits repeated, procured by such Medicines as purge Melancholly, using

using first the gentler, and then the stronger sort by degrees.

And before the Purges, such things must be given as prepare the Melancholy Humor, and opens the narrow passages of the Excrements, in the form of Apozemes, Juleps, or Broths, according to the disposition of the sick party.

And besides the ordinary Openers, Medicines with Steel must be likewise used, whereby those strongest obstructions caused by thick and rebellious humors in the Womb and other parts, may be dissolved.

And that superfluous humors may be derived from the Womb, Issues may profitably be made in the Thighs, which are to be kept open until the Patients monthly courses, (which are commonly stopt in this Disease) shall return unto their ordinary form, in respect of time, quantity, and quality.

In respect of the conjoined Cause, Emollient and Resolving Medicaments are to be applied outwardly, compounded after this manner.

Take the Roots of Marshmallows and Lillies, of each two ounces: the leaves of Mallows, Violets, Marshmallows, Bears-foot, of each one handful: Leaves of Mugwort, Nep, of each half a handful: seeds of Line and Fenugreek of each one ounce: Flowers of Chamomel and Melilot, of each a pugil. Make a Decoction of all, wherewith the Region of the Shave and the groins must be fomented, a warm sponge being first dipped therein, and then squeezed out, and so laid on, and held to the part aforesaid.

For the greater mollifying, the Decoction may be made in water and sweet Oyl, or in the broth made of a Wethers guts.

There may also be added to the Decoction, that it may become more powerful, the roots of Briony and wild Cucumers; for we must begin with the milder, and proceed to the stronger by degrees.

Of the same Decoction (augmenting the quantity of the Simples) may a Bath be made for the Patient to sit in, which is very effectual in this case, and more powerful than a Fomentation.

Also frequent Clysters and Injections into the Womb are to be made of the same Decoction; whereunto the Oyls of Lillies, Chamomel, or sweet Almonds, may be added.

Take of the Oyl of Lillies, and sweet Almonds, of each three ounces: Mucilage of Fenugreek-seed extracted with White-wine one ounce: Hens, Goose, and Ducks fat, of each one ounce and an half, new Butter and Hogs Grease, of each two ounces: Wax and Turpentine as much as shall suffice. Make all into an Oyntment.

This which follows is approved in all hard swellings, being described by Rhasis in his Seventh Book dedicated to King Almanzor.

Take Bdellum, Ammoniacum, Galbanum, of each equal quantities: beat them in a mortar with Oyl of Ben and of Lillies; then add the Mucilage of Fenugreek-seed, Lin-seed, and Figs, in equal quantities. Make all into an Oyntment.

Of the same Materials, adding Wax, may a most effectual Plaister be made, to be applied to the Region of the Womb, both before and behind. Or a Plaister may be applied made of *Emplastrum Diachylum ireatum*.

A Cataplasim or Pultis may be made of what remains after the Decoction aforesaid, being beaten and forced through an Hair Serce, adding of the meal of Linseed and Fenugreek-seed, of each an ounce; six Figs, two drams of Orris root, half a dram of Saffron, Hens Grease, and Oyl of sweet Almonds, of each a sufficient quantity. Make of all a Pultis.

The Bituminous clay taken out of Brimstone Baths, and such as are Bituminous, is profitably applied as a Cataplasim.

The Fume of the Stone called *Pyrites* [that is, the *Marchasite*, or Fire-stone] being made red hot, and quenched in Vinegar, is by *Galen* wonderfully extolled for dissolving all stony hard Swellings, so that it works like a Charm. In the said Vinegar, Savory, and Pellitory may be boyled: but care must be had, lest your *Lapis Pyrites* prove to be the Stone called *Plumbarius*, or the Lead-stone which would do very much hurt.

Finally, All the medicines, as well internal as external, which were before described in our Cure of the hard Swellings of the Liver and Spleen, may also be useful in this case.

Yet must these medicaments in the whole course of the cure be moderated and accommodated with the greatest judgement and discretion imaginable, lest the hard Swelling become harder; or (which is much worse) degenerate into a Cancer, Which all Practitioners fear, when medicaments are unwarily administered for a long time together: so that it is better sometimes to pause, and give or apply nothing, that we may mark what good is done by the former applications. For it is vain striving, when the Swelling (having lost all sense of feeling) hath put on the Nature of a Stone.

CHAP. X.

Of a Cancer of the Womb.

A Cancer is a hard Swelling of the Body or Neck of the womb, which resists the touch, and causeth a most vehement pain, as it were pricking and cutting the part affected.

CAUSES. It is caused by a black Choller gathered in that part, or by reason of a Schirrhus, or senseless hard tumor ill cured, which easily turns into a Cancer, especially in this part of the Body, by reason of the copious afflux of blood, which being retained in those veins which are nigh unto the Schirrhus, and not sufficiently evacuated by the monthly purgations, it becomes adust or burned, and acquires a malignant disposition.

DIFFERENCES. It is ordinarily reckoned to be of two sorts, Ulcerate, and not Ulcerate.

So long as the Morbifick matter is of lesser acrimony and malignity, it causeth a Cancer not Ulcerated; but when it grows more sharp by putrefaction or adustion, it doth exulcerate the tumor, and produce an ulcerated Cancer.

DIAG. The Disease may easily be known by the definition propounded; for if an hard Tumor resisting the touch be felt in the Body of the womb, or its Neck, causing a pricking and cutting pain, we may pronounce boldly that it is a Cancer. Yet it is more evidently distinguished by the eyesight, when it may be seen as in the neck of the womb it may be, with help of a womb-perspective Instrument; for we shall see an uneven and bunching swelling, Lead coloured or black, compassed about with certain branches of veins, as it were with roots; but if it be ulcerated, it sends forth a certain blood-watry quitor or matter which is yellowish or black, and stinking; and sometimes blood, by corrosion of the veins which pass through that part, sometimes in such quantity that the Patient incurs danger of death. Hereunto is added a small Fever, inquietness, Stomach-sickness, an heat in and about the Water-gate, &c.

PROG. By way of Prognostication, we can only say thus much, That a Cancer is incurable, be it ulcerated or not ulcerated. Which as it is true of all Cancers, not excepting those in the outer parts of the body; much more is it of a Cancer in the womb, by reason of the perpetual Common-shore of Excrements which flows into the part.

CURE. Seeing then a perfect Cure cannot be hoped for, we must content our selves with such a Cure as is called *Palliative*. The scope whereof is, to hinder a not ulcerated Cancer from ulcerating; and an exulcerated Cancer, from the becoming more exulcerate: and in both to allay & temper the extremity of the pain. Which must be done, first by universal Purgations of the whole Body, and by other Medicines which may qualifie and evacuate the black Chollerick, and melancholick blood, and hinder the further generation thereof. In the number of which are, bleeding in the Arm, Anle, and Hemorrhoid veins: Potions, Apozems, Juleps, broths, Milk, Whey, cold mineral Waters, and such like Remedies as these usually prescribed by Practitioners for the cure of all Cancers in what part of the body soever. And especially Purgations must be frequently reiterated, that the antecedent matter of a Cancer may be abated.

And then outward Remedies are to be used, such as are moderately cool and astringent, without any corrosive or biting quality; they are commonly applied in form of Liniments or Oyntments. The best are made after this manner:

Take Oyl of Myrtles and Roses, of each two ounces: Juyc of Nightshade and Housleek, of each one ounce. Stir all together in a Leaden Mortar with a Leaden Pestle, until they grow black: then add Litharge of Silver, and Ceruss, both washed in Scabious water, of each two drams: Camphire ten grains: make all into an Oyntment, with which let the part affected be smeared three or four times a day. Or,

Take of Oyl of Egg-yelks, and of roses, of each one ounce and an half, Sugar of Lead one dram, stir them together in a Leaden mortar till their colour change.

This following puts down all the rest, wherewith Swellings of the dugs which have been accounted Cancerous, have been perfectly cured.

Take Egg-Yelks Oyl two ounces: juyc of Nightshade and Veronica or Housleek, of each half an ounce: Quick-silver not killed two drams. Stir them lustily together in a leaden mortar, with a leaden pestle, till they become thick as an Oyntment.

The foresaid Oyntments are to be conveyed into the womb upon long tents, or upon wax Candles, wound in Linnen. But Injections may much more easily be conveyed into the Womb. They are compounded on this manner:

Take Barly Water half a pint: Nightshade and Plantane Water, of each two ounces: Water of Housleek one ounce: white Troches of Rhais two drams: Sugar of Lead one dram. Make of all an Injection.

If pain be very vehement, add to four ounces of the Injection, one ounce of Syrup of Poppies.

Also

Also let the part affected be fomented with the waters of Plantane and Nightshade, or their Decoctions, whereunto may be added the Leaves of Water-Lilly, white Poppy, red Roses, and Camphire. Which Decoction may also frequently be injected into the womb; and it will become much more effectual, if it shall be well wrought about in a Leaden Mortar, or a dram of the Sugar of Lead be added to it.

Among Specifick Remedies, Frogs are commended, being washed and boyled, and laid on as a Pultis, or their Broth being used as an Injection. Also the Decoction, or juyce of River Crabs, injected into the Womb. As also Herb Robert used inwardly, outwardly.

If the Cancer be ulcerated, the Dose of Minerals must be augmented in the aforesaid Liniments, and to them the ashes of River Crabs may profitably be added. And with the Injections, the white Troches of *Rhasis* may be mingled, and Barly Water with the Materials of the aforesaid Injection.

If pain be very urgent, Fomentations of Mallows, Marshmallows, Water-Lillies, Poppy, Henbane, Green Coriander, Dill, Fleawort seeds, Milk, Saffron, and the like, are to be used at convenient seasons; or Pultesses made of them are to be applied. And of their Decoctions, Injections, and Baths to sit in, may be provided.

Yet will not all these Medicaments sometimes serve turn to pacifie a most cruel pain, which sometimes gives the Patient neither rest nor sleep. Which compels us many times to make use of Narcotick or stupefactive Medicines, which in this Disease, by reason of the exceeding Heat of the Humors, do less hurt. And I have seen a woman, having a Cancer in her Dug, that took every night for four months together, two or three grains of Laudanum, and had no hurt, but very great comfort thereby.

If from an ulcerated Cancer much blood do proceed, as it often falls out, let Juyce of Plantane with a little Frankincense be injected into the womb.

CHAP. XI.

Of Mortification, or Gangrenation, and Sphacelation, or Blasting of the Womb.

A Gangrene is the corruption or mortification of a part beginning; but when it is wholly corrupted, and dead, it is said to be Sphacelated or blasted.

CAUSES. In the Genetal parts of Women, this Disease is easily bred, because those parts are moister and softer than ordinary, and do easily receive the Excrements of the whole Body.

It often follows an Inflammation, Imposthume, Ulcer, or Cancer ill cured; when the vital heat of that part is choaked, or destroyed. It is choaked in great Inflammations, when more blood flows in than the Natural heat of the part can digest, or turn into Matter. It is destroyed, either by a cold distemper extinguishing it, or by an hot one, dissipating and resolving the same.

DIAGNOSTICK. A beginning Gangrene is know by an unusual heat felt in the part, a horror and trembling seizes upon the Patient, with a languishing and quick-beating pulse, and with fainting away, or swooning. And seeing this Disease doth for the most part happen to the Neck of the Womb, so that the part affected may be perceived by the Eye; it is discovered to be soft, Lead-coloured, black and carrion-like, and may be prickt or cut, and the Patient never feel it; and it sends forth besides, a stinking and carrion-like smell.

PROGNOSTICK. As for the Prognostick or Predictions belonging to this Disease, it's a most grievous, most dangerous Disease, and for the most part deadly: yet it hath been observed by very many Authors, That the womb being putrified and Gangrenated, hath either fallen away off it self, or been cut away, the womens lives being saved: which Observations of Author's *Schenkius* hath collected to a great number, in the fourth Book of his Observations.

CURE. The Cure is performed with the same Remedies which are wont to be applied to other parts being Gangrenated, if it be in the neck of the Womb, or tend toward the outward parts, as namely with Scarrifications, and washings or bathings with a Decoction of Wormwood, Myrrh, and such like, with the Oyntment called *Aegyptiacum*, the Cataplasim called *De Tribus farinis*, which is thus made:

Take Barly meal, Bean meal, and Orobus meal, of each two ounces: Oxytel one pound. Boyl them to the thickness of a Pultis or Cataplasim. Whereunto if there be added, meal of Lupines, Myrrh, Aloes, and Wormwood, it will be more effectual.

If any part of the womb be wholly corrupt and dead, it must be cut off; or if the Womb fall down, it must be separated, by binding the Ligature every day faster and closer. Of which kind of Operations, there be many Examples collected by *Schenkius* in the fourth Book of his Observations.

Wierus also relates in his Observations, That he cured a woman of twenty five years of Age, who

in the the hottest of the Dog-days, had a certain little bunch growing in her water-gate : Whereunto an unskilful Chyrurgion applying Pulteses that were not proper, within a few days, all that part began to putrifie, grow black and dead, and the Disease pass on with incredible swiftneſs towards the Dung-gate. And *Wierus* undertook the cure after this Method ; First, he squirted good store of the Juyce of Nightshade and Plantane with a Syringe into both the passages three or four times a day ; between which times, he applied a bolster wet with the foresaid Juyces, Vinegar being mixed therewith ; which growing dry was wet again with the same Liquor. And in this course of reiterated Application he continued till the fervent heat was quenched, and the putrification began to cease, She took in the mean while, thrice every day, a Potion of the Decoction of Sorril, Scabious, Burnet, Damask Prunes, the tops of Borage and Buglofs, Marigold flowers, with Water, Sugar, and Vinegar, made in the manner of a long acid, or sharp Syrup. Her Diet was spare, but cooling and tart, to prevent putrification. On the third day, the fury of the burning heat, and of the putrification, was abated. Whereupon he commanded the black and dead flesh to be drawn or plucked out with a little Forceps [a Chyrurgions Instrument, like Tongs or Pincers] and separated round about from the live flesh without any pain, and so be cut off. Then he consumed the reliques even to the live flesh with the Oyntment called *Aegyptiacum*, And proceeded to cicatrize, or bring it to a Scar, after the same manner which is used in other Ulcers.

In the whole course of the cure, care must be had to strengthen the Heart, both by things given in, and applied outwardly. Likewise Emollient, Cleansing, and Refrigerating Clysters, are frequently to be given, which do much help the part affected, by reason of the Neighborhood.

CHAP. XII.

Of the Wombs Wind and Water Swelling, or Dropsie.

THE Inflation or blowing up of the Womb with Wind, and its Dropsie, are by Writers confounded or jumbled together ; so that they call the Inflation a Dropsie coming of wind ; whereas the Dropsie properly so called is ingendered by a watry Humor. Yet are they distinguished, and there is a certain puffing up of the womb with wind, suddenly rushing in, and stretching the same, and causing vehement pain, as in the Chollick ; which because it continues not, but is soon dissipated, it deserves not the name of Dropsie ; and such a puffing up is often seen in Hysterical women which have the Womb fits.

D I F F E R E N C E S. There is therefore to be reckoned a two-fold Dropsie of the Womb ; one from wind, which is like that sort of Belly-Dropsie which is termed *Tympanites*, or the Drum-belly Dropsie : another arising from a wheyish Humor, answering to the Dropsie of the belly, called *Ascites*, that is, the Bottle-belly Dropsie : Some add a third sort, answering to the third sort of Belly-dropsies, called from its cause, *Leucophlegmatia*, that is, white-flegm Dropsie, which is seldom seen in the course of Practice. Yet I have seen a Gentlewoman, which in one day voided such plenty of thick flegm out of her womb, as might weigh probably six or seven pound weight : which flegm long retained, might doubtless have caused in her a Dropsie of the Womb.

Wind and water causing a Dropsie of the womb, are contained either within the Cavity of the womb, or in its Membranes, or in certain Bladders. Touching the Cavity of the womb, it is somewhat doubted how wind and Humors can be contained therein, seeing there is so easie a Passage through the neck and mouth of the womb. We answer, the inner Orifice or mouth of the womb, may be closed by divers ways ; either by thick flegm sticking fast thereunto, and growing hard, or by a Schirrhus, or some other cause. *Mercatus* conceives, That a snotty kind of flegm is voided by the mouths of those veins which are ordained for the monthly Purgations, and that of the said snotty flegm a skin is framed, which covers all the inner surface of the womb, within which thin skin, the wheyish and windy Matter is contained. But *Fernelius* thinks, That water may be contained in the womb, without any thing amiss in its mouth, but barely by its constriction or pursing of it self together. All these sorts are to be allowed of, and may be confirmed by divers Examples.

And first of all, Examples of winds contained in the womb-cavity, are recited by *Sennertus*, in the Fourth Book of his Practice, Part 1. Sect. 2. Chap. 10. The first is taken out of *Valescus de Taranta*, touching a certain Jewish woman of *Lisbon*, who taking her self to be with Child, when she expected to be delivered, a great quantity of wind came away, and so her womb was brought down again. The Second is taken out of *Mathiolus de Gradi*, who relates the same thing to have befallen his own Wife, and other Examples taken out of *Dodonæus*, *Thadæus*, *Dunus* ; and other writers, do testify the like Cases ; and we see the same often in the course of our Practice whereunto may be added a History, which we shall in the Cure relate out of *Solenander*, of a woman who
by

by means of a Fumigation made of Nutmegs, let wind fly out of her womb, which gave a report like a Pistol.

And Examples of water contained in the womb are propounded by the said *Sennertus* out of *Rhasis*, who saw a woman out of whose womb there flowed twenty five *Cotilaes* of water, which is a Measure not used with us, containing about half an Ale-pint. Also out of *Jacobus de Partibus*, and *Dononans*, who relate such a like Story. And *Vesalius* Dissected or Anatomized a woman, in the hollownes of whose womb were found above sixty *Aufsburg* Measures of water, each Measure containing three pints, and the mouth of her womb was grown to a wonder ful hardnes.

And that water is sometimes contained in the womb in bladders, many Authors do testifie, who have seen examples thereof in some women, who voided such bladders full of water from their wombs; among the rest *Actius*, *Valeriola*, *Christopherus a Vega*, *Mercatus*, *Platerus*, and *Fabricius Hildanus*.

Sometimes also women with Child have a Dropsie at the same time in their wombs; as *Fabricius Hildanus* relates of his own wife, whose Belly was swelled to a monstrous greatnes; and at the time of her delivery, she voided first of all eighteen pints of water; and half an hour after, nine pints more; and at last she was delivered of a Boy, strong and healthy. The like case we find in *Skenzius* but with a contrary event, concerning a woman, who being delivered of a living Child, continued still big-bellied, and her belly growing still greater and greater, she died of it; and her womb being opened, a great quantity of water was found therein.

Finally, *Fernelius* hath an Example in the sixth Book of Diseases, Chap. 15. of Water retained in the womb, only by reason of the close shutting of the mouth of the womb without any other fault therein. The story is of a woman that had a Dropsie in her womb, who as often as she had her monthly Purgations, voided all her watry Excrements out of her womb, filling six or eight Basons with a very hot yellowish water, till the swelling of her belly was wholly abated. The next month the like redundancy of watry Excrements being collected, was in like manner evacuated.

CAUSES. The immediate Cause of the windy and watry Swelling of the womb, is the weakness of Natural heat residing in the Liver or Spleen; and from those parts, wind, flegm, or wheyish humors are transmitted unto the womb; or the weakness is in the womb it self, whereby the said Excrements are therein collected and heaped together.

And the causes which weaken natural heat, either directly, or by accident, are very many, and the chief are, of those things which are called by Physicians, *Res non Naturales*, things not Natural: So, cold Air especially after Child-birth, heedlessly received into the womb, is a most effectual cause of this Infirmary. Also cold Air unseasonably received when the Courfes flow, and going frequently into cold water, or padding in the same, especially during the said flux, is a cause thereof. So is much use of cold meats, or windy, as fruits, Herbs, Beans and Pease, and likewise of Vinegar: cold water plentifully and unseasonably drunk down, long and deep sleep, painful childing and abortion, especially if it often happen; immoderate flux of the Courfes, exhausting the Natural heat, or their suppression, choaking the same. Add to these the proper Diseases of the womb, as swellings, Ulcers, and such like, which do resolve the heat of the part; or else shut the mouth of the womb, and hinder the egress of Menstrual blood, and excrementitious Humors.

DIAGNOSTICK. In the Discovery of this Disease, many things are to be considered:

First, How this particular Dropsie of the womb, may be known and distinguished from that of the whole Body?

Secondly, How the several sorts of this womb-dropsie may be discerned, as whether it come from winds, from wheyish Humors or from flegm?

Thirdly, whether it proceed primarily from some infirmity of the womb, or by fault of some other parts of the Body?

Fourthly, whether the Matter offending be contained in the Cavity of the wombs, or between its Membranes, or in certain Bladders?

Fifthly, How to distinguish it from other Tumors of the womb.

Sixthly, How from being great with Child?

Seventhly, How it may be known from a Mole?

As for the first Question. It is distinguished from an Universal Dropsie of the Belly, in that the womb-dropsie swells chiefly the lower part of the Belly; whereas the universal Dropsie distends equally the whole belly in all the parts thereof. Again, in the womb-dropsie, paleness and falling away of the flesh of the whole Body, are not so soon discerned as in the Universal Dropsie, in which also for the most part, there is evident thirst and driness in the tongue, which are not found in the Womb-Dropsie, in which all other Symptoms are likewise far more gentle than is usual in the universal Dropsie. In a word, In the Womb-Dropsie, some wind breaks out of the womb by fits, or a little water comes away, which evidently declare, that wind or water are contained in the womb.

To

To the second Question we Answer thus. That the sorts of the womb-dropfies may be known from one another after this manner. If it arife from wind, the lower part of the belly being struck, gives a found; the belly is afflicted with the pricking pains, which reach sometimes as far as the Midriff, Stomach, Loyns, and other parts; sometimes wind breaks evidently out of the neck of the Womb. Likewise, women often feel their Wombs rifing like a Globe towards their Stomach. Sometimes their breath is short and the fick woman when she awakes out of sleep, oftentimes is much troubled to fetch her wind. After all meat and drink whatever, they are worfe. They often belch, and their belchings give them ease. They are oft troubled with Womb fits or fuffocation of the Mother. Sometimes they are pained below the Navil, fo as they cannot endure to be touched. Those Signs do alfo appear in the Inflation or Blowing up of the Womb with wind, which differs from this Difafe (as was faid before) only in this, that the Inflation is of lefs durance, but a Dropfie of wind continues a far longer time.

But if the Wombs Dropfie arife from a wheyish Humor, the Regions thereof appear foft and flaggy; whereas wind stretches it stiff: there is a greater heavinefs in the part, and a noife as of water flowing this way and that way: fome water now and then drops from the Privity. And finally if it arife from flegm, the foftnefs and flagginefs of the part will be yet greater, and encrease daily more and more; and the bordering parts, as all under the Navil, the Privy parts, the fpace between the Privity and Fundament, with the Loyns, will be feen with a Phlegmatick kind of Swelling.

To the Third Question we answer thus. If there be apparent tokens of the whole Bodies being mifaffected, as by acute or long fevers, immoderate fluxes of blood, grievous diffillations from the Head, weaknefses of the Stomach; Swellings of the Spleen or Liver, and other stubborn Difeaſes of thoſe parts, with which the Wombs Dropfie began, encreasing as they encreased; it will be more than an even lay, that the womb receives the matter of its Dropfie from thoſe parts by way of a flux of Rheume. But if this womb swelling happen when the whole Body is in good health, and do fucceed particular Difeaſes of the Womb, ſuch as are hard Travels in Child-birth, ſuppreſſions of the monthly courſes, or over-great flux thereof, Ulcers, Cholerick, or Melancholick, or hard Tumors, we may conjecture, that the Wombs-Dropfie doth depend upon thoſe particular difpoſitiions, and that the matter cauſing the ſaid Tumor is gathered together in the womb it ſelf, by means of its inability perfectly to digeſt and aſſimilate its nutriment.

To the fourth Question, we may answer by ſaying, That the matter which is contained in the Cavity of the womb, doth make a much larger Swelling than when it is contained in bladders. Again, when it proceeds from a wheyish Humor, a greater fluctuation of the water is perceived than when it is contained in bladders. And if ſo be, little bladders full of water be voided out of the womb, it's a moſt certain ſign, that the Humor is contained in the little bladders.

To the Fifth Question we muſt answer; that the wombs-dropfie is differenced from Tumors of blood or Choler, ariſing in the womb; becauſe in ſuch Tumors or Swellings there is a fever and a pain which is encreaſed by the leaſt touch; alſo the Inflammation reaching even to the parts of Generation. And it is diſtinguiſhed from Schirrhus and Cancerous Swellings, becauſe in it there is no ſuch great hardnefs, which can reſiſt the impreſſion of the finger, but it rather gives way, and pitts.

To the Sixth Quære we ſay: when a woman is big with Child, the ſwelling is not ſo even and depressed, but it is ſharp bunched out, and ſeems greater about the Navil than elſewhere. Secondly, In grearnefs with Child, after ſome months, women are for the moſt part ſomewhat better than they were, becauſe the Child grown big conſumes the greater part of thoſe humors, which in the firſt months were burdensome: But the Dropfie, the further it proceeds the worſe it grows. Thirdly, In greatnefs with Child, the Child is manifeſtly perceived to ſtir, after the third or fourth month; which is not in the Womb-Dropfie. Yet it falls out ſometimes, that when the Dropfie is cauſed by wind, a certain Palpitation is perceived in the womb; but it is eaſily diſtinguiſhed from the moving of a Child, which is more even, and is wont to be perceived in divers parts of the Belly. Fourthly, in greatnefs of Child, the womans duggs ſwell; but in the Dropfie they are extenuated and become ſmaller.

To the ſeventh Quære we answer, that in a Mole, women find a kind of heavinefs in their wombs, which they feel not in the womb-dropfie; and when they lie on the one of their ſides, they perceive the weight to roul like a ſtone to that ſide. Again, in the Mole, violent flux of Courſes comes by fits; Namely, every third or fourth month; which happens not in the womb-dropfie. Laſtly, in caſe of a Mole, the Duggs ſwell, and ſometimes have milk; in the womb-dropfie, quite Contrary.

PROGNOSTICK. As touching the Prognosticks of this Difeaſe. A ſimple Inflation or puffing up of the womb with wind, becauſe it laſts not, is without danger. Yet if not quickly cured, it may grow to a true Dropfie.

A womb Dropfie cauſed by a good conditioned Humor void of putrefaction, is wont to prove a
* long

long Disease ; yet may it in process of time be cured, yea sometimes, the water flows of its own accord out of the womb, and the Patient recovers her health.

But if the Humor be malignant, sharp, or putrid, which is known by the grievous Symptoms following ; the Disease is dangerous, and for the most part deadly : For if the Disease depend upon some private Disease of the womb, it betokens a perfect ruine of the natural Functions of that part ; whence follows at last an universal Dropsie of the whole Body. But if the womb suffer by consent of other parts, viz. of the Liver, Spleen, or Stomach, the Mischief will be the greater, and ruine is thereby threatned to the whole Body. Hence it was well said of *Aetius*, Such as is a womans womb, such for the most part is the rest of her Body.

If wind or water be contained in the Cavity of the Womb, it is more easily cured than if it be shut within little skins or bladders.

[*CURE*.] The Cure of this Disease is performed almost by the same Remedies which have been propounded to cure the Dropsie and Green-sickness. Whereunto some things more properly belonging to this Disease must be added. And in the first place concerning Blood-letting ; In the Disease, being new, proceeding from a suppression of the Courses and from Plenitude still appearing, blood-letting may be convenient ; otherwise it will hurt, seeing natural heat is exceedingly weakened and diminished ; and stubborn Obstructions caused by a cold Humor, do cause fear of an Universal Dropsie.

But Purging is altogether necessary, and must be often reiterated, as we ordered in the forenamed Diseases.

After sufficient Purgation, Openers, Diureticks, and such things as move the Courses, are to be given, such as are described in the places aforesaid. Unto which, these following may be added.

Take *Roots of Smallage, and of Madder, of each half an ounce ; the Leaves of Savin, Feaverfew, Pennyroyal, of each one pugil : Carrot-seeds one dram. Boyl all in the Broth of a young Pidgeon, and let her drink the strained Liquor divers days together.*

Before she drink of the Broth, let her swallow one of the following Pills.

Take the best *Castoreum, Myrrh, Madder, of each half a dram : Saffron twenty grains, With Juyc of Lemmons make all into nine Pills.*

After which Medicaments the Patient must exercise her self stoutly, by which means, not only the Excrements bred in the Bowels, and the whole compass of the Body, may by assistance of heat be dissipated ; But all which is contained in the womb may be voided out, the bladders being broken by violence of the exercise.

If the woman do easily vomit, something may be profitably given her twice in a week to that end ; by which means, not only the Humors which were wont to flow unto the womb, will be recalled, and brought forth ; but the aforesaid bladders sticking in the womb, and sometimes containing a watry Humor, happily may be broken by the vehement motion and agitation, whereupon the Humor offending will be voided.

To discuss the said Humor contained in the womb, the following Bolus or Morfel, will be most effectual.

Take of *Mineral Borax half a dram : Saffron twenty grains. With Juyc of Savin make all into a Morfel. Let it be taken twice in a week.*

Sweat-drivers are likewise very profitable in this disease: for by them, wheyish and flegmatick humors, whether in the womb, or the whole body, are discussed and evacuated.

In the mean while, the inbred heat of the Stomach must be strengthened both with things given inwardly, and outwardly applied; described in the Cures of the diseases of that part.

And outwardly, Medicines must be applied, to strengthen the womb, and to discuss the Humors contained therein.

And in the first place, Fomentations and Baths to sit in, may be made of a Decoction of Briony roots, wild Cucumber, the leaves of Danewort or Dwarf-elder, Mercury, Elder, Origanum, Calamint, wormwood, Rue, Sage, Marjoram, Thyme, Bay Pennyroyal, Mugwort ; Seeds of Broom, Carrots, Cummin, Annis, Fennel ; Berries of the Bay and Juniper Tree ; Flowers of Chamomel, Melilot, and Rosemary. Of which, little bags may likewise be made, boyled in Whitewine. Or the foresaid Ingredients or some of them, may be boyled in the Lye made of the ashes of Vine-boughs.

And that the foresaid Fomentations may work the better, they are to be applied before and behind ; and the sick woman ought to sweat, if she can, in her bed, or in a Stove conveniently prepared : Which likewise may be procured by help of a Bathing-Tub.

In a windy Dropsie, dry Fomentations will be more profitable, with bags of Millet, Salt, Cummin-seed, and Bran, fryed in a pan and besprinkled with wine.

After Fomentation, let her Belly from the Navil downward, be anointed with Nard Oyl, Oyl of Dill, Oyl of Rue, Wormwood, and Southernwood ; which Oyls, if drawn out by Chymical Art, they will be much more effectual.

After Unction, lay on a Plaister of Bay-berries, or Pultis of Cows and Sheeps-dung, with Seed of Smallage, Parsly, and Cummin, as also Honey boyled therewith.

To the same purpose the Skin of a Sheep newly killed is commended, sprinkled with warm Canary-Sack, and laid warm upon the Belly.

Clysters are frequently to be given made of the Decoction of Wormwood, Origanum, Penroyal, Rue, Centaury, and the like; Or of the Oyl of Rue, Nuts and Dill, with Whitewine, Hypocras, or Muscadine. In which Clysters dissolve *Benedicta Laxativa*, *Hiera Diacolocynthidos*, *Terebinthinam*, Confection of Bay-berries, Rosemary-flowers, Honey, and the like.

Injections into the womb may be very profitable to evacuate the Humors contained therein, being compounded after this manner.

Take Roots of *Asarabacca* three drams: Leaves of Penroyal, Calamint, of each half a handful: Savin a pugil: Mechoacan a dram: Annis-seed. Cummin-seed, of each half a dram. Boyl all, and in six ounces of the strained Liquor, dissolve an ounce of Oyl of Orris, and as much of Elder Oyl, and make thereof an Injection.

To the same end may Pessaries be made, thus:

Take *Coloquintida* and Mechoacan, of each one dram: Sal Nitre ten grains: boyled Honey as much as shall suffice. Make all into a Pessary. Or,

Take Bind weed Roots, Roots of *Esula*, of each one dram: Seed of Gith, or *Nigella Roman*, half a dram: Honey as much as shall suffice. Make all into a Pessary. Or,

Take *Elaterium* half a dram: bruised figs as much as shall be requisite. Make them all into a Pessary.

When the Swelling of the womb proceeds from wind, a Fumigation of Nutmegs is very helpful, being commended by Solenander, in these words: *A Woman newly out of Child-bed, exposing her self over-soon to the Wind and Air, fell into insufferable pains, neither could she find any help. At last comes an old well experienced Midwife, and calls for three Nutmegs grossly powdered. Then she put an Earthen pan with hot Coals under the woman, and sprinkled the powder of Nutmegs upon the Coals, so placing the pan, that the woman might receive the smoke through a Funnel into her womb by the Water-Gate. At the same time she was smoked above with the same Fume: Which when it had penetrated into her body, the woman presently cried out, I must needs go to stool: which she had hardly spoken, but a fizzing and sound was heard, such as is made when Gun powder is fired, being shut in a narrow box: which wind being expelled, the woman was perfectly well in a moment. Being advised by this Experiment, having upon like occasion used the like Remedy, I have very often found it to do much good.*

In the same case, Cupping-glasses with much flame are profitably set upon the Navil, for they excellently dispel wind.

If the Disease come from Humors, Issues are to be made in the thighs, that by those Fountains the filth of the womb may be by little and little drained out.

Brimstone and Nitrous Baths are likewise commended by many, both to drink, and to be washed in; provided there be no great heat of the Liver or whole body conjoynd with this Disease.

For the pain of the womb, which is frequently troublesome in this Disease, *Amatus Lusitanus* commends the water or Decoction of Chamomel-flowers, given to the quantity of four or five ounces.

And finally, If the Inflation or puffing up of the womb happen after Child birth, there will need no other Purgation than that by the womb: Which if it find any hinderance, it must be helped forwards by drawing Pessaries, and by Cupping-Glasses fastened to the Thighs, and by other Medicines described in our Chapter of Suppression of the Courses. And if there be wind, the Fumigation made of Nutmeg aforesaid, will be most seasonable.

Chap. 3. Of the falling down of the Womb.

When the Womb loseth its Natural Scituation, and falls toward the Water-Gate, the Disease is termed, the falling down, or slipping forward of the Womb.

DIFFERENCES.] Many Differences there are of this Disease, differing only in degrees: For sometimes only the inner Neck falls down into the Water-Gate: sometimes the whole body of the Womb falls downwards, but does not appear without the Water-Gate, in the threshold whereof appears the inner mouth of the Womb, in likeness of a mans Yard, or a Goose Egg with an hole in it: Otherwhiles with the bottom turned out, it hangs without the Water-Gate like a mans Cod, or an Ostridges Egg, save that it is rugged, and hath an uneven surface: and it is in a word, sometimes so relaxed, that it falls so far out as to reach the Patients Thighs.

The

CAUSES. The immediate Cause of the falling down of the womb is the Rupture, or Relaxation of those Ligaments which are wont to retain it, and its neck, in their proper place.

A Rupture of the aforesaid Ligaments may proceed from all violent Causes, as a blow, a fall, dancing and leaping, lifting some heavy burden, or carrying the same, violent compression of the Abdomen: vehement Coughing which dures long, violent neezing, especially in Child-bed, hard straining to stool, difficult Travail, violent extraction of the Child out of the womb, or of the After-birth; vehement endeavour of the womb to cast out somewhat offensive thereunto, as a dead Child, a Mole, or an After-birth; for then, according to *Galen*, in his Third Book of Natural Faculties, the same thing betides the womb, which is wont to happen to two wraстlers who endeavour to throw one the other upon the ground, till both fall together. Hereunto add, frequent setting of Cupping-glasses upon the Thighs, and very vehement agitation of Body, or of Mind.

Relaxation or slackening of the Ligaments is caused likewise by divers causes, as by a long lasting Catarrh, divers Crudities, which are cast out into the womb, as the sink of the whole Body. Whence it is that women long troubled with the Whites, can scarce avoid this disease, especially elderly women which are most of all troubled therewith. Add hereunto external causes, as are over frequent bathing, especially in cold water; Southern and moist Air, especially being received into the Womb after Child-birth; moist Diet, much drinking, Idleness, long sleep, and all other causes, which may increase flegm, and cause its flux into the Womb.

SIGNS. The Signs whereby to know this Disease are evident to the sense. For the womb is found sticking in the Water-Gate like an Hen or Gooses Egg, or like a Clew of Thred, with the perceivance of a weight pressing upon the Water-Gate, when the Patient stands upright. And while they sit or go to stool, a vehement pain is felt about the privy Parts, and the Regions of *Os sacrum*, or the Hanch-bone. If it hang far out, the greater pain and heat is felt, the Urine comes away by little and little, and makes the womb smart as it passeth.

The Causes procuring this falling down of the womb, may be thus distinguished. If it proceed from looseness or slackness of the Ligaments, it comes by little and little, hath the less pain, and white Purgations have preceded, or other Causes moistening the womb, and relaxing the Ligaments thereof. But if it proceed from a breaking of the Ligaments, the pain is more vehement, and blood sometimes breaks forth; and such Causes have preceded which have been able to break with violence the Ligaments.

PROGNOSTICK.] As for the Prognosticks belonging to this Disease. The Disease of it self is not dangerous; yet it is very unhandlome and troublesome, hindering the Patient from freedom to go and walk at will; also from Conception and convenient expurgation of her Courses.

Yet may it sometimes occasion death, if Pains, Fevers, Convulsions, or other grievous Symptoms be joyned therewith.

Also the Womb in this Case is sometimes corrupted through distemper of the Air, or by violent impulsion, and becomes Gangrenated, which necessitates it to be cut off.

The Disease being fresh, and the Womb coming not far out, is more easily cured than when it is an old Infirmary, and the womb comes far out.

In younger Women, the womb is more easily restored to its place than in Elderly Women.

Falling down of the womb, by reason of the Ligaments being broken, is incurable.

CURE.] To come to the Cure. The womb is to be thrust back into its Natural place, and to be detained there; and the fault of its Bands or Ligaments must be corrected; If they be broken, by things that do glue and fodder together; if they be relaxed or slackened, with things drying, astringent, and strengthening. All which may be done by the following Medicaments.

In the first place therefore, That the womb may more easily be restored to its place, the Guts and Bladder must be disburdened, lest pressing the Neck of the Womb, they should hinder its reduction; forasmuch as the neck of the Womb rests upon the streight Gut, and the bladder rests upon the neck of the Womb.

When the Guts and Bladder are discharged of their Excrements, let the woman lie along upon her Back with her Thighs wide asunder, and her Knees drawn upwards, and let her with her hands thrust her Womb inwards; and force it still upwards into the neck, so as to turn it inwards at it goes, till all is returned within the Cavity of the Belly which should contain the womb. Or if she is not able to do it her self, let her do it by help of the midwife; or use a thick blunt ended stick with Cloaths wrapt about it, by which it may be forced further into the Cavity of the Belly, than is possible by the hands to drive it. Or, for fear of hurting her Body, a Pessary may be made of Linnen Cloth often doubled and rowled together with a string tied fast thereunto, and accommodated to this service of thrusting up of the womb.

But if the womb fallen from its place shall swell, so that it cannot enter into the Cavity of the Belly, the swelling must in the first place be removed. And if there be Inflammation, such things must be applied as are fit to heal the same. If otherwise it be blown up, such things must be used

as will discuss the inflation. *Rodericus a Castro* washes the swollen womb with a Decoction of Beets, and then sprinkles it with Vinegar and Salt, and so when the swelling is abated, he reduceth the same.

The same *Rodericus a Castro* writes, that it is very good towards restoring the fallen Womb, for a Physitian or a Chyrurgeon to come with a burning red hot Iron in his hand, and to make as if he would thrust it into the womb. By that means Nature contracts her self, and the womb with her, and any other part that sticks out of the Body. For he relates that a certain very expert Chyrurgeon did by this stratagem force back a mans Guts, that were ready to come out at a wound in his Belly, when other remedies did no good. For holding a great red hot Iron in his hand, the Patient looking on, he made as if he would Clap it upon the wound. With the sudden fright whereof the Guts were presently drawn back into their place.

Avenzoar in his Second Theizir, Traet. 5. Chap. 4. propounds some such things as this. When this Disease (saith he) begins first to appear, the Physitian may gently cure the same. And it is reduced all these ways, viz. by your hand if you please; and if not, make her lie on her back, and let some body sit upon her brest, and another upon her thighs; and then cause her to be frightened putting some creeping Vermin upon her Leggs, such as Mice, Efts, frogs and such like; by which let her be so frightened as to endeavour to get away by drawing her Leggs and Thighs up to her; whereby all her Members and her whole Body may at once be contracted: by which means the womb will return unto its own place.

Zacutus Lusitanus following *Avenzoar* relates the following story in the 66. Observation of his Second Book. Coming to a woman (saith he) which had her Womb fallen down the space of a year and an half, with extreame hardness; it seemed very hard by reason of its stretching out, to be reduced to its place; especially seeing *Avenzoar* says, that this work must be done before the womb be grown hard. I devised many remedies for this Disease; astringent Infusions, Pessaries, Plaisters, Confections. At last, having wrestled stoutly with the Disease, and could do no good, I betook my self to this stratagem. I put Mice tied by the tails, between the womens Leggs; Which running up her Thighs the woman was mightily frightened, and forthwith (a strange thing to see) her womb was reduced into its proper place. This done, The Plaister against Ruptures being laid upon the Region of the womb and to the Groyns, she remained for the time to come free from that Disease.

Before the womb be reposed in its place, it must be anointed with the Mucilage of Comfrey-Roots, or with an infusion of Gum Tragacanth. Then are powders to be sprinkled thereupon, which have no asperity or sharpness, lest they hurt the Womb or its Neck; but of quality rather gluing than astringent or binding. Such an one may be thus made.

Take *Frankincense*, *Mastich* and *Sarcocolla* nourished (that is, well steeped so as to drink up as much of the Milk as it can hold) with Breast-milk, of each one dram: *Mummy*, Gum arabick, *Acacia*, *Hypocistis*, of each half a dram. Make all into a most fine Powder, to be sprinkled as aforesaid.

The same Powder may be applied in form of an Oyntment, if it be mixed with the aforesaid mucilages, or Oyl of Saint-Johns-wort, or some other consolidating thing.

After the Womb is conveniently re-placed, all art must be used to retain the same in its place, the woman lying in her bed, a little bending, with her Thighs gently stretched out, and the one resting upon the other. And let her abide some days in this posture, and put in at the Water-gate a little Wool, Cotton, or Sponge wet in harsh red Wine or in Rosewater, wherein *Acacia* or *Hypocistis* hath been dissolved.

To further this Retention of the womb in its place, Cupping glasses with much flame are frequent to be fastened under her Dugs and upon the Navil.

Likewise sweet savours are to be presented to her Nose, and stinking things to be applied to her Genitals, unless she be subject to fits of the Mother.

Let the said parts be fomented with a Decoction of Astringent things made in red Wine and the Water of a Symths Forge.

Also Practitioners use a Bath to sit in, made of the same Decoction: In which there needs caution. For it is to be feared, lest in that posture, the womb should again fall from its place, especially at the beginning, while the Disease is yet fresh. But when it hath held the Patient long, and she is provided of a convenient kind of Truss, such a Bath will do much good.

After the said Bath a Fumigation will likewise be very good, of *Frankincense*, *Mastich*, *Sandarach*, red Roses: Others indeed do commend a Fumigation made of salted Eel-skins.

Injections into the womb will work much more effectually than those remedies which are outwardly applied; they may be compounded of the Decoction for the Fomentation or Sitting-Bath aforesaid.

Oyntments and plaisters will likewise be good in this case, such as were described in the Immoderate Flux of the Courses and in the Whites; and as shall hereafter be propounded to prevent Abortion.

The

The Retention of the Womb in it place may likewise be holpen, by astringent and strengthening Medicaments taken in at the mouth. And among the rest, the following powder frequently taken is very proper for this disease.

Take *Mullein* two drams: *Myrtle Leaves*, *Garden Parsnip Seeds* of each one dram: *Shavings of Harts-horn*, half a dram: *Ashes of Cockle-shells* one dram: *red Coral* two drams: Make all into a Powder. The Dose is one dram with harsh red Wine.

Touching these astringent Medicaments both internal and external, it is to be observed; that they must be warily used, if the womans courses do still flow at their seasons, lest they being suppressed may cause more grievous Diseases to follow. The best season for these Medicaments, is when the Patients courses are past.

These Remedies are to be continued twelve or fifteen days together. Also care is at the same time to be taken, that the Patient be neither costive nor loose. For if the Excrementitious be hard, the womb is easily thrust out, by the Patients straining at stool; and a loose Belly doth relax or slacken the bands or Ligaments of the Womb.

While the aforesaid Remedies are used, we must resist the Antecedent cause, by such things as shall purge out and discuss those flegmatick Humors which relax and slacken the Ligaments of the womb.

And the first convenient Purgations must be ordered; which must not be violent in the operation and disturbing, lest they cast the Womb out of its place again, bringing abundance of Humors into those parts.

Some allow of vomiting, because it draws the Humors into the upper parts of the Body: and in that respect it would be profitable, if it were not to be feared in another regard: Namely, because it is performed with great straining, and drives the womb downwards, as much as sneezing. Yea, and experience hath taught that nothing doth more effectually facilitate hard Travail, and bring the Child sooner into the light, than a Vomit given to the Childing woman.

After sufficient Purgation, a Decoction of Guajacum is to be given three weeks together, that every day the Patient may sweat in the morning. And in the Evening let her Belly beneath the Navel be fomented with a Decoction of Sage, Origanum, Marjoram, Thyme, Feverfew, Tanfie, Worm-wood, Rue, red Roses, Cyprus-Roots, Calamint, Cypress Nuts, and the like simples boyled in Smythes Forge-water and red Wine. After the Fomentation, the Fumigation and Liniment may be used which were before described.

Instead of a Sweat-driver, or after the use thereof, Baths arising from Sulphureous Mines, will be singularly profitable, such as our Balerucan Baths; and experience hath shewn that many have been cured by such Baths.

And that a woman may be secure that her womb fall not down again, which it is very apt to do; or if there be no hope of a perfect cure, let her wear such a kind of truss as is called *Hypocrates* his Girdle. Whereby women are so guarded and defended, that without fear of the falling down of their Wombs they may go about and do their daily businesses; also their Womb is thereby defended from the cold. They are made almost after the same manner, as trusses that are used against Ruptures or Burstenness.

Pessaries are likewise very profitable in desperate fallings down of the Womb, which some do make of a good long piece of Cork covered over with Wax. Others make them of Wax alone, some round, others square, triangular, oval or other fashion; which are conveyed into the Cavity of the Womb, and are never taken out, but keeps the womb in its place; so as the woman notwithstanding do all their usual employments conveniently, are enjoyed by Men in carnal conjunctions, do conceive, carry their bigbellies, and bring forth. Which is confirmed with many Examples by *Franciscus Rossetus*, in his Book entituled *De Partu Casareo*, Sect. 6. Chap. 5. and by *Banbini* in his Appendix to *Rossetus*. All which are transcribed word for word by *Schenkius* and *Sennertus* in their proper Chapters, where they are to be seen.

CHAP. XIV.

Of the Womb shut up, or Imperforated.

Virgins that have their Wombs closed up are said to be imperforated, or unboared, like a Barrel of Beer that hath no hole to put in a Spigot. Now this Closure of the womb is wont to be in three places; viz. In the inner Mouth of the womb, in its Neck, and in the outward mouth of the womb next the the Water-gate.

CAUSES.] It is caused, either in the first formation of the Infant, when some Membrane is drawn before the mouth of the womb, or its neck; or by some precedent wound or Ulcer, which growing whole again, the parts of the neck of the womb, or its lips, come to be closed together; or by Tumors shutting or stopping up the inner Orifice; or by some compression, straitness, or distortion, which hinders the mans Yard and seed from going in, and the Monthly Purgations from coming out.

This

DIAGNOSTICK.] This Disease is in part easie, and in part hard to be known. If the closure or stoppage be in the outward Orifice of the Privy, it is discerned by seeing and feeling. But if it be in the neck or Mouth of the womb, it is not discerned till the courses begin to break out, or till the parties begin to addict themselves to generation. For when the time of their monthly Pur-gations is come, pains and gripings are felt in the Region of the womb at certain periods of times, with a sense of weight, yet no flux of Courses follows; the Conjecture will be more probable, if the Virgin be of a good habit of Body, not troubled with any Obstructions, or Cachectick dispositions. The Disease persevering, their womb swells, so that Maidens seem to be with Child; and sometime their whole Body swells, which likewise seems as it were black and blew through the abundance of blood. But if the closure do possess the neck of the womb, it is perceived in the first Carnal Con-junctions, because it doth not admit the Mans Yard.

Lastly, If the Closer be in the Orifice or Mouth of the womb, it is hardly discerned; yet may it be in some measure perceived by the hand of a skilful Midwife; and it gives some suspicion thereof when the mans seed doth presently slip away, as soon as it is cast in.

PROGNOSTICK.] As for the Prognostick. If the Closure be in the Orifice of the Pri-vity, it is easily cured, being opened by a slight Section. But if it be in the inner parts, it is much harder to cure.

When the Passage is stopped with a Membrane, its more easily cured: but when the closure is cau-sed by a fleshy matter, as it happens after Ulcers, the Cure is more difficult.

The Closure of the inner Orifice of the womb is incurable, because the Instruments of Chyrurgery cannot be applied to open the same.

CURE] The Cure of this Disease, because it belongs chiefly to Chyrurgery, we shall dispatch in few words.

If the Closure of the womb have been caused in the first formation, it is to be opened by cutting only. The manner of which cutting is largely described by *Sennertus*, in its proper Chapter.

But if the Closure have been occasioned by reason of an Ulcer, as it happens in the Whores Pox; it is to be considered, whether it be only an excrescence of flesh not wholly stopping the passage, or a perfect and entire growing together of the sides of the neck, or of the Lips. For, if flesh only be grown up, endeavour must be used, convenient Evacuations being premised, first to prohibit the en-crease of that flesh by drying and discussing Medicaments, then to diminish the said flesh by Medi-cines of Frankincense, Birthwort, Bark of Frankincense, Roses, Balaustines, Mastich, Myrrh, Aloes, and such like. Which not doing the deed, we must come unto such flesh-consumers as are least painful, as burnt Allum, *Unguentum Egyptiacum*, and such like. And at last, if this will not consume the flesh, it must be cut off round about, with the same Instrument wherewith the superfluous flesh breeding in the Nose, called *Polypus*, is wont to be cut off. But if the neck of the womb be wholly grown together, we must try to renew the Ulcer, and with the foresaid Medicaments to remove the superfluous flesh. And if that cannot be, we must undertake to cut it, in the very self-same manner as we are wont to cure the natural coalition of the neck of the womb.

If the passage of the womb be shut up by some Tumor, proper Remedies are to be appointed there-unto; such as have been propounded in the Inflammation, Schirrhus, and Cancer of the womb.

If it be caused by compression of the neck of the womb, or of the inner mouth thereof, the compres-sing cause is to be taken away, which may be divers, *viz.* A Stone in the Bladder; a swelling in the streight Gut, Fatness of the Caul, the Legs or Thighs distorted, and going asplay; the Cure of which accidents see in their proper place.

In streightness of the Passage, which is chiefly caused by hardness or dryness, we must work with things moistening, Emollient and Laxative; with Baths to sit in, Fomentations, Liniments, and Pef-saries; and so when the part is relaxed, a little pipe of Lead may be put in, or of white wax artificially contrived, and smeared with Butter, or some Emollient Oyl, which let her always carry, or at least in the night when she goes to bed, and in the day time let a Pessary conveniently made of Cotton be put in the place, being smeared with Oyntment of Marshmallows, or such like.

In Distortion, the same Method of Cure, very near, is to be observed; and let the pipe be so fra-med, that it may gently bow the contrary way to the distortion; and so the neck of the womb may by little and little be reduced to its due place.

Chap. 15. Of Barrenness.

THIS word *Barrenness* or *Sterility*, is not in this place taken in so strict a sense, as to signifie only a total defect, and perfect abolition of Conception; But in a large and ample signification, so as to comprehend all kind of impotency, and every impediment of Conception: Namely, when a woman at such an Age in which she ought naturally to be capable of Conception, and using the com-pany

pany of a man, doth not conceive. And this defect is termed *Agonia*, or *Atechnia*, that is, Inability to conceive or bear children.

CAUSES.] And this Barrenness or Impotency of Conception is caused divers ways; all which for clearness sake, we may reduce to four Heads, according to those four Natural Operations which are required to perfect Conception.

The First of which is, That the Woman in her Genial Embracements do conveniently receive the Mans Sperm into her Womb.

The Second, That she retain the same a convenient season.

The Third, That she cherish and preserve the same in her womb.

The Fourth, That she afford fitting Materials to form the Embryo or first Conception, and duly to augment the same, as need shall require.

Hence Four Impediments of Conception do arise; viz. If the Woman receive not the Seed; If she retain it not; If she preserve and cherish it not; If she nourish it not so as it encrease and grow.

Reception of the Seed is hindered by many Causes; by things Natural, things not Natural, and by things Preternatural. Among things Natural hindering the Reception of the Sperm, in the first place is reckoned, youngness of Age, in which, by reason of the smallness and straitness of the Genital Parts the woman cannot receive the mans yard, or not without very great pain, which makes her worse for Genial Embracements. The same effect is caused by over-great Age, seeing that in elderly Virgins, the Genital Parts, through want of being exercised in actions tending to Generation, do become withered, flap, and flaggy, and so strait that they cannot afterwards easily admit a mans Yard. Likewise, all such as are naturally lame, with distorted Legs, and their Crupper-bone depressed, can hardly put themselves into such a convenient posture during the genial Embracement, as is necessary that the Seed may be duly and rightly received. Hereunto add over-great fatness, which straitens the Passages of the womb, and by greatness of the Belly, hinder the right and fit Conjunction of the man with the woman. And lastly, a cold distemper of the Womb, makes women dull and lustless, so that they enjoy no pleasure (to speak of) in the genial Embracement, or it is long before they are provoked with desire; so that the inner Orifice of the womb is not timely enough opened to receive the Mans Sperm.

Among things not Natural, Passions of the mind hold the first rank, and especially hatred between Man and Wife; by means whereof, the Woman being averse from this kind of pleasure, gives not down sufficient quantity of Spirits, wherewith her Genitals ought to swell at the instant of Generation, that her womb skipping as it were for joy, may meet her Husbands Sperm, graciously and freely receive the same, and draw it into its innermost Cavity or Closet, and withall bedew and sprinkle it with her own Sperm, poured forth in that pang of Pleasure, that so by the commixture of both, Conception may arise.

The things Preternatural, which can hinder the Reception of Seed, are certain Diseases incident to the Genital parts, or to such as border near upon them; as Tumors, Ulcers, Obstructions, Astrictions, Shutting up, Distorsions, Stone in the Bladder, and other such like.

The Second fault in Women, which hinder Conception, (viz. When the Seed is not retained) depends either upon the over-great moisture of the womb, Namely, when the womb is filled with many Excrementitious Humors, by which becoming looser and more flaggy than is fit, it doth not lightly purse and contract it self together, so as to retain the Sperm; or the Orifice of the womb is so slack that it cannot rightly contract it self to keep in the Seed; which chiefly is caused by Abortion, or hard Labor in Child-birth, whereby the Fibres of the womb are broken in pieces one from another, and they, and the inner Orifice of the womb over-much slackned. And that same immoderate moisture may arise both from the proper Constitution of the woman, and from external causes of moisture, such as Baths, Idleness, moist Diet; and especially from the Whites, which flux of Whites happens very frequently, since the womb is as it were the Common-shore, whereinto all the parts of the Body do discharge their Superfluities, so that this is wont to be the most frequent and ordinary Cause of Barrenness.

The Third Cause hindering Conception, (viz. When the Sperm is not sufficiently nourished in the womb,) depends upon such things as are apt to corrupt the seed, as every distemper of the womb, Namely, a cold distemper, which extinguisheth the Seed; an hot distemper, which dissipates the Spirits; a moist distemper, which robs the Seed of its due thickness; and a dry distemper consumes and drinks up the Seed: and thus the Seed being by these distempers corrupted and degraded from its natural Constitution, becomes unfit for Conception. To these Causes, Authors do add Witchcrafts, and Charms, by which all confess that Conception may be hindered. Likewise external things, as Meats and Poysons may do as much, such as are reckoned up by Authors, viz. Among Meats, Vinegar, Mint, Water-Cresses, Beans, and such like; and among Poyson, or at least such things as have a certain venomous property causing Barrenness, The Agat or Jet, the Matrix of a

Goat

Goat or Mule, Glow-worms, Saphires, Smaragds, and the like. And lastly, Malignant and venomous Diseases, may exceedingly corrupt the Seed, and render it unfit for Generation, as the Consumption; Leprous Infections, Whores-Pox, stinking and cancerated Ulcers.

The Fourth and last Cause of Barrenness, (viz. When the woman doth not yield convenient matter to form the Conception, and to augment the same) depends upon a want of Seed and Menstrual blood; so over-young women and over-old do not conceive, through want of both those Materials. The Age of a woman fit for to conceive, is commonly determined to be from the fourteenth to the fiftieth year of her Age. Yea, and though those foresaid Materials are not wanting; if yet they are ill disposed, they are not fit for Generation. And they may be ill disposed through divers distempers, and other Diseases; likewise by reason of bad Diet, producing none of the best blood. So women which gorge themselves with much raw fruit, and cold small drink, breed wheyish blood unfit for Generation: yet we must needs confess, that some women have conceived who never had their Courses, as may be collected out of the Observations of divers Authors; yet so much Menstrual blood was collected in those women, as useth to remain over and above in such as have their Courses, though they had not so much as to cause their monthly Courses.

To the Causes hitherto mustered up, must be added a certain disproportion or unfutableness between the Mans Sperm, and the Womans, which makes they cannot be rightly mingled, nor conspire to the joynt-making up of an Embriion or Rudimental Infant; though there be in the mean while no sensible defect either in the Man or Wife. And it sometimes happens, that the same man can have a child by another woman, and the same woman by another man; whereas they have lived together in the married estate barren. It comes likewise to pass, That a woman shall live with a man for ten or more years together, and not conceive with child, and afterward shall begin to conceive and bring forth: the Cause of which accident is, The change of Temperature caused by years, whereby the Seed comes to have another temper, so that being before disproportionate to the mans Seed, it comes by change of Age to be fitly proportioned thereunto. Now this disproportion of Seeds, consists chiefly herein; when men much exceeding in some quality belonging to their temper, are joyned with women which partake of the self-same excess, viz. When over-hot men are joyned with over-hot women, over cold men with over-cold women; for those distemperatures can procure no mediocrity in the Seeds, and other causes necessary to Generation. Some fly likewise to occult or hidden qualities, which make the Sperms to agree or disagree, though no excess of the first qualities can be discerned.

To these, Authors add a sudden kind of Disposition, which makes some women barren, though no manifest cause of such Barrenness appear in them.

SIGNS. The Signs of Barrenness we will run over according to these four sorts of Causes propounded.

And in the first place, Causes hindering Reception of Seed, are not hard to be discovered, being evident to our very Sences. For tenderness of Age is easily observed, and so is an over elderly state of years; and the evil constitution of those parts which border upon the womb, as when women halt, have crooked wreathen Legs, have their Crupper-bone deprest, or are over-fat; as for the cold distemper of the womb, we shall treat of that in our third rank of Causes. Hatred between man and Wife is known by relation of themselves, or those that live with them. Also the particular Diseases hindering the reception of Seed, as Tumors, Ulcers, Obstructions, Astrictions, shuttings up, Distorsions, may be known through search of the Genital Parts made by a Midwife or Chyrurgeon.

Of the Causes hindering the retention of Seed, which make the second rank, we shall treat of over great moisture among those of the third rank; as for abortion and hard travel, they are known by the womans relation.

The Causes of the third rank, viz. Which have power to corrupt the Seed, do require more exquisite signs to know them by, which we shall prosecute as followeth.

A Cold distemper of the womb, is hereby known; In that the woman longs not after Carnal Embracements, and feels little pleasure therein; her Face is soft, whitish, and cloudy; her feeling is dull about her share, Loyns, and Thighs; she voids thin and crude Sperm, and with little pleasure; her Courses are suppressed, or they come very sparingly, and keep no constant orderly time, and they are pale and discoloured. Add hereunto, Diet preceding of a cooling nature, consisting of a long use of Fruits and Herbs, with much drinking of cold small Drink.

A moist distemper of the womb is known by the lax, and flap, flaggy, soft habit of the womans body, her much sitting, frequent and almost continual flux of Whites; plenty of Courses, thin and watery, no appetite to fleshly Conjunctions, heaviness of her Loyns, aptness to miscarry, plenty of Urine, and a moist Diet.

An hot Distemper is known, by the manly and strong habit of the womans Body, such as is seen in Viragoes and Amazons; by a ruddy countenance, black hair of the Head and Eye-brows; a strong
and

and manly voice; she is frequently disposed to be angry, over-prompt to all kind of actions; her thirst cannot be satisfied, her Urine is yellow, her Courses few, their colour is a dark red, their heat and acrimony so great, that oftentimes they exulcerate the secret passages; their Privities itch, and they are prone to carnal embracements; they are quick and sudden in the voiding of their Seed; they have frequent pollutions, and lustful dreams.

A dry distemper of the womb is known by the small quantity of the Courses, driness, itching, and chopping of the mouth of the womb, little excretion of Sperm in the Genial Embrace; trouble arising from over-much carnal conjunction, and leanness.

If the Seed be corrupted, and barrenness caused by Witchcraft, all other signs will be absent, which are wont to declare the natural and manifest causes of barrenness. There will be likewise some alienation of minds between the married couple, of which neither of them can give any handsome account: Yea, and sometimes they can both of them, but seldom shoot forth their seed; and that with labour and difficulty.

Diet or poysons that extinguish Seed, if they have been taken in, we shall come to knowledge thereof, by diligent questioning of the woman, and those that are about her.

And lastly, Malignant Diseases, such are of power to extinguish the Sperm, as Leprous Malignities, the Whores Pox, and such like, are known by their proper signs.

The fourth Cause of Barrenness, which consists in defect or badness of the Menstrual blood, is known, first by the over-great fatness of the whole body, to the nutriment whereof the blood is carried away, and consumed, and is not allowed for the nutriment of the child in the womb. The same is likewise known by great leanness in the body, and extreme slenderness; for when there is not blood enough to nourish the body, it can hardly superabound to nourish the Conception.

And in a word, all such things as consume, and much diminish the blood, if they have preceded, or be at present in the Patient, they signify want of blood in her body; such as extreme labours and pain-taking, immoderate sitting up and watching, austere fastings, large bleedings at nose or elsewhere, acute or chronical Fevers, Fistulous Ulcers, and Issues that run much.

Sometimes likewise, over-great quantity of blood doth hinder the nourishment of the seed, and of the Conception: for the seed is oppressed with so great plenty, and cannot exercise its formative faculty; which is wont to happen in full-bodied and ruddy women, such as live a jovial life, and delight in Feasting; whose wombs always are bedabbed with a continual moisture.

Now the ill disposition of the womans blood, may be known by the ill habit of her body, the colour of her Courses, and other strange dispositions, together with an ill Diet foregoing.

The disproportion of the Husband and the Wifes Seeds, is hardly known; but if both of them be of a very hot or a very cold constitution, we may conjecture, That the disproportion ariseth from those distempers, if other more manifest causes of Barrenness do not appear.

It is yet harder to discover that kind of Barrenness which depends of a certain hidden disposition, no manifest causes thereof appearing. Yet many experiments are related by Authors, whereby to know whether a woman be naturally barren; which though they carry no great certainty with them, yet are Physicians necessitated sometimes to make use of them, in favour of Princes and Nobles, who are permitted to divorce their Wives in case of Barrenness.

Hypocrates in Aphor. 59 Sect. 5. saith, *If a woman conceive not, and thou wouldst know whether she shall conceive or not, cover her with blankets, and burn some perfume under her, and if the smell proceed through her body up to her nostrils and mouth, know that she of her self is not barren.*

The same *Hypocrates* supposeth that it may be known whether a woman be fruitful or not, by putting a head of scraped and peeled garlick into her womb; for if the next day the smell shall come into her mouth, she is apt to conceive; if not, she is barren.

Or put *Galbanum* softned at the fire, and inclosed in silk, into the womans womb at night, and bind her whole head in perfumed Linnen; if in the morning the crown of her head shall smell of *Galbanum*, the woman is well purged, and will be fruitful.

You may try the same, If you put a little Balsom mingled with water, and received in Cotten, into the womb, binding it with a string to her Thigh; for if the womb do draw it inwards, it is a most approved sign of fruitfulness.

Amatus Lusitanus commends this following as a most true sign: He takes a dram of a Hares runnet, which dissolved in warm water, he gives the woman to drink, being in a Bath of hot water, and fasting. If the woman do then feel pains in her belly, he pronounceth her fruitful; if not, barren.

Many seek to know the barrenness of a woman by her urine, wherein they steep barley: which barley, if it grow within ten days, they count it a sign of fruitfulness; if not, they account it a certain token of barrenness.

And others (finally) do pour the womans water upon Bran or Fenugreek, and take it for a note of barrenness if worms breed there.

For a conclusion to these discoveries, we shall diligently consider and enquire, Whether Conception and Generation be not hindered by fault of the man, or any deficiency in him. For in such a case it were vainly done to torment the woman with a multitude of Medicines. Barrenness proceeding from the man, may be known by the diseases of his Genital parts, as inability to raise his Yard, want of Sperm, swelling of the Stones, Gonorrhæa, and the rest. And it gives some token hereof, if the man be faint-hearted and womanish by nature, if he want a beard, be slow in casting forth his Sperm, and his Sperm be cold, so that his Wife feel it cold in her Womb; if he have but little or no lusts to carnal imbracements, and perceive very little pleasure therein. And lastly, if such causes have preceded, which are of power to make the Seed unfruitful.

PROGNOSTICK.

The Prognostick must be regulated according to the method of the Causes, as we have ranked them.

And in the first place, tenderness of age hinders conception only for a time, which cannot be expected till the woman is more grown. But elderly years cause a total despair of Conception. But if the parties courses do as yet proceed in due season, there may be yet some hope of Conception; howbeit very small, especially in such women as are at the fortieth year of their age; for although women that have had children younger, are likewise wont to conceive at that age; yet such as have never been with child, have little reason to hope that they shall conceive at that age, because the Womb having been so long unmployed, is become withered, shrunken up, and unfit to Conceive with child.

Barrenness which is caused by an evil shape of the Members, as in such as are lame, have distorted thighs, or their Crupper-bone depressed, is incurable.

But if barrenness proceed from over-fatness, or some distemper of the womb not over old, the cure is to be hoped, by procuring leanness, and by correcting the Distempers.

That barrenness which is caused by other diseases, as by a Swelling, an Ulcer, obstruction, whites, want of the Courses, falling of the womb, Consumption, Leprous Manginess, Whores Pox, and such like, is easier or harder to cure, according as the said diseases are either easier to be cured, or hard.

CURE.

For the Cure of this disease, which soever of the causes aforesaid hath procured the same, we must seek the removal thereof.

And in the first place, the straitness of the Genital parts in regard of youngness of age, needs no cure; for as age encreases, they attain a convenient wideness: but in the mean time it is necessary that the party abstain from carnal conjunction: because the over-soon use thereof, doth spoil the natural constitution of those parts.

Barrenness which is caused by lowness of stature, or elderliness of years, is incurable; yet endeavour may be used to help the same, by emollient and relaxing Medicaments, provided the Courses do still flow.

Over-great Corpulency must be corrected by an extenuating diet, and convenient evacuations.

If barrenness seem to arise from a bad course of diet, as in persons given over-much to belly-cheer, to Wine, or small Drink, such women are to be reduced to an exact Course of Life; and all excess of Eating and drinking must be avoided.

Viragoes and strong constitution'd women, such as come near to the nature of Men, that they may be rendred fit for conception, must by all the art possible be effeminated, and reduced to such manners as become their sex; all meats of grosser nourishment being forbidden them, and all labours and exercises; their Courses being made conveniently to flow, by plenty whereof they may be abated of their manly courage, and grow soft and gentle. And if their monthly courses shall not suffice to that end, their Humors must be diminished by frequent Blood-letting and purging; and by frequent bathing and alterative remedies, the whole habit of their bodies must be moistened and cooled.

If Barrenness be caused by the closure of the womb, by distortion, by obstructions, by Tumors or Ulcers; all these must be remedied by such Medicaments as are propounded in those Chapters which treat of their respective Cures.

Barrenness depending upon an hidden property in the woman which is natural to her, is incurable, and therefore it ought diligently to be inquired after, lest remedies be applied in vain.

If Barrenness come by witchcraft, Charming, or hidden powder of Medicaments, there is little place for Physick; but the party must have recourse to prayers and supplication, which being zealously poured forth by men eminent in piety, do procure help from the Almighty.

Howbeit against Medicines which by a secret power do cause Barrenness, a certain Amulets are propounded by Authors, which have a peculiar vertue to resist the malignity of such Medicaments. Cardan will have it, that the Pizzel of a Wolf worn about a woman, will frustrate all such

Incantations

Incantations and Fascinations. Others do much commend the Adament and the Hyacinth Stone; The Ancients called Saint Johns-wort, the Devil-driver. The same vertue is likewise attributed to the Squil or Sea-Onion, to Eryngus, Sagapenum, Rue, and other things, being worn by Man and Wife. Also certain it is, that for the parties concerned, to endeavour confidently to despise and slight all Charms and Witchcrafts, is very profitable in this Case. Also (if the Author of the Witchcraft be not known) it is good for them to change their Habitation, and to forsake their Houses, Beds, wearing Cloaths, and other Household-stuff, wherein the Charms are oftentimes concealed.

If an hot distemper be the cause of Barrenness, the same Cure is to be used, which was described in the hot distemper of the Liver. But if the Excess of heat be yet more violent, recourse must be had to those things which have been described in our Chapter of Womb-fury. But the Camphire must be left out of those Medicines, because it is held to be a very great Enemy to fruitfulness.

Extream dryness hindering Conception, must be cured by a restorative Diet; and if the Consumption of the flesh be much, we must have recourse to the Cure of an Hectick Fever, viz. Use of Milk, frequent Bathing, and such like.

But the most frequent cause of Barrenness is a cold and moist distemper of the whole Body and of the Womb, which is often accompanied with the Whites, whose particular cure must be fetched from its proper Chapter. But the following Medicaments may be peculiarly applied to these distempers, which by a discreet Physician may be varied, so as to make them more heating or drying, according as moisture shall the more offend.

And in the first place flegmatick Humors abounding in the Body are to be evacuated by purging, Diuretick and Sudorifick Medicaments. And certain Revulsions are to be made, by Issues in the Arms, Neck, or Thighs. Also the principal parts are to be strengthened, with Treacle, Mithridate, Tablets, or Lozenges of Aromaticum Rosatum, Confection of Alkermes and such like. Also Purgations must be repeated at certain distances of time, if evil Humors do seem to abound.

Afterward we must proceed to such things, which do by a peculiar vertue or specifick property strengthen the Womb, help Conception, and procure desire of fleshly Imbracements, of which kind of Medicaments there are innumerable forms described by Authors. We shall in this place chuse out the principal and set before you.

And in the first place; An Electuary may thus be made.

Take Roots of Eryngus and Satyrion candied or preserved, of each one ounce; Green Ginger candied, half an ounce: Filbert Kernels, Pine-Kernels and Pistachio's of each six drams: one preserved Nutmeg; Seeds of Rocket and Water-Cresses of each two drams; Ashes of a Bulls Pizzle, the Reins of the Sea Scinkos, and shavings of Ivory, of each one dram; Confection of Alkermes three drams. The Powders Diambra and Diamoschu Dulce, of each one ounce and an half: Amber-Greece half a dram; with Syrup of preserved Citrons make an Electuary, of which let her take the quantity of a Chestnut, at her lying down to sleep, twice or thrice in a week, drinking a small draught of Canary-Sack or Hypocras, after it.

In the form of a Powder, the following Medicaments may be administred.

Take Seeds of Rocket, Siler Montanum, of each half a dram: shavings of Ivory, Cinnamon, Nutmegs, of each a dram, Musk (in such as can away with it) three grains; White Sanders three drams. Mix them and make of all a Powder. The Dose is one dram in Canary. Or,

Take Seeds of Rocket, wild Parsnep, Cinnamon, Powder of the Nutmeg, Electuary Diambra and Diamoschu, of each one dram: the Matrix of an Hare, a Bores stones, a Staggs Pizzle, Cloves, of each half a dram; Musk and Amber-greece, of each six grains, Sugar the weight of all the rest. Mingle them, make them into a Powder, whose Dose is two drams with rich Canary.

The Afterbirth of a woman is believed to be of great efficacy, being dried and powdered, and taken the quantity of a dram.

Some reckon as a secret the Powder of the Liver and Stones of a Boar Pig which the Sow his Mother farrowed alone without any Brothers or Sisters by him. This Powder they say cures Barrenness both in men and women.

Muthiolus in his Comments upon Dioscorides cries up the Seed of the Herb Amy, in these words; The seed of the true Amy, which is brought from Alexandria, does exceedingly help the Seed. For if it be drunk a drams weight in a morning in strong Wine, or in broath of flesh, being finely powdered, every other day three hours before Meat, it gives great hopes of Children. But the Man must have to do with his Wife only on those days in which she does not take the Seed.

In such women whose bowels are apt to be inflamed, the shavings of Ivory will be very good, taken to the quantity of a dram in Whitewine, four or five days together, after the monthly Purgation.

The Essence of Satyrion, described by *Crolius*, is most excellent in this case, if it be given from a scruple and two scruples, to a dram, in a Cup of Muscadine.

Salt of the said Satyrion is also very effectual, given to the quantity of ten grains in Muscadine after the Courses.

Divers Decoctions are wont to be made to the same intent. The most effectual are these which follow.

Take *Etinga* Roots one ounce; *Mugwort*, *Nep* of each a handful. Boyl them in Whitewine. Give in a Cup of the Decoction morning and Evening, with a dram of *Tryphera Magna*, made without *Opium*, nine days together.

Quercetanus highly commends this that followeth:

Take of the Stones of a Ram prepared with Wine and dried, the Matrix of an Hare prepared after the same manner and dried; Mace, Cinnamon, Cloves, with Ginger, seed of *Ameos*, of each two drams; Saffron a dram and an half; Hazel nut Kernels and Pistachios, of each three drams. Beat such of these as require beating, and boyl all in a quart of Muscadine till a third part be consumed. Let her take three or four ounces of this Decoction in a morning three hours before meat, and that three days together; and upon the fourth let her lie with her Husband.

The distilled Water following, is likewise very effectual.

Take of Cinnamon, Cloves, Nutmeg, Mace, of each an ounce: Cubebs, long Pepper, Galanga, Zedoary, Seeds of *Ameos*, Seseleos of each half an ounce: Juniper-Berries one dram: rich white-wine, Rosemary Water, Marjoram-water, Balm water of each as much as shall suffice. Let them digest together six days, and then distil them, and give of the still'd Water morning and evening two or three spoonfulls.

Pena and *Lobellius* propounded as a Secret not to be communicated to any living Creature, the distilled Oyl of the smaller and more delicate sort of sweet Marjoram, mingled with the Runnet of an Hare, and a little Musk, to facilitate Conception.

If a woman upon the fourth day of her monthly Purgations, shall drink about half a pint of the Juyc of Sage with a little Salt, and a quarter of an hour after submit her self to the Genial Embrace-ments of her Husband, many grave men affirm, she will undoubtedly conceive. With which Medicine, *Aetius* testifies that the Egyptian Women after a great mortality by Pestilence, had abundance of Children.

To the aforesaid internal Medicaments external Medicaments must be joyned. In the use whereof, it is diligently to be observed, that before we go about to dry, bind, corroborate the womb, that the filth contained in the Cavity thereof be first drawn away and purged, let it either flow back into the noble part of the Body, or be more affixed to the substance of the womb. First therefore such things must be given as purge the womb, after this manner compounded:

Take *Diaphenicon*, *Hiera Picra*, half an ounce: Turpentine and Honey of Mercury, of each one ounce: Castorium a dram; Mix all, and according to art bring them to such a constitution as shall be fit to make Pessaries, to be put into the womb.

Or, Take *Hiera Picra* half an ounce: Agarick trochiscated and powdered, Orris-Roots of Florence, of each one dram; old Mithridate and Diaphenicon, of each two drams. With Juyc of Mercury, make a Pessary. Rowl it in a cloth, put it up when she goes to bed, and let her keep it two or three hours.

If the womb be very full of Excrements, a more strong Pessary must be put in, after this following Injection.

Take Leaves of Wormwood, Mugwort, Mercury and Rue, of each one handful and an half: Pulp of *Coloquintida* ten grains: Agarick trochiscated half a dram; Ginger and Myrrh, of each a scruple. Boyl all in Water and Whitewine to a pint, wherein dissolve two bunces of Honey of Roses. Let three ounces of this Liquor be injected into the womb for three days together, in the morning, and when she goes to bed, after her courses have done. Then put up this following Pessary.

Take *Hiera Picra* and *Benedicta Laxativa*, of each an ounce: the pulp of *Coloquintida* and Agarick trochiscated, of each half a dram; Spicknard, Seeds of the Roman Nigella, *Sadiva* Leaves powdered, of each a dram; Incorporate them with Honey of Rosemary flowers, and include them in a piece of Silk. Make Pessaries hereof, and put one into her womb, when she is going to bed, and let it abide there two hours, and afterward wash the part with Whitewine.

To strengthen, fast, and dry the Womb, these following Medicaments may be used:

Take Roots of round Birchwort half an ounce: Lignum Aloe three drams; Cyprus Nuts and Roots, of each two drams; Calamus Aromaticus a dram; Dictamnus Creticus, Winter Savory, and Myrrh, of each one handful; choyce Myrrh, Storax and Benjamin, of each two drams and an half; Stoechados, Rosemary-flowers and Marjoram, of each one pugil; Boyl all

all in a sufficient quantity of strong Whitewine. In a pint and an half of the strained Liquor dissolve two drams of Troches of Alipta Moschata, Amber greece, and Musk, of each seven grains: Civer five grains. Make hereof an Injection into the Womb warm, morning and night, for certain days together.

Before or after the Injection, this following Fumigation may be used:

Take Troches of Gallia and Alipta Moschata, of each two drams, Storax Benjamin, and pure Laudanum, of each half an ounce, Lignum Aloes and Lignum Rhodium of each one dram; Nigella Seeds, Cubebs and Cloves, of each four scruples; Amber and Tacamahacca, of each one dram and an half: Mace half a dram. Make of all a Powder, of which with Orange-flower water, wherein Gum Tragacanth is dissolved, make little Cakes of Troches: of which, let one or two be laid upon burning coals, and let the smoak be received by a Funnel into the Patients Womb.

The poorer sort may be smoaked with Myrrh, Frankincense, Lignum Aloes, Storax, Benjamin, Cinnamon and Cloves, of each a like quantity. After the Injection and Fumigation, let the following Pessary be put up.

Take Frankincense, Mastich, of each two drams: Troches of Gallia and Alipta Moschata, of each four scruples: Bistort Roots, Cypress nuts, Shavings of Ivory, and red Roses, of each one dram: Styra, Benjamin and Laudanum, of each two scruples; Calamus Aromaticus, and Cypress Roots, of each half a dram. Make them into a Past With Orange-flower Water; then with thin linnen cloth, make two Pessaries of sufficient greatness; one of which put up when she goes to bed, anointing the top thereof with a little Oyl of Nutmegs and Civer mingled together.

It is furthermore related of Garden-Garlick, That if it be beaten with Oyl of Spike, and thrust into a piece of Linnen made like a Pudding-bag, and so put up far within the Womb, that it powerfully brings down the Courses being stopt, and wonderfully delights the womb, and purgeth it; so that hereby many have been brought to conceive Children, who for a long time have been past all hope of ever having any.

Before the strengthening Injections and Fumigation, a Bath to sit in may be used for an hour together, before the Patient goes to bed; and it may be thus prepared.

Take Roots of Briony, Master-wort, Valerian, Orris, Enula Campana, of each three ounces; Leaves of Marjoram, Mugwort, Nep, Peniroyal, Mercury, Sage, Bay, of each four handfuls: Bay-berries and Juniper-berries, of each an ounce: Boyl all, and make thereof a Bath for the Patient to sit in.

As for total Baths, such as arise from Brimstony and Bituminous Mines, are most excellent; and very many women in this Condition, do flock unto such baths as to a Sanctuary.

After bathing and Fumigation, the Share, and the space between the Privities and Fundament, must be anointed with this following Oyntment:

Take Oleum Nardinum and Moschatellinum, of each an ounce and an half: Oleum Cheirinum half an ounce; Powders Diambre and Diamoschu, of each one dram and an half; Liquid Storax one dram; Civer ten grains; Musk, Amber-greece, of each six grains; a little white Wax. Mix all, and make them into an Oyntment; Wherewith let the parts aforesaid be anointed. Within let her be anointed with Civer, or Indian natural balsom. Or let the Man smear his Yard with Civer immediately before he joyn himself.

Finally, Let Plaisters be applied to the Share and to the Loins, which let her wear continually; or at least every night, until the last week, in which her Courses are wont to flow. Let them be made after this manner.

Take of the Rowl of Emplastrum pro Matrice four ounces; of the Rowl of Emplastrum de Mastich two ounces; Tacamahacca and Caranna, of each one ounce; Powder of Tormentil and Bistort Roots, of each three ounces; Powder of Mirtle two drams; Powder of Aromaticum Rosatum four scruples; Soften them with Oyl of Quinces, adding thereto a dram of Oyl of Nutmegs, Spread it upon Leather, and shape two Plaisters, the one round to be applied to the Share; the other square for the Loyns of the Patient.

Chap. 16. Of Acute and Chronical Diseases of Women with Child.

THe Acute and Chronical Diseases of women with Child are the same in Essence or Nature, and have the same signs, with the like Diseases in women not with Child, or in men; whereof it is needless in this place to speculate thereupon, let the Reader please to look for them in their proper Chapters.

But

PROGNOSTICK. But the Prognostick of these Diseases is not the same; because in women with Child they are far more dangerous, and very oftentimes mortal. So saith *Hypocrates* in Aphor. 13. Sect. 5. For a Woman with Child to be seized by an acute Disease is deadly. For if the Disease have a Fever joyned with it, there is a two-fold danger attending the same (as *Galen* shews in his Commentary upon this Aphorism) one from the Fever, which will kill the Child; another from the slender Diet which is requisite to the Cure of the Fever, but it is not sufficient to nourish the Infant in the Womb. Or if it be an acute Disease without a Fever, as the Falling-sickness, Apoplexy, Universal Convulsion of the whole Body, the Mother and Infant cannot withstand the violence of the disease, neither can they bear such strong Medicines as are requisite to the Cure of those diseases: Yet we must know that this Prognostick is not perpetually true. For we know by the Testimonies and Examples in Authors, and by daily Experience, That many women with Child having acute diseases, escape with their lives.

But Chronical or lingering diseases, as Intermittent Agues, Catarrhs, Tenasmus, &c. do threaten Abortion; and if they cause it not, they can hardly be cured before the women be brought to bed, but do keep her company till she lie down.

Diseases Acute and Chronical in the first and last months, are more dangerous, than in the intermediate months. For in the first months, the bands wherewith the Infant is fastened to the Womb are weak, so they may easily be broken, and the tender Infant is more easily over-pressed with those preternatural Causes. But in the last months, Namely, the sixth, seventh and eighth, the Child being grown greater, requires much nourishment, which in these Diseases it is deprived of. Also the foresaid bands do not stick so fast as in the third, fourth and fifth months, in which there is less danger of Abortion. Therefore *Galen* doth excellently compare the Child in the womb to Fruits hanging on a Tree, which upon their first growing out have very tender stalks, so that they may be easily shaken off with the wind, or any other violent commotion; and when they are near ripe, they hang not so fast upon the bough, as in the intermediate spaces they did.

CURE. Likewise the Cure of the aforesaid diseases in women with Child doth remarkably differ, as touching their Diet, and those two grand Remedies, Blood-letting and Purging; whereunto we may add Medicaments which evacuate by other ways, viz. Such as move the Courses, Piss. drivers and Sweat-drivers, because it is feared lest by these evacuations, abortion may be caused: of these therefore we shall only treat at present, referring what else belongs to the cure of these Diseases to the proper Chapters, where such respective diseases are handled.

As for matter of Diet, it is not for women with Child in Acute diseases to be enjoined too spare, lest the little Infant be famished; neither is it to be allowed so liberal, that the Fever should be thereby strengthened; but we must steer a middle course with this Caution, That in the first months of their Belly-burden, a thin Diet be enjoined, and in the latter somewhat more solid and plentiful, because the Child doth then stand in need of more nourishment. Yet if there must needs be some error in Diet, it is better to err in keeping too full, than too slender a diet; for recovery is chiefly to be expected from the strength of the Mother and the Child.

Touching Bleeding, that Aphorism of *Hypocrates*, viz. the 13. of Sect. 5. is presently brought in opposition, where he says, *If a Woman with Child be let blood, she miscarries, especially if the Child be grown.* And *Galen* renders the reason in his Comment, because the Blood being let out, the Infant wants its nourishment, whence follows Abortion. On the other side, daily Experience shews, That in very many diseases of big-bellied women, especially acute diseases, as the Pleurisie, Inflammation of the Lungs, continual Fevers, and such like, blood-letting is necessary, and may be administred, not only in the first, but also in the middle months, and sometimes in the last months of a womans Belly-bearing. Which if it be omitted, both Mother and Child are in great danger of death. And to this latter Opinion the Elder Physitians assent, not dissenting from the taine of *Galen* and *Hypocrates*, by so doing. For therefore it is they held a woman would miscarry, if being with Child, she were let blood, because blood being taken away, the Child would want its nourishment. So that if blood may so be taken away, as that the Infant shall not want its Nourishment, there will be no danger of Abortion thereby.

Now so the case may stand: As first, In the first months of a Womans Belly-bearing, while the Infant in the womb is little, and wants but little Nourishment, for then its Nourishments by bleeding will not be drawn away, especially if certain signs of superfluity of blood be apparent in the mother. So that from the first month to the fifth, Blood-letting may be safely practised. But in the middle and last months, greater circumspection is to be used, because the Child being greater, and wanting more Nourishment, cannot so safely admit of Phlebotomy. Howbeit if the Woman abound with Blood, and a small quantity be taken away, she may safely be let blood, because hereby the Diseases will be allayed; neither will so much Nutrimient be thereby withdrawn from the Child, as to cause Abortion. But if it seem that *Hypocrates* thought otherwise, let us consider that we let blood after a far other fashion than the Antients did; they let blood by pounds, and we by ounces. The very truth is, there

is no better way to preserve women from Abortion, than by Blood-letting when it springs from over-much blood strangling the Infant, and overwhelming the same, in such women as have been accustomed out of their time of being with child to have a plentiful flux of Courfes for divers days together. Thus *Petrus Salius Diversus* in his 22. Chapter of his Book of particular Diseases: *I for my part protest* (quoth he) *that I have preserved many women from Abortion, which they had often suffered, only by letting them blood in the first months of their being big.* Neither would I have it thought, that no other kind of Blood-letting may be practised in childing women, save that which is sparing or moderate. For sometimes plentiful bleeding in the last month hath done very much good. And I have sometimes experienced this plentiful Blood-letting in the last month, when the women with Child were afflicted with a burning Fever, and were full of blood, hoping thereby an abatement of the Fevers, and an hastening of the Birth, both which I obtained by Blood-letting, and saved both Child and Mother in danger of death, by this only Remedy. Which being in some Patients omitted, and neglected by Physicians, minding more the words of *Hypocrates*, than the matter it self, hath been the cause that both Child and Mother hath miserably perished, being strangled by the plenty and fervency of blood. So far *Salius Amatus Lusitanus*, in his 57. Cure of his 1 Section, let a woman with Child of eighteen years of Age Blood in the sixth month four times with happy success, she being in a burning Fever. And *Rodericus a Castro* in his third Book of Womens Diseases, Chap. 21 writes, that he let a woman of Lisbon blood, who had a Pleurisie in the eighth month, and was given over for desperate by other Physicians, four times and no less, one after another, and she recovered, and had a healthy Boy. And to conclude, If I may freely relate somewhat from mine own Experience, I will set down the following History, which is a rare one, and worthy to be regarded. The wife of John Vicules, Citizen of Montpellier, had three Miscarriages one after another at several times of her being with Child: When she was the fourth time with Child, about the end of the second month, she was taken with the same pains of her Belly and Loins, which had been the usual fore-runners of her former Miscarriages. I being called to her, and considering she was a Sanguine woman, and full of blood, presently caused four ounces of Blood to be taken from her; and within half an hour the aforesaid pains quite ceased, and the woman was so well that she would not use those other Medicines which I prescribed for her to prevent Abortion. Now these Symptoms appeared in the self-same time, wherein she was wont to have her courses, when she was not with Child. Again in the third month of her being with Child, at the same period of time, the same Symptoms return upon her: She sending for me, desires I would order her to be let blood, seeing the month preceding she had found so sudden help thereby. I consent, and she is again let blood, with like good success as before. In like manner in her fourth, fifth, sixth, seventh and eighth months, the same Symptoms returning, in their just distances of time, she was again let Blood and presently recovered. The last of her bleedings was but eight days before the beginning of her ninth month, with like profit as before; and about the end of the ninth month the said woman brought forth a live Male-child, and lusty.

Yet I would not have a young Physician moved with these examples, be too bold in letting women blood in their last months of being with Child. But the Nature of the Diseases and of the women must be diligently considered, that Medicaments may be conveniently suited thereunto. Always remember that sins of omission are lighter than sins of commission, and that it is better in a doubtful case to fall short, than to outpass the due and fitting bounds. Yet when he finds the evident indications of Blood-letting, let him boldly draw Blood, first informing the by-standers or friends of the sick there is more danger of Abortion, and of the death of Infant and Mother, from the Cruelty of the Disease, than from Blood-letting: and always remembring that but little blood be taken away, that the Child may not miss of its nourishment. And if plenty of blood require a larger quantity to be taken away, let it be done at divers times, and not all at once.

Wherefore the foresaid Aphorism of *Hypocrates* does not absolutely forbid the opening of a Vein, but only warns that Physicians be wary what they do in that kind. Which is elegantly delivered by *Cornelius Celsus* in the 10. Chapter of his 2 Book, in these words. *The Antients did judge that young and old people could not bear Blood-letting. And they perswade themselves that a woman with Child let Blood would miscarry. But experience hath since taught us, that these are no general Rules, and there are other considerations of more weight, which the practitioners are to regard. For it matters not of what Age the Patient is, nor what she hath in her Body, but what her strength is. So that if a young man be weak, or a woman not with Child be weak, Blood is ill taken from them, for the remaining strength dies, and they perish. But a strong Child, and a strong old woman, and a woman with Child that is lusty, are safely cured by bleeding. So far Celsus.* Some latter Physicians have dared to open the lower Veins in Women with Child, to Cure the Falling-sickness by consent of the womb, the Venereal and Pestilential Bubo, yea, and to prevent Abortion, as we may see in *Zacutus Lusitanus* in his Book of wonderful Cures Obser. 23. Book 1. and Obser. 130. and 151. of Book 2. Who by his own and other mens experiments

experiments endeavours to prove, that such Blood-letting may be safely practised. Which I leave to prudent Physicians to consider of.

We said about the beginning of this Chapter, that there is no difference in Curing the Diseases of women with child, saving with respect to the greater remedies; which differences must be in them thus determined, *viz.* That the diseases which hold women not with Child, as vomiting, want of Appetite and the like; in them being not with Child, they are to be Cured rather by vomiting than by Blood-letting, because they come from evil humors abounding in the stomach and the whole Body; but in women with Child, they need rather Blood-letting, because they spring from Blood retained in the very beginning of their being with Child. And experience hath taught that the vomiting which is wont often to trouble women with Child, is in the first months of Childing exasperated by purges, but by bleeding much abated, yea and wholly taken away, if the Blood-letting be iterated every month till the Symptom cease.

The use of Purging in women with Child *Hypocrates* hath defined in Aphor. 1. Sect. 4. women with Child (saith he) are to be purged, if the humor offending do work in the fourth month, and to the seventh. But these about the seventh less. And we must take heed what we do when the Child is very young, or old. *Galen* in his Comment says that there is the same proportion between a Child in the womb and fruit upon the Tree. For fruit when it first grows upon the bough, it is held by a very tender stalk, and therefore quickly falls, being shaken by a vehement wind. Afterwards when they are grown greater, they are not easily separated from the boughs. And yet when they are fully ripe they fall off of their own accord. In the same manner women suffer abortion in the first and last months, because in them the Child is not so fast tied to the womb. But in this age of ours, purges are wont to be given to women with Child in all the months (very near) of their being with Child, in Diseases springing from the tyranny of humors and Excrements vitiated, when the matter is in motion and work, or when it is concocted: so often as there is more danger feared from the evil Humor causing the Disease, than from the commotion raised by the purging Medicaments. Gentle and harmless Medicaments have made Physicians bolder in this kind, such I mean as we use at this day, as Rhubarb, Myrobalans, Cassia, Manna, Senna, Agarick and the like. But we must always remember that saying of *Hypocrates*; and we must more freely give purges in the middle months, and more warily in the first and last. Also the use of Pills is evermore suspected in women with Child; both because they make a greater commotion in the Body, and also by reason of the Aloes, which by reason of their extream bitterness is an enemy to the Child and is thought to open the mouths of the Veins. But if sometimes the use thereof seems necessary, in some grievous infirmities of the stomach, which are wont frequently to infect women with Child the first months of their being with Child, let it be carefully washed with Rose-water, that the Acrimony thereof may be taken away; or let it be mixed with strengthening and astringent things, as Rhubarb, Mastich, and such like.

Clysters are not very safe, because by compressing the Womb they may cause abortion. So that when there is need of them, and in women accustomed to that kind of evacuation, they must be made in less quantity, and of such things as are rather mollifying and lenifying, than much purging.

In a word, touching Sweat-drivers, Piss-drivers, and such things as move the Courses, our Opinion is, That Movers of the Courses properly so called are never to be used in women with Child. And Piss-drivers because they likewise are apt to bring down the Courses, ought to be suspected; and if the necessity of some Disease require the use of them, the gentler must be made choice of. And finally Sweat-drivers may be safely given, because they drive the Humors out by the Habit of the Body, whereby no danger of abortion is incurred, inasmuch that women in the middle of their being with Child, have been cured of the Whores Pox, without harm to their Child.

Chap. 17. Of Abortion or Miscarriage.

ABortion or Miscarriage is the bringing forth of an imperfect or unripe Child. And consequently a child dead in the womb is not counted an Abortion till it be excluded. So that whether a live or dead Child be brought forth, not being ripe, nor having attained to the just term of growth which it ought to have had in the womb, it is to be termed an Abortion, or Miscarried Child.

CAUSES. The Causes of Abortion are some Internal, some External. The Internal may be reduced to four heads, *viz.* to the Humors, to the Child, to the Womb, and to the Mothers Diseases.

The Humors may cause Abortion while they offend in quantity or in quality.

They offend in quantity either by way of excess or of Defect.

Humors offending by way of excess, are seen in a Plethorick or over-full Constitution of Body; for Blood being more plentiful than is requisite to nourish the Infant in the womb, flows into the Veins of the womb, and is excluded by way of the monthly Courses, and brings away the Child with it.

Defect

Defect of Humors fitting to Nourish, springs from such Causes which are able to draw the Nourishment from the Child, as fasting, whether voluntary or forced; as when women with child lothe all kind of Meat, or vomit it up again; a thin diet in acute diseases, immoderate bleeding by the Nose, Hemorrhoids, Womb, or by immoderate Phlebotomy. Whereupon *Hypocrates* in *Aphor.* 34. *Sect.* 5. If a woman with child go very much to stool, it is to be feared that she will Miscarry. Hereunto may be referred extream leanness of the whole body, wherein there is not blood enough to nourish the Infant. Of which, *Hypocrates* in *Aphor.* 54. *Sect.* 5. speaks thus, *Women with child being very lean, not by Nature, but accident, as famine, long-sickness, &c. they Miscarry, until they get their flesh again.*

In respect of the Child, Abortion may happen, if it be over great, so that it cannot by reason of its bulk be contained in the womb; hence it falls often out that little Women miscarry, especially if they be married to men bigger than ordinary, whose Children grow very great, and find not in the Womb place large enough to contain them, till they come to their perfect growth. Which made *Hypocrates* say in his Book of Superfoetation, *If any Woman conceive frequently, and do duly and at a certain period of time Miscarry, as in her second, third or fourth month, or latter; the narrowness of her Womb is in fault, which is not able to contain the Child as it grows great.* Also plurality of Children may cause Abortion, as when two or three or more are contained in the womb at one time; for then the Womb over loaden excludes the Children before the fit time: which is the cause that Women often miscarry of Twins. Also the dead Child is to be reckoned among the causes of Abortion; for as soon as the Child is dead, Nature doth forthwith fet her self to cast it forth.

Abortion happens in respect of the Womb it self, if it be not of largeness and capacity enough sufficiently to widen it self according as the Child grows, as was shewed above out of *Hypocrates*. As also if there be any thing preternatural in the womb, as an Inflammation, a Schirrhous Tumor, an Imposthume, and very many diseases besides. And finally if the womb be over moist and slack, that it cannot contain the Child so well as it ought to do.

In respect of the Mothers Diseases, Abortion comes two ways. First of all, when her diseases are communicated to the Child, whereby it is killed, or so weakened that it cannot receive due nourishment nor growth; such are continual and intermitting fevers, the Whores Pox, and many such like. Secondly, when the said diseases of the Mother do cause great evacuations or great commotions of the Body, large bleedings, from what part of the Body soever, fluxes of the Belly, grievous swoonings, Falling-sickness, Vomiting and *Tenasmus* [that is perpetual going to stool, and voiding nothing but a little slime] which above all other Diseases is wont to cause Abortion, because by that frequent and almost continual endeavour of going to stool, which perpetually attends this disease, the Muscles of the Belly are perpetually contracted, and do more compress the womb than the streight Gut upon which the womb rests; which continual compression or squeezing of the womb, doth at last cause Abortion.

External Causes which further Abortion, do some of them kill the Child, others draw away its nourishment, and others dissolve those bands wherewith the Child is fastened to the womb.

The Child is killed by grievous commotions of mind, as Anger, Sadness, Terror, &c. Meats earnestly longed for and not obtained, strong purging Medicaments, such things as provoke the Courses, such things as drive forth the Child; such things as are reckoned by a secret property to destroy the child in the womb: abominable smells, especially the stink of a Candle ill put out.

The child is deprived of its nourishment, by the Mothers being famished, and by immoderate loss of her Blood, especially when the child is big: As *Hypocrates* teaches in *Aphorism* 60. *Sect.* 5.

The bands which fasten the child to the womb are loosed by vehement exercise, Dancing, Running, Riding or Jolting in a Coach or Cart: carrying of an heavy weight, or lifting it from the ground, a violent fall and squelch, a blow upon the Belly that mauls the child, vehement motion of the belly by Coughing, Vomiting, Looseness, Neezing, Convulsions, crying out, immoderate or over wanton venereal Embraces. And in a word, vehement motion of the Arms, by drawing somewhat violently to a body, by turning a wheel, or doing some such work, may exceedingly further Abortion or Miscarriage.

SIGNS. The Signs of present Abortion are manifest of themselves. But such as go before Abortion and Prognosticate the same, are these: An unusual heaviness of the Loins and Hips, a lothness to stir, Appetite gone, shivering and shaking coming by fits, pain of the Head, especially about the Roots of the Eyes: a straitning of the sides, and of the belly above the Navil: the flagging or falling, and extenuation of the Dugs, which made *Hypocrates* to say in *Aphor.* 37. *Sect.* 5. *If the Dugs of a woman with child so suddenly grow small, that woman will miscarry.* For extenuation of a womans dugs in such a case, doth signifie want of blood in those veins which are common to the womb and the dugs, by means of which defect the child is in danger to Miscarry. But if abortion shall

be caused by some external efficient, causing violent agitation of the Child in the womb, and a bursting of the Vessels, with a pain raised in those parts; the Spirits and Blood run speedily to the genital parts, of which the Dugs being destitute, grow smaller than they were. Furthermore, Plenty of Milk dropping from the Dugs doth argue a weak Child, and consequently portends Abortion; according to *Hypocrates* in Aphor. 52 Sect. 5. But if frequent pains, and almost continual, do torment the Reins and Loins, reaching towards the Share as far as *Os Sacrum*, with a certain endeavor of going out of the womb, it is a certain sign of a woman that she will shortly miscarry. For those parts do signify that the Membranes and Ligaments wherewith the Child is fastened to the womb is stretched and torn in sunder. And if so be that pure Blood, or such as is wheyish, or water flowing from the womb, do follow the aforesaid pains and endeavors of coming out; it shews that Abortion is hard at hand, and that the Vessels and Membranes of the womb are broken, and the mouth of the womb open. At the same time, the Situation or posture of the Child is changed; for whereas it lay high, and possessed the middle of the Woman's Belly like a Sugar-loaf bearing out; it is now gathered round like a Foot-ball, and rolled down towards the Water-gate. Also oftentimes there follow grievous Symptoms, as Shiverings, Tremblings, Palpitations of the Heart, Swoonings and abundant Bleeding.

Hereunto may be added what *Hypocrates* teacheth us in the Second Book of Popular Sickneses, Text 17. That if after violent external Causes, such as are a blow, a fall and such like, vehement pain, and perturbation arise in a Woman with Child, she suddenly (or at most the same day) Miscarries; but if the external cause were weak, the Abortion may be deferred till the third day, which being once over, there is no longer danger of Abortion, because such wounds and hurts are wont to grow well again upon the third, or at most the fourth day, or very much to be mitigated and asswaged; whereupon the Child is again confirmed in the womb and retained. Which precept is of great moment in the Practice of Physick, that Women with Child being hurt by some external accident, should keep their bed for three days or longer, and use such Remedies as prevent Abortion.

PROGNOSTICK. The Prognostick of Abortion may be divers, after this manner:

Women are more endangered by abortion, than by due and timely Child-birth, because it is more violent, and unseasonable; for as in ripe Fruit, the Stalks are loosed from the Boughs, and the Fruit falls of it self; so in a Natural Birth, the Vessels and Ligaments wherewith the Child is tied to the womb, are loosed and untied as it were of their own accord, which in case of Abortion must needs be violently broken asunder.

Very many women become Barren by their Miscarriages, by reason of those exceeding rendings and tearings which do wholly overthrow the dispositions of the womb.

Much bleeding accompanied with fainting, raving and Convulsions, is wont to cause death; and *Aretæus* testifies he never saw any escape who in the time of their abortion, or afterwards, had Convulsions-fits.

Inflammation of the womb caused by abortion, is for the most part deadly; for Blood flowing to the womb in great quantity, is not purged out, but putrifies therein, and regurgitates or flows back into the upper parts; whence arise burning Fevers, pantings of the heart, Heart-burning, and other Symptoms enumerated before.

Abortion is more dangerous in a woman that never bore Child before, because being unaccustomed to Pains, and having those Passages more strait, she is longer and more vehemently tormented.

Women very lean or very fat, are endangered by Miscarriage; the former, because of their weakness; the latter because of the narrowness of those Passages by which the Child must come forth.

Abortion is more dangerous in the sixth, seventh and eighth months, because the Child being the greater is excluded with the more pain and difficulty.

Women which have a more loose and moist womb than ordinary, do Miscarry commonly without danger, especially in the first month; because those parts in such women, do easily give away, whence their pain and trouble is the less.

Hypocrates in the second Book of Popular Sickneses, affirms, That to Miscarry of a Male Conception of three score days old, helps a woman whose Courses are stopped: By stopping of Courses, he understands only their immutation, when women are not sufficiently, or conveniently purged at their monthly seasons; for by such an abortion or Miscarriage as aforesaid, those stopped passages are opened, and the Blood is drawn towards the womb, which came thither but slowly in former times. Our ordinary women seem to have taken notice of the truth of this saying of *Hypocrates*, who touching an abortion of a few months, are wont to say by way of Proverb, *A Miscarrying woman is half with Child again.*

CURE.

The cure of abortion consists in Preservation, for that which is past cannot be helped. But all the Symptoms which follow abortion, are the same which accompany women duly brought to bed.

The

The Preservation from Abortion hath two principal Points or Heads: The one concerns the woman before she be with Child: The other when she is with child.

Before the woman is with child, all evil dispositions of body which are wont to cause abortion, must be removed: as fulness of blood, badness, of Humors, and peculiar Diseases of the womb, viz. Distempers, Swellings, Ulcers and such like.

Fulness of Blood opens the Veins of the womb, or strangles the Infant while it is in the womb, This if it be a pure and simple plenitude, may be cured by Blood letting, such as shall answer the quantity of blood super-abounding.

But badness of Humors is either cholerick and sharp, so as to open the Orifices of the Veins, or by provoking nature to stir up the expulsive faculty, whereby the child comes to be expelled with those evil Humors; or by reason of plenty of Excrements heaped together in the first Region, and distending the belly, it suffocates the Child; or it vitiates the blood in the whole habit of the Body, rendring it unfit to nourish the Child; or it fills the vessels of the womb which retained the child, full of slime and snot.

This Badness of Humors may likewise be holpen by blood-letting, but it must be in a lesser quantity, seeing the principal scope of the cure, is by frequent purgations, to take away the superfluous Excrements of the Body. And in the spaces between Purge and Purge, such things must be used, as help the distemper of the Bowels, mitigate the sharpness of Humors if there be any, or thicken the said Humors, in case they be too thin. Or if flegmatick Humors are too rise, they must be dissolved by Sweat-drivers, Piss-drivers, and other Remedies. Howbeit we must diligently observe, that whatever ill humor abounds, Issues are wonderful profitable to prevent abortion: of which *Zacutus Lusitanus* gives a special note, in these words: *By most happy Experiments I have observed, That frequent abortion caused by corrupted Humors which flow from the whole Body to the Womb, and by their evil disposition or abundance do kill the Child, is hereby as by a most present help prevented: Many women did Miscarry upon this very account, among which some having oftentimes brought forth a Child of seven months or four months growth, but torn and putrified, could by no other means be freed from so great a Calamity, save by Issues made in their Arms and Thighs, which were always made at the beginning of the fluxion; by which means they went out their time, and brought forth Children healthy, and not defiled with any Infection.*

The peculiar Diseases of the womb, as great Moisture, Swellings, Ulcers, and such like, must be cured by their proper Remedies described in the Chapters which treat of them.

In women with Child, if the same Causes be present as in other women, the difficulty is yet greater, because big-bellied women cannot so easily bear all kind of Remedies. Yet, lest being destitute of all help, they should remain in extream danger of Miscarriage and Death, some kind of Remedies are to be used.

In case thereof the Patient be too full of blood, she must have a vein opened, though with child, especially in the first month; and that the second and third time, if need be. Always remembering that there never be much blood taken away at a time. Of which kind of bleeding we have discoursed more at large, in the foregoing Cure.

And when there is an abundance of some very bad Humors, gentle Purgations must be reiterated, especially in the middle months of a womans being with Child. And if a moist, Rheumatick, Snotty, or windy distemper do annoy the Patient, we may sometimes proceed to a Sudorifick Diet, at least a gentle one, in the stronger sort of women.

Mean while, in the whole course of being with Child, astringent and strengthening Medicaments, are to be used, such as have a vertue to hinder abortion. Many of which have been described in our Chapter of immoderate flux of the Courses; whereunto these following may profitably be added.

Take of Kermes-berries and Tormētil Roots, of each three drams: Mastich one dram and an half. Make all into a Powder, of which give the Patient half a dram at certain distances of time, or as much as may be taken upon the point of a Knife. Or,

Take of red Coral two drams: Kermes-berries, Date Stones, of each one dram: Shavings of Ivory half a dram: Pearls not bored through, a scruple. Make of all a Powder.

And let her swallow every day certain grains of Mastich in the morning.

Our ordinary women do frequently use Plantane Seed, which they take in the morning about the quantity of half a dram, with Wine and Water, or in an Egg, or Broth, or by its self, almost every day, the whole time of their being with Child, and that not in vain.

To the same purpose very effectual Electuaries are compounded, according to this following Example.

Take Conserve of Roses two ounces: Citron-peels candied six drams: Myrobalans candied, pulp of Dates, of each half an ounce: Coral prepared, Pearls prepared and Shavings of Ivory, of each a dram; with Syrup of Quinces, make all into an Opiate, of which let the Patient take often the quantity of a Chesnut.

If a Liquid form shall be more desired, a Decoction of Tormentil-Roots, sweetned with Conserve of Roles, may profitably be given.

The following Lozenges are very good; for they strengthen, and do by little and little free the Body from Excrements, though sometimes they do not visibly purge.

Take Mace, the three sorts of Sanders, Rhubarb, Senna, Corals, Pearls, of each a scruple: Sugar dissolved in Rose water, four ounces. Make all into Lozenges, weighing three drams a piece. Let her take once or twice a week by it self, or dissolved in a little Broth.

Outwardly Oyntment and Plaisters are to be applied, made after this manner.

Take Ship-pitch half an ounce; Frankincense an ounce; Mastich half an ounce; Dragons Blood and red Roses, of each two drams. Make all into a Cerate or Plaister. Or,

Take Oyl of Mirtles and Mastich, of each one ounce; red Sanders and yellow, Hypocistis, Acacia, of each half an ounce: Spodium, red Roses, of each two drams, Bole-Armenick, Terra Sigillata, Shavings of Ivory, of each two scruples; Turpentine washed in Plantane Water an ounce; Wax as much as shall suffice. Make all into a Cerate or a plaister, spread it upon a Cloth, and apply it to the Reins.

Plaisters compounded of the Mass of *Emplastrum pro Matrice*, and *Emplastrum contra Rupturam*, are to be applied to the Region of the Share, and of the Loyns. Or after this manner following.

Take of the Mass or Rowl of *Emplastrum pro Matrice* three ounces, Bisfort Roots, Acacia, Hypocistis, Pomegranate peels, of each half an ounce; Laudanum six drams. Moistens and soften them with Juice of Quinces, and make a Rowl of Plaister for the use aforesaid.

Concerning plaisters it is observed, That they must not be worn long together, but taken off ever and anon; otherwise, if they stick too long upon the Back, they do so heat the Kidneys, that the poor Women are sometimes troubled with sharpness of Urine, or do sometimes piss Sand, Stones, yea, and Blood it self.

Neither must we omit such things which are accounted by a secret property of their Nature to retain a Child in the womb; as an Eagle-stone worn about the Neck, a Load-stone applied to the Navil, Corals, Jaspers, Smaragds, Bones found in the hearts of Stags, and such like, worn under the Arm-pits, or hanged about the Neck.

Zacutus Lusitanus in Obs. 152. of the second Book of wonderful Cures, commends a Girdle made of the Hide of a Sea-horse; and if that be not to be had, he saith a Wolfs Skin may profitably be used instead thereof.

And that the success of these Medicaments may be happy, the patient must be enjoined to rest and keep her self as quiet as possible she can, both in her Body and Mind; also to abstain from Genial Embracements, which do vehemently towze and disquiet the womb. For while the womb opens it self to comprehend the Mans Sperm, with which it is exceedingly delighted, it drives forwards the lately conceived Child, not yet thoroughly fastened in the womb.

But if notwithstanding the Medicines aforesaid, by reason of the vehemency of the Cause, whether it be internal or external, the Patient be ready to Miscarry, we must apply our selves to do the best we can, with these following Remedies. And in the first place, so soon as pains and throws shall be perceived in the lower parts of the patients Belly toward her Share, in her Loyns, and about the *Os sacrum*, we must seek to allay and stop them, both by things given in, and outwardly applied, according to the variety of Causes. For if abortion be provoked by Crudities and Winds (which is most usual when it begins from an internal Cause) a Powder must be given, compounded of *Aromaticum Rosatum*, and Coriander seeds: Yea, we may give of the *Aqua Imperialis*, if the quantity of flegm and wind be very great.

At the same time let Carminative, or Fart-forcing Medicaments be applied below the patients Navil: such are bags of Annis-seed, Fennel-seed, Fenugreek-seed, Flowers of Chamomel, Elder, Rosemary and Stoechados mingled together; Or a Rose-cake fried in a Pan with rich Canary, and sprinkled with Powder of Nutmeg and Coriander, or the Caul of a Wether newly killed, or his Lungs laid on warm.

If with these means the pains cease not, let a Clyster be cast in made of Wine and Oyl, wherein two drams of *Philonium Romanum* may be dissolved, or Narcoticks may be given inwardly in a smaller Dose to allay the violence of Humors and Winds, as we are wont to do in pains of the Cholick.

But if by reason of contumacious pains that will not be asswaged, or of the violence of some external cause, blood begin to come away, Reveling Medicines are to be applied, to withdraw the course of the blood from the womb: such are, rubbing of the upper parts, and painful bindings; also Cupping-glasses fastened to the Shoulder-blades, under the Dugs, and under the short Ribs on both sides. Yea, and if the woman be full of Blood, it will not be amiss to take some blood from her, both when she begins to void blood, and especially before it begins to come; and the blood must be taken away at several times, a little at once.

And

And if all this will not suffice, but the Flux of blood continues, we must proceed to astringent and thickening Diet, and Medicaments; and so the Powders and Eleſtuaries formerly described, may be adminiſtred. Also Juyce of Plantane new drawn, and Sprup of Poppies to the quantity of an ounce, with Powder of Bole-Armenick or Dragons-blood.

Also outwardly may be used Fomentations binding and strengthening, made of Pomegranate-peels, Cypres Nuts, Acorn-Cups, Balaustins, Grape-stones, and such like things boyled in Smiths water, and red Wine.

Or a little Bag full of red Rose-leaves and Balaustins, may be boyled and applied hot to the Patients Belly.

Hereunto may be added the foresaid Plaisters and Cerecloaths: Or for to cause the more aſtriction, make a Cataplaſm of Astringent Powders, with Turpentine, and the whites of Eggs, which must be spread upon Tow or course Flax, and applied to the Navil and the Reins warm. The Tow which shall be applied to the Navil, must be moistened with Wine; that which is to be applied to the Kidneys, with Vinegar.

The two following Medicaments are accounted for secrets, and it is believed they will certainly hold the Child in the womb, if they be used before it be loosened from the wombs Vessels.

Take twelve Leaves of Gold: Spodium a dram; the Cocks Treading of three Eggs that are not addle. Mix all very well, till the Gold be broken into small Atomes. Afterwards dissolve them in a draught of Whitewine, and give it to drink three mornings together.

At the same time let the following Cataplaſm be laid on.

Take male-Frankincense powdered two ounces; five whites of Eggs; let them be stirred about together over hot coals, always stirring them that they may not clodder together; add Turpentine to make them stick. Then spread it upon Parcels of Tow, which lay upon her Navil as hot as she can possibly endure them, twice a day, morning and evening, on the three days aforesaid.

Chap. 18. Of Hard Child birth.

HARD Travail in Child-bearing, is such as keeps not the due ordinary Laws of Nature, taking up longer time than ordinary, and accompanied with more vehement pains than are usual, and other more grievous Symptoms.

CAUSES.] Divers Causes hereof may be assigned, and both internal and external. The internal depend either of the Mother, of the womb, or of the Child.

In respect of the Mother, Travail with child may become sore and hard by the weakness of her Body, either Natural, or in regard of Age, as in very young and very ancient Women; or in regard of Diseases wherewith the woman was troubled during the time of her going with Child, or is still troubled. Hereunto also leanness, and over-great dryness of the whole body, may be added; as also over-fatness, and grossness compressing and straitening the passages of the womb; ill shape of such bones as border upon and embrace the womb, as in such as limp, wind stretching the Guts; a stone or preternatural Tumor possessing the bladder, and pressing the womb; and the ill constitution of the Lungs and other parts serving for Respiration, because holding the breath is very necessary to exclude the Child.

In respect of the womb, divers Diseases thereof may cause a sore Labour, as Swellings, Ulcers; Obstructions, Aſtrictions, Stoppages arising from preternatural Causes.

In respect of the Child, Hard Travail is caused, when there is some fault therein, in respect of its substance, its quantity, its Figure, and certain things thereunto belonging.

The Child is faulty in regard of substance, when it is dead or putrified, or some ways infected, or weakened with some Disease, so that it hath no ability to contribute to its own exclusion.

In regard of quantity likewise, the Child doth not suffer its own Birth, which is either discrete or severed quantity, or concrete and joyned; the former is called number, the latter Magnitude. In regard therefore of continued quantity, the child is faulty, if the Body or Head of it be over-great which makes the Birth thereof become difficult and labourſome; in regard of the disjoyned quantity of the child or burden, labour becomes difficult, as when there are more than one in the womb; so the Birth of Twins is more painful than of a single Child for the most part.

In respect of the Figure or Scituation of the child in the Womb, difficult Travail happens many ways; as when the Child endeavours to come forth with its feet or its hands foremost, or puts out one hand only, or one foot; or when it endeavours to come forth doubled, with its breech or its belly foremost.

In regard of the Childs Adjuncts or certain things belonging to the Child, difficulty, of Travail happens, when those membranes which enclose the Child are more thin than ordinary, so that they come to break sooner than they should; whence follows an over-quick effusion of the Waters contained therein, whereupon the mouth of the womb remains dry at the time of the exclusion of the Infant; or where the foresaid Membranes are more thick and compact than ordinary, by which means the Child is hardly able to break them.

External Causes depend upon things necessary and things contingent: the things necessary are such as Physicians commonly call *res non Naturales*, things not Natural. So a cold and dry Air, and the Northern-wind are very hurtful to a woman in Travail, because they straiten the whole body, drive the blood and spirits inward, and prove very destructive to the Infant coming forth of so warm a place as the womb. Also air more hot than ordinary, dissipates the spirits, and exhausts the strength both of Mother and Child, easily introducing a feverish Inflammation into a Body replenished with ill Humors, and exagitated.

Meats raw and hard to digest, or of an astringent quality, taken in large quantity before the time of travail, may render the same laborious, the stomach being weakned, and the common passages stopped, which in this case ought to be very free and open.

Sleepiness and Sottishness do slacken the endeavours both of the Mother and the Child, and shew nature to be weak.

Unseasonable stirring of the woman doth much delay the Birth of the Child, when as she refuses to stand, to walk, lie down, or to sit upon the Midwives stool, as need shall require; or when she is unduly agitated to and fro; whence it comes to pass, that the Child cannot issue in a fitting posture or loses the good posture it had, by reason of the Mothers undue and disorderly moving her self.

The retention of Excrements at the time of Travail, as of Urine distending the Bladder, of hard Excrements in the strait Gut, and Hemorrhoids much swelled, do straiten the neck of the womb, and divert Nature from her endeavour of expelling the Child.

And in a word, vehement passions of mind, as Fear, Sadness, Anger, may very much encrease the difficulty of Child-birth.

To things contingent are referred Blows, Falls, Wounds, which may very much hinder the Birth: hereunto likewise appertain the parties assistance in time of Travail to help the labouring woman *viz.* strong women & maid Servants, which may lift her up and support her when she is in her labours, and especially an expert Midwife, which ought to manage the whole Business. For if the Midwife err in her office, it is wont to cause difficulty of Birth. For sometimes the Midwives do over-soon exhort the Childing women to hold their breath and to strain themselves to exclude their Child, while the bands which fasten the Child to the Womb, are as yet unloosed; by which means, the strength of the woman is wasted before hand, which should have been reserved to the just time of her Travail. Yea, and the truth is, while the Midwives do over-soon perswade the Childing women, that the time of their Travail is at hand, they bend all their strength to exclude the Child, and oftentimes violently break those bands with which the Child is fastened, and cast themselves into no small Jeopardy.

DIAGNOSTICK. Hard Travail is known both by the Childing-woman, and by the assistants, but especially by the Midwife. And in the first place, if the woman continue a longer time than ordinary in her Labours, as two, three, four or more days: whereas a truly natural Child-birth ought to be accomplished within the space of twenty-four Hours. Again, it is a Sign of an hard Labour, if the Womans pains be weak, and are long before they return, and if her pains are more about her Back than privities. And the Causes of hard Travail, are known by relation of the Childing-woman, and are for the most part evidently to be seen. So the weakness of a woman, her over-leanness, or over-fatness, is perceived by the habit of her Body. Diseases of the womb are known by their proper Signs. The Childs weakness is known by its weak and slow moving it self. But the Signs of a dead Child shall be declared in the next Chapter. The greatness of the Child may be gathered from the stature of the parents, especially when a Big Bodied man is matched with a little Woman. But when there are none of these Signs, and the woman labors stoutly, and the Child stirs and makes its way sufficiently, and yet the Travail is hard and painful; it is a token that the secundine or Afterbirth is stronger than ordinary, and can hardly be broken, which conjecture is more probable, if no water or moisture come from the Woman during her Labors. The disorderly posture of the Child is perceived by the Midwife, and other Causes are visible to the Eye, as we said before.

PROGNOSTICK. As for the Prognostick. Hard-travail is of it self dangerous; in which sometimes the Mother, sometimes the Child, and sometimes both do lose their lives.

If a Woman be four days in Labour, its hardly possible the Child should live.

Sleepy Diseases and Convulsions which befall a woman in Travail, are for the most part deadly.

Sneezing which befalls a woman in fore Travail, is good. Out of *Hypocrates* in his Aphorisms

To

CURE.] To cure difficulty in Child-birth, first all causes which may delay the birth, are as much as may be to be removed. And afterwards, such Medicines as further the Birth are Methodically to be administred.

And in the first place it is common among the Women to give a groaning wife a spoonful or two of Cinnamon-water. Or Cinnamon it self in Powder with a little Saffron may be given; or half a dram of *Confectio Alkermes* may be drunk in a little Broth. Also Saffron alone being given ten grains in every Mels of Broth the woman takes, or every hour being taken in a little Wine, is very good. Or,

Take Oyl of sweet Almonds and Whitewine, of each two ounces: Saffron and Cinnamon of each twelve grains: *Confectio Alkermes* half a dram: Syrup of Maiden-hair one ounce and an half: Mix all, and make thereof a potion.

If this shall not suffice, but that stronger things must be used, the following potion will be most effectual, which I have had frequent experience of.

Take *Dictamnus Cretensis*, both the Birthworts and Trochises or Cakes of Myrrh of each half a scruple: Saffron and Cinnamon of each twelve grains: *Confectio Alkermes* half a dram: Cinnamon-water half an ounce, Orange-flower and Mugwort-water of each an ounce and an half: Make all into a potion.

Among the more effectual sort of Medicaments are numbred Oyl of Amber, Oyl of Cinnamon and extract of Saffron, which do in a little quantity work much, viz. Extract of Saffron to five or six grains, Oyl of Cinnamon to four or five drops; Oyl of Amber to twelve or fifteen Drops, in Wine, Broth or other Liquor.

Sneezing hastens the Birth, for *Hypocrates* in the Aphor. 35: Sect. 5. saith Sneezing which happens to a woman in fore travail is good. Sneezing may be provoked by the following Powder.

Take white Hellebore half a dram: Long Pepper one scruple, Castorium five grains. Make all into a Powder, and blow thereof the quantity of a Pease.

The same *Hypocrates* prescribes another Remedy in the first Book of Womens diseases, which is omitted by all authors almost. And that is the opening of one of the lower Veins of the Body, which he propounds in these words. But if (saith he) a Big-bellied woman be so stopped that she cannot bring forth, but continues sever days in her pains: if she be a young woman, vigorous and full of Blood, her Ankle Veins must be opened, and Blood taken away, according as her strength will bear. Although this remedy be never used by our Practitioners; and it seems much to be feared, because in Travail nothing is so needful as strength, which may be weakned by Blood-letting: Yet if difficult Travail do arise from fulness of Blood, which *Hypocrates* doth insinuate in these words, where he sayes, If the Woman be young and in the prime of her strength, and very full of Blood, there is no question, but bleeding may be very profitable, because the Veins being very full of blood are wont to make all other inward passages of the body more strait. Whence it comes to pass, that in pains of the Stone in the Kidneys, the like Blood-letting doth often work wonders, and facilitate the expulsion of Stones both in the Kidneys and Uretors.

Also hard Travail may be holpen not only by these inward Medicines prescribed, but likewise by outward.

Let the Midwife therefore frequently anoint the womb of the Childing-woman with Oyls of Lillies, sweet Almonds, Lin-feed, and such like.

Also let her be fomented on the nether parts with an Emollient Decoction of Marshmallow and Lilliy-Roots, Leaves of Mallows, Violets, Mugwort, Seeds of Line and Genugreek, with the flowers of Chamomel and Melilot.

Let sharp Clysters be administred, by the provoking vertue of which the expulsive faculty of the womb may be likewise rouzed up; and the Guts being emptied will afford larger space for the womb.

Let her Navil be anointed with Oyl of Amber. Some commend the Gaul of an Hen applied to the same part.

Also such things may be used which are thought by a peculiar property to help the Birth: as Eagle-Stone, Load-Stone, Storax, and the rest being fastened to the Hips.

Hartmannus commends the Eyes of an Hare taken in the month of March, which are carefully to be taken out and dried intire with Pepper. Let one of these with Pepper be so tied to her Belly, that the Sight of her Eye may touch her belly: and it will bring forth the Child, be it alive or dead. Which being done, take away the Eye lest it bring forth the womb it self. He says likewise that it is good to bring out the Mole.

Heed is likewise to be taken that the woman carry no precious Stones about her, either in Rings or otherwise, but let her lay them all away: for many of them are conceived by a peculiar property to retain the Child in the womb.

If the Child seem to be weak, it must be refreshed, both with strengthening things given to the Mother, as warm Wine, *Confectio Alkermes*, Cinnamon-water; and also with things outwardly applied

applied, as with a crust of bread, or a Rose-cake strewed with powder of Nutmegs, Cinnamon, Cloves, Kermes berries, sprinkled with *Aqua Imperialis*, or with warm Wine. Or with a piece of Wether mutton a little broiled upon a Gridiron, and sprinkled with water of Roses, or of Orange-flowers: with the cawl of a Wether newly kill'd, not yet cold, and such like.

If the child begin to come forth in a disorderly manner, as by putting out one Foot, one Hand, or any other way, the Midwife must no ways receive it on that manner, but thrust it into the Womb again, and compose it to a right and natural posture or form of Egress. Which must be done by laying the Childing woman on her back in the bed, with her head somewhat low, and her buttocks high: and then gently pressing her belly towards the short ribs, and thrusting the child into the womb. Afterward let the Midwife endeavour to put the child into a right posture for coming out, by an artificial hand, procuring that the child turn its face towards the mothers back, and its buttocks and thighs let her lift up towards the mothers navel, and so hasten the same unto a Natural manner of coming forth.

When all hope of the childs coming forth is past, or when the Mother is almost dead, some Authors proceed to the *Cæsarean Section* (that is to cut the child out of the womb, as *Cæsar* was cut out) of which *Franciscus Rossetus* hath printed a most elegant Treatise, in which by many reasons and examples he endeavours to shew, that such a thing may be sometimes done with good success. Howbeit, seeing this Operation is very dangerous and terrible, it ought seldom or never be practised by a discreet Physitian, that would preserve his own reputation.

Chap. 19. Of a Dead Child.

IN fore Travail of child-birth by reason of great and long Labour, the child is oftentimes killed; and sometimes before a womans pains come upon her, the child happens to die through some preternatural accidents, such as those which are wont to cause Abortion: and if it hath not attained to the due time of natural birth, it causes abortion; but if it have, it causes a hard and sore Travail, because in a due and natural birth, both the Mother and the child ought to join their forces, to bring it from the dark dungeon to the liberty of day.

CAUSES. All such things therefore which cause difficult Child-birth being in a greater and more grievous degree, are of power to kill the child. But especially the Child is wont to be kill'd, if it come in so untoward and preposterous a Figure, that it can by no means be brought forth in that manner, neither can the Midwife or Chyrurgeon draw it forth, or reduce it to a better posture. For while sticking thus in the mouth of the womb, it frustrates all the endeavours of the Mothers straining her self to exclude it; it comes to pass, that in those strainings, various motions and compressions, sometimes both Mother and Child, sometimes the Mother alone, and sometimes the child alone doth die. It is to be admired which *Fabricius Hildanus* writes, touching two women which died through hard Labor, in whom their wombs were found broken asunder, and the heads of the Infants in their Mothers bellies. By which we may gather how strongly a lusty child doth labor to work it self out of the mothers womb.

DIAGNOSTICK. A dead child is known, when the motion thereof ceaseth, which either the mother did feel, or the Midwife perceive by her hand laid on; or either warm and strengthening things which were wont to awake and rouse up the powers thereof when they were in a slumber or stupified. Also the mother finds a great sense of weight, with which and pain of the belly they are troubled: when they turn from one side to another they perceive the child to roul from one side to another like a stone. The lower part of the belly feels very cold, the native heat being extinguished and those spirits dissipated, which were formerly in the child; their eyes become hollow and troubled, their Face and Lips pale; their extreame parts appear cold and of a Leaden-colour: their Dugs become flap and flaggy, and at length, when the child rots, stinking moistures flow from the womb, like water and blood: their belly is blown up with vapors ascending thereunto; a filthy smell, and stinking breath comes both out of the mouths of such women, and from their whole bodies. If the after-birth be excluded before the child, it is a certain token that the child is dead in the womb.

PROGNOSTICK. As to the Prognostick. A child dead in the Womb is a very exceeding dangerous thing, and if it be not timely voided forth, it is wont to cause Feavers, Faintings, Dead-sleeps, Convulsions, and death it self.

Yet sometimes a child dead in the womb may be kept a long time, as appears by many stories related by divers Authors, which *Schenkius* hath collected in great number as rare Cases, and *Sennertus* hath transcribed out of him, touching many women which have voided the Bones of Children dead and putrified in the Womb, by their Water-gate, their Dung-gate, and by a swelling that broke in their Belly.

I have

I have seen one woman which voided all the bones of her Child by her Navil, and her Navil growing afterwards whole again, she recovered her perfect health.

CURE.] The Cure consists wholly in the Exclusion or Extraction of the Child; for seeing great danger of life attends the Mother so long as the dead Child is in her Womb, as soon as ever by the foregoing signs we certainly collect the Child is dead, we must make haste to force it out. Which is done by the same Remedies which were formerly propounded to hasten the Birth. But among them we must choose out the most strong and effectual, whereunto some other things may be added which are yet stronger, after this manner:

Take Leaves of Savin dried, round Birth-worth Roots, Troches of Myrrh, and Castoreum, of each one dram; Cinnamon half a dram; Saffron half a scruple. Mix all into a Powder. The Dose is a dram in Savin-Water. Or,

Take Dictamnus Criticus, Savin, Borax, of each a dram; Myrrh, Asarum Roots, Cinnamon, Saffron, of each half a dram. Mix and make all into a Powder. The Dose is a dram in the foresaid, or such like Liquor.

In the mean time, let the Fomentations aforesaid be applied to the Privities, the Share, and space between the Water and the Dung-gate: adding Briony Roots, Roots of wild Cucumer, Florentine Orris, round Birth-wort, called *Aristolochia Rotunda*, and Broom flowers.

After Fomentation, anoint the said parts with *Unguentum de Artanita*, or with this following:

Take *Aristolochia Rotunda*, or round Birthwort, *Coloquintida* and *Agarick*, of each one dram: Gum-Ammoniac dissolved in Wine and Bulls Gall, of each two drams: with *Oleum Cheirinum*, as much as shall suffice. Make all into an Ointment.

Also let this Pessary be put up into the Womb:

Take *Aristolochia Rotunda*, Orris Root, Black Hellebore, *Coloquintida*, Myrrh, of each one dram: Galbanum, *Opopanax*, of each half a dram: with Ox Gall, make all into a Pessary. Or this:

Take *Ammoniacum*, *Opopanax*, *Castorium*, *Sagapenum*, black Hellebore, wild Vine, round Birthwort, Pulp of *Coloquintida*, *Scammony*, of each one scruple; *Euphorbium* one dram: With Juice of Rue, Bindweed, wild Cucumer, and an Oxes Gall; make all into a Pessary.

Zacutus Lusitanus in Obs. 154. of the Second Book of his strange and admirable Cures, doth testify, That a dead Child in the ninth months growth, producing many Symptoms in the Mother, was driven out by this Pessary, and by help of an Oily Bath, wherein was mixed the Decoction of such Herbs as do open and widen the Passages of the Body.

A Fumigation of Galbanum or an Asses Hoof, may be received by a Funnel into the Womb.

If the Matter hang long it will be good (the Woman being sufficiently strong) to give her a purging Medicine; whereby evil Humors, which in this case are easily collected, may be evacuated, and the dead Child consequently cast forth.

Angelus Sala, in his Book which he calls *Triumphus Emeticorum* (that is, the Triumph of Vomits) doth witness, That in this case he had often with happy success given four or five grains of *Mercurius vitæ*, which doth most powerfully expel the dead Child, and excel all other Medicines in that point. Which notwithstanding, in regard of its vehement working, requires great Caution and Discretion in the Physician that would use it.

If after Medicines long tryed, the dead Child cannot be ejected, we must implore the Chyrurgeons aid: Who may pull it out, either by Instruments, as *Paulus Aegineta* describes the manner, or only help of the hand, as is taught by *Carolus Stephanus*, *Banbini*, and others; all which are diligently transcribed by *Schenkius* and *Sennertus*.

CHAP XX.

Of the After-birth retained.

IN a Natural Birth, commonly the Secundine is excluded presently after the child, yet sometimes it is retained in the Womb, by which means the Mother is in great danger of her life.

CAUSES.] The internal causes of this retention are, the over-thickness of those Coats, and their too great compactness, by which means they cling more fast to the side of the womb: their being swelled through confluence of Humors, which is stirred up in a laborious Travail; weakness of the Mother caused by hard Labour, so that she wants strength to exclude the After-birth; and the shutting up of the Mouth of the womb after the Child is come away. But the external causes are, the cold Air, by force whereof the Secundine is repelled; and the wombs mouth stopped; certain smells, by which the womb may be enticed upwards or agitated; some grievous passion of mind, as fear, or sudden terror or frowardness of the Childing-woman, which will not abide in such a posture, nor use such

endeavours as are necessary to this work; the over great weight of the Infant, by which the Navil-string is broke upwards, and the Secundine is left within; and the Error of an unexperienced Midwife, which cuts the Navil-string too soon, or holds them not fast in her left Hand, as she ought to do; for if she let them go, they are drawn back into the womb, and there lie hid with the After-Birth, which they ought to have holpen to pull out.

DLAGNOSTICK.] The Tokens of a Secundine retained are needless, it's apparent of it self; yet sometimes a bit thereof is severed from the whole and retained, which is not so easie to be known; yet it may be known, because the womb after the Birth doth yet labour to cast somewhat forth, although those endeavours are not so great as formerly; there is perceived in the womb, a sense of pain and heat, and after certain days, a filthy and carrion-like smell exhales from the Womb.

PROGNOSTICK.] The Retention of the Secundine is a very dangerous thing, as if it continue some days in the Womb, it acquires a filthy putrefaction, whence ariseth an acute Fever, aptness to Vomit, fainting, difficulty of breathing, a Diaphoretick Sweat, Coldness of the extreame parts, Hysterical Fits, Fits of Falling-Sickness, and at last death it self.

CURE] *Hypocrates* in the Second Book of Popular Sicknesses, by the example of a certain Carriers Wife, doth hint unto us, That it is good in this case, when corrupt Blood doth suddenly come from the womb in large quantities, for it is hopeful that those Membranes being rotted and wasted, will flow forth upon the sixth or seventh day.

The After-birth retained, is expelled by the same remedies which were propounded to drive out the dead Child, whereunto we may add some appropriated or Specifick Medicaments, mentioned by Authors.

Gesnerus and *Angenius* do very much commend the Stones of a gelded Horfe, cut in pieces and dried in an Oven. The Powder whereof is given, as much as can be taken up between three Fingers, with the Broth of a Pullet; which Medicines, if need be, must be twice or thrice reiterated.

Rulandus gave thirty drops of Oyl of Juniper with happy success.

Some advise Childing-women to hold an Onion hard between their Teeth, and squeeze it there, swallowing down the Juyce; and bite it so three or four times, still sucking out the Juyce, and swallowing the same: and at last to drink a draught of warm Wine upon it, which presently helps them.

Forestus makes relation of a certain Midwife which received this following Secret from a Jewish Physitian. She took the green tops of Lovage, she stamped them, and strained out the Juyce with the best Rhenish wine, and gave a draught of it to the Patient.

Angelus Sala commends *Mercurius vita* in this Case, as well as in the Expulsion of a dead Child.

Hereunto add, Sneezing, Fumigations, Fomentations, Liniments, and other Medicines both inward and outward, formerly described in the case of a dead Child.

The following Decoction used by a Country-woman of ours, hath done wonders.

Take Vinegar of Roses eight or ten pints: Bay leaves and Bay berries, of each three handfuls: one Rose-Cake cut in bits. Boyl all together, and let her Hips and Legs be a long time together bathed, from her Groyns down to her Feet. Upon the use hereof, the womb hath opened of its own accord, and the After-birth fallen away. To this Decoction may fitly be added, of Myrrh and of the two Birthworts, of each one ounce.

And among other helps, the hand of a Skilful Chyrurgeon can do much, being put into the Womb before the Inflammation or Inflation be augmented. For he laying hold of the After-births, and gently turning them this way and that way, may draw them out, and free the woman from so many Symptoms, and tiresom Medicines.

If the Secundine can by no means be perswaded forth, but stick strongly to the womb, and there putrifie, suppurating things are to be put into the Womb, cleansing things being mingled with them, that as much as is putrified may be by little and little brought forth. To which intent *Rondeletius* commends *Unguentum Basilicum*, especially if it be dissolved in the following Decoction.

Take Leaves of Mallows with their Roots, three handfuls; Roots of the two *Aristolochias* or Birthworts, of each six drams; Linseed and Fennugreek-seed, of each half an ounce: Violet Leaves one handful; Flowers of Chamomel and the smaller Centaury, of each half a handful. Boyl all in water, mixing therewith (if there need great suppuration, or reduction to Matter) a little Oyl; but if there be more need of detersion, or cleansing, add a little *Unguentum Egyptiacum*.

Chap. 21. Of Immoderate Flux of the Loches, or Child-bed Purgations.

THe Immoderate flux of Child-bed Purgations, called from the Greek, *Loches*, is not to be estimated from the quantity, or the time of continuance; because that in divers Natures, Age, and Courses of Life, it is very different; but from the ill-bearing of the Woman, and her weakness therefrom arising.

CAUSES.] The Causes of this immoderate Flux, are the over-wide opening of the Vessels, or their rending in hard Travel, or the Violent drawing forth of the After birth; or a more than ordinary quantity of the Blood, which had been collected in the Veins of the Womb, during the whole course of the Womans being with Child; or the thinness and sharpness of the said Blood, which doth too much open the mouths of the Veins, and provoke Nature to Excretion.

DIAGNOSTICK.] Immoderate Flux of the Child-bed Purgations is known, as hath been said from the strength of the Woman, which is dejected through the exhaustion of her spirits that issue with the Blood; also the blood is clotted, and the Patient loaths all meat, is pained under her short Ribs, feels a distention of her Belly; her Pulse is weak and frequent, her sight is dimmed, she hath noise in her Ears, is subject to Swooning and Convulsions.

PROGNOSTICK.] As all great Fluxes of Blood are dangerous, because Blood is the Treasure of our Life, so the immoderate Flux of the Child-bed Purgations is more dangerous than the rest, because of the Travel which goes before, and weakens the Patient. But the danger is more or less, according to the greater or less quantity of the Blood which comes away, and as the Symptoms are more light or grievous which attend the same; which made *Hypocrates* to say, in the 55. Aphor. of the fifth Section, *If Convulsion or Swooning betides a Woman upon her Feminine Purgations, it's a shrewd sign.*

CURE. The Cure of an Immoderate flux of Blood, consists in one only point, viz. The stoppage of the said Flux. Yet extraordinary care is to be taken, lest that be kept within, which by these Purgations was wont to be carried away, and so prove the cause of grievous Infirmities. And therefore if the Flux do not extreemly purge, we must begin with lighter Medicaments, proceeding by little and little, if need shall require, to such as are stronger.

And in the first place, The violent motion of the Blood is to be bridled by an incrassating or thickening Diet, as by Panadaes, Jellies, Rice, Starch, with Calves-foot Broths, Pears, and Quinces boyled, roasted Flesh sprinkled with Juice of Pomegranates.

Let her have pretty plenty of Meat, but not at once, but divers times one after another. For by this means the Heat and Spirit which in the womb do assist to the Expulsion, are called away to the Stomach, and by that means the Patients strength is restored.

Let her Drink be Water that hath had Iron quenched in it, or Gold, or in which a little Mastich hath been boyled. Then such things are to be used as do revel the Blood into the superior parts, as rubbings and bindings of the upper parts, Cupping-Glasses fastened under the short Ribs on either side.

It is good likewise to bathe the Patients hands in hot Wine, in which *Confectio Alkermes*, or Venice Treacle, hath been dissolved.

Also let her Belly be moderately swathed with a Rowler or Swath-band; because hereby the Vessels of Blood will be pressed together, and the immoderate Flux hindered.

Let Linnen Cloaths be applied to the Loyns, moistned with a mixture of Water and Vinegar, by which the blood contained in the *Vena Cava* is tempered, and the motion thereof hindered.

If the Flux be very immoderate, and weaken the Patient, so that there is danger of death, we must have speedy recourse to stronger Remedies: Among the rest, this following Potion hath commonly good success.

Take Waters of Plantane, Orange flowers and Roses, of each one ounce; Syrup of Corals, or where it is wanting, of red Roses, one ounce: Sal Prunella one dram: Dragons-Blood ten grains. Make all into a Potion.

If the flux do yet continue, a Powder, or an Electuary for divers Doses may be prescribed after this manner:

Take Blood-stone four scruples: Powder of Bole-Armenick red Coral, prepared Pearls, of each one dram: Seeds of Plantane, Coriander prepared, grains of Sumach, of each two scruples. Mix all, and make them into a most fine Powder, of which let her take one dram with a Decoction of Knotgrass and Syrup of Quinces.

Take Conserve of Roses and Comphrey Roots, of each one ounce; Bole armenick, Troches de Carabe and prepared Coral, of each one dram: with Syrup of Coral or of dryed red Roses make all into an Electuary, of which let her take the quantity of a Chesnut, drinking a little of her ordinary drink after it.

Also a Fomentation and an Oyntment will profitably be applied outwardly, made after this manner:

Take Tops of red Mastich or Lentisch, Plantane, Cypress, Olive, and Solomons Seal, of each one handful: red Rose-leaves two pugils, Myrtle-berries one ounce and an half, Cypress Nuts, six: Peels of Pomegranates two pugils: boyl all in Steel-quenched Water and astringent harsh red Wine, and with the strained Liquor bathe the Privy parts, very luke warm, and almost coldish.

Take of the Countesses Oyntment, or Unguentum Comitisse two ounces; Juyce of Plantane one ounce: work them together into one Oyntment, to be used after the Fomentation.

Also an Injection may be made of the Juyce of Plantane into the Womb, commended by Galen in the Fifth Book of his Method, or the Decoction of the aforesaid Fomentation.

Other Remedies not helping, to open a Vein in the Arm is a present Cure, if the Blood be drawn out in distant spaces of time; for experience hath taught, that many women given over as incurable, have by this means recovered.

And finally, the Disease still remaining, all Medicines prescribed for the immoderate Flux of the monthly Courses, may be used in this Case likewise.

And among the Medicines for immoderate Courses, Cataplasms were propounded to be applied to the Share and Loyns; unto which the following Cataplasme or Pultis may be added, very good for all immoderate Fluxes of Blood, but especially for these Child-bed Purgations.

Take pure Soot from the Chimney not mixed with Dirt, eight ounces: work it lustily with the strongest Vinegar, and make a pultis to be applied to the Reins of the Back.

And it is here specially to be noted touching sleep, that while the Blood flows plentifully, the Woman must not be suffered to sleep, for many by that means are taken away, because the natural heat retiring inward, causes the flux to be greater. And if sleep in such a case cannot be avoided, some must be always by, of the servants, to feel her pulse, and mark how she fetches her breath.

In a word, if clotters of Blood do settle in her womb, and cause a pain and stretching therein, endeavour must be used speedily to bring it out, lest coming to putrefie, they transmit filthy Vapours to the Brain and Heart, and cause a Fever. Therefore the Childing-woman, if strong enough, ought to walk gently, or stand bolt upright for some time together, or to sit upon the groaning-Chair, as if she had list to stool. And if this suffice not, the clotters are to be dissolved with a warm Decoction of French-barly and a little Oxymel or Honey of Roses injected into the Womb. But here we must go warily to work, lest while we bring out the Clotters, the Flux of Blood be afresh provoked.

CHAP. XXII.

Of Suppression of Child-bed Purgations.

THe good and happy success of Child-bearing doth especially depend upon the convenient and orderly flux of the Loches or Child-bed Purgations; seeing the Impurities which have been collected in the Veins of the Womb, during the nine months time of the Womans Belly-bearing, are wont to be avoided by these Evacuations; but if they be suppressed wholly or diminished, infinite Dangers and Calamities arise thereby, viz. Acute Fevers, Phrenzies, Madness, Melancholies, Quinzies, Pleurisies, Inflammation of the Lungs and other swellings, which are for the most part malignant.

CAUSES. The Cause of this suppression or immunitation are, the thickness of the Blood, narrowness or obstructions of the Vessels, which hinder the free egress of the Blood; cold Air heedlessly received into the Womb, which closes the Orifice of the Vessels, taking cold at the Feet, drinking of small cold Drink, Fear, Affrightment, Sadness, and other Passions of the Mind, which withdraw the Course of the Blood from the Womb.

DIAGNOS. This Suppression is manifest of it self, and the diminution thereof is not to be adjudged by the Quantity which comes away, because some Women have more superfluous blood, and some less. But the perfect knowledg thereof is gathered from the supervenient Symptoms, such as are a swelling of the Belly, a pain possessing the nethermost part of the belly, the loyns and groyns; redness of Face, difficulty of Breathing, Perturbation of the Eyes, Shivering-fits, Fevers, Fainting-fits, and other Symptoms related before.

PROGNOSTICK. The Prognostick is drawn out of the Symtoms propounded as supervenient to this Disease; for they being for the most part dangerous, the cause from which they spring, must needs be very dangerous likewise.

Childing

Childing-women are freed from the foresaid danger, if some other evacuation happen which may at least in some measure supply the defect of these Purgations, as Bleeding at the Nose, or by the Hemorrhoid Veins: plenty of Urine, with a footy settling, or plentiful sweating. Or if after some days Lead coloured, black and stinking matter begin to flow forth. But it is to be feared lest by the corrupt Blood, Ulcers should be bred in the womb.

CURE.] The whole Cure of this Malady consists in the provocation of these Purgations, which must be endeavoured by such Medicines as provoke the Course of the blood downwards, and open the Vessels of the womb.

And in the first place, Emollient, Purging and Opening Clysters are to be administered, made after this manner:

Take Roots of Marshmallows and Water-Lillies, of each one ounce: the long and round Birthwort of each three drams; Leaves of Mallows, Marshmallows, Pellitory, Mercury, of each one handful: Linseed, and Fenugreek-seed, of each half an ounce; Flowers of Chamomel and Elder, of each two pugils: Boyl all to a pint. In the strained Liquor dissolve Oyl of Dill and Lillies, of each one ounce: Hiera simplex, half an ounce: Unguentum de Arthanita one dram. Mix all into a Clyster.

Let her Thighs be rubbed downwards; Let the Toes of her Feet be tied till they ake again; let divers Cupping-glasses be fixed to her Groyns and Hips, and let some of them be scarrified.

If these means suffice not, open the veins about the Knees, or of both the Thighs, or the Hemorrhoid Veins, if Nature seem to encline that way.

If a Fever be caused by suppression of these Purgations, a Vein must be opened in the Arm, as shall be said in the Diseases of Women in Child-bed.

This following Fomentation may be applied to her Belly beneath the Navil, and to the Privy Parts.

Take Roots of Marshmallows, Lillies, Briony, Angelica, and Birthwort round and long, of each an ounce; Leaves of Mercury, Mugwort, Pennyroyal, Savin, Calaminth, of each one handful; Linseeds and Fenugreek seeds, of each an ounce; Flowers of Chamomel, Melilot, Elder, Tansie, of each a pugil. Beat them and cut them according to art, and put them into two bags; which boyl in Fountain-Water, and apply by course one after another.

After Fomentation anoint the aforesaid Parts with Oyl of Lillies, Sweet-almonds and Sesamum, adding thereto a little Saffron.

Hereunto may be added such Pessaries and Fumigations as have been set down in our Chapter of Suppression of the Courses, beginning with the most gentle.

Let her drink a Decoction of opening Roots, Cinnamon and red Vetches, with a little Saffron.

Or, Take Opening Roots, of each two drams; Leaves of Betony, Endive, Maiden-Hair, of each a handful; Schœnanth one pugil; Annis-seed and Fennel-seed, of each one scruple; red Vetches a spoonful. Boyl all to a pint and an half. To the strained Liquor add Cinnamon-water two drams; Syrup of the five Opening Roots three ounces. Let her take four ounces twice a day.

Before the Fever be increased, we may sometimes give Troches of Myrrh one dram; with White wine or Fennel-water.

Forests useth this following Decoction, though there be a Fever:

Take French Barly one handful; Liquoris scraped half an ounce; Schœnanth one dram and an half, Boyl all to a pint for three Doses.

For the weaker he causeth one dram of Schœnanth to be boyled in Chicken-broth, which he gives the Patient to drink.

Also a Purgation may be convenient, seven or nine days after she is delivered, of the Infusion of Rhubarb, Agarick or Senna, or with a Laxative Broth made of opening Herbs and Roots with Scirnal, or with an ounce and an half of Manna dissolved in Broth.

Chap. 23. Of Gripings after Child-bearing.

GRipings do so frequently betide Women in Child bed, that very few women are free from them: But they are not wont to seek to the Physitian for these Pains, because within two or three days they go away. But if they happen more sharp, and of longer durance than ordinary, they are forced to send for the Physitian, who before he prescribe any thing, must consider the Causes.

The chief Causes of Gripings and Pains after Child-birth, are the plenty of Blood, its thickness, sharpness, and narrowness of the Vessels. For the Veins of the Womb having for nine months forborn their usual Evacuation of Blood, and the Blood being gathered in great quantity, and by its retention

retention becoming thick and sharp; while it goes through the narrow passages, it causeth pains, which return by Fits, as often as the Womb endeavours a new expulsion of Blood; which being over, they cease till such time as other blood doth seek its way forth.

Sometimes these Gripings are caused by Winds, or by Cold received into the Womb, but not so often.

These Pains are differenced from others which are wont to afflict the Belly by their continuance, and by the distances of holding up, which they observe according to distant fits of the bloods issuing forth: and the Women themselves can easily distinguish these pains from all others.

Thick Blood is known by clotting, but the thin blood by its tenuity, fresh colour, or yellowish.

If the Pain spring from wind, it is more wandring, being sometime in one part of the Belly, and sometimes in another; neither doth it observe the distances in which the Blood issues. If cold Air have entered the Womb, it may be known by a relation of what hath been acted about the sick woman.

These Pains are not dangerous, but for the most part exceeding troublesome: therefore must be removed or mitigated as soon as may be.

The Cure of these Gripings ought to be directed to these ends; *viz.* That the Vessels of the Womb be made wider, the Blood thinner, and its sharpness mitigated. All which may be accomplished by these following Medicaments.

And first of all, let the Patients Belly be gently swathed, that her womb may settle, and not be moved this way and that way, as often falls out after Child-birth, by reason of the sudden Evacuation.

Then give her three ounces of Oyl of sweet Almonds new drawn, with an ounce and half of Syrup of Violets, and two ounces of Hippocras.

Let Clysters be cast in of Milk and Sugar, with the Yelks of Eggs.

Or they may be made of a Decoction of Chamomel-flowers and Mugwort in Pullet-Broth, adding Oyl of Lillies, and the yelks of Eggs.

Anoint her Belly with Carminating or Wind-expelling and opening Oyls, as Oyl of Dill, Rue, Jasmine; or with this following, which being of great efficacy, ought to be made in time convenient, and kept in the Apothecaries Shop for such occasions.

Take Roots of round Birthwort, Orris and Peony, of each one ounce; Cypress Roots half an ounce; dried Leaves of Mugwort, Feverfew, Origanum, Calamint, Peniroyal, Dictamnus Cretensis, Wormwood, Savin, Rue, Betony and Sage, of each one handful; Flowers of Rosemary, Stechados, Lavender, Chamomel, Dill, St. Johns-wort and Elder, of each half a handful; Bay-berries and Juniper-berries, of each half an ounce; Seeds of Cummin, Rue, Peony, Carrots, and Agnus Castus, of each three drams; Cloves, Nutmeg, Cinnamon, Ginger, of each two drams; Storax and Myrrh, of each one ounce. Let all being beaten and cut, be steeped in six pints of old Oyl, adding a little Whitewine. And put them into an Earthen Vessel close stopped, the space of a week; and then boyl them over hot Embers the space of four or five hours; then let the Oyl be strained out, and reserved for use. If the foresaid Oyl be wanting upon occasion, let the foresaid simples boyl in equal portions of Oyl and Whitewine, till the Whitewine be consumed; then let the Oyl be strained out.

Also a Fomentation may be made of the Decoction of Mugwort, Bawm, Bay-leaves, Calamint, Carrot-seed, Cummin and Caraway-seeds, Flowers of Cheiri and Chamomel, in Water, White-wine or Milk.

Or the following Cataplasim may be applied;

Take three or four Onions well boyled in water; beat them in a Mortar, and put thereto Seeds of Line and Cummin beaten, of each one handful: As much Chamomel-flowers: Barly-Meal as much as shall suffice to make all into a Pultis. And if need be, add a little of the Water wherein the Onions were boyled. Spread it upon a Cloth, and apply it warm to her Navil.

It is likewise profitable to apply the Skin of a Weather newly flead off, while it is warm, to her Belly. For this kind of warmth is very near of kin to our Natural heat, concocts and mitigates the cause of the pain; also it hinders the Skin of the Belly from gathering into wrinkles.

These following Medicines may be given inwardly:

Take Carrot-seed powdered one dram; Whitewine three ounces. Mix them: Give it warm twice a day. Or,

Take Nutmeg, Annis seed, Cinnamon, of each one scruple: mix them into a powder to be taken in Whitewine; or give one scruple of Oyl of Nutmegs in Broth. Or,

Take Date and Peach kernels, of each half a dram; Nutmeg four scruples; Powder of Diamargaritum Calidum two drams, Annis seed one dram, Cinnamon two scruples, Saffron ten grains, Sugar the weight of all the rest. Make all into a most fine Powder, whereof give two drams in Wine twice or thrice a day, if the pains are much.

Foreſſus gave a Decoction of Chamomel Flowers in Beer, or a Decoction of Mugwort and Chamomel in Pullet-Broth, with good ſuccels.

It's good preſently after ſhe is brought to bed; to give her the Broth of an old Cock three days together early in a morning while ſhe is faſting, with a little Cinnamon and Saffron.

The following Powder taken preſently after the delivery of a Woman, doth wonderfully preſerve her from Gripping; inſomuch that it is thought, if it be given a Woman after her firſt Childing, ſhe will never after in her following Lyings-in, be troubled with theſe Gripes.

Take the greater Comfrey Root dried one dram; Peach Kernels and Nutmeg, of each two ſcruples: Amber half a dram; Amber-greece half a ſcruple; Make all into a Powder; of which let her take one dram in Whitewine, or if ſhe be feveriſh, in Broth.

For her ordinary Drink, let her uſe a Decoction of Mugwort with Cinnamon.

If the Gripings be cauſed by Cholerick and ſharp humors, they are cured much after the ſame manner that the Cholick is cured, when it proceeds from Choler. As for example:

Take Syrup of Violets and Borrage, of each one ounce. Mucilage of Quince ſeeds drawn out with Violet-Water half an ounce; Water of Borrage and Scorzonera, of each three ounces. Mix all, make thereof a Julep for two Doſes. Or,

Take Oyl of ſweet-Almonds two ounces; Syrup of Violets one ounce; Borrage-Water half an ounce. Mix all for a draught.

External Medicines muſt likewiſe be uſed, ſuch as are Laxative and Emollient, which do likewiſe by one and the ſame labour eaſe pain.

Oftentimes, after they are brought to bed, Women are pained in their Groyn, by reaſon of their wombs being gathered together like a ball in their Groyn. It is cured by applying to their Navil a Plaifter of Galbanum and Aſſaſetida, in the miſt whereof ſome grains of Muſk muſt be put.

CHAP. XXIV.

Of Acute Diseases of Women in Child bed.

WHAT we ſaid before touching the Acute Diſeaſes of Women with Child, we may now repeat touching the Acute Diſeaſes of Women in Child-bed; viz. That they have the ſame Eſſence of the ſame Signs, with the like diſeaſes in women which are not with Child, and in men. So that we ſhall refer the Reader for the Theory of theſe Diſeaſes, to their proper Chapters.

D I F F E R E N C E.] Now the Acute Diſeaſes are for the moſt part continual Fevers, both Eſſential, as *Synochus putrida*, a continual Tertian and the reſt; and alſo Symtomatical, which accompany inward Inflammations, as the Pleuriſie, Inflammation of the Lungs, Inflammation of the Liver, Phrenzy, and ſuch like.

Yet there is a peculiar ſort of Fever, which befalls almoſt all women in Child-bed, which is called by them the Fever of their Milk, which is wont to befall them about the third or fourth day after they are brought to bed, when their milk begins to encreaſe in their Breasts; and it ariſeth from the reflux of the blood from the Womb to the Dugs, and the motion and agitation thereof. Which kind of Fever is reckoned among the Diary Fevers of the longeſt durance; neither needs it any Medicines, becauſe within three or four days, viz. about the ninth after her delivery, it is finiſhed by ſweat. It is diſtinguiſhed from putrid Fevers, becauſe commonly it ſeizes the woman about the fourth day after her being delivered, and her Dugs begin to be filled with milk, and to be troubled with hardneſs, pain and heat; with heat and heavineſs in her Back and Shoulders; alſo her Child-bed Purgations flow duly, which ſeldom is ſeen in Putrid Fevers.

C A U S E S.] Now putrid Fevers do befall Women in Child-bed from three cauſes, viz. Suppreſſion of their Child-bed Purgations or diminſhing, by the heaping together of bad Humors during the time of their Belly-bearing, which were agitated by their Labors, or by Errors in their Diet. Some add immoderate Flux of the Child-bed Purgations, which is rather a ſign of the ſecret badneſs of humors cauſing the Fever, but cannot be it ſelf any cauſe thereof.

In ſuppreſſion of the Child-bed Purgations, the Blood and vitious Humors which are collected during the whole time of her going with Child, do flow back again into the greater Veins, and there putriſie, and ſometimes are carried to the Liver, Spleen and other parts, in which they raiſe Inflammations; or if they abide in the Veins of the womb, they putriſie, and ſo cauſe a Fever in thoſe Women which were before in perfect health.

But if (the Child-bed Purgations duly flowing) a Fever ariſe, it comes either from ſuperfluity of Choler, or from Errors in Diet. Evil humors agitated by the Labors and pains of Travel, do eaſily inflame, and putriſie and ſtir up a Fever. Errors of Diet may happen divers ways: And firſt in point of eating, in which women that lie in, are wont to be very faulty, ſtopping themſelves with plenty

plenty and variety of Dishes, which cannot be by them digested, but causeth putrefaction in their Bodies. Another error is committed when Childing-women do unadvisedly expose themselves unto the cold Air, especially while their Milk-fever is in its vigor, which is wont to be terminated by sweating and transpiration, which is hindered by heedless admission of the cold Air, whence it comes to pass, that the Fever which of it self was void of danger, and would in a few days have ceased, is changed into a dangerous putrid Fever.

There is yet another frequent Cause of the Fevers of Childing women, *viz.* When the After-births are not wholly cast forth, but some portion remains behind. This happens principally in the Womb-liver, when a part thereof sometimes annexed to the Womb, and left there, doth putrefie; which makes the Child-bed fluxes to come forth greenish, stinking, and Carrion-like; and if within few days it be not seperated from the womb and excluded, it casts the sick woman into great danger of death, seeing it may mortifie the Womb.

DIAGNOSTICK. If Clotters of Blood, or any other preternatural thing, shall remain in the Cavity of the Womb after Child-bearing, it may thereby be known, because the neck of the Womb remains soft and open, neither is the inner Orifice thereof shut, neither is the womb drawn upwards; and whereas when all goes well after Child-birth, the womb is drawn upwards, and its neck and orifice are quickly shut. An Example hereof is propounded by Dr. Harvey, in his Treatise *de Partu*, concerning a Woman, who having a Malignant Fever, and being very weak, miscarried; and after exclusion of a perfect Child, and uncorrupted, yet being very weak, with a creeping Pulse and cold Sweats, she was ready to give up the Ghost. He feeling her womb, perceived the Orifice thereof lax, soft, and very wide; and putting in his fingers, he drew forth a Mole as big as a Gooses Egg, having certain holes in it, containing a clammy, black and stinking putrefied matter, and the Woman was soon freed from the aforesaid Symptoms, and quickly recovered her health.

It happens likewise in some Women that the Orifice of the womb presently after their delivery, is so shut up, that the blood contained within the Womb, suddenly clotting and putrefying, causeth most sad Symptoms; and when no Art can bring it forth, present death follows. Yet Dr. Harvey relates in the place aforesaid, the History of a Woman cured by him of this Disease. The Lips of the Water-gate were swelled, and very hot; the mouth of the womb was hard and close shut: He opened it a little with an Iron Instrument which he forcibly put in, so as it would admit an Injection made by a Syringe; and thereupon, clotted, black and stinking Blood, some pounds in quantity, came away; by which means the sick Woman had present ease.

PROGNOSTICK. The Prognostick of these Fevers herein only differs from the Prognostick of such like Fevers which happen to those that are not in a Childing-condition; because through the Labours of Child-birth, the strength of the Patient is more dejected; and by reason of the Child-bed Purgations suppressed, there is a greater redundancy of humors in the Veins, and in both respects the Party is in greater danger.

The Decision of that famous Question, *Whether the Computation of the days of the Womans sickness ought to be made from the beginning of her Disease, or from the day in which she is delivered of her Child*, makes much to clear the Prognostick of this Disease, especially to foretel the Crisis. Which Question we shall therefore thus briefly determine: If the Birth of the Child were natural, attended with no grievous Symptoms, and the Child-bed Purgations were as they should be, and the Fever come some days after, the account ought not to be made from the day of the Childs birth, but from the day the Fever began, which was provoked by some other preternatural Cause, *viz.* Evil humors lurking within the Body, or from some external Cause. But if the Child-birth were hard and beside the Course of Nature, and the Fever arose after three or four days, we must reckon from the day of the Child-birth, because then the whole order of the Body began to be overthrown, and the humors to be disturbed, which was followed by the Fever. So in grievous wounds of the Head especially, though the Fever come not till after the fourth or fifth day, yet the account is wont to be made from the day of the Wound received, because the humors began then to be in a commotion, and to be disposed to cause a Fever.

CURE. The Cure of these Fevers differs not from the Cure of other Fevers, unless in point of those great Remedies, Blood-letting, and purging; in the administration whereof there is no small scruple, which we shall briefly endeavour to remove.

As for letting of Blood in Acute Diseases of Women in Child-bed, the disagreement of Authors is so great, by reason of the contrary Indications on the one side, and on the other, that we can scarcely find two of the same mind. We shall briefly in these following Theorems or Maxims, propound that Opinion which cometh nearest the mind of the wisest Authors, and is in the course of Practice most successful.

An Acute Disease befalls a Child-bed woman, either in the beginning or in the middle, or in the end of her Lying-In.

If it happen in the beginning, and the woman be plentifully purged, there must be no other evacuation

cuation of Blood than that which is directed by Nature when she rightly and conveniently performs her operations. But if the Child-bed Purgations are suppressed, or flow sparingly, let the inferior Veins be opened, and take a good quantity of Blood away: because at that time the Child-bed Purgations of Blood ought by the appointment of Nature to be plentiful.

If an Acute Disease happen in the middle time of her Lying-in, two things are to be considered: The one is, Whether the Morbifick matter be contained in one particular place, or if it be dispersed through the Veins. The Second, Whether the Woman hath been conveniently purged or not, in regard of quantity. If the disease proceed from matter scattered abroad, as in Fevers, and the Woman hath not been fully purged, the lower Veins ought to be opened: because both the Morbifick matter will be diminished, and her Natural flux will be provoked. But if the Woman have been sufficiently purged, and the Disease get ground, and the Natural Evacuations have not been sufficient for the Disease, the inferior Veins must be opened notwithstanding; and so much Blood must be taken away, that by two Evacuations that may be accomplished which the Disease requires, according to the Doctrine of *Galen*, in the Ninth Book of his Method, Chap. 3.

If the Fever be very high, and great heat vex the Patient, let that be done which we shall presently declare; which ought to be performed when the Disease ariseth of Matter driven into some corner, and there putrifying.

In a particular Acute Disease, as the Pleurisie, Inflammation of the Lungs, Quinsie, and the like, we must mark whether the Fluxion be only beginning, so that the Disease is only ready to seize upon the Patient, or is in its beginning, and very little Blood be collected in the part. For then the inferior Veins are to be opened, that revulsion may be made to such opposite parts as are at greatest distance from the part affected, and by that means that preposterous motion of Humors may be stopped. But if the fluxion be already in good measure begun, and an Inflammation bred which proves very troublesome, whether the Woman be sufficiently purged or not, the Superior Veins are presently to be opened right against the part affected, because such an Evacuation draws Blood out of the part affected. But if the inferior Veins should be opened, which are neither next the part affected, neither can Evacuate there from, both the strength of the Patient will be weakned by the evacuation, and that matter which is by Nature driven into a corner, and subdued, will not be thereby diminished. And so you must either draw all her Blood in a manner out of her Veins to reveal the matter of the Disease from the part affected; or the Woman will be killed by the Disease before sufficient Revulsion be made. Neither need we fear, lest by taking Blood from the upper Veins, we should draw the Course thereof from the womb, because in such Causes the superior parts of the Body do abound with Blood. And although much Blood be taken away, yet are not the Veins so emptied, that they should be forced to draw new Blood from other parts. Yet for the greater Caution, it will not be unprofitable before blood be taken from the superior Veins, to cause the Thighs to be lustily rubbed, and presently after to tie them with bands so hard, as to pain the Woman, which must abide so bound till the bleeding be over, and a little after they may be loosened; and now and then Cupping-glasses must be fastened to the same parts, or at least they must be again well rubbed. So we may procure an Evacuation of the matter offending, and yet preserve the Natural course of the blood towards the Womb.

The same course is to be taken in vehement and Burning Fevers: For although the matter offending be dispersed through the Body, yet is the Burning heat so great about the Heart and Bowels, that it cannot be so well extinguished by the opening of a small and far distant Vein, as by the opening of a nearer and greater, such as the Vein called *Basilica*.

This Method of Curing may be observed not only in Child-bed women, but in other women who are taken with Acute Diseases, and have their monthly Courses upon them.

If in the end of a womans Lying-in, an Acute Disease befall her, the same Course must be followed as in the middle, the same conditions being observed; observing this for a Rule, that by how much a woman is further from the beginning of her Lying-In, by so much more safely may the upper Veins be opened; but the nearer she is to the beginning, yea, even in the middle, we are to open those Veins with the greater premeditation. And if the Disease be not importunate, nor the sharpness thereof require such a thing, and the Natural Purgations be copious, we must wholly abstain. But if the Purgations be scanty, we must open the inferior Veins to supply that which is wanting in the Evacuations. But if the contrary shall happen, let us follow the Rule which we prescribed to be followed, in the urgency of an Acute Disease.

The use of Purging in Childing-women that are held with Acute Diseases shall be comprehended in these following Maxims.

While the Child-bed Purgations do naturally flow, a Purge is never to be administered; for it is to be feared lest Nature be diverted from her Business.

But if the Child-bed Purgations are not kindly, we must consider whether their fault consist in Quantity, or in Quality.

If they offend in Quantity, so as to be too little, so that the woman be purged either not at all, or not sufficiently: After all remedies fit to procure these Purgations, have been given in vain, and the Morbifick Matter appears digested, eight, ten, or twelve days being past since she was brought to Bed, according to the more or less urgency of the Disease, she may be purged gently, wholly abstaining from all stronger Purgatives.

If other Purgations offend only in Quality, so that a white Flux, or some other unnatural colour do proceed from her, the Matter being ripe, she may in the last part of her Lying-in be safely purged.

But this must evermore be generally observed, That by how much the longer a Childing-woman is distant from the day of her bringing to bed, by so much the more safely she may be purged, and contrariwise: For experience hath taught us, That Women wanting their Child-bed Purgations, if after the seventh or ninth day they are taken with a looseness, they commonly scape. But if the Looseness seize upon them on the first days, viz. on the second, third, or fourth, for the most part they die.

And so have we finished the Cures of Womens Sickneses; All Praise and Honour be given to G O D therefore.

The End of the Fifteenth Book.

THE
 Sixteenth BOOK
 OF THE
 PRACTICE
 OF
 PHYSICK.

*Of Diseases of the Joynts, and Rheumatick Pain of
 the whole Body.*

THE PREFACE.

THough all Diseases of the Joynts depend upon the same Causes, differing only in respect of the place affected, and are wont to be cured with the same Medicines; yet is there some difference between the Sciatica or Hip-Gout, and the pains of other Joynts, by reason of the structure and largeness of those part, of which the Huckle or Hip bone is articulated and made up; in respect of which it requires some diversity in certain Medicines; therefore it is that I have resolved to treat of the Sciatica by it self. And because the Rheumatick pain incident to the whole Body hath great Affinity with the running-Gout which afflicts only the Joynts, I have thought good to annex the Explication thereof in this place; so that this Book will consist only of Three Chapters: Of which, the First will treat of the pains of the Joynts in general. The Second, Of the Pains of the Huckle bone, called Sciatica. The Third, of those Rheumatick Pains which seize all Parts of the Body.

Chap. 1. *Of Pain in the Joynts, called Arthritis,
 or the Gout.*

Arthritis, or the Gout, is a pain in the Joynts which comes for the most part by fits, stirred by an Influx of Humors into the said Joynts.

The parts pained are, Membranes, Tendons, Nerves, and all the Nervous parts that are near the Joynts, which are stretched by the Humor which flows into them, or by their sharpness are pricked and twitched; but the Ligaments which spring out of the Bones are void of sense. Now the Humors which cause the Gout do seldom flow into the very Cavities of the Joynts, and that only in an old Gout, and where the Cavities are wider than ordinary, as it happens in an old Sciatica, in which sometimes the Thigh-bone falls out of its place, the Ligaments and other parts binding the Joynts together, being loosened, and then the Cavity of the Joynt is filled with starchy kind of flegm, as we see in Hypocrates, Aphor. 59. Sect. 6.

It is wont here to be demanded, why the Humors flowing into Nervous and Membranous parts, and distending and twitching them, they should not cause a Convulsion? We answer, that the Parts affected in the Gout are chiefly Membranes, which being no instruments of motion, they cannot cause a Convulsion, though never so much stretched or twitched. And although the Tendons and Nerves ordained for motion should be likewise pained, yet do they not cause a Convulsion; because to make a Convulsion, the Muscles must be drawn back to their Head, and that retraction ought to be made by a contraction of the Nerves which are inserted into them; but when they are gone out from the Muscles, or are come unto their extremity, though they be distended, yet can they not contract the Muscles.

DIFFERENCE. Authors do commonly make four sorts of Gouts, according to the diversity of the Joynts affected; *Chiragra*, or the Hand-gout, when the pain is in the Hands; *Sciatica* and *Ischias*, when it is in the Hip; *Gonagra*, when it is in the Knees; and *Podagra* or the Foot-gout when it is in the Feet. And the pains of the other Joynts go under the common name of *Arthritis*: though *Parvus* have imposed proper names upon every one of them drawn from the parts affected; calling the Pain in the Joynts of the Jaw-bone *Syagoniagram*; in the Neck *Trachelagram*, in the Back-bone *Rhachysagram*; in the Shoulder *Homagram*; in the Elbow *Pechyagram*. But these Names have not been entertained by Practitioners. Therefore its sufficient to refer the Pains of those Parts to the general names of *Arthritis*.

There are besides, other differences of the Gout; as that some Gouts are general, occupying all, or most of the Joynts of the Body; others particular, residing only in some one Joynt: some are ingrafted and Hereditary from the Parents; others are adventitious caused by external Causes and Errors in Diet.

Now the humors which breed the Gout, may have their Course not only into the Joynts, but sometimes also in other parts of the Body, as the Head, Teeth, Sides, yea and the internal parts, as the Liver and Spleen, and stir up divers Pains in these parts, which Pains are not to be termed the Gout, though they are caused by the same matter which causes the Gout.

Again, all pains seated in the Joynts merit not the Name of Gouts, for sometimes there are swellings in the Joynts, especially in the Knees, from which pains arise, occasioned by thick, flegmatick, and Melancholick humors, which pains continue very long, but are not to be reckoned among the Gouts, but have a distinct Nature of their own. Which difference will more clearly appear by the different Characters of the Gout, which we shall describe in our Diagnosis thereof, that is, in the Art of discerning the Gout from other Diseases, by certain signs and tokens.

CAUSES. The next immediate Cause of the Gout is a serous or wheyish Humor, either by its quantity stretching those sensible parts which are about the Joynts, or by its sharpness twitching the same. That this matter is wheyish, is hereby known, because thick Humors could not so easily flow into the Joynts, and they would make a more visible swelling in the Joynts, which is wont to be very little, yea in the beginning there appears no swelling at all, though there be a most bitter Pain; and that the Tumor which is in the Gout never comes to suppuration or ripeness of matter, which often happens in other thicker humors, if they have never so little Blood mingled with them. But in the Gout the blood is drawn to the Joynts, as appears by the Inflammation of the Parts; yet there never happens any suppuration or growing to a mattery Head, because Serosities or wheyish Humors rule the roast, and they hinder Suppuration.

But this wheyish Humor is seldome pure and sincere, but hath other Humors or their serosities and thinner parts joynd with it; whereupon great varietie arises, according to the greater or lesser Acrimony of the Humors mixed with the wheyish Humor, according to which the pain is more or less; the Tumor is sometimes notably great, and sometimes not visible; some are of a red colour, others yellow or white; in some the malady is soon ended, in others it continues long; sometimes a mighty and fervent heat possesses the parts, otherwhiles little or none is discerned; sometimes hot things laid on do good; otherwhiles they do hurt, and cold things help. Howbeit, it cannot be denied but that the wheyish Humor may of it self have more or less Acrimony, according as it hath more or less Salt mixed with it: for seeing the serous or wheyish humor is wont to dissolve and drink up those Heterogeneous Salts which are multiplied in the Body by reason of the multiplicity of meats we use (whence it is that all the serum or wheyish humor in us is Salt) according as this Humor is more or less salt; and according as the Salts mixed therewith have more or less sharpness, more or less pain is wont to be caused.

And because in the Gout, as in every Fluxion, four things are considered, the matter flowing, the part sending that matter, the part receiving the same, and the ways by which the fluxion is made; seeing we have spoke of the matter flowing, we are now to speak of the other.

Touching the part sending the humor, there is disagreement among Physitians. *Fernelius* would have all the material cause of the Gout (which he takes to be thin and Flegmatick) to flow from the Head; not from the Brain it self, (whose Excrements are either voided by the Nostrils, or flowing through
